and any other suggestions which may have come to their knowledge, intended to diminish the risk or to mitigate the effects of accidents to passenger vessels at sea.” Then there is an answer to that which is, I think, the last letter that I think need be read and which will be included in the documents which will go before your Lordship. It is the 27th April. This is from Sir Norman Hill, the Chairman, and the Secretary, “We are desired by the Merchant Shipping Advisory Committee to inform you that your letters of the 16th, 20th, 24th and 25th inst. were brought before the Committee at a meeting held yesterday.” I have the letters of the 24th and 25th, but they really do not add anything. “The Committee fully recognise that the proved impossibility of keeping such a vessel as the ‘Titanic’ afloat, after a collision with ice, until the arrival of outside succour, has created an entirely new situation, which was neither in the contemplation of the Board of Trade nor of the Committee in the consideration of the extension of the existing boat scale in regard to vessels of 10,000 tons and upwards. In advising on such extension in July last, the Committee aimed at providing ample boat accommodation on large passenger vessels in accordance with the principles that were adopted by the original Life-Saving Appliances Committee, and which principles had apparently been fully justified by many years of experience. It is with satisfaction that the Committee note that the Board of Trade, apart from the new possibilities demonstrated by the loss of the “Titanic,” agreed in the essentials with the recommendation of the Committee. In face of the new facts, the Committee, at their meeting yesterday, reopened entirely the question of the revision of the boat scale for large passenger vessels, with a view of providing the maximum of protection for the passengers and crew in the event of an overwhelming disaster, whilst, at the same time, maintaining the principles in regard to the stability and sea-going qualities of the ship itself, and to the prompt and efficient handling of the boats carried under the existing scale, which hitherto have proved not only essential to safety, but also adequate for all ordinary emergencies. The questions involved are not free from difficulty, but they will receive the immediate attention of the Committee. Pending their consideration the Committee note that assurances have been received by the Board of Trade from representatives of most of the large passenger lines to the effect that every effort will be made to equip their vessels, at the earliest possible moment, with boats and rafts sufficient to accommodate all persons on board. In regard to the recommendations forwarded with the Committee’s letter of the 4th July last that the Board of Trade should, having regard to the developments in shipbuilding since the Report of the Committee of 1891, on Spacing and Construction of Watertight Bulkheads, review the requirements designed to attain the standards at present enforced under Rule 12, the Advisory Committee note that the Board of Trade have under consideration the appointment of a Committee of equal standing to that of the Committee of 1891. In view of the great importance of this question the Advisory Committee desire us respectfully to urge that such a Committee be appointed at as early a date as possible. The subject of the general revision of the statutory regulations as to boats and life-saving appliances on all ships, which, apart from the questions on all ships, boat accommodation on vessels over 10,000 tons, is for the first time referred to the Advisory Committee by the letter of the 25th instant, together with the particular questions raised in the letters of the 16th, 20th, and 24th instant, are also receiving the immediate attention of the Committee. At yesterday’s meeting sub-committees were appointed to give immediate consideration to the subjects

requiring detailed examination. These sub-committees will pursue their enquiries concurrently, and we are desired by the Advisory Committee to inform you that their investigation into the revision of the Life-Saving Appliances Rules will be proceeded with as expeditiously as possible." That, I think, is all the correspondence that is really material. There are letters which refer to it, but I do not think they help at all. Now if I may just deal, while they are getting these minutes, with the report of July, 1911. It is quite clear from that, that if that Report had been adopted the boat accommodation on the "Titanic" would have been very far short of that which would have been necessary to take off all the passengers and crew from the vessel.

*The Witness:* That is so.

*The Commissioner:* And it appears to me it would have been very far short of what was, in fact, on the "Titanic."

*The Attorney-General:* Yes. If it took advantage of the right to apply for exemption provided they satisfied the Board of Trade as to the watertight compartments and also that they had the proper wireless telegraphy apparatus, that would be the case.

*The Commissioner:* What was the tonnage?

*The Attorney-General:* 46,000.

*The Commissioner:* She would have had 16 boats under davits.

*The Attorney-General:* Yes, and 8 which were to be readily available for attachment to davits. So that it would be 24 boats which must have a minimum cubic capacity of 8,300.

*The Commissioner:* What was the cubic capacity of the boats on the "Titanic"?

*The Attorney-General:* The total capacity was 11,325, of the 20 boats.

*The Commissioner:* Comparing the boat accommodation by the cubic contents, the boat accommodation was, in fact, on board the "Titanic" considerably in excess.

*The Attorney-General:* But I think we are measuring a little too soon, because you have to add something to the 8,300. I put the question a little too quickly yesterday to Mr. Carlisle, and then pointed out that it was not quite right. If you add the three-fourths you will get then 6,225 which must be added, giving a cubic capacity altogether of 14,525 as against 11,325, the actual cubic capacity of the boating accommodation on the "Titanic."

*The Commissioner:* It would be short by the difference between 11,000 and 14,000.

*The Attorney-General:* Yes, there would have been accommodation for about 300 persons more.

*Sir Robert Finlay:* But that additional accommodation, 6,225, which my friend has referred to, would not be required, having regard to the watertight compartments under the recommendation of the Committee, on application to the Board of Trade.

*The Attorney-General:* I agree.

*The Commissioner:* So that, I think, as Mr. Carlisle said, it comes back again to the same thing.

*The Attorney-General:* I think so.

*The Commissioner:* If you take into consideration the sufficient watertight bulkheads or compartments to satisfy the Board of Trade.

*Sir Robert Finlay:* The obvious intention of the report was that the provision of watertight bulkheads should be encouraged by allowing a dispensation from the additional boats.

*The Attorney-General:* I agree.

*The Commissioner:* This correspondence shows that, I think.

*Sir Robert Finlay:* And the comparison is really between the 8,300 cubic feet which are required

## **Page 605**

and the 11,325 cubic feet which the "Titanic" had. It comes back to what was said in the first instance.

*The Commissioner:* Just allow me to read something which may explain or afford an answer to a question which I put as to why the White Star Line stopped at 1,178 in finding accommodation for the people on board. The "Titanic's" boats could carry 1,178. The suggestions of the Advisory Committee would necessitate boats to carry 1,452. That is what you said just now.

*The Attorney-General:* Yes, quite right.

*The Commissioner:* If the Board of Trade's approval as to subdivision were obtained and one-half the additional boats excluded, the number would be reduced to 1,141, and the White Star Line provided accommodation for 1,178, that is to say, a little above the total number required.

*Sir Robert Finlay:* That is under the old Rule - under the Rules as they existed unmodified by the recommendations of the Advisory Committee.

*The Commissioner:* No, that is not at all what I mean. What I mean is that the boats provided upon the "Titanic" complied with the recommendations of this Advisory Committee, the Sub-Committee.

*The Attorney-General:* I think probably my friend and I are in agreement upon it. What we are venturing not to agree with in what your Lordship said is in taking the half of the 8,300 in order to give you that total of 11,000 odd. That you only do under Rule 12 of the old Rules. If, as Sir Robert Finlay says quite rightly, you adopt the Committee's recommendation, as you do for your figure of 8,300, and if you assume that the "Titanic" had applied for exemption because of its efficient watertight compartments, then following out still the recommendation of the Committee you would exempt them from all additional craft, and therefore you would get back to the 8,300.

*The Commissioner:* Yes, you would.

*Sir Robert Finlay:* That is right.

*The Commissioner:* But apparently they had not adopted that.

*The Attorney-General:* They had not. That is right. And, of course, if the "Titanic" did not apply, then she had to provide boat accommodation for a capacity of 14,525 feet. I think this recommendation of the Committee is the first time, so far as I can trace in the very numerous documents I have had before me, that the Merchant Shipping Advisory Committee had recommended that there should be a total exemption from the requirements for the additional craft if efficient watertight compartments were provided, and also provided that there is a proper wireless telegraphy apparatus. So that the direction of the Committee apparently in 1911 was still more for less requirements for

boats if you have both the proper wireless telegraphy apparatus and efficient watertight compartments. That is the position, I think.

*The Commissioner:* Of course, the great object I suppose must be to reach that condition of things which will render recourse to lifeboats quite unnecessary.

*The Attorney-General:* That is it.

*The Commissioner:* That is what you strive for.

*The Attorney-General:* And one has always to bear in mind the enormous importance of wireless telegraphy in that connection, because if you can manage to keep your vessel afloat for a few hours, and particularly if you are on a track, as these Atlantic vessels are, you then can communicate with all other vessels on the track, and there is every chance of passengers being saved straight from the vessel by the boats which are provided. That is, no doubt, what the Advisory Committee had in mind, and that they had to compare with the question of hampering the boats and encumbering the decks by the provision of many more boats and davits. Those are some of the balancing considerations, and the Merchant Shipping Advisory Committee took the view which your Lordship has before you.

*Sir Robert Finlay:* There is also the possibility of fire to be considered as a reason for lifeboats.

*The Attorney-General:* Certainly, but I think the same consideration would apply. At first sight it looks as if, if there was a fire, there must be accommodation for all the passengers at once, and that undoubtedly is a very serious question to consider. But that brings us to the matter again, to the other considerations which do not apply to collisions.

*Sir Robert Finlay:* The question is what is reasonably practicable. If it were carried to the extreme there would be no ships.

*The Commissioner:* It always comes back to that. The difficulty one has with a statement of that kind is to say what is reasonable.

*Sir Robert Finlay:* It would realise the dream of the poet of an oarless sea.

*The Attorney-General:* I propose now to give your Lordship a short statement, with the assistance of Sir Walter Howell, as to the requirements of the law in foreign countries, but your Lordship has brought it upon yourself, because you asked for it, and I think it is rather important you should have it.

*The Commissioner:* That was because I thought it would help.

*The Attorney-General:* It may.

*The Commissioner:* I did so because I had seen it suggested that upon the German boats particularly a larger provision was made for life-saving apparatus than on ours.

*The Attorney-General:* That is right. Certainly, according to the legal requirements they would have to provide more boats than according to our requirements, and it is for that reason I will give them to your Lordship. I will do it shortly. It is again a document which will be printed.

*The Commissioner:* Do you want Sir Walter Howell for it?

*The Attorney-General:* I do not think so. We will have sufficient copies printed to supply all my friends, so that they will be in the same position as everybody else in the case.

*Sir Robert Finlay:* We can see it, and if anything arises on it observations can be made or questions put, but it is probably not necessary to read it aloud in Court. It takes a long

time. It may be put upon the notes, and anything necessary can be added by way of statement.

*The Attorney-General:* It may be necessary to ask some questions about it.

*The Commissioner:* You must do it in your own way.

*The Attorney-General:* I am not desirous of reading it in Court, and I do not think it is necessary to do that in detail.

*The Commissioner:* Have you shown it to Sir Robert Finlay?

*The Attorney-General:* No, I have not.

*The Commissioner:* Do not you think it would be worthwhile to let him consider it and see if you can agree upon it?

*The Attorney-General:* There is no difficulty about that. I do not require his agreement. The documents are all taken from official documents. The difficulty is to present it in a concise form. That is the trouble. There is no controversy about that matter at all. But it is long -

*The Commissioner:* I do not want to have a long document put before me on a point of this kind. I should be satisfied if you could tell me whether the German requirements if applied to the "Titanic" would have provided a larger lifeboat accommodation than was provided on the "Titanic."

*The Attorney-General:* Yes, undoubtedly. I have told your Lordship that.

*The Commissioner:* Yes, you have said that.

*The Attorney-General:* If you are satisfied with that, of course it is very short. *The*

*Commissioner:* I am not sure that I need anything more, because I should probably come to the conclusion that if on the German boats a larger accommodation is provided, it is practicable to do it, that is to say, that it does not make the boat tender, it does not unduly encumber the deck, and that the accommodation is an advantage and not a disadvantage.

## **Page 606**

*Sir Robert Finlay:* I think the figures with regard to these two boats, the "President Lincoln" and the "President Grant," were handed in whilst Mr. Wilding was in the box. I think the result arrived at is that the German requirements would have been slightly in excess of what was on board the "Titanic."

*The Attorney-General:* I do not agree with that at all.

*The Commissioner:* I daresay you can give it to me in percentage.

*Mr. Maurice Hill:* I worked them out the other day, but I cannot find my note. My recollection is that one of the "President" ships had boat accommodation equivalent to 36 percent of the total passengers that could be carried, the other 38 percent, and the "Titanic" had 33 percent. I will work it out again.

*The Commissioner:* 33, 36, and 38.

*Mr. Maurice Hill:* That is my recollection.

*The Commissioner:* The two larger ones being the Germans?

*Mr. Maurice Hill:* Yes.

*The Attorney-General:* There is one important factor with regard to this. We may be dealing with two different things. As I understand it, my friends are dealing with facts. I was not. It is important we should get it clear, because I think there is a distinction. I was calling your Lordship's attention to what the requirements are, not the number in fact carried, but what the requirements are according to the German scale. They may not be the same thing.

*Sir Robert Finlay:* That is what we were dealing with.

*Mr. Maurice Hill:* The figures I dealt with were the figures given the other day, which I think were the total number for which boat accommodation was required on board German ships compared with the total number of passengers and crew which could be carried on those German ships.

*The Attorney-General:* But that is a different thing from what you said. If that is what you mean, then I know where we are. But in answer to my question it was said that that was the number which was in fact carried. At any rate, so long as we know where we are, that is all right. We only want to be quite clear. I wanted to give your Lordship the requirements according to the German law. I think it is a matter that wants looking into, because the figures worked out by my friends do not agree with my view at all of the German requirements.

*The Commissioner:* That is why I suggested you should compare your statement with that of Sir Robert Finlay.

*Sir Robert Finlay:* I am certain what my friend has in his statement will be accurate. It has been carefully prepared officially. It may require possibly supplementing; but I do suggest that it would be very unedifying to have read out this very long document. *The Attorney-General:* Nobody is suggesting that it should be read out. We are not upon that at all. What I am upon now is this - I have agreed entirely with what you said with regard to that -

*Sir Robert Finlay:* I beg your pardon.

*The Attorney-General:* What I am dealing with is what my Lord said, because I was doing this in consequence of a statement which I made earlier in the case, when your Lordship said you would like evidence about it, and I said we would give it. In consequence of that somebody at the Board of Trade has prepared a memorandum giving the history with regard to various countries. Your Lordship says you do not require that particularly if it is right to say that the requirements according to the German scale are sufficiently large to provide boat accommodation to carry all the passengers and crew on the "Titanic."

*The Commissioner:* I did not quite say that. What I meant was this. I want to know what are the German requirements with reference to the number carried in the ship, the requirements as to lifeboat accommodation: I want to compare them with the English requirements, and see what the difference in percentage is. I understand Mr. Maurice Hill to tell me that the percentage in the "Titanic" would be 33 percent., the percentage in one of the two German boats 36 percent, and in the other 38 percent.

*The Attorney-General:* Does my friend mean by that that according to the requirements of the German law the boats would have accommodated 36 percent. and 38 percent of the human life on board the vessel?

*The Commissioner:* No.

*Mr. Maurice Hill:* The maximum human life which according to the German law could be carried on the vessel.

*The Commissioner:* That is what I understand. It may be the figures are wrong, but, if the figures are right, then I think I have sufficient information.

*Mr. Maurice Hill:* I am going to check my arithmetic, because I did it somewhat hurriedly, and it may be wrong.

*Sir Robert Finlay:* I think it would be convenient that this general statement with regard to the laws of foreign countries and requirements should be handed in. It is not necessary to read it, but it may be convenient to refer to it, and it is highly desirable that when a memorandum of this kind has been drawn up giving information it should be available for future use.

22496. (*The Attorney-General.*) There is no difficulty about it; it can be done. (*To the Witness.*) I do not know whether you have made a calculation or whether anybody at the Board of Trade has made this calculation of the number of boats which would have been required according to German requirements for the "Titanic"? - No, I have not had a comparison of that made, but I have the particulars about the large German ships. *Sir Robert Finlay:* At page 538 of the Notes your Lordship will find a statement with regard to the "President Lincoln" and the "President Grant," and a Note with regard to the British Board of Trade requirements, the American law requirements, and the German law requirements. The Note is what is most immediately in point in regard to your Lordship's question. "The British Board of Trade require 9,625 cubic feet; the American law requires 11,520 cubic feet; and the German law requires 13,343 cubic feet" of boat accommodation in each vessel.

*The Commissioner:* There is a difference there of 50 percent.

*The Attorney-General:* Yes; I cannot understand my friend's figures. However, we shall not get any further by discussing it now, but what we must do is to calculate them and agree upon them, and then we will give your Lordship a tabulated statement which has been agreed between us with regard to it.

*Sir Robert Finlay:* Yes.

*The Commissioner:* Who was it who produced those statistics?

*Sir Robert Finlay:* Mr. Wilding, my Lord. It was a statement handed in while Mr. Wilding was in the box. Mr. Laing says at Question 20887: "It is the particulars of the 'President Lincoln' and the 'President Grant' which Mr. Wilding told us about; and he has tabulated on a piece of paper the British Board of Trade requirements, the American requirements and the German requirements. (*The Commissioner.*) I should like to see it," and it was handed in.

*The Commissioner:* I notice in the two German boats to which reference was made, there is a very large proportion of collapsible boat accommodation.

(*The Attorney-General.*) Yes. I am not sure that is the way to get at it; it certainly is not the most reliable. We have got the requirements, and you have to calculate from those requirements what a vessel with a tonnage of 46,000 tons would have to carry in boating accommodation. I make it a very big number of boats indeed, far more than has been mentioned, and I am anxious to have it right. (*To the Witness.*) Will you tell me, Sir Walter, have you yourself, or somebody in the Board of Trade, made the calculations on the basis of the German requirements? - What the

German requirements would have been for the “Titanic”? No, we have not. I have done it, but what I want to know is can you tell me whether in fact the German liners carry boats, speaking generally, of the number required according to the German law? - No, I cannot say.

*Sir Robert Finlay:* It is extremely important to know what the practice is. *The Attorney-General:* And that is why I was drawing the distinction between the statement of requirements and facts.

*The Commissioner:* I quite appreciate that. That is why you criticise Mr. Maurice Hill. *The Attorney-General:* Yes.

*(After a short adjournment.)*

*The Attorney-General:* My Lord, I have now got the minute from the Board of Trade, which I will read.

*The Commissioner:* You mean the minute of the 4th of April, 1912?

*(The Attorney-General.)* Yes. The minute of the 4th of April, of Sir Walter Howell’s is: “I agree to the action proposed.” Then there is a note of Captain Young’s of

the 28th of March, and there is also a note of G. E. B. That is Mr. Baker. (*To the Witness.*) Mr. Baker is your principal clerk? - In the Marine Department.

You have looked at this, I think? - Yes.

Is this what you referred to when you said you gave directions on April 4th for that letter which was subsequently sent on April 16th? - Yes.

Was any other direction than that given before the letter of April 16th was sent? - No direction whatever.

22503. So that the letter of April 16th, according to that, would be carrying out the directions which you had given on April 4th? - Precisely. 22504. Is that how it stands? - That is exactly how it stands.

So that it would follow from that that when the letter was sent on April 16th no alteration was made in that letter in consequence of the loss of the "Titanic"? - Not the slightest alteration.

It was simply carrying out what had been directed on April 4th? - Exactly.

And nothing else? - And nothing else.

Then, as I read to my Lord, there is a letter on April 20<sup>th</sup>, which does refer to the loss of the "Titanic"? - Exactly.

And is that the first letter there is, and the first reference in any way to the loss of the "Titanic"? - Quite.

Would the letter of 16th April be a letter drafted in accordance with the directions which had been given which would appear on the minute? - Exactly. 22511. Will you just look at this? (*A document was handed to the Witness.*) You have a copy of the minute in front of you? - I have.

22512. I see there is a draft there of Mr. Baker's? - A minute of a draft. 22513.

A minute of a draft. What is the date of that? - 1st February.

22514. You have the document in front of you. Then there is a note, is there not, of Captain Young - a memorandum? - It is referred to Captain Young before it comes to me.

22515. Let us just understand the steps. On that minute there is first of all the minute of a draft by Mr. Baker? - Quite.

That is the 1st of February? - The 1st of February.

Then after that what happened? - That is referred to Captain Young and to me. 22518.

But first of all referred to Captain Young? - First of all, referred to Captain Young.

Then what does Captain Young do on that? - He proceeds to consider it, and on the 30th March he says, "Please see my remarks herewith."

Are those remarks there and are they dated the 28th of March? - The 28th of December.

No, no - look - The 28th of March, I beg your pardon.

Then that comes before you with his minute and the remarks attached? - Quite.

You go through it? - Yes.

And then you agree with it? - Yes.

In the note which I have it is "I agree to the action proposed" - It came on to him on the 30th March, and on the 4th April I put, "I agree to the action proposed." 22526.

Then the letter which is sent is in accordance with the draft, and the note by Captain Young? - Precisely.

To sum it all up, the letter of the 16th April is based upon data collected before the "Titanic" sank.

22527. (*The Attorney-General.*) Quite, and made with the aid and written in pursuance of directions given by Sir Walter on the 4th April. (*To the Witness.*) That is how it stands? - That is exactly how it stands.

*The Attorney-General:* Then the subsequent correspondence I have read to your Lordship - you see how it stands - when attention is called to the loss of the "Titanic" by the letter of the 20th.

*The Commissioner:* The letter of the 20th is not of much significance.

*The Attorney-General:* No, my Lord.

*The Commissioner:* It was the letter of the 16th. I wanted the suspicion, if there were any, cleared away that that letter was written in consequence of the loss of the "Titanic." If this Witness is right, it is obvious that it was not.

*The Attorney-General:* The only importance of the letter of the 20th, if it is of importance, is that that first takes up the point of the loss of the "Titanic." I think it right to state, my Lord, with reference to the point we were discussing before with regard to German requirements - that they should be gone into more carefully and agreed between us, so that your Lordship might have the exact calculation according to the German requirements of the boats that the "Titanic" would have had to provide - that so far as I can follow from the "President Grant" and "President Lincoln," and the boats which were provided by the "President Grant" and the "President Lincoln," in fact, the boating accommodation was not up to the scale which is required by the German Rules. I do not know what the reason may be. Whether they have any power to deal with it, I cannot tell. It is important to bear that in mind, and that is why I drew the distinction between the facts stated and the requirements according to the scale.

*Sir Robert Finlay:* With reference to what the Attorney-General has just said, the difference between my friend Mr. Maurice Hill's calculation and the note as to the requirements - your Lordship pointed out how different the percentage would be - would be explained if the boating accommodation which in fact was required for the "President Lincoln" and the "President Grant" was less than the boating accommodation apparently required by the Rules. Then, of course, the discrepancy to which your Lordship called attention between the apparent requirements of the Board of Trade Rules and the German Rules, and the percentage worked out by my friend Mr. Maurice Hill, which was based upon the actual boating of the "Titanic," and these two vessels - that disappears. *The Attorney-General:* That explains what I could not follow in the percentages which my friend Mr. Hill was giving.

*Sir Robert Finlay:* I daresay we shall be able to get possibly some information of whether there is any ground for supposing that in practice the German requirements are not always insisted upon.

*The Attorney-General:* It is rather difficult to get that.

*The Commissioner:* I daresay it is. According to the statement of the Attorney-General, whether

*The Commissioner:*

they are insisted upon or not, they are not complied with.

*The Attorney-General:* That is what I find by reference to the "President Grant" and the "President Lincoln," which are the two instances we have before us.

*The Commissioner:* According to his statement, the requirements are one thing and the compliance with them quite a different thing.

*(The Attorney-General.)* It may be - we shall have to look into it and see - that there is some dispensing power in regard to the German Regulations and that possibly that is the explanation of it - that although it does not comply with the scale, nevertheless it may be in compliance with the German law as administered. *(To the Witness.)* I would like to ask you this. With reference both to the American and the German Rules which you have put before us, am I right in this, that neither the American nor the German Rules provide that there should be boating accommodation for all on board? - That is quite right.

And, further, that both of them are based on gross tonnage? - Quite right.

Can you tell me - I am asking this question because I think it will save your Lordship going through so many documents - what is the case with reference to other countries? Take, for example, France. How do the Rules of France compare with our own requirements of boats? - I think they are reasonably approximate to our own. I think I may say that of most of the other countries. Some are a little more and some a little less, but they are reasonably approximate to our own.

*The Attorney-General:* It does not seem to me, subject to anything that your Lordship may desire, that it is useful to compare them unless there is a real substantial difference between them.

*(The Commissioner.)* As far as I am concerned, I do not want to trouble you with the German Rules.

*The Witness:* I have a half-sheet of paper here containing a few particulars which, I think, really crystallise the matter. It will show you all the facts.

*(The Attorney-General.)* May I see it. *(The document was handed to the Attorney-General.)* I think this is quite useful, it gives the information in a very compendious form, and unless your Lordship thinks it will not assist you I will have it put on the Notes, so that it will be available to everybody. *(The document was handed to the Commissioner.)* It is a Table showing the minimum requirements of the Life-saving Appliances Rules of certain foreign countries for a vessel of just over 10,000 tons. *(To the Witness.)* That, if I understand it correctly, only shows the minimum requirements for a vessel of just over 10,000 tons? - Quite so.

It does not help us as to the requirements for a vessel, say, of 46,000 tons? - Quite so.

*The Commissioner:* I do not see that it is of much value.

*(The Attorney-General.)* It does not seem to me to be of much value if that is all it shows - a vessel of just over 10,000 tons? - My point is that we have accepted that as reasonably approximate to our own.

That is not the point we are on. We may take that, I think, quite compendiously as showing that the requirements of Denmark, France, Germany, the Netherlands, Norway, Sweden and the United States, for vessels of just over 10,000 tons, are approximately the same as our own? - Yes, and for all of those below.

*The Attorney-General:* Yes, I know, but we are not concerned with that. If that is all that we shall get out of this Table I do not think I will encumber the Note with it.

I do not think it is worth encumbering the Note with it.

*(The Attorney-General.)* Nor do I. *(To the Witness.)* There is one other matter I wanted to ask you about, and that is with reference to wireless telegraphy. Your Lordship will remember there is a question with regard to that before you. Has there been an interdepartmental discussion between the Board of Trade and the Post Office as to the action to be taken? - Yes, there has.

And the question of how far wireless telegraphy should be made compulsory, and under what conditions and safeguards, is at present under consideration, is it not? - Yes.

*The Attorney-General:* Then subject, my Lord, to this question of the agreement between us, with which I do not think it is necessary to trouble Sir Walter, I think that is all I want to ask him.

*The Commissioner:* Mr. Scanlan, before you begin to examine the Witness, could you tell me in a few words first of all whether you are going to make or suggest any charges of neglect against the Board of Trade? Can you tell me that first?

*Mr. Scanlan:* No, there is no specific charge of neglect. I think there appears on the evidence matter on which a comment of neglect could very properly be made to your Lordship, and I purpose asking a few questions dealing with that.

*The Commissioner:* I will tell you why I am asking you. Both you and Mr. Edwards have been of great use to me in putting your points to the Witnesses, and it would help me to understand your view of the conduct of the Board of Trade if before you examine this Witness and the others you could tell me whether there are any specific acts - if that is the right word - of neglect that you suggest against the Board of Trade.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* I ask you the question for this reason. We all know that outside there has been a considerable outcry against the conduct of the Board of Trade, and I am to enquire into the circumstances. I should like to know from you now, if you can tell me, if there is any specific act of neglect - I do not like the expression - that you charge against them?

*Mr. Scanlan:* I follow your Lordship. I say that there is a neglect in reference to the lifesaving appliances, basing this assertion on the fact that the obligation to make provision for life-saving appliances is imposed not on an Advisory Committee but on the Board of Trade itself, and that the Board of Trade, through the years in which the tonnage of ships has been going on increasing, have been negligent, as a Department of State, in not making better regulations, in not bringing the regulations more up to date. Another point is that in the interval, since the Advisory Committee reported, attention was drawn in the House of Commons, the only place where the responsible executive head of the Board of Trade can be got at, to the importance of providing life-saving appliances commensurate with the number of passengers carried, as opposed to provisions based on

*The Commissioner:*

tonnage. And, again, we say that the Board of Trade Regulations with respect to the manning of ships are defective; in point of fact, that when a former President presided at a Commission especially appointed to enquire into this, he had the importance of a manning scale brought under his notice, and he stated that the Department already had power to impose a manning scale under the provisions of the Act of 1906. I am going to make this point, my Lord, that notwithstanding the powers which the Board have, and which a former President of the Board of Trade credited his Department with having, the manning scale is defective. For instance, if the "Titanic" had been allowed to go to sea with what the Board of Trade Department looks upon as the adequate, the maximum requirements which they had designated for any ship up to the present, she would have had not half of the crew which she carried. Then another point which I think it is worthwhile to raise, and which I intend to put to Sir Walter Howell, is this: In a Commission appointed by the Government for the Board of Trade in 1896 the question of manning and deficiency of the crew was specially considered, and one of the recommendations of that Commission in regard to the engine department or for firemen is that: "A candidate for the rating of fireman should be 18 years of age or over and have had six months' service as

## Page 609

trimmer in a steamer," and this recommendation of their own Committee has been ignored.

*The Commissioner:* What sort of a Committee was that - A Departmental Committee?

*Mr. Scanlan:* This, my Lord, I understand, is Sir Edward Reed's Committee. It is the Committee appointed by the Board of Trade to enquire into the Manning of British Merchant Ships. The names of the Commissioners are: The Right. Hon. Mr. Mundella, Sir E. J. Reed, the Right Hon. A.B. Forward, Sir Francis Evans, Mr. Havelock Wilson -

*The Commissioner:* That is sufficient. The Committee obviously comprised people who were not officially connected with the Board of Trade at all.

*Mr. Scanlan:* That is so, my Lord.

*The Commissioner:* You appear to me to be a little inconsistent. You began by making a charge against the Board of Trade, as I understand, of this kind, that they called in aid Advisory Committees, whereas they ought to act upon their own judgment.

*Mr. Scanlan:* Of course, I say that, and I think it is a tenable, general proposition. *The Commissioner:* And then you go on to say - it may be logical or reconcilable - that you complain that they did not act upon the advice of the Advisory Committees.

*Mr. Scanlan:* Well, my Lord -

*The Commissioner:* You first of all say that they ought not to have any Advisory Committees at all, and secondly, you complain that they do not act upon the advice of the Advisory Committees.

*Mr. Scanlan:* With respect, my Lord, I have said that the Board of Trade, as a Board - I do not know what it is -

*The Commissioner:* There is an old joke about that, but you must not trot it out! *Mr.*

*Scanlan:* It is not that, my Lord, but I think if the Regulations are in question it is

important that we should know something of the personality of the Board of Trade.  
*The Commissioner:* You have given me enough information now. Now let me hear your questions.

*Mr. Scanlan:* There is another point that I should like to mention to your Lordship, if I may. I do not know whether your Lordship will allow questions to be put on it, but it is right that I should mention it - it was touched on by the learned Attorney - and that is in reference to the alteration of the loadline.

*The Commissioner:* I did not hear him touch upon it with Sir Walter Howell. *The Attorney-General:* I mentioned it, and I said that I did not think, as far as I could see, that it affected this case, and therefore I was not going into it.

Nor has he touched on the question with Sir Walter Howell about the Rules and Regulations as to the manning.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* There is no reason why you should not.

*Mr. Scanlan:* Certainly, my Lord.

### **Examined by Mr. SCANLAN.**

Without going into the history of the Board of Trade Regulations, may I take it from you that the "Titanic" had a supply of lifeboats and other life-saving appliances considerably in excess of the requirements of the Board of Trade? - She certainly had more boats than were required by the Board of Trade.

Now, I want to put to you another question with regard to the provision of bulkheads, and watertight compartments. Is it the case that in order to qualify a ship for exemption from some part of the requirements of lifeboats, all that the Board of Trade require in a ship like the "Titanic" would be four watertight bulkheads? - Before she has any relaxation from the Rules she has to prove to the Board of Trade that she is an efficiently subdivided ship to their satisfaction.

*(The Commissioner.)* You must bear in mind that I suffer from the infirmity of deafness. You do not speak so that I can hear you. Do not whisper into the ear of Mr. Scanlan. Let me know what you are saying - Yes, my Lord, I am very sorry.

*(Mr. Scanlan.)* In order to qualify for exemption, I submit to you that what the Board of Trade instruct their superintending officers to require in a ship like the "Titanic" would be four watertight compartments. Is that so? - No, certainly not.

*The Commissioner:* Where did you get that from, Mr. Scanlan?

*Mr. Scanlan:* I have just got information from one of those instructing me that that is so.

*The Commissioner:* It must be in some printed document. I have not heard of it so far.

*Mr. Scanlan - To the Witness:* Do your Instructions for the Regulation of surveys of ships apply to this point?

*The Commissioner:* Apply to what point?

*Mr. Scanlan:* The point of the division of ships efficiently into bulkheads and watertight compartments.

*The Commissioner:*

*The Commissioner:* “Efficiently” is one thing, and “Into four separate compartments” may be quite another thing.

*Mr. Scanlan:* It is No 16 of those Rules.

*The Commissioner:* Do not you be misled by bad examples and found your questions upon mere hearsay information.

*Mr. Scanlan:* This is a point I was instructed to put, my Lord, on the responsibility of those who are advising me.

*The Commissioner:* Where is the gentleman who is advising you?

*Mr. Scanlan:* Here, my Lord. (*Pointing.*)

*The Commissioner:* Sit down for a moment or two and ask him what he means and then get up again.

*Mr. Scanlan:* If your Lordship pleases I will pass from that point and go to another.

*The Commissioner:* But you have not elucidated it. You have left me in a fog.

*Mr. Scanlan:* I think the Witness is able to take you out of the fog, my Lord.

*The Commissioner:* Then get him to do it.

*(Mr. Scanlan - To the Witness.)* Can you explain, Sir Walter, what is the provision in your Regulations in regard to watertight compartments? - With reference to emigrant ships like the "Titanic"?

Yes? - It is that in order to get any exemption from the requirements as to boats, they must comply with the requirements laid down in the Reports of the Bulkheads Committee, which have been adopted by the Board of Trade as the standard for bulkheads.

*The Commissioner:* Now ask him what that is?

*Mr. Scanlan:* Do you mean the requirements of the Bulkheads Committee as applied to a ship like the "Titanic"? - That I must leave to be explained by the technical officers.

22544. *(The Commissioner.)* Oh, dear, dear me. I get into confusion when you push off the answer to somebody else who is not in the witness-box? - It is simply because I am afraid of misleading you, my Lord.

*The Commissioner:* Never mind about that. Answer the question. Go on. *Mr.*

*Scanlan:* May I take it, Sir Walter, that you are not in a position to give this information?

*The Commissioner:* Oh, don't you help him in that way. I want you to make him give me the information.

*(Mr. Scanlan.)* Sir Walter, if you are not able to give this information, why are you not able to give it? - Because I cannot carry in my head all the recommendations of the Bulkheads Committee.

But you are the head of the Marine Department of the Board of Trade, and this is an

## **Page 610**

important concern of your Marine Department. I suppose you will take care that you will get this information from somebody else in your Department? - Certainly. 22547. Now with regard to the manning scale, is there any suggestion to your inspecting officers as to what would be a sufficient crew for a ship like the "Titanic"? - The "Titanic" was an emigrant ship.

Yes? - There are certain Regulations laid down to guide the emigrant officer in declaring that he is satisfied with the manning. He has to clear the ship and be satisfied with her manning before she goes to sea.

Is there any standard of sufficiency by which he may satisfy himself? Has he any directions as to what would be a sufficient crew? - Yes, he has.

What, according to his directions, would be a sufficient crew? - "In steamships" - shall I read it or give a general idea of it?

*The Commissioner:* Will you put your question again, I did not hear it?

*(Mr. Scanlan.)* What would be the requirements of the Board of Trade, the instructions given to your clearing officers, as to a sufficient number of crew? - I have in my hand the scale. It goes up to 9,700 cubic feet - the "total capacity of boats and rafts required under the life-saving appliances Rules" - and here are the different scales - the total capacity of

boats and rafts that should be carried. I will take the 8,900 to 9,300, which is nearly at the end of the scale - 46.

*The Commissioner:* Where can I find it?

*Mr. Scanlan:* It is the "Instructions Relating to Emigrant Ships."

*The Attorney-General:* Page 10 of the book, "Instructions Relating to Emigrant Ships." 22552. (*Mr. Scanlan.*) You will find the Table and scale on that page, my Lord. - That is the Table they have to guide them.

This deals exclusively with deckhands? - Yes.

Do you give any directions to your clearing officers as to the number of officers a ship should carry - a ship, say, like the "Titanic"? - There are certain statutory requirements with regard to that.

Can you say, according to those requirements, how many officers would be required? - I think a master - I am speaking from memory, I have not the paper before me - two mates.

A carpenter? - A master and two mates. Are you asking me to define deckhands?

No, I am not asking you yet to define deckhands, but to tell my Lord how many of a crew a ship like the "Titanic" would be expected to carry? - I have given you an indication from the Table.

I know you have given me an indication that applies exclusively to deckhands. Do you give any directions to your Marine Superintendents as to the number in the stokehold, in the engine room, and in other departments of the ships? - No.

Or the number of officers? - The number of officers I can tell you in a moment.

You mean the number of masters and so on.

Masters, and so on? - One master, two mates, two certificated engineers. 22561. One master, two mates, two officers of the rating of mate, and two certificated engineers? - Yes.

Is that all? - Yes, I think that is all the statutory requirement.

Of course, it would be manifestly an improper thing to let a ship depart on a voyage with such an incomplete crew as that - a ship like the "Titanic." Am I right in thinking that unless you call the requirements which you have indicated to my Lord a manning scale there is no such thing in existence as a manning scale for modern ships? - Yes, that is so.

(*The Commissioner.*) I heard your question, but I did not hear the answer. Please speak out a little? - I am so sorry, my Lord. The answer is that there is no definite manning scale for merchant ships.

Do not use an adjective of that kind. I do not know what you mean when you say "definite." Is there any? - No.

*The Commissioner:* Then you can leave out "definite."

(*Mr. Scanlan.*) Has the attention of the Board of Trade been frequently called to the importance of stipulating for a minimum scale of manning? - Yes, the Board of Trade has frequently had its attention called to that point.

(*The Commissioner.*) Have they considered the matter? - Oh, yes, it has been considered, my Lord.

What has happened upon the consideration? - That no manning scale hard-and-fast has been laid down.

You have used another qualification. I do not know what "hard-and-fast" means. Has any manning scale been laid down at all? - Well, instructions have been issued to the officers as to the number of deckhands that must be carried as a minimum, or else the vessel is regarded as not being fit to go to sea and seaworthy.

*The Commissioner:* Where are those instructions?

*The Attorney-General:* Do you mean with regard to emigrant ships?

*The Witness:* In order to answer Mr. Scanlan's question, I should really have to read you these requirements in the Circular.

*(The Commissioner.)* In what circular? - In the "Instructions relating to Emigrant Ships" that your Lordship has before you.

What page do you want to read? - I want to give an instance of the engine room staff.

What page? - Page 11, paragraph 23. There are instructions to our Surveyors there that:

"The following scale has been prepared for the guidance of the Emigration Officers with regard to the manning of the engine room and stokehold." Then there is a Table on page 11 of these "Instructions relating to emigrant ships."

*The Commissioner:* What was the horse power of the engines of the "Titanic"? *Mr.*

*Wilding:* Indicated, or nominal, my Lord?

*The Commissioner:* Nominal.

*Mr. Wilding:* I have not got the nominal figures here, my Lord. The total indicated horse power plus the shaft horse power was about 60,000. The nominal horse power appears in the certificate, and I have not got the figures.

*(The Commissioner.)* I am told the nominal horse-power was 6,906. *(To the Witness.)*

What in this scale would indicate the number of engineers to be carried in a vessel the nominal horse-power of which is 6,906? - I am very sorry not to be able to answer your Lordship, but I am unable to answer that question.

*The Commissioner:* Am I right in saying that there is nothing in the scale to indicate it?

*Mr. Scanlan:* Six thousand nine hundred and six I take to be the nominal horse-power, my Lord.

*The Commissioner:* That is right. Now, I am asking him what there is in this scale which indicates the number of engineers to be carried in a vessel with engines of that capacity or power, and as I understand - I do not know whether I have understood him rightly - there is nothing in this scale.

*The Attorney-General:* There is something, I should think.

*Sir Robert Finlay:* I think the last line seems to indicate it.

*(The Commissioner.)* I do not know whether Sir Walter will say that? - No. I should like to ask one of my technical officers to answer that question.

The only thing I see is "600 and over" - seven engineers? - There is nothing else so far as I can see at present.

*The Commissioner:* How many engineers did the "Titanic" carry, in fact? *Mr.*

*Scanlan:* I think the total in the engine room department was 327.

*Mr. Roche:* The engineers numbered about 32. It depends upon whether you count electricians, but they numbered about that.

*Mr. Scanlan:* I was including the engineering department and the boiler department, my Lord, and, from an abstract I have, it appears to be 327.

*The Commissioner:* What is 327?

*Mr. Scanlan:* The total crew carried by the "Titanic" in the engine room and the stokehold.

*(The Commissioner.)* You said just now that in order to answer Mr. Scanlan's question you must refer to page 11 of the book under the head of "Engine room Staff." Now, is there anything else under that heading which will help us? - There is a series of paragraphs after the scale which give the emigrant officer guidance in dealing with this matter.

*The Commissioner:* Let us see what they are.

*The Attorney-General:* It is said to be a guide, and not a hard-and-fast Rule. 22577.

*(The Commissioner.)* "The following scale has been prepared for the guidance of the Emigration Officers with regard to the manning of the engine room and stokehold." Taking the only figure that can by any means be considered as applying to the present case for engines of the nominal horse power of 600 and over, seven engineers are required, one donkeyman, three greasers, two store-keepers, and one fireman for every 18 square feet of fire-grate surface in the boilers." Is that right? - Yes, that is as I read it. That applies to a boat with engines of 600 nominal horse power and over? - Yes, my Lord.

Do you suggest that that constitutes any guide to your Emigration Officers as to the requirements in respect of manning the engine room that should be made when the engines are ten times as great and powerful as those as are specified here? - As far as they go, my Lord.

What do you mean by "as far as they go"? - They go to 600 and over. 22581. I know. But do you mean to say "600 and over" means anything. I do not know how far it means. Do you mean to say that it would have been sufficient in the "Titanic" to have had seven engineers, one donkeyman, three greasers, two storekeepers and one fireman for every 18 square feet of fire-grate surface in the boilers? - Oh, no.

Where is the man who has this book put into his hand to find what he ought to require in the case of a ship with engines like the "Titanic"? - I am afraid I cannot satisfactorily answer your Lordship's question.

Do you think an answer is to be found at all? - I think the answer will be found when you examine the technical officer who deals with this matter.

It may be so? - Yes, my Lord, that is it.

*(Mr. Scanlan.)* May I direct your attention, Sir Walter, to the agreement and account of the crew prepared by the Registrar-General. I see some particulars given here as to the number the crew shall consist of. Are you acquainted with this document? - Yes. 22586. Will you please read this and tell me if this printed matter at the top has reference to the manning? *(The document was handed to the Witness.)* - Yes,

it is such minute print that I can hardly read it. That is the agreement between the men and the master of the ship.

That is the agreement which the Board of Trade revise and assent to? - It has to be entered into in the presence of the superintendent.

Have the details given there any relation to what the Board of Trade considers sufficient?

- I can only put it to you in this broad way. The Emigration Officer before he clears the vessel has to be satisfied that she is properly and efficiently manned, and the instructions that he is given are only as a sort of guide to him in what his requirements should be.

Those are the only instructions? - I think those are the only instructions. *Mr. Scanlan:*

May I take it from you that there are no instructions issued acting on which an officer of your Board would be in a position to demand that there should be for a ship like the "Titanic" a crew of anything like the proportions of the crew carried. *The Commissioner:* I do not understand that question.

*Mr. Scanlan:* I mean your requirements, I submit, are not at all up to what the owners evidently consider a proper crew for the "Titanic."

*The Commissioner:* I do not know what you mean. You talk about "your requirements," addressing Sir Walter.

*Mr. Scanlan:* I mean the Board of Trade.

*The Commissioner:* I know, but I do not know what their requirements are.

(*Mr. Scanlan.*) Quite, my Lord. (*To the Witness.*) You have, I take it, a general power - I think it is under the Act of 1906 - to regard a ship which is insufficiently manned as unseaworthy? - Yes.

But you have not yet drawn up a manning scale expressing the view of the Board as to what is a sufficient and a deficient crew? - That is so.

I was asking you a moment ago if this question had been brought under the notice of the Board, and you stated that it had. I want to ask you this further question. Was it brought under the notice of the Board of Trade, both on behalf of the seamen and on behalf of owners? - I do not quite follow your question.

(*The Commissioner.*) It is a plain enough question. - I do not know what he means by "on behalf of owners."

*The Commissioner:* What he means to say is this: Did the owners bring the matter to your notice, and did the Unions bring the matter to your notice? That is what he means by the seamen - the Unions.

(*Mr. Scanlan.*) Mr. Havelock Wilson, in particular? - The Unions certainly have often desired a manning scale.

Have the shipowners themselves desired a manning scale? - I do not recollect that they have.

*Mr. Scanlan:* I take it that it has been brought forward by the men?

*The Commissioner:* Do not deal with this too long. You must remember that this is a little bit away from our Enquiry, because it has not been suggested that there were not enough men in the engine room.

*Mr. Scanlan:* On the contrary, my Lord. I say I have no fault whatever to find with the number of men in the engine room, but that in the conduct of their department which your Lordship is asked to go into in this Question 26, it is relevant to consider what Rules they had made for the manning in the engine room.

*The Commissioner:* I do not say it is irrelevant, but inasmuch as there is no complaint against the manning of the engine room in the "Titanic," I point out to you that it is not, in this Enquiry, of very great importance. Generally, you may ask him whether they have power to draw up a manning scale, and whether they have drawn it up, and whether they have been asked to do so.

*(Mr. Scanlan.)* You have said, Sir Walter, that you have been asked to draw up a manning scale. I will put this further question to you: No manning scale has been drawn up? - No manning scale extending to all vessels has been drawn up.

*Mr. Scanlan:* I want to ask you now if you consider it would be desirable to draw up a manning scale.

*The Commissioner:* I am not sure that you should ask him that. The Union think so, obviously.

*(Mr. Scanlan.)* With regard to the rating -? - Will you allow me, before passing from this, to call your attention to Section 305 of the Merchant Shipping Act of 1894, which deals with the crew of an emigrant ship.

*(The Commissioner.)* What is it? - It shows the way my Lord, in which the Emigration Officer, who is the responsible officer, deals with the clearance of an emigrant ship - the legal requirements.

Read it to me. - "Every emigrant ship shall be manned with an efficient crew for her intended voyage to the satisfaction of the emigration

## **Page 612**

officer, from whom a certificate for clearance for such ship is demanded. After the crew have been passed by the Emigration Officer, the strength of the crew shall not be diminished nor any of the men changed without the consent in writing either of that Emigration Officer or of the superintendent at the port of clearance. (2) Where the consent of a superintendent has been obtained, it shall within 24 hours thereafter be lodged with the said Emigration Officer. (3) If the Emigration Officer considers the crew inefficient, the owner or charterer of a ship may appeal in writing to the Board of Trade, and the Board shall, at the expense of the appellant, appoint two other Emigration Officers or two competent persons to examine into the matter, and the unanimous opinion of the persons so appointed, expressed under their hands, shall be conclusive on the point."

*The Commissioner:* As I understand it, Mr. Scanlan, that seems to answer you? 22600.

*(Mr. Scanlan.)* That is in the Act of Parliament? - That is so.

*The Commissioner:* It is left by law to the discretion of the Emigration Officer. *Mr. Scanlan:* What I suggest, my Lord, is that if it is left to the discretion of the individual Emigration Officer, you may have a difference in practice between one port and another.

*The Commissioner:* Certainly you may.

*Mr. Scanlan:* And it is for that reason, my Lord, that I respectfully suggest, as a matter for this Inquiry, that it is desirable to recommend a manning scale which would be universally observed.

*The Commissioner:* That would appear to me to involve - it may be right, you know - an alteration of the law, not to leave the matter in the discretion of different minds at different places, but to make one hard-and-fast Rule.

*Mr. Scanlan:* That is so, my Lord.

*The Commissioner:* That does not throw any discredit in any way upon the Board of Trade itself. You cannot yet - I do not know what you may be able to do later on - blame them for obeying the law.

*Mr. Scanlan:* I will read, my Lord, one short sentence from the report of a conference between the representatives of the United Kingdom, the Commonwealth of Australia and New Zealand on the subject of Merchant Shipping legislation.

*The Commissioner:* What date is that?

*Mr. Scanlan:* It is in 1907. The then President of the Board of Trade, Mr. Lloyd George, was talking with reference to manning, and he is asked, "Which section?" and he said, "There is only one section. We have simply extended the definition of unseaworthiness to undermanning. We can issue any instructions we like to our Surveyors; we can impose a scale."

*(The Commissioner.)* Who said that is extending the definition of unseaworthiness to undermanning, because I always understood undermanning did constitute unseaworthiness? - A special Act was passed. Doubt had been expressed whether unseaworthiness included undermanning. I never thought it did, but an Act was passed to make it quite clear that unseaworthiness included undermanning.

Did you suppose it did not? - I never supposed it did not, but some people raised doubts, and an Act was passed to remove those doubts.

*Mr. Scanlan:* That is the Act of 1907.

*The Commissioner:* You may drop this now, and go on to the next point.

*(Mr. Scanlan.)* You know it was stated in this paragraph that I have referred to that you could issue instructions. May I, my Lord, with your permission, carry it this one step further? You have not issued any such instructions, or imposed such a scale as the President said you might then impose? - I think this is rather difficult matter, and I hope I may be allowed to explain it to you for a moment. It rather involves me construing what Mr. Lloyd George said, but I think I must do it. Mr. Lloyd George said that the Board of Trade can detain any ships which they or their officers regard as being unfit to proceed to sea without serious danger to human life, and they can also issue to their Surveyors instructions to guide them in coming to a conclusion as to when a ship was or was not unseaworthy and that among the reasons for which a ship could be detained were defective equipments, machinery, over and improper loading, and undermanning, so that in a sense it would be possible for the Board of Trade to lay down a scale with regard to the vessels - to say you should detain a vessel if she did not come up to a certain standard.

That, I think, explains that matter.

It explains everything except the reason why you have not imposed such a scale or issued such instructions? - But we have.

Can you explain that? - We have issued the instructions.

(*The Commissioner.*) Apparently, there are Emigration Officers, or whatever they are called, to survey these ships, and that gentleman apparently has the power of saying a ship is not sufficiently manned, and if he says so, then the ship does not get a certificate, and cannot go to sea. Is not that the position? - With regard to emigrant ships, certainly, but Mr. Scanlan was asking me about all sorts of other ships - a manning scale.

(*Mr. Scanlan.*) There is not, so far as the "Titanic" is concerned; but it is considered desirable by those whom I represent to bring before your Lordship as a point at this Inquiry the desirability of having a fixed scale. (*To the Witness.*) Do you think it would be desirable with regard to the rating to fix a standard of efficiency for the stokehold, in accordance with the recommendation I read to you? - When was that recommendation made?

It is in the report of the Manning Committee of 1894. - That is a great many years ago. That report, or rather those reports, for there are several of them, made very numerous recommendations to the Board of Trade, and the several reports do not agree with each other. What the Board of Trade attempted to do on receipt of that report was to see what the majority of the Committee agreed upon, and if possible to act upon it. It is many years ago now. I do not remember whether that particular recommendation was in the Majority Report or not.

I think this is the Majority Report signed by almost all of the members? - Very well. The recommendation here is very distinct, as you will hear - "That a candidate for the rating of fireman should be 18 years of age or over and have had six months' service as a trimmer in a steamer"? - I am quite sure the Board of Trade have laid down no Rule which adopted that recommendation.

Have you any recommendation contrary to this from any other committee on this point? - I do not think so.

May I submit that it would be desirable to make some Rule on this point? - The Board of Trade that day were evidently advised not to do it.

I am speaking of now? - You are not asking me for an opinion, are you? 22614. I am told not to ask you for an opinion, and I will bow to his Lordship's ruling. With regard to the Rules for the provision of lifeboats and life-saving appliances, the only alteration made since 1890 is the one alteration from 9,000 tons and upwards to 10,000 tons? - 10,000 tons, and upwards.

And the only additional accommodation stipulated for there is 250 cubic feet - that is on page 17? - That is right.

Two hundred and fifty cubic feet according to your scale means lifeboat accommodation for 25 additional people? - And it also carries with it the additional requirements for additional boats, you know. Every time you raise the proportion of boats in davits you proportionally increase the other, the additional boats.

That is 25 here, and 18, I am informed, with a possible diminution in respect of bulkheads? - I have no reason to think that is wrong. 22618. That is for about 40 people additional? - Yes.

22619. You were asked some questions with regard to America, and your statement to my friend

Sir Rufus Isaacs was that at present, roughly speaking, we are in the same position as America for lifeboat accommodation? - Each has accepted the passenger certificate of the other. I am not prepared to say that in every detail they assimilate, because that is not so.

*Mr. Scanlan:* Are you aware that a recommendation, or a Rule, is now in force, since April of this year for ocean going steamers, which provides that "each and every steamer navigating the ocean must be provided with sufficient lifeboat capacity to accommodate every person on board, including passengers and crew, excepting infants in arms." *The*

*Commissioner:* That is some American book, is it?

*Mr. Scanlan:* It is the general Rules and Regulations provided by the supervising inspectors as amended in January, 1912, and the date is April 27th of this year.

*The Attorney-General:* That is after the "Titanic."

*The Commissioner:* I was asking you: Is it an American book?

*Mr. Scanlan:* Yes, I think so.

*The Commissioner:* That is a sort of - if I may respectfully say so, I do not wish to criticise what they do in America - legislation after the event.

(*Mr. Scanlan.*) Yes, my Lord. We have heard people like Mr. Sanderson say here to you, my Lord, that he and the shipowners were waiting anxiously for the recommendation of your Lordship, and under this Question 26 your Lordship is invited to advise as to what alterations should be made in the recommendations; and in that view I think this alteration in America of very special importance to bring under your Lordship's notice.

*The Witness:* There has been a great deal done here since the "Titanic" disaster.

Are you aware of this regulation? - I was not aware of it until you told me. *The*

*Commissioner:* I have at present serious doubts whether it would be a wise thing to direct lifeboat accommodation for every soul on board - I have serious doubts about it. It never has been done. It is quite true that the loss of the "Titanic" appears to point to the probability of it being wise to increase the lifeboat accommodation.

*Mr. Scanlan:* From other information which I am able to place at your Lordship's disposal, the whole of the shipowners of this country have come to the Board of Trade and have expressed their willingness to put on lifeboat accommodation for every person carried.

(*The Commissioner.*) That may be? - I should like to say what has been done with regard to that. The President himself has held a series of conferences at the Board of Trade with the shipowners in order to see whether anything could be done to bridge the interval of the loss of the "Titanic," and the recommendations of this tribunal and of the Committees appointed: the President, by means of conferences with the representatives of the shipowners, and by means of correspondence, has been in communication with the owners of the various classes of passenger steamers - emigrant ships, foreign-going passenger vessels, home trade vessels, cross-Channel boats, and excursion steamers. In the result, as regards foreign-going passenger vessels the owners of practically the whole of foreign-going passenger ships of 1,500 tons and upwards have intimated that they either already carry boat and raft accommodation for all on board or that they intend to do so as soon as practicable. I am bound to add that in certain cases it was intimated -

22623. Are you reading something? - I am only reading my own note of what has taken place: I am bound to add that in certain cases it was intimated that the owners had doubts as to the expediency of a large increase of boats, but that the full complement of boats was made chiefly with a view to meet public opinion.

22624. Public opinion is of very little value against the opinion of experts? - I entirely agree with that, my Lord.

*The Attorney-General:* Your Lordship may remember that I read a passage in a letter which was written by Sir Norman Hill with reference to this.

*The Commissioner:* That was the letter of - when?

*The Attorney-General:* The 27th of April, 1912.

*The Commissioner:* Will you read it again to me?

*The Attorney-General:* This is the letter which, unfortunately, you have not before you now, but which you shall have in the documents: "In face of the new facts, the Committee at their meeting yesterday re-opened entirely the question of the revision of the boat scale for large passenger vessels with a view of providing the maximum of protection for the passengers and crew in the event of an overwhelming disaster, whilst, at the same time, maintaining the principles in regard to the stability and sea-going qualities of the ship itself and to the prompt and efficient handling of the boats carried under the existing scale, which hitherto have proved not only essential to safety, but also adequate for all ordinary emergencies. The questions involved are not free from difficulty, but they will receive the immediate attention of the Committee. Pending their consideration, the Committee note that assurances have been received by the Board of Trade from representatives of most of the large passenger lines to the effect that every effort will be made to equip their vessels, at the earliest possible moment, with boats and rafts sufficient to accommodate all persons on board."

*Mr. Scanlan:* May I read to you, my Lord, just one sentence from a speech by the President of the Board of Trade? It is practically what Sir Walter has said: "Some time ago I told the House that the owners of practically all the ships over 10,000 tons have assured me that in future as soon as circumstances permit, that is as soon as they can get the boats, they will in every case carry sufficient boat or raft accommodation for every one on board."

*The Commissioner:* What is it you are reading from?

*(Mr. Scanlan.)* I am reading from Hansard the report of the speech of the President of the Board of Trade. - That is the same thing as I have told you, only it does not include so much.

Have you had any dissent from any large body of shipowners to making this provision? - Any large body of shipowners?

Yes? - I have heard several, but I cannot say I have heard it from a large body of shipowners. I have heard some of them say: "We have done this against our better judgment in order to meet public clamour."

You were asked in the course of your examination by Sir Rufus if there was an objection on the score of the commercial running of ships profitably to provide boats. Is that an objection - that they are too costly? - I cannot tell you that because I do not know the cost.

*(The Commissioner.)* I do not think the cost could be an objection - Nor do I, my Lord.

(*Mr. Scanlan.*) I do not think so, my Lord. There is a view put forward that one way to secure safety is to increase the floatability, if I may use the expression, of ships. Has that been brought under your notice? - You mean the improvement of watertight bulkheads. Or of making better and more scientific provision to ensure that the ship will float after a certain accident? - Yes.

I suggest to you as a reasonable thing, in view of new regulations, that not only should more stringent regulations be enforced in regard to bulkheads, but that it is also reasonable to provide lifeboat accommodation for every person carried on a ship - on an emigrant and passenger ship? - What question do you ask about that?

I suggest to you that it is reasonable and I ask your view? - I do not care to express my view, my Lord, unless you tell me to. This is the way I can answer your question, that I think it is a matter that deserves very attentive consideration. That is my personal view, please.

Your Department is responsible for making regulations to ensure the safety of the passengers carried? - Yes, but in any case I am sure you do not

## **Page 614**

wish to misunderstand me. I am not expressing here today the view of the Board of Trade. I expressed that personal view to you because I thought it was only fair to you. 22635. I think you indicated in your evidence that the question of the speed at which vessels should be allowed to travel in fog or in the presence of ice is a matter on which you are likely to make regulations? - Did I?

*Mr. Scanlan:* It was touched on in the evidence.

*The Commissioner:* When?

*Mr. Scanlan:* I do not remember.

*The Commissioner:* Not by this gentleman, certainly.

(*Mr. Scanlan.*) Is the question of speed and the presence of ice a matter which is under consideration by the Board? - I think it possibly comes under the terms of reference to the Advisory Committee - possibly, I am not sure. I think so.

I think it does. It is stated by the President of the Board of Trade that that is a matter which he expects to be carefully considered here? - Quite.

*Mr. Scanlan:* Now, with regard to the loadline. Again I agree, my Lord, that it may be fairly said that this is not strictly relevant to the loss of the "Titanic."

*The Commissioner:* If you fancy that I am going to suggest every point upon which it is possible, and perhaps right, for the Board of Trade to make new Rules you are making a mistake.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* I shall do nothing of the kind. I should never come to an end with this Enquiry.

*Mr. Scanlan:* I had not thought that, my Lord, but I was instructed to raise this point. I thought it might happen that, as there has been referred from this Court the information which your Lordship has collected in regard to bulkheads and watertight compartments, some reference back of that kind might be made in reference to such Rules.

*The Attorney-General:* It opens up such a big question. I hope you will not unless it is necessary.

*The Commissioner:* I cannot go into questions like that - no.

*Mr. Scanlan:* I do not wish to do anything more than indicate that it is a subject in respect of which seamen are dissatisfied with the Board of Trade.

**Examined by Mr. CLEMENT EDWARDS.**

Unless a ship gets a declaration of clearance from the Board of Trade it cannot go to sea?  
- No.

That is to say, the Board of Trade accepts and discharges the duty and responsibility of saying whether a ship is seaworthy or not? - Are you referring to an emigrant ship?

I am referring to any kind of ship for the moment? - The responsibility is totally different with different ships. I must ask you to confine your questions to one particular class of ships.

So far as the Board of Trade is concerned it is a universal responsibility, is it not? - No. If you will tell me what sort of ship you are referring to, I shall be able to answer you quite precisely.

Will you tell me what is the distinction in the responsibility of the Board of Trade in the giving of a declaration as to a ship -? - What sort of ship?

Will you kindly follow me, Sir Walter, and allow me to complete my question so that you will then be able to answer. Will you kindly explain what is the difference between the responsibility of the Board of Trade in regard to the declaration in the case of a ship which is not an emigrant ship and in the case of a ship which is an emigrant ship? - Certainly. In the case of an emigrant ship the Board of Trade has, in the most minute way, to make itself responsible for the fitness of the ship to go to sea. Not only her seaworthiness and her equipment of every kind, but even her medical stores; and the clearance is refused unless the officer is absolutely satisfied in every respect that she is fit to go to sea. That is in the case of an emigrant ship.

What happens in the case of a non-emigrant ship? - In the case of the next class, the passenger steamer -

*The Commissioner:* No, no.

(*Mr. Clement Edwards.*) Surely Sir Walter, you could not have appreciated the point, or I did not make myself clear. It is a responsibility that is imposed upon the Board of Trade in all cases? - What is a responsibility?

The giving of a declaration before a ship may proceed to sea? - Certainly not. 22647.

Will you now explain what is the position in the case of a ship which is not an emigrant ship? - That is precisely what I was doing when you interrupted me. I said that in the case of a passenger steamer the Board of Trade have a declaration from their shipwrights' Surveyor, their engineering Surveyor, that that ship is fit to carry passengers - so many passengers. That is a totally different thing from an emigrant ship. No examination of the ship is made before she goes to sea unless there is some reason to believe that she is unseaworthy. She has her declaration; that authorises her to carry passengers, to have so

many boats for these passengers, and so on, but no clearance is required unless there is reason to believe that she is unseaworthy.

22648. I put this to you: Can any sort of a ship proceed to sea from this country without a declaration or an authority from the Board of Trade? - Certainly. 22649. What sort of a ship can? - Any kind of a ship but an emigrant ship.

Do you suggest, Sir Walter, that any registered English ship can leave a port of this country without an authority from the Board of Trade? - Certainly.

Do you know the form called the A.A. form? - That is with regard to emigrant ships. Only? - Only.

Is it not a form for every ship which signs on its crew in this country? - That is the Customs form you are referring to.

I am referring to the Board of Trade. Have you an A.A. form there? - No, I have not. I do not remember quite what it is, but I do know that the Board of Trade have no power to stop a ship unless she is unseaworthy, and that the only ships they clear - 22655. That is not what I am putting to you. The certificate of the Board of Trade is taken as tantamount to a declaration that she is seaworthy, is not that so? - That means that no question has been raised. I should like to have the form before me.

This is the point I want to get to, Sir Walter, that there is no other body in this country except the Board of Trade which accepts and discharges the responsibility of permitting the ship to go to sea in a state of supposed seaworthiness? - I believe the Board of Trade is the only body.

That is all I wanted to get at. Now what I want to ask you is this. I want to ask you several questions as to the extent, character, equipment, and competency of the Board of Trade for this purpose, and I want to ask you this question first of all; who are the Board of Trade for this purpose? - You are asking me to answer an antiquarian question, I think.

I think we know that constitutionally the Archbishop of Canterbury is a member of the Board of Trade? - I will do my best to answer you, with pleasure. I may say that legally I believe the Board of Trade is a Committee of the Privy Council.

(*The Commissioner.*) Mr. Edwards said, "For this purpose." I do not think that is what Mr. Edwards means? - I was going on, my Lord, to say what practically it consists of.

I think he wants to know who are the persons - give their names, so that we may know who take these matters under their special care? - You mean in the Marine Department?

I do not know where they are? - Am I to begin with the President, the Cabinet Minister?

## **Page 615**

(*Mr. Clement Edwards.*) For the purpose of the Merchant Shipping Act has the Board of Trade any other meaning except the Marine Department of the Board of Trade? - As controlled by its political officers, of course, it means the Marine Department of the Board of Trade, certainly.

So that for all practical purposes of responsibility, when we are talking of the Board of Trade in connection with this Enquiry it is the Marine Department? - Yes, but subject to what I have said, controlled by the Parliamentary Officers and the Permanent Secretary.

Then for this purpose it is the Marine Department, plus the Legal Adviser, plus the Permanent Secretary, plus the President, plus the Under-Secretary? - The Parliamentary Secretary - it is the same thing. That is so.

Now of whom does the Marine Department consist? - I think most of this is in the evidence.

Will you kindly answer my questions unless you are stopped from answering by my Lord? - Well, it consists first of all of the headquarters staff and the Chief.

You are the Chief? - Yes. I am assisted by a professional member of the Marine Department who is a sailor. Then there is a staff of consultative officers, the principal Surveyor for tonnage, the principal ships' Surveyor, who is a naval architect, the chief inspector of ships' provisions, and the Engineer Surveyor-in-chief. I think I have given you all of them. Those are the principal consultative officers.

Then in addition to those you have a body of Surveyors? - Yes.

And they are divided into Shipwright Surveyors and Engineer Surveyors? - I might complete my list of the consultative officers. There is also the principal examiner of masters and mates and the chief examiner of engineers. I think that completes the list now.

Now as to the Surveyors; they are divided into Shipwright Surveyors and Engineer Surveyors? - Shall I tell you what they are?

Yes? - There are the principal district officers - there are nine of those; 80 Engineer Surveyors; 34 ship Surveyors; 17 nautical Surveyors, including one assistant to the principal examiner of masters and mates; five sanitary Surveyors; 31 clerks, assistant clerks and boys; and 72 boat-men; a total of 273 officers. 22672. Does that include the emigrant officers? - Certainly.

What are the qualifications required for the Chief District Officer? - Some of the Chief District Officers are sailors; others are engineers.

Are there any qualifications laid down in writing for these different positions? - Yes, I could give the form of application for each of those posts, beginning at the bottom, showing exactly what the qualifications are, if necessary. That is all set out in printing. 22675. Will you kindly let us have those? It does not matter now, but we would like to have them some time? - You want to know what the qualifications are for each class of officer?

22676. What qualifications are required for each class? - That shall be prepared. 22677.

You have certain instructions which you issue to Surveyors, is that not so? - Yes.

22678. And those instructions are varied from time to time? - Yes, by circular. 22679.

Who is responsible for the variation of those instructions from time to time? - The Department itself.

22680. That is the Marine Department? - That is the Marine Department. 22681. What I want to know is this. Supposing you come to a case where you think there should be a variation in the instructions to a Surveyor, what will be the procedure gone through by

the Department for the purpose of issuing the new instructions? - It depends upon the nature of the instruction. They will take the best advice available as to whether that instruction should be issued - that variation.

Supposing there is a variation in the instructions as to the requirements for bulkheads, for instance? - That would go to the Chief Ships' Surveyor or Naval Architect. We should be advised by him.

Who will be responsible for initiating? - It might be anybody. It may be a Surveyor at the port, it may be a member of the public, it may be some public body. It might emanate from anybody.

Who will exercise the responsibility as to deciding the relative importance of a suggestion of this sort which may lead to a fresh instruction? - I have told you the technical officers would advise the Department.

That is to say, if something comes into your Department relating to a particular thing? - Let us say bulkheads.

That would automatically go to whom? - Mr. Archer, the Chief Ships' Surveyor. 22687. And will he on his own responsibility draft a fresh instruction, or is there any consultation, and if so, between whom? - It depends entirely upon the circumstances of the case. He probably would make a suggestion. He might say, "I entirely agree with this," or "I entirely disagree," giving his reasons for either course, or he might suggest that we should make further inquiries before we decide.

Who will he say that to? - He would refer that to the Department.

The Department - does that mean to you for this purpose? - It means that if it were a professional case it would go to the professional officer first, to Captain Young, and then it would come to me from Captain Young.

That is to say, it is not in the nature of a round table conference from time to time, if I may use that term, but a document passed on and initialled with a recommendation, or something of that sort? - If it is an important recommendation all kinds of things may happen - conferences with shipowners, conferences with the Seamens' Union. All sorts of conferences might happen if it was an important thing. 22691. There is no one definite method of fixing responsibility for a new suggestion from time to time? - Yes.

Do you follow? - Any new suggestion of importance would go on from me with my endorsement either in favour or against for the approval of the Parliamentary Chiefs, if it were of any importance.

What power have you to insist upon either the erection of bulkheads or as to their shape and character in a ship? - Do you mean in the case of an emigrant ship? 22694. Yes, in the case of an emigrant ship? - I think if the Local Surveyor pointed out anything that he thought was wrong, that would go to the Chief Ships' Surveyor. 22695. I am not asking you as a matter of practice. I put it to you, what legal powers have you to either order the erection of a bulkhead or to determine its shape and character? - I might say that if the arrangements which were being proposed would make the ship unseaworthy we should refuse clearance.

22696. Where do you get any legal power from to insist upon a bulkhead? - It would entirely depend upon the opinion of the Surveyor who was going to issue that declaration.

22697. I am afraid I have not made myself clear. Do you say that you have power under

the Merchant Shipping Act to insist upon the erection of bulkheads? - I think I may say no. If we have any power it is very indirect.

22698. That is exactly what I am coming to. You do not suggest that you have any direct power under the Merchant Shipping Act to order the erection of bulkheads in any ship? - That is so.

*Mr. Edwards:* Is your only power derived indirectly because you are clothed with authority by the Merchant Shipping Act to order a certain number of boats or life-saving apparatus?

*The Commissioner:* I do not think so. They have the same power which Sir Walter Howell read to

## Page 616

us from the Act of Parliament, to refuse to allow a ship to go to sea unless it satisfied the requirements of the particular Surveyor as to seaworthiness. You remember that? *Mr. Edwards:* Yes, I was coming to that point. It is Section 305, I think, or Section 271. *The Commissioner:* The way you were putting the question would lead apparently to this, that the "Titanic" might have gone to sea without a single bulkhead in her. *Mr. Edwards:* I think, my Lord, with respect, that that is the strictly legal position, and what I am really directing my question to show is the insufficiency of the law, and therefore the insufficiency of fixing the responsibility in the matter of bulkheads. (*To the Witness.*)

Where do you say, Sir Walter, that you get any authority from to insist upon a bulkhead?

*The Commissioner:* He has told you that there is none. I think the answer involved in that question is that the ship cannot go to sea unless she gets a certificate from a competent man appointed by the Board of Trade to say that she is fit to go to sea, and part of the requirement to make her fit would be bulkheads. There is no direct authority in any Act of Parliament that I know to the Board of Trade to require bulkheads, but there is, you may call it, an indirect authority - the authority that is covered by the section of the Act we have heard read. That is the way, I think it stands; I may be wrong.

(*Mr. Clement Edwards.*) You have heard what my Lord has said. Do you agree that that is the position? - I think it would be quite impossible for a vessel like the "Titanic" to go to sea certified by the Board of Trade without any bulkheads. The Emigration Officer would not clear her. The Shipwright Surveyor would not say she was all right in his declaration, in fact the declaration would be refused, and so would the clearance by the indirect powers to which his Lordship referred.

You have heard what my Lord has said, that inasmuch as you have power to withhold your declaration because a ship is unseaworthy it is competent for you to say that she would not be seaworthy without bulkheads, and therefore you say she must have bulkheads? - It would be competent for the Board of Trade to take that line. It has to be remembered that the shipowner always has an appeal from their decision to a Court of Survey.

The next point that I want to come to is, if that is your power that is exercised by the giving of the declaration by your Surveyors? - Yes. The decision is come to by the Department, of course.

I do not quite follow you? - I mean, if a difficult question were raised it would be referred to the Department for decision.

That is to say, if a difficult and special question were raised it would be referred back to the Department? - Yes.

That I am coming to in a moment, but in the ordinary way, it is in your Surveyor's discretion to give a declaration as to the seaworthiness of a ship? - Yes. 22705. Have you any definite regulations which fix the character and form and strength of the bulkhead by which your Surveyors may be guided? - No, there are no definite Rules on that subject. So that the question of whether a ship is seaworthy, at all events, in relation to the bulkheads, is a matter which is left to the personal judgment, without guidance, of each particular Surveyor that you have in your employment? - I am perfectly sure that every Surveyor would report any question about bulkheads of that sort to the Department for guidance.

I will put that to you in a moment. What may or may not be done is one question. So far as the powers are concerned, it is within the personal discretion of each Surveyor to say whether he considers a particular bulkhead in a particular ship is right or not - he has not to refer to any specific standard? - What he has to do is to declare that he is satisfied with the hull of the vessel.

And for that purpose he has not to refer to any specific standard? - No. I do not think any specific standard has been laid down.

Is it not a fact that you have among your Surveyors a large number of persons who have had no special training apart from any experience they may have derived in their position in the Board of Trade, in the testing of the character of bulkheads? - Every Surveyor, before his appointment is confirmed, has to pass an examination that satisfies the Chief Ships' Surveyor that he is -

*(The Commissioner.)* I wish you would try, when the question admits of an answer of "yes" or "no," to answer it by "yes" or "no." - Yes, my Lord, I always try to do that.

*The Commissioner:* If you will listen to the question put to you again you will see that it admits of one of those answers. Now put it again, Mr. Edwards.

*(Mr. Clement Edwards.)* Have you not in your employment as Surveyors a number of gentlemen who have had no practical experience and training in bulkheads except what they have derived in their experience as Surveyors to the Board of Trade? - If I am to say "yes" or "no," I think I will say "no."

Then we may take it from you that every one of your Surveyors has had experience of testing bulkheads apart altogether from their experience in the Board of Trade? - That is where it becomes so necessary for me to qualify what I say.

I did not ask you not to qualify your answer, Sir Walter. Qualify it as you like? - A Surveyor is not allowed to make a declaration for a vessel upon the particular points with which he is entrusted that is to say, hull, equipment and machinery, until he has satisfied the Board of Trade that he is fit to do it.

That is a very general and beautifully vague answer. What test have you at the Board of Trade for the efficiency of your Surveyors in this matter of bulkheads? - That the officer has passed the Chief Ships' Surveyor. I really must ask you to ask the Ship's Surveyor any further questions on that when he is examined. I cannot carry it any further. *Mr.*

*Edwards:* Who is the gentleman that you suggest that I should ask, because it seems in

this Enquiry we are constantly being put off and told that other people are coming who will give the information, and when they come they do not give it. *The Commissioner:* Oh, you must not make that complaint, Mr. Edwards. I have asked you over and over again to give me information, and you always tell me that you are going to do it at some other time.

(*Mr. Clement Edwards.*) Of course, my Lord, I know I have shown a pedantic regard for the Rules.

*The Witness:* What I am most anxious that the Court should understand is that I am not a technical officer but an administrative officer, and that the whole of my administrative staff is at your disposal.

*The Commissioner:* Never mind, let us go on.

(*Mr. Clement Edwards.*) Will you give me the name of the gentleman who can give me all this information? - Mr. Archer.

Is it not a fact that you have regulations and instructions which only require under any circumstances four bulkheads to be put in a ship? - Yes.

And that upon those bulkheads, if they satisfy a particular Surveyor, there may be a declaration of seaworthiness so far as bulkheads are concerned? - I do not think the declaration would go very far.

I did not ask you that, Sir Walter. Do you mind, please, answering my questions in the form in which they are put. Any qualification you like to make you can make afterwards, of course. Is it not a fact that, under your regulations, if there are four bulkheads put in, that then your particular Surveyor may issue a declaration of seaworthiness so far at all events as bulkheads are concerned? - And so far as his personal responsibility is concerned, yes.

## **Page 617**

*The Commissioner:* Will you refer me to this Rule?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* That is the Rule that Mr. Scanlan referred to.

*Mr. Edwards:* It is on page 8, my Lord, Rule 16: "An efficient and watertight engine room and stokehole bulkhead."

*The Commissioner:* What book are you reading from now. Is it another one.

*Mr. Aspinall:* It is the "Regulations and Suggestions as to the Survey of the Hull, Equipments and Machinery of Steamships Carrying Passengers." It is the book which your Lordship was referred to yesterday by the Attorney-General when he was examining Sir Walter, especially in the earlier stages of his examination. He was directing your Lordship's attention to this Clause 16. He was there dealing with the jurisdiction of the Board of Trade in seeing that proper collision bulkheads were put in, and a part of that clause has since been deleted, as appears in the book that the Attorney-General handed up.

*The Commissioner:* What is the book called.

*Mr. Aspinall:* The book is called, "Regulations and Suggestions as to Survey." *The Commissioner:* Have I had a copy of it.

*Mr. Aspinall:* I think so, my Lord. My recollection is that the Attorney-General handed it in to your Lordship yesterday afternoon. I may be wrong. It may be that the Attorney-General handed it up in the form in which Mr. Dones is handing it up to your Lordship

now. (*The document was handed to the Commissioner.*)

*The Commissioner:* Is this it, Mr. Edwards, "16. Collision bulkheads, watertight compartment round stern tube, and other bulkheads."

*Mr. Edwards:* That is it, my Lord.

*The Commissioner:* Let me see what it says.

*Mr. Edwards:* "16. An efficient and watertight engine room and stokehole bulkhead, and an after watertight compartment to enclose the stern tube of each screw shaft, should be fitted in all seagoing steamers, both new and old, and in the absence of any of these the case must be specially referred to the Board of Trade before a declaration is given. As regards other bulkheads, although a thorough subdivision of the ship is desirable, the Surveyors should not for the present refuse to grant a declaration because these are not fitted."

"The distance of the collision bulkhead from the after side of the stern measured at the level of the lower deck should not be less than one twentieth of the vessel's length measured from the afterpart of the stern to the fore part of the stern post."

*The Commissioner:* Where is the statement that he is bound to issue a certificate though there may be only four bulkheads?

*Mr. Edwards:* At the end of the clause: "As regards other bulkheads, although a thorough subdivision of the ship is desirable, the Surveyors should not for the present refuse to grant a declaration because these are not fitted."

*The Commissioner:* Is that all.

*Mr. Edwards:* That is all on that point, my Lord.

*The Commissioner:* But it is not enough for you. This does not say that if he thinks a ship is unseaworthy he is to grant a certificate.

*Mr. Edwards:* I am afraid that your Lordship did not quite catch the whole of the question. I spoke of seaworthiness in relation to the bulkhead.

*The Commissioner:* Is there anything here which says if he thinks the ship is unseaworthy with four bulkheads, he must nevertheless grant a certificate?

*Mr. Edwards:* No, my Lord. If my question suggested that, I at once desire to say that I did not intend that.

*The Commissioner:* I think you were suggesting that there was some obligation upon him to grant a certificate if there were four bulkheads.

*Mr. Edwards:* No, my Lord - that if there were only four bulkheads, and the ship in his opinion was seaworthy, that then he could grant his declaration without reference back to the Board of Trade.

*The Commissioner:* Oh, yes; possibly he can, but then the important thing is, of course, is the ship seaworthy? *Mr. Edwards:* In his opinion?

*The Commissioner:* In his opinion - you must have it in the opinion of somebody, you know.

*Mr. Edwards:* Quite, my Lord. But, if your Lordship will notice, according to him, in the case of four bulkheads the Surveyor may himself exercise a personal judgment. In other cases he has to refer back to the Board of Trade.

*The Commissioner:* They think, I suppose, perhaps with good reason or bad reason, that they can rely upon their Surveyors to exercise a wise judgment.

*Mr. Edwards:* That I have no doubt about.

*The Commissioner:* This Rule does not appear to me to bear out the suggestion that I understood you to make; that is all I mean.

*Mr. Edwards:* My Lord, if I by any slack use of language conveyed the impression to your Lordship's mind -

*The Commissioner:* Mr. Scanlan had this Rule in his head, I suppose, but when I pressed him about it he put his helm hard a'starboard and shunted away from it.

*Mr. Scanlan:* May I say, my Lord, that Sir Walter said he was bringing forward a Witness who would answer that point.

*Mr. Edwards:* In the meantime, I had not got the exact point.

*(Adjourned to tomorrow at 10.30 a.m.)*

## In the Wreck Commissioner's Court

SCOTTISH HALL,

BUCKINGHAM GATE,

*Thursday, 13<sup>th</sup> June, 1912.*

### PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

## TWENTY-THIRD DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K. C., M.P. (*Attorney-General*), SIR JOHN SIMON, K. C., M.P. (*Solicitor-General*), MR. BUTLER ASPINALL, K. C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K. C., M.P., MR. F. LAING, K. C., MR. MAURICE HILL, K. C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.) MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K. C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K. C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

**Page 620**

**Sir WALTER J. HOWELL, Recalled.**

**Further examined by Mr. CLEMENT EDWARDS.**

I think yesterday we were just on the subject of the Regulations and Suggestions to Surveyors, and we were on Rule or regulation 16. I notice on page 8, Rule 16, that certain paragraphs have been struck out, and there is inserted, dated February, 1907, a slip of an amended Rule: "In all sea-going steamers coming under survey for passenger certificate for the first time the following requirements regarding the height of the bulkheads should be complied with." The collision bulkhead is in all cases to extend to the upper deck. If

an iron or steel watertight deck or flat is fitted below the upper deck at the afterend of the vessel and forms the top of the after watertight compartment, the aftermost bulkhead may terminate at the said watertight deck or flat, but if no such watertight deck or flat is fitted, the aftermost bulkhead should extend to the upper deck." What was it that led to that alteration in February, 1907? Can you tell me? - I am sorry to say I cannot. This is rather an illustration of what I have said once or twice, that I am anxious that questions of this kind should be put rather to the officers who will follow me as experts on their particular points, than to me as an administrative officer. *Mr. Edwards:* I am quite content with that, Sir Water, if I know that that officer or those officers are going to be called as Witnesses.

*The Attorney-General:* Which officer is it you are referring to?

*The Witness:* This is Mr. Archer.

*The Attorney-General:* He will be called.

(*Mr. Edwards.*) Very well. (*To the Witness.*) Now yesterday I think your expression was that in cases of special difficulty, or in things of an exceptional character, the matter would not be decided in the discretion of the local Surveyor, but would be referred to the Board of Trade? - Any question of importance would be.

When it was proposed to build these two colossal ships, the "Titanic" and the "Olympic," was there any reference to the Board with regard to that? - That is a question Mr. Archer will be able to answer much better than I should be able to do.

You can tell at least if there was any reference to the Board. I am not going to ask you as to details? - I am under the impression that certainly there were questions referred to the Board.

If there were, would Mr. Archer be in possession of the documents relating to the reference? - Yes.

Can you tell me apart altogether from the special reference, when the question came up of the construction of these two great ships which were something above and beyond anything we had had before, whether the Board gave any special consideration to their size in relation to safety? - I am under the impression that the professional officers certainly did consider that.

And again perhaps I can get something from Mr. Archer? - And Sir Alfred Chalmers and Captain Young.

Apart from those two officers, was there any general consideration or discussion? You told us yesterday that on matters of great importance there might be discussion between the different members of the Department? - I think they were talked about, but I do not remember any special discussion with regard to any difficult question that arose.

You have no record, no minute or anything of that sort dealing with the subject? - I do not recollect one, but these officers will be able to tell you better than I can. *The Commissioner:* It would be a convenience to me if you would tell me what particular questions they are which you think ought to have been discussed? *Mr. Edwards:* One of the questions which has emerged is that on a boat of this size with these decks, the provision of a large number of boats on the upper deck was likely to make the ship tender.

*The Commissioner:* That is quite enough for that; I can understand that. Now what other question?

*Mr. Edwards:* Then there is the point as to the relative means of access from the different quarters of the ship to the boat deck in the event of accident.

*The Commissioner:* Very well, you mean relative as between the different classes? *Mr. Edwards:* I mean relative to the different classes and the crew, and also relative of course to the size of the ship, with these additional decks as compared with what for convenience I will call the older type of ship.

*The Commissioner:* What is the other question if there is any?

*Mr. Edwards:* Then there is the question, of course, of the bulkheads and the watertight doors, and the question of manning, which I did not wish to touch upon except in a general question. There was a question I was going to ask as to the efficiency of the deckhands and their numbers.

*The Commissioner:* Is there anything else?

*Mr. Edwards:* No, I think not.

*The Commissioner:* That serves as an indication to Mr. Archer, who I hope is here, of the matters upon which he must prepare himself as far as you are concerned.

(*Mr. Edwards.*) I am obliged, my Lord. (*To the Witness.*) I think it was in 1909 you issued some instructions on the subject of manning - a circular? - Yes.

And I think in that circular you stated that there must be a sufficient number of efficient deckhands. Now, have you any standard or test of efficiency of a deckhand? -

The deckhands -

*The Commissioner:* Do answer the question. Have you any standard? I do not know what it means, because I do not know what the standard of a deckhand is, but have you any?

(*Mr. Edwards.*) A standard of efficiency?

*The Witness:* There is no standard laid down in this circular, but the Emigration Officers have a standard.

(*The Commissioner.*) What is it? - I do not know.

How do you know that? - Well, I happen to know in my own mind.

I do not see how you can know they have a standard, if you know nothing about the standard? - Then I must say I know nothing about it.

I do not know what a standard of efficiency for a deckhand means? - I suppose it means the service they have had - the experience they have had.

The length of service? - Yes, the number of years they have been at sea. That would be regarded as a standard, whether they attain the standard laid down for an A.B., for instance, service of so many years before the mast. But I am rather construing Mr. Edwards's meaning.

(*The Commissioner.*) When are boys taken on a ship? I suppose at 14 years. Is there a standard of efficiency so far as a boy of 14 years old is concerned? - There is no standard of efficiency as far as we are concerned with regard to a boy of that kind. 22738. I suppose he must be a healthy well-grown boy with hands and feet and arms and legs? - Yes; no doubt.

*Mr. Edwards:* Is there issued from the Marine Department of the Board of Trade anything in the nature of a code of qualifications by which your respective officers may test the efficiency?

**Page 621**

*The Commissioner:* The answers to that I am sure is No. Do you want a printed qualification for a greaser? I do not know what this means.

*Mr. Edwards:* If I may say so with respect, I only want to get this point. We have it with regard to the seaworthiness of a ship; we have it in regard to bulkheads, that it is a matter in the discretion of the local Surveyor.

*The Commissioner:* Be clear. What is the "matter in the discretion"? You say "it" is a matter. What is it?

*Mr. Edwards:* What I have just said.

*The Commissioner:* Then say it again.

*Mr. Edwards:* What is a matter within the discretion of the local Surveyor is the issuing of a declaration that a ship is efficient.

*The Commissioner:* That we know. *Mr.*

*Edwards:* And seaworthy.

*The Commissioner:* Is that the "it" that you referred to?

*Mr. Edwards:* And in the case of bulkheads Sir Walter told the Court yesterday that there was no regulation laid down and no standard fixed for bulkheads. The matter of deciding whether they were right and proper was within the discretion of the local Surveyor without reference to any code or standard.

*The Commissioner:* Yes.

*Mr. Edwards:* Now, what I really want to get is this: when the Marine Department issue a circular requiring that there shall be efficient deckhands, whether there is any actual test of that efficiency, or whether that again is a matter to be determined entirely according to the particular views of the particular local officers.

*The Commissioner:* What is it you suggest ought to be in these directions - the height of the man, the width across the chest, or - which I can understand - how long he has been at sea? That I can understand as being of some value.

*Mr. Edwards:* Exactly, my Lord. I do not pretend there is a test of efficiency dependent upon the height.

*The Commissioner:* It must be, more or less, you know. I should think that if a dwarf presented himself he would be rejected. I think he ought to be rejected.

22739. (*Mr. Edwards.*) There is authority for asking "why God made the gem so small, and why so huge the granite"? (*To the Witness.*) All I want to get at is this: whether there is any sort or kind of common standard laid down by the Board of Trade by which the local officers may test the efficiency of a deckhand? - I can answer that quite simply, No. 22740. Therefore it is left entirely to the discretion and the judgment of the different local officers? - That is so.

*The Commissioner:* You do not help me unless you suggest to him what you think ought to be done. Suggest to him what ought to be done.

(*Mr. Edwards - To the Witness.*) Do you not think that when your Department takes upon itself the responsibility of saying there shall be efficient deckhands it should issue instructions indicating of what that efficiency shall consist? - It has been thought better to leave it to the local officers.

Do you or do you not think it would be better to have a common fixed standard for all the ports in the United Kingdom, instead of that standard, varying with the particular judgment of the different local officers.

*The Commissioner:* You know it is there I want your assistance. What do you say ought to be the standard laid down?

*Mr. Edwards:* That there ought to be a medical test and that there ought to be a test of service and a test of efficiency.

*The Commissioner:* What do you mean by a "test of service"? *Mr.*

*Edwards:* Length of service.

*The Commissioner:* Do you mean enquiries into the man's past connection with the sea?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* You do not mean some practical test?

*Mr. Edwards:* I am coming to that.

*The Commissioner:* But do you mean that? Do you mean that he is to be put into an engine room to grease in order to see whether he can grease?

*Mr. Edwards:* That would not be a deckhand, my Lord.

*The Commissioner:* Well, take a deckhand.

*Mr. Edwards:* I was coming to that. A deckhand might include the duty of being a lookout.

*The Commissioner:* Is the ship to put out to sea with men in the crow's-nest in order to find out whether they are good look-out men?

*Mr. Edwards:* I do not suggest that, my Lord. There are commonsense limits. *The*

*Commissioner:* I want to know where the commonsense limits come in, because it appears to me at present that if you have a really qualified man representing the Board of Trade to see these men, to look at them, and to make enquiries about them, and to ascertain what their past is, you have as good a test as you can have.

*The Attorney-General:* There is some definition of it. I do not know whether your Lordship noticed it. But I am afraid I was trying to get something else for the Court, and I am not sure I followed exactly what men Mr. Edwards means.

*The Commissioner:* I understand the suggestion of Mr. Edwards is that the selection of the deckhands and of the crew generally should not be left in the discretion of a local officer representing the Board of Trade, but that he should have a list of printed directions - and then I am asking Mr. Edwards, what they are to be - which would control the discretion.

*The Attorney-General:* There are some instructions with reference to it.

*The Commissioner:* Will you tell me one?

*The Attorney-General:* Yes, I notice this, that amongst the requirements, which have been already mentioned, in the book, "Instructions Relating to Emigrant Ships," at page 10, which gives the scale, to which my friend's attention was called, there is this: "The term 'deckhands' means the master and the mates and all *bona fide* able-bodied seamen.

The carpenter, boatswain, quartermasters, lamp trimmer and other petty officers who have served or are fit to serve in the capacity of A.B. may be regarded as *bona fide* able-bodied seamen for this purpose. Of the total number of deckhands carried one in five may be an ordinary seaman and two boys may be taken in place of each ordinary seaman so allowed. One cook and one steward may be reckoned as *bona fide* able-bodied seamen if they produce proof that they have served as A.B.'s, and the Emigration Officer is satisfied by actual trial that they can pull an oar and are fit to serve in that rating. Tradesmen, such as joiners, etc., are not to be counted." Those are the instructions. Of course, as your Lordship knows, the able-bodied seaman is defined, there is no doubt as to what that means. That is section 126 of the Merchant Shipping Act. He must have served at sea for three years before the mast. Then there is the ordinary seaman and, of course, ship's boys.

*Mr. Edwards:* Do you not think, Sir Walter, that there ought to be a minimum standard or test laid down for every one of the deckhands in the matter of boat handling, for instance?

*The Commissioner:* Will you, if you can, in words state to me what the direction is to be or what you suggest it should be? Tell it to me in words.

*Mr. Edwards:* I suggest, my Lord, that the men ought to undergo an examination and a test to show that they can handle a boat, not only in a smooth sea, but can handle a boat in even a rough sea.

*The Commissioner:* How is that test to be applied.

*Mr. Edwards:* I should suggest that it might very well be applied by the local Marine Board or the local marine officers. It is not a test which I suggest should be applied *ad hoc* a particular voyage, but it is a test which should be applied as a condition of a man getting a certificate.

## Page 622

*The Commissioner:* I want to know from you how is it to be applied; you cannot order a rough sea, you know.

*Mr. Edwards:* You can take advantage of a rough sea, my Lord.

*The Commissioner:* But the men may not be there when there is a rough sea.

*Mr. Edwards:* Exactly.

*The Commissioner:* The local officer may say: "It is a great pity you did not come here yesterday; we had a high wind; today it is all smooth and calm." Have a little common sense. You cannot lay down these hard-and-fast Rules, and in my judgment, at present, at all events, it is very undesirable that you should. It is far better to leave the matter in the discretion of a qualified man, and let him exercise his discretion. It seems so to me. *Mr.*

*Edwards:* With very great respect, my Lord, it is rather, if I may say so, because I apprehend that to be your Lordship's present view - *The Commissioner:* It is.

*Mr. Edwards:* And because your Lordship will be responsible for the issue of recommendations from this Enquiry that I am very anxious to give evidence which may somewhat shake your Lordship's faith in the view to which you have given expression.

*The Commissioner:* Do you really suggest to me - I understood you did just now - that at

Belfast or Southampton or wherever it may be, the local officer is to wait for a rough day in order that a seaman may go out in a boat and show him what he can do. Is that what you suggest?

*Mr. Edwards:* I do suggest that, my Lord.

*The Commissioner:* Then I think it is an outrageous thing. Are steamers to be kept waiting until it is a rough day?

*Mr. Edwards:* I purposely safeguarded myself by saying that I did not suggest that this kind of test or examination should take place *ad hoc* a particular voyage.

*The Commissioner:* When is it to take place?

*Mr. Edwards:* It may take place at any time before a man gets a certificate that he is an efficient person capable of being a deckhand.

*The Commissioner:* Then this is not a test that is to be applied before the Surveyor issues his certificate to that particular steamer; it is a test to be applied some time or other in the lifetime of the particular sailor?

*Mr. Edwards:* That is precisely what is now done, my Lord, in regard to A.B.'s. That is to say, it is required by the Merchant Shipping Act that so many A.B.'s shall be carried. When a man comes and says, "I am an A.B.," he is not put through any particular test; he is asked to produce his certificate.

*The Attorney-General:* That is right.

*The Commissioner:* That is quite right.

*Mr. Edwards:* And what I suggest is, if that is done with A.B.'s, there is no reason why it should not be done with any ordinary seaman, and I was going to put this: Is it not the fact that a recommendation -

*The Commissioner:* Is there any Rule which requires that an A.B. shall be tested in a rough sea in an open boat?

*Mr. Edwards:* No, my Lord.

*The Commissioner:* Do you suggest that there should be?

*Mr. Edwards:* I do suggest that there should be a test for the deckhand.

*The Commissioner:* Of that kind?

22742a. (*Mr. Edwards.*) Of that kind, and that before a man may obtain a position on a ship as a deckhand he shall produce a certificate which shows, among other things, that he is perfectly capable of handling a boat under all the probable circumstances which are likely to arise on a voyage. (*To the Witness.*) Sir Walter, has not a recommendation come or has not the Advisory Committee considered this question of tests for all seamen? - I believe it has been before them.

Is not this the proposal which came before the Advisory Committee: "That this

Committee call the attention of the Board of Trade to the failure on the part of certain shipping companies to carry out the recommendation of the Advisory Committee respecting the crews engaged in the deck department on British vessels, and this Committee recommends that in future all seamen engaged in the deck department be qualified seamen and prove such qualification either by producing three years' certificates of discharge, or failing this, proving that they have knowledge of the compass, can steer, do ordinary splicing of wire and hemp rope, tie ordinary knots, and

have a knowledge of the marks and deeps of the lead line.”

*The Witness:* Which letter is that?

22743a. (*Mr. Clement Edwards.*) It is in the minutes of the Advisory Committee of 1910.

*The Witness:* I have no exact recollection of it; I do not remember that particular letter.

The professional officer will be able to answer that, I think. I have now the reply sent to their recommendation, if I may read it.

What is the reply? - This is an extract from a letter to the Advisory Committee in reply to their recommendations. This is dated 13<sup>th</sup> October, 1908.

Will you read your reply? - Yes, it is a long letter. This is in reply to the report of the Merchant Shipping Advisory Committee, 1908. They made a recommendation, and this is the reply: “The proposal to test and certify the efficiency of seamen beforehand is also not free from difficulty from the administrative point of view. The present practice, as stated above, is to require that the members of the minimum effective watches shall all be efficient seamen, and if there is any doubt the men are examined on board by one of the nautical Surveyors. This ensures a practical test of the men at the commencement of the voyage, and it has been carried out without difficulty or delay. To test and certify the efficiency of the men beforehand might possibly obviate the necessity for a visit by the Surveyor, but the tests, if they are to be of real value to masters and men, would have to be systematised and standardised and protected from impersonation and fraud. Apart from the practical difficulties which this would entail, the Board feel great hesitation in attempting to inaugurate such a system by departmental instructions without express statutory authority.”

That is in 1908? - That is in 1908.

Now, in the Minutes of 1910 you will find, I think, a further reference to this subject by the Advisory Committee? - I have not it.

*The Commissioner:* Read it, Mr. Edwards; you have got it, I have no doubt.

(*Mr. Edwards.*) “That this Committee is of opinion that no superintendent of a Mercantile Marine office should allow any seaman to be treated as equivalent to an efficient seaman unless such seaman can produce a certificate from any competent body recognised by the Board of Trade showing that he can comply with the requirements above referred to.” Those are the requirements I read: “And this Committee further recommends that specific instructions be sent to superintendents to that effect.” Now, have you that Minute? - I have not it before me here; I think the nautical officer can give it to you.

Can you tell me if, in fact, any instructions have been issued to superintendents of the marine offices to that effect? - No, I think not.

Do you issue from the Board of Trade any regulations as to distress signals at sea? - Yes.

Can you refer the Court to them? - Speaking from memory, I think the distress signals are contained in the International Regulations for Preventing Collisions at Sea.

*The Commissioner:* Now what points are you going to make on this, Mr. Edwards? Is it that distress signals are not effective, or what?

*Mr. Edwards:* No, my Lord. The point here is as to whether, if there are common distress signals part and parcel of the Regulations under the Merchant Shipping Act, then it may bring the

responsibility home to those responsible for the navigation of the "Californian." That is what I am upon.

*The Commissioner:* At present, so far as I am concerned, you need not labour that point, because, if it be the fact, as I am disposed at present to think it is, that the "Californian" saw those distress signals, and that they were the signals of the "Titanic," I have no doubt at all in my mind that they ought to have made efforts to get to the "Titanic."

*Mr. Edwards:* Then I will not pursue that point.

**Examined by Mr. HARBINSON.**

Is there a Statistical Branch of the Board of Trade? - Yes.

Does that Statistical Branch keep a record of the passengers that leave this country and go to America every year? - I have no personal knowledge of what is kept in the Statistical Department, but I believe they do.

Could you ascertain for the Court, the percentage of the different classes that leave the United Kingdom each year and go to America? - Yes, I can certainly promise that, if you will say within what period.

22755-6. I will before the Enquiry closes? - You will send us word.

*The Commissioner:* Can you tell us how many Irish emigrants were on board this ship the "Titanic"?

*Mr. Harbinson:* Less than 200, my Lord.

*The Commissioner:* And how many emigrants were there altogether?

*Mr. Harbinson:* I should say, my Lord, somewhere about 800.

*The Commissioner:* Now can you tell me this. The 600 were foreigners, I suppose.

*Mr. Harbinson:* English and foreign, I should think.

*The Commissioner:* I am not at all sure.

*Mr. Harbinson:* I am not able to say the exact percentages.

*The Commissioner:* No, the exact percentages I should not expect you to be able to ascertain. I think you will find it is a fact that something less than 200 were Irish emigrants.

*Mr. Harbinson:* Roughly speaking, 180, I think, my Lord.

*The Commissioner:* Something like that; I think that is right, and that the remainder were foreigners. Now have you ascertained what percentage of the Irish emigrants were saved and what percentage of foreigners were saved?

*Mr. Harbinson:* I do not think there are any returns. I know the percentage of Irish.

*The Commissioner:* What is the percentage of Irish?

*Mr. Harbinson:* The percentage of Irish was something like 30, but I will tell you accurately.

*The Commissioner:* I will accept it for the moment; I daresay it is right. That would be about 60 of the Irish emigrants saved. Now what percentage of the others were saved?

*Mr. Harbinson:* It has been put in, my Lord; I will just refer your Lordship to it in a moment.

*The Commissioner:* Does it distinguish between Irish emigrants and foreign emigrants?

*Mr. Harbinson:* No, my Lord.

*The Commissioner:* That is what I want.

*Mr. Harbinson:* There is no table put in distinguishing them. There is none. *The*

*Commissioner:* How many third class passengers were saved altogether. In the Attorney-General's opening, is it?

*Mr. Scanlan:* Yes, my Lord.

*Mr. Harbinson:* The Table put in quite recently by the Solicitor-General sets it out.

*The Attorney-General:* That is the same thing. It only sets out what I opened. *Mr.*

*Harbinson:* Of the third class passengers the Attorney-General says there were 709 carried, 176 saved, making the percentage of saved 25 percent. *The Attorney-General:* That is right.

*The Commissioner:* You say there were 180 Irish emigrants?

*Mr. Harbinson:* Roughly that is it, my Lord, I think.

*The Commissioner:* And 60 were saved?

*Mr. Harbinson:* That is my recollection.

*The Commissioner:* Very well, 60 saved. How many third class; there were 709, were there?

*Mr. Harbinson:* Yes, 709 carried and 176 saved.

*The Commissioner:* There were 529 other than Irish. Now how many of those were saved. I suppose 116. Is that right? If the figures are right the unfortunate people whom you represent were saved to a much greater extent than the foreigners.

*Mr. Harbinson:* Of course, my Lord. So far as I know that is a speculative calculation. There has been no evidence put in which would give the figures correctly.

*The Commissioner:* But we know the total number.

*Mr. Harbinson:* Yes, and there has been no evidence given of the exact number of Irish, and no discrimination made.

*The Commissioner:* I am taking your own figure.

*Mr. Harbinson:* As far as I know, I have given them to you.

*The Commissioner:* I think they are probably right.

*The Attorney-General:* Will your Lordship tell me the figure? Am I right in thinking the figure was 60 of Irish emigrants which my friend gave.

*The Commissioner:* Yes.

*The Attorney-General:* It is very desirable to keep as close as we can to the percentage. He says it is under 200 that were carried. I wanted to ask this. I suppose he arrives at that from the number of third class passengers who sailed from Queenstown.

*Sir Robert Finlay:* Yes.

*The Attorney-General:* Because Irish emigrants are not likely to have shipped at Cherbourg.

*Mr. Harbinson:* No, I should not think so.

*The Attorney-General:* We have the exact number; it is 113, and if that is right and 60 were saved, it would make it that more than 50 percent of the Irish emigrants were in fact saved.

*The Commissioner:* What do you say to that?

*Mr. Harbinson:* I merely gave your Lordship a rough estimate of the figures.

*The Attorney-General:* I am only taking them and people who were not emigrants.

*Mr. Harbinson:* I cannot vouch for the accuracy of the fact that there were 60 saved. *The Attorney-General:* I have the number here of those that shipped as third class passengers at Queenstown, and taking them all as emigrants that would amount to 113, and that must at least cover all those who were Irish emigrants shipped in this vessel.

*The Commissioner:* I had accepted Mr. Harbinson's figure. If that is so, then 50 percent of the people whose interests, in a sense, are represented by Mr. Harbinson, were saved.

*The Attorney-General:* Yes, a little more.

*Mr. Harbinson:* Could the Attorney-General tell us exactly - he has the figures before him - the numbers of men and women saved, because that would shed a light on the number who sailed from Queenstown.

*The Attorney-General:* I am much obliged to your Lordship for indicating the value of it. We will analyse the 113 and see how many were women and children, and then we can compare that with those saved.

*The Commissioner:* I am speaking of emigrants still, and I think it would be impossible to distinguish among the third class between emigrants and people who were not emigrants.

*The Attorney-General:* I am treating them all as emigrants.

*The Commissioner:* You must treat them all as emigrants.

*The Attorney-General:* That is what I am doing.

*The Commissioner:* You can find out for me how many of them were shipped at Cherbourg, and how many of them were shipped at Southampton.

## **Page 624**

*The Attorney-General:* Yes.

*The Commissioner:* I should think those shipped at Southampton were probably not all emigrants; but it does not matter. It may be assumed that they all were.

*The Attorney-General:* We will pursue that line and give your Lordship the figures on it and, so far as we can, trace the saved and see how many of the emigrants or third class passengers from each port were saved.

*The Commissioner:* That can be done, of course.

22757. (*Mr. Harbinson - To the Witness.*) Have the Board of Trade any Regulations enjoining upon shipowners the necessity of having printed notices put up in, say, the third class accommodation to indicate which way third class passengers should go, which staircase they should use, in cases of emergency? - No.

*The Commissioner:* Exercise your own common sense. Do you think, Mr. Harbinson, that if such notices were stuck up, any body would ever read them. Judging for myself I do not believe anyone would ever read them; I never should. Perhaps I ought to. The

question is, What would happen, not what ought to happen. Have you ever been on board a ship?

*Mr. Harbinson:* I have never been to America, but, if I may relate my personal experience, every time I go across the Channel one of the first things I do is to read the notices.

*The Commissioner:* You are one of the most extraordinary men I have ever come across. The first thing I do, if it is about the middle of the day, when I get on a crossChannel steamer is to get some lunch, and the notion that I should go about the decks or about the ship reading all the notices that are stuck up never occurred to me.

*The Attorney-General:* That is not the class of literature your Lordship chooses. 22758. (*Mr. Harbinson.*) I regret that luncheon is an occupation I am never able to take part in at sea. (*To the Witness.*) Now, you make regulations in your instructions to emigrant ships as regards the third class accommodation, Sir Walter? - Yes.

22758a. I see you have it here. Do you, as a matter of fact, or have your Department, as a matter of fact, appointed travelling inspectors to see that in the course of the voyage between British ships in different ports the regulation that you make is carried out? - No.

*The Commissioner:* On that point I should like to ask a question. Does the ship carry any officers whose duties may be described as those of a policeman, to give information and to see that order is kept?

*Mr. Harbinson:* Yes, the Captain is responsible, I should say, and the Master-at-arms - the Captain certainly. He is responsible for order and discipline.

*The Commissioner:* I am told the Master-at-arms discharges those duties. Is there only one Master-at-arms, or are there more?

*The Attorney-General:* There were two on the "Titanic."

(*The Commissioner.*) Do you know what the duties of a Master-at-arms are, Sir Walter? - No, my Lord.

*The Commissioner:* Would it be the duty of the Master-at-arms, Mr. Attorney, if people desired to be shown about the ship, and how to move about in it, to show them?

(*The Attorney-General.*) I will enquire. I should have thought not.

*Captain Bartlett:* The Masters-at-arms, my Lord, generally police the deck, and keep a look-out for fire and anything of that sort. They do not escort the passengers round the deck at all. There are stewards for that purpose - chief third class stewards. 22761. (*The Commissioner.*) What I want to know is this: Supposing a third class passenger were to ask a third class steward (I mean by that a steward in the third class) to show him the way to the boat deck, would the steward do it?

*Captain Bartlett:* The steward would do it after consulting the purser; he would take it to the head of the department.

(*The Commissioner.*) There is only one purser, I suppose? *Captain Bartlett:* No, we had four on board the "Titanic."

(*The Commissioner.*) Have you a purser for the third class?

*Captain Bartlett:* No, my Lord, not specially appointed for the third class; there is one to the first and one to the second, and there is an assistant to each. Those pursers attend to the whole of the passenger department of the ship.

(*The Commissioner.*) Supposing a third class passenger applied to one of those stewards and said, "I want to see how I can get up from my quarters to the boat deck," what would that steward do?

*Captain Bartlett:* He would report it to the chief third class steward, and he would take it to the purser.

(*The Commissioner.*) Then would the purser, as a matter of course, provide for showing the man how to get to the boat deck?

*Captain Bartlett:* Most certainly, my Lord. They would be taken round especially in a case like this. It has never been asked, to my knowledge.

(*The Commissioner.*) I know; people never ask these things, but I want to know if they do happen to ask, whether there is any information supplied?

*Captain Bartlett:* Most certainly there is.

(*Mr. Harbinson - To the Witness.*) If I may suggest to your Lordship, the point I am at with Sir Walter is, what precautions are taken in the course of a voyage to see that the Regulations of the Board of Trade as regards sanitation and matters of that sort are in force. Are there any travelling inspectors or people who visit ships from time to time to see that those Regulations are in force? - On shore?

Or between ports? - Not between ports, not a travelling inspector.

Take a British ship as an illustration that was going, for instance, to South America, and then from South America to some other port before returning to Great Britain. Would there be any inspector or officer of the Board of Trade whose duty it would be to see that on those boats between different ports the regulations are in force? - No.

When the Merchant Shipping Act of 1906 was being discussed was not this question of boat accommodation prominently brought before the Committee? - The Parliamentary Committee?

Yes, and pressed on the then President of the Board of Trade. Do you know? - I do not remember. I should be sorry to say yes or no. There were so many subjects.

22772. (*The Commissioner.*) Who was President of the Board of Trade at that time? - Mr. Lloyd George.

22773. (*Mr. Harbinson.*) Since then has this question of boat accommodation been prominently brought to the notice of the President of the Board of Trade. I mean prior to the date of the "Titanic" accident. Take the year 1910. Was it not pressed upon his attention in 1910? - I only remember it being done by the Advisory Committee. 22774. Do you remember whether or not, while the "Titanic" and the "Olympic" were on the stocks in Belfast, the question of the boat accommodation that would be provided for them was then pressed on the attention of the President of the Board of Trade? - I do not recollect that it was. It would certainly form a subject of Enquiry by the local Surveyor. If a question in Parliament were brought before the attention of the President of the Board of Trade, it would be the duty of your department to give the answer? - To give the President particulars upon which he would base his answer.

Do you know if the reply given at the time with reference to the "Olympic" was that the vessel had not only the statutory accommodation,

but even more. Do you know if that was the reply given by the Board of Trade at the time? - Yes, I think I may say yes.

So that the question of boating accommodation on the "Titanic" and the "Olympic" before they were launched, was brought to the notice of the President of the Board of Trade? - Undoubtedly. Will you allow me to add, it had been frequently discussed in the Department before that.

With reference to those ships? - Yes, and about other vessels.

And yet they were allowed to go to sea with the number of boats that the White Star Line installed, in excess, as we know, of the number required by the Board of Trade?

- Yes.

*The Commissioner:* I do not see how they could have prevented it.

*Mr. Harbinson:* My suggestion is that the Board of Trade act slowly in the matter, but there was time to have the new regulations prescribed and enforced. Your department does not act in a hurry.

*(The Commissioner.)* I hope not.

*The Witness:* I think if it is necessary it does.

If it takes 12 days to write a letter, how long would it take to frame Regulations for Merchant Shipping? - I think it depends upon the amount of consideration necessary. 22782. I notice in these Instructions - I may be wrong - you have framed no regulations as yet with reference to wireless telegraphy, have you? - No, they are under discussion now by the Committee.

22783. Wireless telegraphy has proved a most vital means of communication? - Yes.

*The Commissioner:* We are a long way from the point.

*Mr. Harbinson:* The suggestion I make is that wireless telegraphy was one of the points that was considered with reference to the regulation of the number of boats. The three points were, watertight bulkheads, the new tracks, and wireless telegraphy. That was stated as one of the reasons why the Board of Trade did not consider that it was necessary to provide such a large number of boats. You did not make any effort to put wireless telegraphy under proper control?

*The Commissioner:* What do you mean by that?

*Mr. Harbinson:* For instance, my Lord, framing regulations that would prevent an operator from selling his account of a disaster to the highest bidder. That is the point.

*The Commissioner:* I have nothing to do with that, you know. These men are not particularly well paid.

*(Mr. Harbinson.)* With regard to fire, I think the Attorney-General mentioned the question in the course of his very exhaustive examination: I suggest to you (of course, it will be for my Lord) that this question of fire, especially since the electric light has become the method of illuminating ships, is a matter which ought to be very carefully considered - the possibility of fire at sea through the fusing of wires. Have you framed any regulations regarding the installation of electricity and electric wires on ships? - I do not think so, but that will be for the professional officers to tell you.

In the event of a fire on one of these leviathan steamers, would it not be, as a matter of fact, necessary to have boats to transfer all the passengers and crew to some place of safety, if that were convenient? - I think so, certainly.

I suggest to you that is another consideration that would weigh in the scale in the case I am pressing upon my Lord and the Court, that is, having boat accommodation for all? - I have no doubt that has been considered.

**Examined by Mr. HOLMES.**

Carrying on that point about fire, is there any requirement in the Rules for supplying lifesaving appliances, for having extinguishers, or other appliances with regard to fire? - I do not remember that there are any.

Is the only statutory provision on the point Section 432 of the Merchant Shipping Act, which requires that every British sea-going steamship shall be provided with a hose capable of being connected with the engines of the ship, and adapted for extinguishing fire in any part of the ship. That is the only requirement? - That is the only one I can recollect.

Is there any provision for periodical survey of the appliances which may be voluntarily provided on board a ship by the owners? - I think it was one of the points that would receive the attention of the Emigration Officer before he cleared.

Can you point out anything in the report by the Emigration Officer which deals with the fire appliances on the ship? - I have not a copy of the declaration before me.

Beyond the words "the other equipment"? - He is required to satisfy himself with regard to everything on board the ship, that she is seaworthy and fit to proceed.

That is only in the case of an emigrant ship? - Yes.

In the case of an ordinary passenger ship there would be no examination whatever? - We have one regulation I should like to read with regard to passenger steamers. It is paragraph 78 of the Regulations: "Passenger steamers going to sea should be provided with a hose adapted for the purposes of extinguishing fire in every part of the ship, and capable of being connected with the engines of the ship, or with the donkey engine, if it can be worked from the main boiler. The Surveyor must take care that it answers the required purpose. The fire hose should be connected and stretched to judge of its length, and thoroughly examined at every survey, and at least once a year (and at any other time that the Surveyor thinks it necessary) tested with the conductor in its place by pumping water through it by the main or donkey engines at full speed. A proper conductor and metal bend or goose neck form part of its equipment, and should be provided."

That simply deals with the statutory hose that is required? - Yes.

22794a. Is there any provision made for a fire drill on board ship? - This is the only supplementary regulation to that. This refers to emigrant ships: "Means for extinguishing fire."

The importance of the point appears to me to be this, that unless provision is to be made for the sufficient boatage on ships to carry all passengers, the most stringent Rules should be applied for putting out fire on board a ship, which appears to be one of

the points which will not be assisted very much by the increased watertight bulkheads? - May I finish my reply? The next is paragraph 20: "Means for extinguishing fire. The Emigration Officer should be satisfied that the means for extinguishing fire are adequate and in good working order. Approved chemical extinguishers should be provided for use in the steerage compartments."

That is, again, on emigrant ships only? - That is on emigrant ships only, yes; and I wish to add to that a provision in the Merchant Shipping Act, 1894, Section 290, Sub-section (1): "Every emigrant ship shall, in addition to any other requirement under this Act, be provided with the following articles" - they are then detailed; and it says in sub-section "(d) with a fire-engine in proper working order and of such description and power, and either with or without such other apparatus for extinguishing fire as the Emigration Officer may approve." I think that exhausts the list.

On an ordinary passenger steamer which does not carry emigrants, or an ordinary cargo steamer, there is no requirement but the one about hose? - That is so. 22798. Is there anywhere any requirement for fire drill on board any ship? - I think not.

## Page 626

Are you personally the officer who appoints these Surveyors under the Merchant Shipping Act? - They are appointed with the approval of the President.

Do they have a form of written appointment? - Yes.

And that is signed by you? - That is usually signed by me.

I think you said to Mr. Scanlan that in making that appointment, you rely upon the fact that he has passed the Chief Ships' Surveyor? - On that particular subject, yes. 22803. It then becomes the duty of the Surveyors to sign these declarations for passenger certificates? - Yes, if they have passed all the examinations required of them. 22804. And do you, as a matter of course, issue a passenger certificate on receiving a declaration made by one of these Surveyors? - One or more, yes.

I am not going into details with it, because you have referred us to the Chief Ship Surveyor for that purpose. Do I rightly understand you to say that in the case of a passenger steamer it has to be surveyed once a year at least? - At least.

If she is also an emigrant ship she has to be cleared every voyage? - Quite so. 22807. In the case of a ship which is neither a passenger steamer nor an emigrant ship, is there any systematic survey of any kind whatever? - It depends on the meaning of the word "systematic."

I will leave out the word "systematic." Is there any survey provided? - Yes, if we have reason to believe or have received a complaint that anything is wrong, we can at once order a survey, and, if necessary, a detention.

But unless you receive some communication from somebody or have a sort of instinct that something is wrong, there is no regular system of survey? - No.

Do you not think that system of survey ought to be extended to all ships? - I am not prepared to express an opinion without very full consideration.

Is not it just as desirable that the boats on a cargo steamer should be in good order as on a passenger steamer? - Oh, they are carefully surveyed every time the vessel is surveyed. You have told us there is no special provision for a survey? - But every time she has her certificate extended, every time when she gets her certificate, she is surveyed. What certificate are you talking of now? - The passenger certificate. 22814. (*The Commissioner.*) Can you tell me whether any cargo boat that leaves Hamburg is surveyed? - No.

*Mr. Holmes:* I was going to ask him about the German regulations. I believe they are very much more stringent.

*The Commissioner:* Can you give me any information? Take Hamburg. Is every cargo ship surveyed before she leaves the port?

*Mr. Holmes:* Not every time she leaves the port, my Lord.

*The Commissioner:* She may never come back again, and she may never have been there before, for aught I know. Can you give me any idea of what the German requirements are as to surveying cargo boats?

*Mr. Holmes:* No, my Lord, I cannot, but I am sure your Lordship would not suggest that because they do not do the right thing in Germany it ought not to be done here. *The*

*Commissioner:* Not at all; but I have such faith in the good sense of the Germans that if I found they did not do it, I should think they did not do it because there were good reasons for not doing it.

(*Mr. Holmes - To the Witness.*) Can you help us upon that? Do you know what the German Regulations are? - I am not sure. I do not think they survey every vessel; certainly not. I should think no.

Do they survey every passenger vessel? - I think so.

And do you know how many Surveyors survey each vessel? - No.

*The Commissioner:* Does it not depend upon the size of the vessel?

*Mr. Holmes:* I think not, my Lord. My instructions are there are three separate departments, and each Surveyor of the different parts surveys different parts of the ship. 22818. (*The Commissioner.*) Who is it sees the ship is not overloaded? Anybody? - Yes, our Surveyors exercise a general supervision. There is a loadline disc on the ship. 22819. Who is it sees the vessel is not laden below the line? - Any of our Surveyors is supposed to report that.

Do the Surveyors, in fact, visit each ship in order to see whether she is loaded below the loadline or not? - Oh, my Lord, certainly not; it would require an army of Surveyors.

*The Commissioner:* No, I think we have had Sir Walter Howell nearly long enough, Mr. Holmes.

(*Mr. Holmes.*) Just two more questions. (*To the Witness.*) Can you tell me upon what principle only four boats out of all those supplied on a ship are required to be equipped under these Rules with compass and lamp, and so on? - No, I cannot answer that question. One of the technical officers will answer that.

It is a fact that there are only four? - Speaking from memory, I think that is correct.

In reply to Mr. Scanlan, you agreed that it would be improper to allow a ship of the size of the "Titanic" to go to sea with only two certificated officers in addition to the Captain? - Of course, I should say so, decidedly.

That is the extreme limit which can be required by the Merchant Shipping Act?

- By statute, yes.

Then do you not agree that the Merchant Shipping Act, on that point, is out of date, and requires amendment? - I think that requires very careful consideration. There are many considerations to be taken into account, and I should hesitate to say that it was wise to legislate on the subject, having regard to our present practice in our Mercantile Marine.

You do not suggest we should rely upon our present practice for all the requirements of ships? - No; but I think directly a Government Department lays down a minimum there is a very strong tendency to make that the maximum.

*Mr. Holmes:* At present the minimum is two.

*(The Commissioner.)* I have had something to do with the new Wages Bill, and I found just the reverse. I found the tendency was to make the maximum the minimum? - I think, for instance, that it was the habit of some steamship companies to carry seven certificated officers, and soon after that the Board of Trade laid down a Regulation requiring five. I think it would be a strong temptation to that firm to consider whether they would not reduce their practice.

*(Mr. Holmes.)* I am not suggesting that anything of that kind should be done. What I suggest is that there ought to be a graduated scale in the same way as there is for boat accommodation? - I will repeat what I said, that I think it is a matter deserving very attentive consideration.

*Mr. Pringle:* May I ask one or two questions, my Lord?

*The Commissioner:* Yes.

### **Examined by Mr. PRINGLE.**

There is a Naval Architect to the Board of Trade? - Yes.

Who is he? - Mr. Archer; he is called the Chief Ship Surveyor.

Has he any experience as a Naval Architect? - Yes. He will tell you when you examine him what his experience was.

There is another point. You classified the Surveyors who are in the employment of the Board of Trade. You said that there were 80 Engineer

### **Page 627**

Surveyors and 34 Shipwright Surveyors. I find that is not the classification in the Merchant Shipping Act. They are classified as Engineer Surveyors, Shipwright Surveyors, or both. Now, how many of these would be described as both Engineer and Shipwright Surveyors? - I should have to carefully look through the list, but an amendment was made by the Act of 1906 with regard to the titles of our officers.

You use the old phraseology; does the amendment make any difference, in fact?

Is it not simply a change in the name? - Yes, I think it is.

Could you say whether it is the practice in the various ports to have a ship surveyed by a Shipwright Surveyor as distinct from an Engineer Surveyor? - If any question is

considered necessary to be investigated by a wooden ship Surveyor, he would be called in at once; otherwise it would be passed by the ship and Engineer Surveyor. 22835. Do you still adhere to the idea that there is a distinction between a wooden ship Surveyor and an iron ship Surveyor? - In some cases of old wooden ships; you require very special qualifications to survey an old wooden ship which has nearly passed out of date, but we still have a few officers qualified for that.

22836. I wish to be clear. Do you mean that a Shipwright Surveyor is employed for the purpose of the survey of wooden ships? - Some of them, yes, special officers. 22837. I asked generally, all of them? - No, there is a special class of Shipwright Surveyors so-called, and there is another class of Surveyors called Ship and Engineer Surveyors, but the chief of the staff will be able to give you evidence of that much better than I can. I can only answer generally.

*Mr. Edwards:* May I suggest that your Lordship gets this Witness to clear up a certain point. Your Lordship will remember that in the two certificates that were put in from the report of the survey of an emigrant ship and the declaration survey of a passenger ship, there was a disparity in the certificates as to the accommodation in boats D. In the one certificate it was certified that boats D should hold 80 persons, whereas in the other certificate it was certified that the boats of Section D should hold 64.

*(The Commissioner.)* Will you put it to him yourself.

*The Witness:* It is quite a simple answer.

*(Mr. Edwards.)* Will you tell us? - A slight error was made; it was put 64, and it should have been 80.

*Mr. Edwards:* The certificates are by the same Surveyor, are they?

*(The Commissioner.)* No, I think not. *(To the Witness.)* Are they? - I am not quite sure, but the nautical officer will clear that up.

But have not you the certificates in your hands? - I am not quite sure they are the right ones.

*Mr. Edwards:* I want to see if there is a common standard of arithmetic at least among the Surveyors.

*The Commissioner:* I thought you had a contempt for arithmetic.

*(Mr. Edwards.)* That is only on ethical grounds, my Lord.

*The Witness:* I think I must still tell you the Surveyor must give you the information you need.

*Mr. Laing:* I have no questions, my Lord.

*The Commissioner:* That is the best examination I have heard. Now, Mr. Attorney, do you want to ask anything? *The Attorney-General:* No.

***(The Witness withdrew.)***

*The Attorney-General:* Your Lordship will remember that yesterday we had a discussion about the requirements of the German law for a vessel the size of the "Titanic." We have agreed upon the result of applying the German scale to a vessel of the size of the "Titanic," and upon the assumption that she had applied and received the exemption on the ground of efficient bulkheads, because there is the same Rule in Germany.

*The Commissioner:* There is.

*The Attorney-General:* Yes, just the same as ours. Half of what they call a supplementary accommodation is excused if the compartments are certified or passed as efficient.

Therefore, it is exactly on the same footing as ours. The result of it will be this, that the cubic capacity of the boat accommodation to be provided would be 31,992 cubic feet. That is made up of the 21,328 which would have to be boating accommodation proper - that is to say, lifeboats and boats within the regulations, and the supplementary, which would be one-half which would be 10,664, which may consist of collapsibles, rafts and boats of other description, making altogether 31,992. The 21,328 cubic capacity would require 34 boats, that is to say, there would have to be 34 boats carried in davits - I think, in davits, according to their Rules. And there would be, besides that, an accommodation which it is not easy to put into figures, because it depends upon the particular kind of craft which is permissible for the supplementary accommodation; you may have collapsibles or rafts, and so forth. The effect of that is - I think I was right in what I told your Lordship yesterday - that it is clear that their demand is very much greater than the demands which we make, because the effect would be that you would have an accommodation altogether for 3,198 people.

*The Commissioner:* And the boat is calculated to carry how many?

*The Attorney-General:* Your Lordship means the 34 boats?

*The Commissioner:* No, I mean how many is the ship supposed to carry, or is capable of carrying, crew and passengers?

*The Attorney-General:* I do not think I have that. Of course, I have it for the "Titanic."

*The Commissioner:* Oh, yes.

*The Attorney-General:* I cannot answer the question.

*The Commissioner:* I will hand you down this.

*The Attorney-General:* I think I know what your Lordship is referring to.

*The Commissioner:* It was sent to me this morning. (*Handing a paper to the Attorney-General.*)

*The Attorney-General:* Yes, and it was sent to me. It is rather difficult to tell. You cannot tell by this. The question is answered to some extent by this, that the German requirements take no note of the number of passengers. Your Lordship had that in evidence yesterday.

*The Commissioner:* Do you mean to say that if there were a cargo boat of the size of one of these boats, it would require the same number?

*The Attorney-General:* No, that was not the point at all. We are dealing with passenger steamers and emigrant steamers. The point I am making is with reference to the evidence we had yesterday, that their standard is tonnage and not number of persons carried. That is the point I am on.

*The Commissioner:* But so ours is.

*The Attorney-General:* I agree. That is the point we are making upon it.

*The Commissioner:* The basis is tonnage in both cases.

*The Attorney-General:* They have the same Rule as we have. That reference to cargo boats would introduce another Rule which the Germans have.

*The Commissioner:* The observation was only made because I did not understand. *The Attorney-General:* She need never carry more boats than are necessary to carry all the persons on board. As your Lordship heard, in certain cases we have enough to carry all persons on board on each side. But, dealing with this particular question, as applied to steamers of what I may call the first class, requiring the most extensive and careful survey, passenger and emigrant

## **Page 628**

ships, the result is that the boating accommodation required by the German law would be 34 lifeboats, and also a number of boats of the capacity of this 10,000 odd which would carry 3,198 people. So far as I can tell from the Note I have of the German requirements, I do not know that any difference would be made, except, of course, this, that according to the German law and German requirements a vessel need never carry more boats than are required for all the passengers. Supposing she had more passengers and crew than 3,198, she still would only be required to carry the boat accommodation with a cubic capacity which I have described.

*The Commissioner:* The figures in that newspaper that I handed to you seem to have been carefully collected. I do not know whether they are accurate, but if they are accurate the German boats do not carry sufficient lifeboat accommodation to provide for all the lives in the boats.

*The Attorney-General:* They do not.

*The Commissioner:* But they provide considerably more than we do.

*The Attorney-General:* That is right; I think it comes approximately to this. I am only giving now a rough average from looking at it. It would work out at 25 percent unprovided for, according to these figures we have before us, in the German boats, and according to the requirements of a vessel like the "Titanic," with the number of passengers carried, it would be 66 percent unprovided for.

*The Commissioner:* The "Titanic" carried 2,208 souls, passengers and crew.

*The Attorney-General:* Yes.

*The Commissioner:* Have you made any calculation to see what the German law would require in the case of a ship of that size, carrying that number of people.

*The Attorney-General:* No, but we can. It is quite simple.

*The Commissioner:* Because it is suggested to me - I do not know whether it is right - that if you make that calculation you will find that the "Titanic" was carrying as much in the way of lifeboats as the German law would require.

*The Attorney-General:* That I am sure was not so. That is quite simple.

*The Commissioner:* I am wrong, Mr. Attorney.

*The Attorney-General:* There is a point in it, because in estimating with regard to the "Titanic," at any rate for the purpose of this voyage, it not being necessary, according to German law, to carry more boats than would be required to carry all on board, what you have to consider is not the full complement on the "Titanic," but what she actually did carry in passengers and crew. So that, whatever the tonnage is, she would never, according to German law, be required to carry boats to accommodate more than 2,208

persons. It might be that she might carry a good many more, but she was not carrying them, and one has to consider that in making the comparison in the case of the "Titanic" as she sailed.

*The Commissioner:* What was suggested to me and what I ought to have put to you, was that if this boat with only 2,200 people on board had been provided with lifeboats in accordance with German requirements, there would have been sufficient lifeboat accommodation on the "Titanic" to carry everybody on board.

*The Attorney-General:* Yes, assuming of course that she was provided with boats sufficient to carry the full complement of passengers and crew that she could carry.

*The Commissioner:* That is it.

*The Attorney-General:* According to German law.

*The Commissioner:* I think I put it accurately: If she had had lifeboats in accordance with the German requirements it would have so happened that she would have had sufficient lifeboats on board to accommodate all the people on board, and a good many more. But still it does not do away with the point that even, according to German requirements, the German steamers do not carry sufficient lifeboats to accommodate all that may be carried on the steamer.

*The Attorney-General:* Not only not sufficient lifeboats but not necessarily sufficient boat accommodation.

*The Commissioner:* When I say "lifeboats" I mean collapsibles and rafts as well. *The Attorney-General:* Yes.

*The Commissioner:* And that newspaper which I handed down to you shows that, and oddly enough - I do not know why it should be - a shortage of accommodation in different boats. I think it is the Norddeutscher Lloyd or the Hamburg Amerika - I do not know which. The percentage of the shortage of boats varies in different boats.

*The Attorney-General:* It would depend on the tonnage, would it not?

*The Commissioner:* Yes. In one boat there is a short accommodation to the extent of, I think, 709; in another boat the shortage accommodation is much less.

*Mr. Maurice Hill:* Is your Lordship talking of the "President" boats? *The Attorney-General:* No.

*The Commissioner:* I am not sure that it is not the "President" boats.

*The Attorney-General:* I do not think so. Neither of the "President" boats is in this. *The Commissioner:* I thought it was.

*The Attorney-General:* No, they are quite different.

*The Commissioner:* I am not sure that it is not sufficient for me to be able to note the fact that if the "Titanic" had been sailing under German law she would have carried much more boat accommodation than, in fact, she did.

*The Attorney-General:* Yes.

*The Commissioner:* That is what I wanted, because there was a suggestion that it would be inconvenient to put additional boats upon the boat deck, and there was a suggestion, too, that it might tend to make the ship tender.

*The Attorney-General:* Your Lordship will note - it is not necessary to discuss it; I think I understand how the misapprehension arose - the calculations of percentages which, I was questioning yesterday with regard to the two "President" boats as compared with the

“Titanic” must be wrong. It is based upon some misapprehension. It seems to me they lead to quite different conclusions.

*The Commissioner:* That is a matter of argument. There seems to be no dispute between you that if this boat had been sailing under the German flag she would have carried a great deal more boat accommodation than she did.

*The Attorney-General:* The figures I have given, your Lordship, are agreed figures. They are based upon Mr. Wilding’s calculations.

*Mr. Maurice Hill:* That is right, my Lord. If you take a ship of the size of the “Titanic,” according to the German law, it will work out in the figures which the Attorney-General has given. I cannot tell your Lordship what the percentage of boat accommodation to people who could be carried on board would be in such a case without knowing how many people under the German law could be carried on board a ship of that size. Therefore, I cannot give you that percentage. The figures which I gave you of percentages were based upon the figures on page 538 of the Note of the two “President” boats, the two Hamburg Amerika boats, and those percentages are accurate. And according to Mr. Wilding’s evidence they are based upon figures which are according to German law, and according to German law the “President Lincoln” was entitled to carry 4,108 persons and complied with the law in giving boating accommodation for 1,465 persons; that is, for 35.5 percent of the number which she was entitled to carry. The “President Grant” in the same way was entitled to carry 3,991 persons, and gave boating accommodation, complying with the law, for 1,516 persons. That is for 37.9 percent. The tonnage of these two ships was a little over 18,000 tons. Your Lordship will notice that in each case the ship was entitled to carry a larger number of persons than the “Titanic” by English

## **Page 629**

law was entitled to carry. How many persons the “Titanic” by German law would have been entitled to carry I cannot say.

*The Commissioner:* I remember we had that evidence. That must mean that the passengers in some way or another are packed close together.

*Mr. Maurice Hill:* I am told that if the “Titanic” had been fitted up entirely for third class she might have carried 10,000 or 12,000; she had room for them.

*The Commissioner:* She had cubic space for them?

*Mr. Maurice Hill:* Yes.

*The Attorney-General:* I agree with what my friend has said with regard to the “President Lincoln” and the “President Grant.” That is not the point on which I was dissenting from the calculation. I agree those were substantially accurate. The slight variation is not worth mentioning. One has to bear in mind always, and it is brought out by reference to the “President Lincoln” and the “President Grant,” that the German law equally does what we have done - that is, base its demands for boats upon tonnage, and not upon the number of souls carried, and in those cases it pans out rather differently. They carried a very large number of passengers, much more than the “Titanic” would carry, and yet, nevertheless,

would have had to find many less boats than the "Titanic" according to the German law. That is the point of it.

*The Commissioner:* Yes, that is the point, and it is an important point. *The Attorney-General:* Undoubtedly.

*The Commissioner:* It was stated of the "Titanic" that it provided large spaces for what has been called luxury, adding of course to the tonnage of the vessel. If the lifeboat accommodation were calculated with reference to that tonnage which is not occupied by passengers in the sense of carrying passengers, why of course it makes the provision of boats very much larger than it would otherwise be.

*The Attorney-General:* Certainly.

*The Commissioner:* So that in that sense the provision of these large spaces for what are called luxury - racquet courts and swimming baths and suchlike things - would tend to increase the lifeboat accommodation, although they tend to decrease the number of persons carried.

*The Attorney-General:* That is so.

**Sir ALFRED CHALMERS, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

I believe you hold a Master's certificate? - Yes, I do.

I believe you served at sea for some 17 or 18 years in the Mercantile Marine and in various classes of vessels? - I did.

And in the year 1877 you joined the Board of Trade, did you not? - I did. 22846. I think you joined the Survey Department, and in 1896 you were appointed Professional Member of the Marine Department? - That is so.

In that year you became the Nautical Adviser. That is what it really comes to, does it not? - To the Marine Department, yes.

And you served in that capacity with the Board of Trade until August, 1911? - Until August, 1911, that is right.

I think you were due to retire in 1910, but in order to complete certain negotiations with foreign countries you stayed on? - I did.

I want to avoid as far as I can travelling over the ground that was travelled over by Sir Walter Howell yesterday, but you have your office in London, I believe? - Yes, Whitehall Gardens.

Certain questions have been asked, and perhaps it is well the matter should be dealt with:

You have immediately under you two other gentlemen, one Mr. Boyle? - Yes.

He is the Engineer Surveyor? - Yes, Engineer Surveyor-in-chief.

And the other is Mr. Archer? - Yes.

And he deals with the hull and matters of that sort? - Yes.

Now, just in order to see what happened in the case of the "Titanic" and that class of ship, the "Titanic" as we know, was built at Belfast, and in order to comply with the law relating to passenger ships, she had to obtain a Board of Trade passenger certificate? - That is so.

And the officer who was surveying the ship at Belfast was a Mr. Carruthers? - For the "Titanic" I do not know; I left the Board before the "Titanic" was finished. 22857. At any rate, we know he was, and what would happen would be this, that as the ship was being built he would send over the plans to these two gentlemen we have mentioned, Mr. Archer and Mr. Boyle? - That is so.

And if, while the ship was being built, there was no difference of opinion between him and the builders as to whether the Board of Trade Regulations were being complied with he again would seek the advice of the head office? - Of course, that is the case.

And then what eventually would happen would be that that gentleman on the spot, whom we know to be Mr. Carruthers, would make a declaration that the Board of Trade requirements had been complied with, he would give that to the owners, the owners would send it on then to the headquarters in London? - That is the procedure.

And then Sir Walter Howell would issue the passenger certificate? - Yes. 22861. And then the next step the Board of Trade would take would be this: the ship having been built, having got her passenger certificate, then goes to Southampton, and then the Emigration Officer comes on to the scene? - That is so.

22862. We know his name was Captain Clarke - perhaps you do not; and then he has to comply with the law relating to the clearance of an emigrant ship? - Yes. 22863. That is the procedure? - That is the procedure.

I believe, so far as the "Titanic" is concerned you yourself had nothing to do with the supervising; you took no part in the supervision of her building? - No.

Of that you know nothing? - No.

You left your office, as you told us, in 1911, and you were succeeded by Captain Young? - That is the case.

Who at the present time holds that office? - Yes.

During your term of office did you sit on various Committees which were considering the question of the safety of ships? - Yes.

I do not want to know the names of any of them, but you did sit on those Committees? - Yes, I did, on many Committees.

You have told us that you became a professional member in 1896, and we know that in 1894 the Rules which have been referred to were enacted? - The 1894 Rules were in force.

They were in force when you came into office? - That is the case.

But I believe they have been the subject matter of your consideration from time to time? - Yes.

We were told by Sir Walter Howell that it was in 1904 that he specially consulted you with regard to that matter? - Yes, that is the case.

Now I just want to refer your attention to this. Lord Mersey yesterday asked Sir Walter Howell this question. He was pointing out to the Witness that the Rules came into force in 1894, and that we are now in 1912, that is a difference of 18 years, and that there had been no alteration in the scale. The question that Lord Mersey put to the Witness, having pointed those facts out to him, was "Why has it never been altered?" and Sir Walter Howell answered thus, "I can only

just indicate to your Lordship. That will be explained by the professional officers." You are the gentleman I think he had in his mind. Can you give my Lord the reason why it was that no alteration was made in the Table? - Yes, I can.

Will you give it, please? - I considered the matter very closely from time to time. I first of all considered the record of the trade - that is to say, the record of the casualties - and to see what immunity from loss there was. I found it was the safest mode of travel in the world, and I thought it was neither right nor the duty of a State Department to impose regulations upon that mode of travel as long as the record was a clean one. Secondly, I found that, as ships grew bigger, there were such improvements made in their construction that they were stronger and better ships, both from the point of view of watertight compartments and also absolute strength, and I considered that that was the road along which the shipowners were going to travel, and that they should not be interfered with. I then went to the maximum that is down in the Table - 16 boats and upwards, together with the supplementary boats, and I considered from my experience that that was the maximum number that could be rapidly dealt with at sea and that could be safely housed without encumbering the vessel's decks unduly. In the next place, I considered that the traffic was very safe on account of the routes - the definite routes being agreed upon by the different companies, which tended to lessen the risk of collision, and to avoid ice and fog. Then, again, there was the question of wireless telegraphy which had already come into force on board of these passenger ships. I was seized of the fact that in July, 1901, the "Lucania" had been fitted with wireless telegraphy, and the Cunard Line, generally, fitted it during that year to all their ships. The

Allan Line fitted it in 1902, and I am not sure that in 1904 it had not become quite general on the trans-Atlantic ships. That, of course, entered into my consideration as well. Then another point was the manning. It was quite evident to me that if you went on crowding the ship with boats you would require a crew which were not required otherwise for the safe navigation of the ship, or for the proper upkeep of the ship, but you are providing a crew which would be carried uselessly across the ocean, that never would be required to man the boats. Then the last point, and not the least, was this, that the voluntary action of the owners was carrying them beyond the requirements of our scale, and when voluntary action on the part of shipowners is doing that, I think that any State Department should hold its hand before it steps in to make a hard-and-fast scale for that particular type of shipping. I considered that that scale fitted all sizes of ships that were then afloat, and I did not consider it necessary to increase it, and that was my advice to Sir Walter Howell.

You have now left the Department, but in view of the disaster that happened to the "Titanic," could you give us the benefit of any opinion you may have as to whether it would not be reasonably practicable to at any rate extend the scale? - No, I would not extend it.

You would not? - No. I would not personally. I consider you would be putting an undue strain upon the Masters and Officers - that they could never possibly get people into the boats in case of a disaster.

*The Commissioner:* I do not understand that answer.

*(Mr. Aspinall.)* First of all I gather, in view of what you have been saying, that you wish to convey the opinion that you do not think it would be practicable to have boats for all on these large steamers? - Certainly not.

But you do not even go as far as this - you do not think that it would be expedient to extend the scale in existence at the present moment? - I do not. *Mr. Aspinall:* Why would not it be practicable to have more boats than are required under the existing Rules?

*The Commissioner:* If you will allow me to say so, that is not the question to put. The question, I think, is: Why is it not expedient?

*Mr. Aspinall:* Why is it not expedient to have more boats?

*(The Commissioner.)* No, to extend the scale? - Because if you extend the scale, if the Board of Trade by their one man power, as is suggested, that is to say, the professional officer alone completes the scale without referring it to an Advisory Committee, it could be fallen foul of. If you refer it to an Advisory Committee I hold that you will get a smaller quantity than you will by the voluntary action of the shipowner, and that scale proves it.

Let me see that I understand what you mean. Do you mean that in your view it is better to leave it to the discretion of the shipowners than to lay down by a scale a hardand-fast Rule? - I do.

Is that what you mean? - That is what I mean.

Is that why you say you do not think it is expedient to extend that scale? - That is the case.

If that is so, why have a scale at all - any scale? - The reason of this scale, my Lord, was that up to 1890, when these life-saving appliances came into force, the scale was a very antiquated one, and no matter what ship was built the highest tonnage was 1,500 tons and upwards, and if you sent an 8,000 ton ship to sea in those days she only had boats equal to 216 people.

That is not an answer that appears to me to be satisfactory. - What I mean to say is there was a necessity for this scale then, but there is no necessity, in my opinion, to extend it now.

Then does your evidence lead up to this, that there is no occasion now to have a scale at all? - No. I admit that this scale is good, as far as it goes, and it goes as far as I want it to go, because I say that when you have provided for 10,000 ton ships that boat capacity is sufficient for a 50,000 ton ship for all practical purposes, and I quote the record of the trade, which proves that it is sufficient.

The shipowners do not seem to think so? - The shipowner, or that class of shipowner, at any rate, the passenger shipowner, is always exceeding the Board of Trade in lifeboats and in everything - in every single iota.

Why? - For the simple reason that they want their ships to be as commercially valuable as possible. They want the passengers to go by them, and therefore they put facilities on board.

Do you mean to say, then, that the shipowners provide unnecessary things in order to induce the public to travel in their boats? - Unnecessary to safety.

You mean that? - Yes, I do.

You think that it is not desirable to encumber the decks of a ship with unnecessary things? - Quite so.

Then you think that the "Titanic" would have been a better sea-going ship if she had gone away with a smaller number of boats than the existing scale requires? - It would have been just as good.

Better? - No, I do not say it would have been better.

I thought you said it was, because I thought you said that it was not desirable to encumber a ship's deck with unnecessary articles? - That is a matter of degree, but the degree of the excess with which the White Star fitted the "Titanic" was not of such a degree as would encumber it beyond the scale requirements.

22894a. (*Mr. Aspinall.*) At any rate, that is your opinion? - That is my opinion. 22895. I suppose there would be no practical difficulty in fitting the "Titanic" with more boats, and yet not really encumbering the decks? - No, I do not suppose there would be. I have never been on board of her, and could not tell.

## Page 631

(*The Commissioner.*) I am afraid - I do not want to criticise you adversely, I am sure - that your opinion flies in the face of the conduct of British shipowners - I mean shipowners sailing boats of this kind, and flies in the face of the practice on German boats of a similar kind? - As far as the German boats are concerned, I do consider that they are encumbering their decks unduly, and in case of a disaster I am afraid the consequences would be very bad. I say that advisedly.

There may be something in what you say. We know that the boats on the "Titanic" did not carry away anything like the number that they were calculated to carry. Do you think that if there had been a smaller number of boats on the deck it would have been an easier thing to have filled them, and that possibly more lives would have been saved? - Not knowing the circumstances of the loss, I cannot put myself in that position. 22898. Did you understand the question? - I quite understood it. I should say that there would have been a probability of just as many being saved.

With the smaller number of boats? - With the smaller number of boats - possibly more, because there would have been more spare room.

Of course, I can imagine the boat deck being so congested with boats that the working of them would be extremely difficult? - Very difficult indeed, because all the boats that are not under davits would have to be man-handled.

(*Mr. Butler Aspinall.*) Is this a matter that you had to consider a great deal during your term of office - the question of boats? - Yes, a very great deal.

And you have given it a great deal of serious consideration? - All the life-saving appliances we gave consideration to.

And since this disaster happened, and you knew you were going to be called here, did you apply your mind to the experience which was to be derived from the "Titanic" disaster? - Yes, I did.

And you are still of the same opinion? - I am still of the same opinion. 22905. So far for the boats. Now I want to ask you some questions with regard to another matter on which

certain questions were asked Sir Walter Howell. There is provision made in the Merchant Shipping Act that the Emigration Officer before he grants his clearance shall see that there is an efficient crew on board the ship? - That is the fact.

And for the guidance of the officer it has been pointed out that there is a Table provided? - That is the case.

In some cases it does not seem to meet the requirements of the present day, but in practice did you find during your term of office that the statutory requirement, namely, that the officer should exercise his own discretion as to the efficiency of the crew, met the requirements of the case? - Decidedly, in all cases.

I suppose you managed your business to see that these Emigration Officers were competent people and men of experience? - I visited the out ports once, and sometimes twice, a year. I saw them all myself and gave them instructions, and saw that they were up to their duties.

22909-10. Did you find in practice that the system has worked well? - The system has worked admirably.

### **Examined by Mr. SCANLAN.**

Your experience before going to the Board of Trade was entirely experience as a seaman? - Entirely.

In seamanship? - Yes.

And your highest certificate is that of Master? - Yes.

Your total experience on the sea was 16 years? - Between 16 and 17 years. 22915. You were five years an Apprentice, I think you were four years a Second Mate, three years a First Mate, and four years a Master? - I am not sure, I cannot remember the dates.

You had no experience of ship's construction, you were never employed in a shipyard? - I was never employed in a shipyard.

And I suppose until you got the situation in the Board of Trade you had very little occasion to go into shipyards? - Oh, yes, I had. I was appointed to two new ships, where I had to inspect their construction.

But you had no occasion specially beyond the interest which a seaman has in the construction of ships, to take any part in the designing of ships? - No, but the interest a seaman takes is a very great one.

I admit that some seamen take a very great interest in it. You have retired now from the Board of Trade? - I have.

On pension? - On pension, under the age limit.

A year ago? - Yes.

Therefore, I suppose when you give your opinion that the scale of lifeboat accommodation should not be increased, you do not presume to express to my Lord the present opinion of the Board of Trade? - Not at all.

This is the opinion that the Board of Trade formerly entertained? - It is the opinion I formerly entertained.

I think you still entertain it - do I understand aright? - I shall entertain it. 22925. And I think until last year you represented the highest opinion of the Board of Trade? - Of the Marine Department.

Of the Marine Department of the Board of Trade? - Yes.

You were the right arm on which the last Witness relied? - I cannot say that - except in nautical matters.

You were the professional man who would be responsible for advising the Board of Trade? - That is the case.

Had the question of providing lifeboat accommodation in proportion to the number of passengers carried been brought under the notice of your Department in recent years before you left the Board of Trade? - Never.

Had the question of providing additional lifeboat accommodation, even if not on the scale to accommodate all on board, been considered by the Board of Trade and brought under your notice? - It had been considered by us when the "Olympic" was projected; not till the "Olympic" was projected.

In what form was the matter presented to you when the "Olympic" was projected? Was it in the form of a question as to whether the construction of such a large ship demanded an extension of your scale? - No.

Tell me in what form it was presented? - In my own mind. I evolved it in my own mind.

In what shape did this question present itself to you; what was the occasion of considering it? - The occasion was that the largest ships before that were about 31,000 tons, the "Lusitania" and the "Mauretania," and the 45,000 odd tons that was represented by the "Olympic" was rather a jump, and I thought it might be prudent to advise the Department to refer the matter to the Advisory Committee, because, although we had power to vary the Rules ourselves, it has always been the practice of the Board, as a Statutory Committee was appointed, to deal with lifesaving appliances, to refer the matter to the Advisory Committee.

Did you refer it to the Advisory Committee? - The Marine Department referred it to the Advisory Committee.

Did you make yourself acquainted with the Terms of Reference to the Advisory Committee? - Yes, I did.

In the Terms of Reference I think you state that consideration should be given to the

## **Page 632**

provision of bulkheads and other things? That was stated? - Yes.

Did you express as the view of the Board of Trade, the considered opinion of yourself and others that the provision of additional lifeboats was not so necessary in the case of ships which were divided into watertight compartments? - That is the case.

So that it would be scarcely fair to say that the action of the Advisory Committee was left free from restrictions by the Board of Trade? - That I cannot say. The Advisory Committee had a very free hand and exercised it.

Were you present at any of the meetings of the Advisory Committee? - None at all.

Do you know if the minutes of the meetings of the Advisory Committee have been kept?  
- I do not know. The clerical officers would know that.

Do you know whether the clerical officer is coming here who kept the minutes of the Advisory Committee? - I do not. Not being attached to the Department, I know nothing about it.

Do you know whether the question of the insufficiency of lifeboat accommodation was pressed upon that Committee by any of its members? - I do not. 22943. Or whether they took evidence? - No, I do not. I know nothing of their procedure at all.

Did the Advisory Committee make a report? - They did.

Is that the Report of last year? - That is the Report of last year.

Had any other Report been made previous to that? - Not to my knowledge. 22947. Do you know any reason from a practical point of view - I mean do you know any reason affecting the safety of the ship - that makes it undesirable to increase the lifeboat accommodation? - The undue encumbrance of the decks, and the provision of extra hands to man them.

22948. Would that make it unsafe for the ship - to have a number of extra hands to man the lifeboats? - Not unsafe, but it would take away from her commercial value. 22949. Was the principal consideration that you had in adhering to the old scale, the commercial value of the ship? - No. The several reasons that I gave were the reasons.

22950. Was it a leading consideration with you? - No, it was a subsidiary one. 22951. Was there any other consideration, apart from encumbering the deck space, as to the safety of having lifeboats on a ship, that influenced you in coming to the decision that you should not increase the scale? - Simply that they were not necessary, in my opinion.

The opinion has been expressed to my Lord and the Court that the provision of additional boats might make the ship more tender. That did not impress itself upon you, did it? - No, not at all.

You do not think it would make a big ship more tender? - No, and if it did you could compensate for it easily.

By ballasting? - Yes.

I want your views as a nautical expert on this question: How many seamen, deckhands, would it be desirable to carry for each lifeboat? - I should say about three, in some circumstances it might be two. It all depends on the size of the boat.

But at least - ? - Two.

You think it would be desirable to carry at least two? - Yes.

And the scale you had provided, was it prepared on a calculation based on that assumption, that two or three would be necessary? - More or less, yes.

And if, although in opposition to your opinion, and presumably to your advice, the lifeboat accommodation is increased, I presume it follows that the manning, so far as deckhands is concerned must be altered and the number increased? - Yes, that is so. 22960. You have said in answer to Mr. Aspinall that if fewer boats had been carried on the "Titanic" you might have had a larger number of people saved? - I did - there might have been, I said. I did not say there would have been, but there probably would have been.

On what do you base that statement? - For the simple reason that, knowing they had so many boats to trust to, they probably sent the first lot away not fully loaded. I do not want to criticise the officers or the Master of the ship at all, but I assume it is probable that that may have been the case; whereas if they had had fewer boats they would have taken good care that they utilised them to the fullest extent.

How can you make such an assumption in view of the fact that the "Titanic" did not carry sufficient lifeboats to carry all the people on board. Even if they had been filled to their utmost capacity, there must have still have been a large number of people left on board the "Titanic"? - Certainly, a certain percentage must be.

Does not that dispose of the consideration for occupying the boats to the full extent that you spoke of? - Yes, it does.

Then there is nothing in this argument of yours? - Oh, yes, there is. In my opinion, there is.

That more people would have been saved if there had been fewer boats? - That is my opinion. That is all I can tell you.

I think your statement comes to this, that you do not see any reason to have a scale of lifeboat accommodation? - Not beyond the present scale.

Do you know that one reason for having your scale, even such as it is, is to meet the requirements of emigrant ships, passenger ships going to foreign countries? - Yes.

22968. You know that a British ship taking passengers to America has to conform, to some extent, with American requirements? - The American requirements, up to my time of leaving the Department, were our requirements. Therefore, when our requirements were met, the American requirements were met.

I think you mean that the American requirements for British ships - ? - The American requirements recognise ours as equally effective, and therefore our ships were not interfered with on the other side.

Is not this the case, that the American requirements, even before the "Titanic" disaster, provided a scale for American ships registered in America which would give greater accommodation than the scale provided in this country by our Board of Trade? - That I cannot remember. I only know that they recognised ours as equally effective as theirs.

And that by a convention between this country and America the American nautical authorities recognised the certificates given by the Board of Trade? - Quite so. 22972.

And one reason for increasing the scale and paying attention to it is to conform with the laws and requirements of foreign countries. Now I want to ask you a question on the manning of ships. Has the attention of the Board of Trade been directed by the Advisory Committee to the importance of having a manning scale? - I believe so, two or three times.

22973. And is it the fact that, in spite of that recommendation, no manning scale has been set up? - There is no manning scale, but there is a guiding instruction to the Surveyors as to what kind of undermanning is pronounced as unseaworthiness. 22974. But nothing beyond what the former Witness has told us - you heard his evidence? - That is with regard to cargo ships and passenger ships, not to emigrant ships.

22975. With regard to passenger ships? - Not with regard to emigrant ships. 22976. There is nothing more than that? - I beg your pardon, there is the Emigration Officer's absolute power. But there is no scale? - There is a scale. Here you have it on page 10, a scale of manning.

### Page 633

That scale, as a matter of fact, applies to the deck, surely? - No. If you look further on you will find the engine room and stokehold on page 11.

That is only up to 600 nominal horsepower? - That is a guiding line, but the Emigration Officer, in his discretion, can extend that scale to any length.

What I mean is this. I want you to recognise a distinction between a discretion entrusted to an officer and the provision of a scale by which the officer should be guided? - The discretionary power of the Emigration Officer is a statutory one. The instructions are not statutory; they are simply for his guidance.

He is given statutory power to exercise his natural discretion? - Quite so. 22982. But one man may exercise it one way and another man may vary that practice? - No.

Is there a standard? - There is no standard in this way, in print, but there is a standard of uniformity arrived at by the fact that I am going about from port to port and establishing that standard.

The standard is what you told the different officers? - In consultation with them, yes.

But it is not reduced to writing? - Not reduced to writing, no. You do not require it.

In plain language there is no such thing in existence as a scale of manning for passenger and emigrant ships? - But there is. It is down here on pages 10 and 11. 22987. "The scale is intended rather as a guide for dealing with doubtful cases than as a hard-and-fast Rule, and no questions need be raised with regard to vessels in which the same total manning has been accepted previously"? - Quite so.

There is nothing in figures to guide a man for a big ship like the "Titanic"? - Oh, yes, there is. He can exercise his discretion by extending the table.

He has to exercise his discretion? - Yes, by extending the table from his knowledge. He is not a landsman; he is a seaman, and he has the knowledge.

If there was a scale, his discretion would be out of the question? - Not at all. He would still exercise it. He would exercise it if there was a scale.

Suppose there was a minimum scale, would not it follow that he would have to see that at least that minimum scale was complied with? - So he does, according to this. 22992. Can you tell me from pages 10 and 11, or anywhere else in your instructions, what is the minimum scale for the manning of a ship of the size of the "Titanic"? - Yes. 22993.

Kindly give me the figure then - how many officers? - You will find 48 for the number of deckhands to be carried.

That is from the boats? - That is from the boats.

Now take the officers? - The figures for officers we have never had occasion to lay down, for this reason, that the voluntary action of shipowners has always prevented the Emigration Officer from stepping in to say: "You must draw the line at this." 22996. That is no answer to my question at all? - Yes, it is.

If you pay attention you will see that it is not. Is there anything in what you call the scale which prescribes the number of officers to be carried on a ship like the "Titanic"? - No; but there is in the Statute.

You say no, and I take that answer? - The Statute says that the Emigration Officer must be satisfied that the ship is efficiently manned. He can call for 12 officers if he likes.

I will take that as an admission - that there is no scale in reference to that, at all events.

That is plain enough? - No, because you are not dealing with landmen; you are dealing with seamen. Seamen do not use a scale. They use their own power and discretion.

Is there any scale for engineers? - Yes, a scale, so far, up to 600 horse-power and over, so that when it gets beyond that -

According to what you are pleased to call the scale, how many engineers would have been required for a ship like the "Titanic"? - That I did not go into because it was not required. The voluntary action of the owners found so many that we did not require to go into it.

I have heard of the voluntary action of the owners before, but there is no indication there as to the number of engineers? - There is an indication, if you work it out.

How can you work it out? - You work it out in your own mind with the help of the Engineer-in-chief.

Applying your mind to the point, I will give you the engine room accommodation of the "Titanic," and I want you to tell me from any scale you have how many engineers would be required? - How many I would have required? *The Commissioner:* Do you suggest, Mr. Scanlan, that there were not sufficient engineers on board this boat?

*Mr. Scanlan:* No, my Lord, on the contrary, that all the requirements of the Board of Trade have been more than complied with.

*The Commissioner:* And not only that, but that there were sufficient engineers to work the boat efficiently.

*Mr. Scanlan:* I believe so, my Lord.

*The Commissioner:* Then what is it we are bothering about?

*Mr. Scanlan:* We are considering the Regulations made by the Board of Trade. That is one question.

*The Commissioner:* I know, but you see in the particular questions before us, regulations or scales, or no regulations and no scales, the boat, so far as regards engineers, was as good as she could be. What is the use of our taking up time enquiring about these scales? If you find that the thing works without scales, I should think it is far better to leave it alone.

*Mr. Scanlan:* I am instructed, my Lord, that in practice it does not work without a scale - it does not work effectively.

*The Commissioner:* It did in this case, at any rate.

*Mr. Scanlan:* I agree it did in this case, my Lord. I should not have taken up your Lordship's time on this, but for Question 26, which says: "The Court is invited to report upon the Rules and Regulations made under the Merchant Shipping Acts, 1894-1906, and the administration of those Acts and of such Rules and Regulations, so far as the consideration thereof is material to this casualty, and to make any recommendations or suggestions that it may think fit, having regard to the circumstances of the casualty, with a view to promoting the safety of vessels and persons at sea."

*The Commissioner:* Now, just consider that question - it is a very compendious sort of question. We know that in this case the ship was amply provided with engineers. You admit that yourself.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* I am only expected to report upon matters that affected or were affected by this casualty.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* The engineers are not touched by it at all. They were provided - plenty of them were provided, and as far as I know - I certainly believe it at present - they were efficient men. They stuck to their posts, you know - they did that, at any rate. I think we are a little far away from the question.

*Mr. Scanlan:* My Lord, I say in regard to the engineers that I cannot impugn that statement or qualify it in any way. But take the deckhands and the men in the stokehold.

*The Commissioner:* I am only on the question of the engineers. The deckhands stand on a different footing altogether.

23005. (*Mr. Scanlan.*) I will leave the question of the engineers. (*To the Witness.*) Has the attention

## **Page 634**

of the Board of Trade in your time been directed to the efficiency of deckhands - seamen?  
- Yes.

And did the Advisory Committee recommend the Board of Trade to impose a test, or standard of efficiency? - Not in my recollection.

I put it to you that this recommendation was made in 1910: "That this Committee calls the attention of the Board of Trade to the failure on the part of certain shipping companies to carry out the recommendations of the Advisory Committee respecting the crews engaged in the deck department on British vessels, and this Committee recommends that, in future, all seamen engaged for the deck department be qualified seamen and prove such qualification, either by producing three years' certificates of discharge, or, failing this, by proving that they have knowledge of the compass, can steer, do ordinary splices of wire and hemp rope, tie ordinary knots, and have a knowledge of the marks and deeps of the load-line." Was this brought under your notice? - If it was in 1910 it would be brought under my notice.

Was anything done by the Board of Trade in furtherance of this recommendation - in the way of carrying it out? - No, not that I know of. 23009. Why? - Because we never had a case brought before us of inefficiency. *The Commissioner:* I do not think that is what Mr. Scanlan means. We have had the matter discussed quite recently in another place. Do you proceed upon the principle that you ought to wait for a disaster before you take means to prevent such a disaster happening, or do you go upon the principle that you ought to take means first in the hope of preventing the happening of the disaster? - We take means first, when the ship is being built.

[There was no question 23010.]

Then I do not understand your answer to Mr. Scanlan now? - We did not lay it down in print, the exact matters, because we left it to our nautical officers to deal with. The procedure was this, that when an officer signed her articles of agreement the superintendent who was witnessing the signing of the crew considered either that the numbers were sufficient or that the crew fell below the standard laid down in our Circular, and he would report that matter at once to the Principal Officer.

Which do you call your Circular? - The manning Circular No. 1,463. I think it is, and the Principal Officer at one told off a nautical Surveyor to go to this ship to visit her, to muster the crew and to satisfy himself that they were efficient deckhands in his opinion. He was a seaman, and it was left, as it should be, to his knowledge and discretion as to what he considered an efficient seaman.

23013 (*Mr. Scanlan.*) Was it not pressed upon the Board of Trade as a matter deserving careful consideration that a definition of efficiency and a standard of efficiency should be set up? - Yes, and the Marine Department considered it impossible.

Is it impossible to carry out this recommendation here of having a test of seamanship - you have heard me read it? - When a ship is signing articles, yes.

I did not say when a ship is signing articles. For instance, you know - ? - But we have nothing to do with the ship until she is signing articles.

You have something to do with the seamen? - We have nothing to do with the seamen until they are signing articles.

You give certificates? - No, we do not give certificates.

You got certificates of efficiency yourself by passing examinations? - You mean the officers and masters?

You as an officer? - Yes - competency.

*Mr. Scanlan:* Surely there is no impossibility in having an examination or some test of the competency of a man who gets a certificate for seamanship - efficiency. 23020.

(*The Commissioner.*) That is a statement by you? - I do not agree with you. *The*

*Commissioner:* It is not a question. Will you suggest what the examination is to consist of?

*Mr. Scanlan:* Yes, my Lord, I will read it - such qualification or such certificate may be got "either by producing three years' certificates of discharge," that is in accordance with the Act of 1894, "or failing this, of proving that they have knowledge of the compass.

*The Commissioner:* How are they to prove it? Is there to be an examination, or what?

*Mr. Scanlan:* I will tell you what was suggested, my Lord - either that there should be an examination under the Board of Trade, or that the Board of Trade should empower committees of shipowners and seamen to set examinations themselves, and on their reports, or certificates, of the candidates passing those examinations, to give such certificates.

*The Commissioner:* A sort of Civil Service examination of these men that are to go to sea?

*Mr. Scanlan:* Yes, my Lord - I do not say that it is a Civil Service examination. It would be a voluntary body.

*The Commissioner:* You know how gentlemen desiring to enter the Civil Service are gathered in a big room - hundreds of them, and printed questions are put to them to

answer. Do you suggest that that sort of thing should be done with seamen? *Mr.*

*Scanlan:* I do, my Lord, and I am giving what was the opinion of the Advisory Committee of the Board of Trade.

*The Commissioner:* I do not care much about that. I want to know what your suggestion is.

*Mr. Scanlan:* I cannot set myself up as above the Advisory Committee of the Board of Trade, in this matter, at all events.

*The Commissioner:* I think on that particular point your real opinion would be worth more than the opinion of the Advisory Committee.

*Mr. Scanlan:* Then, my Lord, I agree with the Advisory Committee in this particular.

*The Commissioner:* You did not observe the adjective that I put before "opinion"!

23021. (*Mr. Scanlan - To the Witness.*) I take it from you that you, at all events, do not consider that the Advisory Committee were warranted in making such a suggestion, or that it had good reason for making this suggestion to the Board of Trade? - I do not.

23022. With regard to the handling of boats, have not you at the Board of Trade considered that a man recognised as an efficient seaman should have a competent knowledge of the handling of boats? - Not the handling of boats, but the rowing of boats - handling with an oar.

That he is to pull an oar? - Yes.

Your inspectors are directed to make some investigations in regard to that? - Yes.

I put it to you that a recommendation was made that there should be a standard of efficiency for men in the stokehold; have you any recollection of that? - Yes, I have.

And that nothing was done to carry out that recommendation? - Nothing.

You did not consider it advisable to do so? - No, I did not.

Do you believe in the efficacy of a sight test for men placed on the look-out on ships? -

The owners insist upon it. In a great many cases it is certainly efficacious. 23029.

Do you believe in making it obligatory? - No, I do not, not in the case of seamen.

Not for seamen? - Not for seamen.

I mean look-out men? - I say that there is no necessity for the State to step in and make it obligatory.

But you say some shipowners do it? - Yes, some shipowners do it - nearly all the passenger shipowners do it.

That implies, does it not, that some shipowners do not do it? - I suppose so, but

I do not know of any that do not, except from hearsay, that is all, and I cannot quote that.

23034. We were told in the course of this investigation that one of the look-out men on the "Titanic" had not been tested as to his sight.

## **Page 635**

Do not you think for a man discharging that responsibility that there should be a sight test? - I think if I was master of one of these ships I should insist on it.

But as you were in a position of speaking for the Board of Trade, do not you think it is a requirement that should be insisted on? - No, I do not think it should be a State requirement at all.

You believe, I think, in the minimum of stated requirements? - I do.

And the maximum of discretion to your officers, and to the voluntary action of shipowners? - I do. That is how the mercantile marine has been built up.

And that was the policy of the Board of Trade in your day? - It was my policy. 23039.

And you speak for the Board of Trade? - No. The Assistant Secretary of the Marine Department did.

### **Examined by Mr. HARBINSON.**

Do I rightly understand you that in the light of all that has occurred to the "Titanic," this "Titanic" calamity, you still stick to this scale? - I have said so.

*Mr. Harbinson:* So I gather. Did I also rightly gather that you said in answer to Mr. Aspinall that it was the custom for shipowners to provide boats in excess of the scale?

*The Commissioner:* He did say so.

*(Mr. Harbinson.)* I am obliged to your Lordship. *(To the Witness.)* You knew that that was done? - Yes, we were cognisant of it every day.

And you also said, I think, that it was in order to induce the public to travel on board their steamers? - I did not say to induce the public, but to make extra precautions for safety which they considered necessary but which the State had not considered necessary.

Therefore you knew, as the Board of Trade - because you were the responsible officer of the Board of Trade - that the owners of ships were holding out as an inducement the excess number of boats over your requirements in order to get the public to travel on their boats? - Not only to get the public -

It was an inducement held out to them? - Incidentally, it was.

*The Commissioner:* What is the use of repeating all that the man has already said. So far, you have done nothing but say: "You said this; you said that," and "You said the other thing."

*Mr. Harbinson:* I wanted to rightly understand that he did say it, my Lord.

*The Commissioner:* Not at all. You did understand what he said, because you stated it quite accurately. Do not let us waste time.

*(Mr. Harbinson.)* That being so, did you not consider it advisable to issue a regulation to the public, to be posted on the ships, warning the public who travelled by them that there was only accommodation provided, according to this scale, for one in three or one in four who travelled? - There was no necessity to do so. The public could see it for themselves when they got on board. 23046. Where could they see it? - On board the ship.

*The Commissioner:* What is this suggestion - it is quite novel to me - that there should be some printed notice on the ship for the people coming on board - "Take notice: This ship does not carry sufficient lifeboats to accommodate all the people on board." Is that it?

*Mr. Harbinson:* My Lord, it would be only fair, I think, that something like that should be done in view of the fact that the Department -

*The Commissioner:* Is it your suggestion that that ought to be done?

*(Mr. Harbinson.)* My suggestion is that the Board of Trade should not allow the shipowners to induce the public to travel by false pretences - on the false pretence that there is ample boating accommodation? - Shipowners never issue such a notice. *Mr. Harbinson:* I suggest that you should not have allowed them to take all these people.

*The Commissioner:* Do not trouble about that.

*(Mr. Harbinson.)* You knew that they were holding out these inducements to the public? - No. They put the boats on board, and the public can see them.

Do you suggest that every person who travels on a steamer goes and makes enquiries to know whether in case of danger there is a seat for him in the lifeboat? - I do not know whether he does or not.

You do not know? - In some cases they do.

Do you think he does? - Yes. I was travelling across from Calais to Dover not long ago, and a gentleman, a landsman, told me exactly the number of passengers that could be saved in the boats.

*(The Commissioner.)* Is a copy of the passengers' certificate stuck up in the ship? - It is posted up in the ship.

So that if there is anybody curious enough to go and read it he will find out what the lifeboat accommodation is? - He will.

Do you think any one ever does go and read it? - I do not think they ever do. *Mr.*

*Harbinson:* Would it not be advisable to issue a regulation directing their attention to it?

*The Commissioner:* Do you suggest that there should be a notice at the side of the certificate, a printed notice: "Take notice, there is a certificate at the side of this piece of paper; please read it."

*Mr. Harbinson:* I would suggest, my Lord, in view of what the Witness has said that he thinks the public when they take a ticket probably expect that there is a place in the boats for them - that is to say, they should know whether there is, or is not, in case of danger.

*The Commissioner:* Would you suggest that each person as he goes on board should have a copy of the certificate handed to him?

*Mr. Harbinson:* It could be put on the passenger ticket; the intimation to that effect could be printed on it. At any rate, that would be a means of letting the public know exactly where they are.

*The Commissioner:* No, it is not a means of letting them know - it is not at all a means, because if you pester these people with notices which they do not read - which experience tells us they do not read - they do not know. They never read such things.

*Mr. Harbinson:* Presumably they do - a passenger ticket, a contract? - Very seldom.

*The Commissioner:* Do you mean these long printed things?

*Mr. Harbinson:* Yes, the thing you get when you take a ticket.

*The Commissioner:* I do not know what sort of a thing you are talking about, but if they are anything like the things I have seen, nobody reads them. They read them after they have got a claim, you know.

*Mr. Harbinson:* They do not all postpone it until then, my Lord.

*The Commissioner:* They do - they always do until then, and then they find out that they have rights, or they have not rights, that they knew nothing at all about.

*(Mr. Harbinson - To the Witness.)* I would like to direct your attention, in view of what you have said, to page 8 of the Rules under the Merchant Shipping Act, 1894, why, if what you say is so - why if excess of boats beyond this scale was not necessary in the case of passenger ships and emigrant ships - why do you say in division (A.), class 4, on page 8, at the bottom of the paragraph, that: "Ships of this class shall carry, on each side, at least so many and such boats of wood or metal placed under davits (of which one on one side shall be a boat of section (A.), or section (B), and on the other side shall be a boat of section (A.), or section (B), or section (C), that the boats on each side of the ship shall be sufficient to accommodate all persons on board." Was not

### **Page 636**

that quite a necessary regulation? - Where is that?

It is on page 8 of your Rules with regard to life-saving appliances, made in 1894? - What division?

Class 4(A.)? - That is for passenger steamships. That is not for emigrant ships. 23058. If the boats that you have indicated were unnecessary in the case of the Titanic," that is in excess of your scale. If it was not necessary to carry boats for all on board according to your proposition, why did not you modify this regulation by reducing the number of boats, and thereby disencumbering the decks? - Because in the one case it is a limited crew that you are providing for, and you can easily do it, and in the other case it is a large number.

23059. Is that the principle you are going on, that because you have a limited crew and a limited number of people, it is desirable to provide for them, but when you have a large crew, and a large number of people, it is not desirable? - It is not practicable. 23060. So that it is a question of practicability? - It is a question of practicability. 23061. If you were satisfied that it would be practicable to carry on one of these huge leviathans sufficient boats for all on board by reducing the deck space, would you consider it desirable that that should be done? - No, I would not, because if you look at the record of the trade you will see that this trade has been carried on with absolute immunity from loss always, and it is not necessary.

*The Commissioner:* This is not helping me a bit.

*(Mr. Harbinson.)* You say where it is practicable it is desirable? - There is no doubt about it being practicable in the case of a small crew.

Assuming that my Lord came to the conclusion that it was practicable that a large boat like the "Titanic," by reducing her deck space and stowing boats on the poop and on the well deck, could carry sufficient boats to accommodate everybody on board her, would you say that that would be desirable? - I would not. What is his Lordship's opinion I have nothing to do with.

You say that in the case of small boats where it is practicable it is desirable? - The Rule says this. I was not one of the Committee that drew up the Rules.

Do you agree with the Rules? - I agree with it because they are there. 23066. Merely because they are there? - Merely because they are there. I might be inclined to revise them.

But you did not when you were advising the Board of Trade? - I did not. There was no necessity to.

Was it while you were advising the Board of Trade that your attention was specifically directed to the cases of the boating of the "Titanic" and the "Olympic" while they were on the stocks at Belfast? - No, not the "Titanic." 23069. The "Olympic"? - Yes, the "Olympic" was then projected.

And when it was projected the question was mooted at the Board of Trade when you were in a responsible position? - The question originated with myself.

And was it on your advice that the boating accommodation on the "Olympic" was not increased? - No, it was not. It was on my advice that the question was referred to the Advisory Committee.

I see, you were responsible for referring it to the Committee, but you gave no direct advice to your Department? - None.

Therefore, you were not responsible for the answer that was given at the time by the President of the Board of Trade? - Not at all.

**Examined by Mr. CLEMENT EDWARDS.**

Has the "Titanic" disaster led you to believe that any single one of the Board of Trade Regulations should be modified? - No.

That is to say there are no lessons to be learned from this disaster? - No, because it is an extraordinary one. The Board of Trade, the Marine Department, guards against ordinary occurrences, not extraordinary.

It is an extraordinary Department for guarding against ordinary mishaps? - Perhaps so - very good.

I am not quite sure that I caught correctly your view as to the effect of recommendations being made by what you called a one man Department, and by an Advisory Committee. I think you said that if an Advisory Committee made a recommendation it would put up the backs of the shipowners? - No, I did not. I said the one man power might. The Advisory Committee could not because the shipowners are represented on it.

I only wanted to get it quite clear. That is to say, that a recommendation, an identical recommendation, which came through and from an Advisory Committee would be likely to find greater acceptance than if it emanated from the Department itself? - Quite so.

You have spoken of the Marine Department as a one man department. Who is the one man? - No; I did not speak of that. I said that as far as the nautical advice was concerned which was given to the Assistant Secretary of the Marine Department, it was given by one man, assisted by the officers whom he liked to call into council. 23080. When you were there, in nautical matters you were the one man of that Department? - I was.

You said that it would be better to leave the boating scale to the shipowners themselves? - To leave the extension of it.

Why do you say that? - For this reason, that up to 1890 the scale that was in force for emigrant ships was for 1,500 tons and upwards, but in practice the shipowners who were sailing across the Atlantic with 4,000, 5,000 and 6,000-ton ships were going beyond that scale tremendously. It was really their practice which was crystallised by the Live-Saving Appliances Committee into this scale.

Has it occurred to you that the shipowners were doing that because the scale of the Board of Trade was ridiculously antiquated? - Because it was antiquated, yes. 23084. And there was some need to bring it up because of the increased tonnage? - Quite so.

If there was a need to raise the scale from 1,500 tons and upwards to 10,000 tons and upwards, why is it not necessary to raise the scale for 20,000, 30,000, and 40,000 tons and upwards, as we now have ships of that size? - I have told you the reason that I consider the number of boats and life-saving appliances laid down by the Rule is the maximum useful number that can be used and really employed to save life.

Then what you would say is that in relation to the growth of ships of a colossal character there has been a much greater growth of other improvements - what I may call collateral safety appliances than there was from the period of 1,500 tons up to the period of 10,000 tons? - Quite so.

*The Commissioner:* We have had all this before, Mr. Edwards.

*(Mr. Edwards.)* With respect, my Lord. I only wanted to get one point quite clear from him for the purpose of laying the foundation for two further questions which I propose putting. *(To the Witness.)* Do you think that if the scale should be left to the shipowners themselves, that other questions like bulkheads should be left to the shipowners themselves? - Yes, I do.

Do you think that the number of men that are carried should be left to the shipowners themselves? - Yes, I do.

What do you think should be left, if anything at all, for a Marine Department of the Board of Trade to do? - To administer the Merchant Shipping Acts.

Does not the Merchant Shipping Act lay down certain requirements? - Yes, it lays down certain requirements, and we see that those

## **Page 637**

requirements are carried out. If anyone works beyond them we do not find fault. 23091. What it comes to is this, that you think that though you are required under the Merchant Shipping Act to say whether a ship is seaworthy or not, that in the matter of bulkheads the thing should be left to the shipowner himself? - It is not entirely left to the shipowner, the bulkhead.

*The Commissioner:* No, that is not the meaning of the Witness's evidence at all. *Mr.*

*Edwards:* As I understood him, he said that in his view the question of bulkheads should be left to the shipowners, such as the scale; then I pressed him and asked him what in his view the Marine Department should do, and he then said it should administer the Merchant Shipping Act.

*The Commissioner:* You are telling me what I have heard already, but what I am objecting to is your paraphrase of his supposed answer. What he means, as I understand,

is this. There are certain statutory duties which the shipowners have to conform with; that is to say they have to prepare their ships for sea, and get them into a seaworthy condition, and it is the duty of the officers of the Board of Trade to see that that is done, and that will involve a consideration of the bulkheads.

(*Mr. Edwards.*) Then may I put it, Sir Alfred, that your view is this: that you should not lay down codes and standards and scales for these different things for the shipowners, but that you should leave them to do these things, and then decide whether they have done them or not by the personal judgment of the particular officers of the Marine Department? - We have laid it down.

(*The Commissioner.*) I think that is right? - We have laid it down with regard to the bulkheads.

(*Mr. Edwards.*) Where? - In our instructions.

Where? - And the Statute lays it down for the Surveyor. The Statute tells the Surveyor that before he makes his declaration the hull must be sufficient and efficient for the purpose intended. The hull of the ship requires bulkheads. In a large ship like that it not only requires them for watertight compartments, but it requires them for purposes of strength; and that ship would not have got her freeboard assigned to her under the Statute unless she had had those vertical bulkheads and those transverse bulkheads.

I think we are a little at cross-purposes. I do not want to misrepresent you, but I think what I have put does represent what you say, that is to say, that the Merchant Shipping Act says in effect that no ship shall go to sea unless it is seaworthy? - More than seaworthy. The passenger certificate is more than seaworthiness.

(*The Commissioner.*) "Seaworthy" is sufficient for this particular point - bulkheads? - Quite so.

(*Mr. Edwards.*) Will you just follow me for a moment, and then I will leave the point. According to your view, the Merchant Shipping Act lays it down that ships cannot go to sea unless they are seaworthy? - Yes.

Your view is that it shall be left entirely to the shipowner as to what shall be done to make the ship seaworthy, either in respect of hull or bulkheads, or machinery, or boat equipment, or manning, or anything? - In excess of our requirements.

And then that they shall come to you, and it shall be in the personal discretion of the particular responsible officer of the Marine Department to say whether they have a seaworthy ship for the particular purpose for which it is intended? - We laid down particulars as to these points.

*The Commissioner:* Oh, dear, dear me! Do not answer a statement of that kind. It is quite accurate, Mr. Edwards, and I have heard it over and over again. Their theory is that it is sufficient to have these matters to be judged of by the persons whom they appoint.

23101. (*Mr. Edwards.*) That is your view? - As long as they work in excess of our requirements we leave it to them.

That is not an answer to the question, and I really must get it from you. You heard what his Lordship said, and you have heard my question. Does that represent your view? - No, you have misrepresented my view.

Will you please tell us what your view is? - My view is this, that there are certain requirements with regard to bulkheads, and every other matter laid down in our Rules,

and if they work beyond that we leave the shipowner a free hand. But he must obey our requirements. He can go as far beyond them as he likes. We leave him a free hand. What I want to get at is this. You speak of your requirements. You say you have certain requirements for bulkheads? - Yes, we have.

Do you think that the requirements for bulkheads should be abolished, and that the bulkheads should be left to the shipowner? - No, we would leave our requirements in. 23106. That is inconsistent, if you will allow me to point out, with your answer to a previous question of mine, as to whether you would leave bulkheads to the shipowner in the same way? - I mean to say beyond our requirements - leave the matter to them beyond our requirements. I explained that fully.

Do you think that in view of what has happened to the "Titanic," and in view of the fact that you say that you would anticipate these troubles, and provide against them, that your present requirements as to bulkheads are sufficient? - Yes.

What do you understand to be your requirements as to bulkheads? - Our requirements as to bulkheads, as far as watertight compartments are concerned, are stated in paragraph 16.

That there shall be four bulkheads? - Yes. But there comes a question of bulkheads for strength purposes, and I told you that before that vessel could get her freeboard she would have to come up to certain standards of strength, and for that standard transverse bulkheads were required.

That is exactly what I want to get at. Have you in print any standard of strength; have you in print any scale of scantlings for bulkheads? - Yes, we have the Bulkhead Committee's Report.

Beyond what is to be found in the Bulkhead Committee's Report, have you any other scale or standard? - No, but everything is submitted to our Principal Ships' Surveyor. That is exactly the point. That is to say that whether a thing is satisfactory or not is not referable to any printed standard or scale, but is referable to the personal judgment and discretion of a particular officer? - No. As far as the freeboard is concerned the standard of strength is laid down by the tables of freeboard, and that is statutory. 23113. I was not on freeboard? - But I am on freeboard, because it relates to the strength of the ship.

But may I remind you that for the moment you are in the box to answer my questions, and not to travel to matters which you may think right and necessary. Therefore, will you please leave freeboard alone and bring your mind to bear on my question as to bulkheads. In the case of bulkheads, have you, beyond what is to be found in the Report of the Advisory Committee, any scale or standard of strength? - Of strength we have, in the tables of freeboard.

Of the bulkheads? - Yes.

Where are those tables? - Tables of freeboard. It does not go as far as a bulkhead, because it comes into the strength of the ship, both longitudinal, transverse, and vertical, and the bulkheads are concerned in that.

Have you a standard or scale of bulkhead, I am asking you, except what is to be found in the Report of the Sub-Committee? - Yes, I have told you. Our standard of strength is laid down in the tables of freeboard.

*Mr. Edwards:* Will you, please, produce those tables and show me where there is anything at all said about bulkheads?

*(The Commissioner.)* There is nothing said apparently, but what he says is that the consideration

**Page 638**

of bulkheads is necessarily involved in it. - It is involved in the question of the transverse and the vertical strength of the ship and the longitudinal as well.

I rather gather from what you say that bulkheads are not specifically mentioned in the provisions that are made with respect to freeboard? - Not specifically mentioned. 23120. But you say that the consideration of them is necessarily involved? - The consideration of them is necessarily involved, absolutely.

*(Mr. Edwards.)* May I just test that. It is possible to get the strength apart altogether from watertight bulkheads, is it not? - Not in a ship of that sort.

That is to say, you might have transverse structures which were not watertight?

- They would not have the necessary strength.

Do you suggest that the strength of a transverse structure depends upon it being watertight? - No, but it depends upon the scantling.

Do, please, follow my question, Sir Alfred. The question of the relative strength of a transverse structure does not in the least degree depend upon whether that structure is watertight or not? - That I am not prepared to say, because I am not a naval architect.

*(The Commissioner.)* But you can answer the question? - No, I cannot.

*Mr. Edwards:* I do not think I shall trouble you any further, Sir Alfred. *The*

*Commissioner:* I am very glad to hear that.

*(After a short adjournment.)*

**Re-examined by the SOLICITOR-GENERAL.**

My friend Mr. Clement Edwards was asking you, before the adjournment, about transverse bulkheads, and you replied as to their value from the point of view of stiffening the ship. I suppose that a transverse bulkhead of a given scantling and dimensions will equally stiffen the ship, whether it has been caulked and made watertight or not? - Quite so.

But supposing that a naval engineer puts into a ship bulkheads of sufficient scantling to give it strength, is it conceivable that he should not go to the trouble of caulking them and making them watertight? - Not at all; he would be sure to do so. 23128. *(The Commissioner.)* Suppose it is not watertight in the strictest sense of the term, is it true that any quantity of water likely to get through may be kept down by the pumps? - Quite so; it would be quite under the control of the pumps.

*(The Solicitor-General.)* I am much obliged, my Lord. Of course, a big vessel like the "Titanic" must have bulkheads to stiffen her, or else when she is on a wave she would break? - Quite so.

*(The Commissioner.)* The Bulkhead Committee's Report was in 1891, I think? - Yes.

Since that Report has the Board of Trade given any consideration to the question of subdivision of vessels by watertight bulkheads? - No, no special consideration.

You have not considered the question of subdivision with reference to floatation since that Report? - No, not beyond what the Report gives.

Has the Board of Trade had under its consideration the desirability of watertight decks? -

Only when a bulkhead is stepped, then the deck must be made watertight. 23134. *(The Solicitor-General.)*

The deck then really becomes part of the bulkhead? - Yes.

*(The Commissioner.)* And the watertight condition would only apply to that part of the deck which formed part of the bulkhead? - That is so.

That is not what I mean. You have not considered the desirability of having watertight decks running along the ship? - No, not above the top of the double bottom.

The top of the double bottom is practically a watertight deck.

Has the Board of Trade had under its consideration the desirability of double sides? - No.

You have not had under consideration the desirability of longitudinal bulkheads? - I think it has been under consideration, but we have never gone any further than considering it.

***(The Witness withdrew.)***

*The Commissioner:* Do you think you can get this information, Sir John? I do not think a Witness can do it. *(Handing a paper to the Solicitor-General.)* I want also particulars of the track that has been settled by the different Steamship Companies since this disaster.

*The Solicitor-General:* With regard to that matter, my Lord, possibly your Lordship would like to have it indicated graphically upon a chart?

*The Commissioner:* Certainly. What I am advised it would be important for us to know is exactly where the turning point is.

*The Solicitor-General:* Yes, the angle; the corner, as they call it. I think my friends have charts which show it.

*Mr. Laing:* Yes, my Lord, we have it.

*The Solicitor-General:* With regard to these two questions, I think one of them we shall be able to supply your Lordship with, and I will enquire as regards the other. Sir Ellis Cunliffe puts into my hands now a list of all passenger steamships in the British Mercantile Marine of 10,000 tons and upwards, showing the gross tonnage, year when built, and the crew, and boat equipment, and out of that we can pick what your Lordship needs. *(Handing same to the Commissioner.)* I am not quite certain whether the document your Lordship now has before you gives the year in which the ship is built?

*The Commissioner:* Yes.

*The Solicitor-General:* Then, my Lord, we can pick out those which are since 1894, and that, I think, would be the answer to the question put.

*The Commissioner:* The question relates from 1891.

*The Solicitor-General:* What your Lordship handed to me is from 1894.

*The Commissioner:* Is it?

*The Solicitor-General:* Yes, the question your Lordship handed down was as to the numbers and tonnage of all ships over 10,000 built from 1894 onwards.

*The Commissioner:* Those will be in this list?

*The Solicitor-General:* They must be included in it.

*The Commissioner:* Because I see you go back as far as 1893, at any rate. *The*

*Solicitor-General:* It will include them. I think that purports to be a list of all British ships in existence over 10,000 tons.

*The Commissioner:* It is a list of passenger steamships in the British Mercantile Marine of 10,000 tons and upwards for which a passenger certificate is granted by the Board of Trade, and their boat equipment. We can pick out of this the information we want. *The*

*Solicitor-General:* If I can have it back I will have it done, but I wanted to see that it is the sort of information you wish.

*The Commissioner:* It is.

*The Solicitor-General:* Then I will have that done, and I will ask a question upon the other point. As regards this other question, as I follow it, it is directed to ascertain how many vessels have sought to take advantage of the reduction in the number of boats on the ground that their watertight compartments justify it. I think that is the point.

## **Page 639**

*The Commissioner:* This question is not asked with reference to the number of boats carried, but it is to ascertain how many ships have the bulkheads divided to meet the Bulkhead Report of 1891.

*The Solicitor-General:* I do not know whether we can tell your Lordship that. Of course we could do this: we could let your Lordship know how many ships have come to the Board of Trade and have said, "True it is that your regulations require that we should carry such and such a number of boats, but we seek to take advantage of your provision that if we are satisfactorily divided into watertight compartments we may have fewer."

*The Commissioner:* I thought we had that already in evidence.

*The Solicitor-General:* Somebody has mentioned it, I think.

*The Commissioner:* Was not it said that it averaged about four a year.

*The Solicitor-General:* I have heard some general statement of the sort, and I think one of the Witnesses we are calling will be able to tell you, but that is not the same thing.

*The Commissioner:* No.

*The Solicitor-General:* Because one refers to an application to the Board of Trade, and the other refers to a matter of fact.

*The Commissioner:* Yes, one refers to Rule 12 in one of these small books. *The*

*Solicitor-General:* In the Life-saving Appliances Rules. It is the last Rule before one comes to the schedule.

*The Commissioner:* Yes, and we had evidence about that; I do not know who it was gave it.

*Mr. Laing:* Sir Walter Howell, I think; I will find the passage.

*The Solicitor-General:* I am very much afraid we cannot give the other information, because necessarily that is not a matter which is brought specifically to the Board of Trade's notice, unless an application is made.

**ALFRED YOUNG, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

*The Commissioner:* Is this the last of the Board of Trade Witnesses?

*The Solicitor-General:* No, my Lord.

(*Mr. Butler Aspinall - To the Witness.*) Are you the successor of Sir Alfred Chalmers in the post of Professional Member of the Marine Department of the Board of Trade? - Yes.

I think you came into office on the first day of September, 1911? - That is correct.

Do you hold an Extra Master's certificate? - Yes.

I think you have had seven years of command at sea? - Yes.

I think you joined the Board of Trade staff as nautical Surveyor in 1891? - Yes. 23144.

And were later on appointed to your present post as professional member? - Exactly.

Was Mr. Carruthers, the Surveyor, surveying the ship whilst she was being built at Belfast? - Yes, so I understand.

Did anything relating to her construction or equipment come before you? - Not directly. What do you mean by that? - Well, any observations he would have to make with regard to the construction of that vessel would naturally go direct to the Principal Ship Surveyor.

That we have been told is Mr. Archer? - Yes.

But did it reach you in the end? - No, it did not reach me as a direct message, but I have seen papers in connection with it which I desired to see. That is all. 23150. You cannot assist us in any way with regard to the construction of the "Titanic"? - No, not so far as that survey is concerned.

Do you remember having brought to your notice the Report of the Advisory Committee of 1911? - Yes.

That Report has been read. In consequence of that Report did you yourself take any action to enable you to advise the Board of Trade as to the requirements of that Report? - Yes.

What did you do? - First of all, I naturally looked through to see what it consisted of, and I realised that it was not quite in accordance with our ideas, and that there were certain points in relation to the Report of the Advisory Committee which would have to be referred back to them, because they did not quite fit in with our ideas, mainly with regard to the depth of lifeboats.

Sir Walter Howell told us yesterday with regard to this, and I think his evidence came to this, that you, the nautical adviser, in conjunction with other members of your staff, went into this question with a great deal of care? - We did.

And did it require some little time? - It required considerable time.

On the 16th of April of the present year a letter was written from Sir Walter Howell to the Advisory Committee, and he told us yesterday that you were the person who gave him the information which is contained in that letter. Is that right? - Quite. 23157. And I find in that letter this statement: "The Board are of opinion that a very careful and thorough revision of the Table should now be made." That is the Table dealing with - ?- The extension of the boat scale.

Was that your opinion? - Undoubtedly. It is a matter which should be carefully looked into.

(*The Commissioner.*) Did you hear Sir Alfred Chalmers' evidence? - I did. 23160. Do you agree with it on this point? - Not absolutely, with regard to the degree of extension.

(*Mr. Butler Aspinall.*) You think there should be an extension? - I do.

To what extent? - To a reasonable extent.

What does that mean? - Well, it should be a reasonable extent in view of the object that we seek. In other words, what I had in my mind when I advised the Board as to the action they should take in the matter was not that we should have an increase of boats for all persons on board, but that we should have a reasonable extension of the scale in order to provide for a proper and safe transfer of the passengers from one vessel to another in case of adversity. That was the primary idea in my mind in regard to the extension of the scale, and I indicated that to the Board many months before that. 23164. Apply your opinion to the concrete case of the "Titanic." To what extent do you think the Board of Trade Rule should be extended to fit the case of the "Titanic"? - Well, what I advocated myself and what I should prefer to give this afternoon is this: I laid it down that we should require at least 26 boats under davits.

And what would be the cubic contents of those 26 boats? According to the present requirements the cubic contents of the boats required to be placed under davits on the "Titanic" is 9,625 feet. That is right, is it not? - Yes.

For 16 boats? - That is, of course, altogether, with the three-fourths additional.

That is not entirely under davits.

No, not entirely under davits. You are quite right, I am wrong in saying under davits? -

What I had advocated as being required under davits was 26 boats having a capacity of 8,200 cubic feet.

And if those boats were not sufficient to carry all on board, then I suppose you would consider

## **Page 640**

that the Board of Trade should insist upon the three-fourths? - Yes, the continuation of the old Rule.

When you speak of 26 boats, do you mean each of the size that were placed upon the "Titanic"? - Boats of 600 cubic feet, yes. That is what I had in my mind. 23170.

Were the boats 600 cubic feet that were placed in the "Titanic"? - A trifle over, I think.

(*The Solicitor-General.*) They were 650? - Yes, to hold 64 or 65 people.

*The Commissioner:* They were smaller.

*The Solicitor-General:* Inasmuch as one allows 10 cubic feet for each passenger in a lifeboat, it follows that a boat that will take 65 people is a boat with 650 cubic feet. This Witness suggests 600 cubic feet.

(*Mr. Butler Aspinall - To the Witness.*) In view of the fact that Sir Walter Howell told us that this letter was the outcome of material supplied to you before the disaster, it follows that this opinion that you have been giving us was not an opinion arrived at in consequence of the "Titanic" disaster? - I cannot make it too clear that the opinions that I formed and the advice that I offered to the Marine Department of the Board of Trade was thought out many months before the disaster occurred.

In view of the disaster, do you think that the scale suggested to us now should be increased? - What scale is suggested now?

Well, your suggestion? - I do not think that there is any necessity to increase that scale beyond what I have already laid down.

Do you think it would be practicable to increase it? - In many cases it would be practicable, certainly; in some cases, I think, it would not. It depends a good deal upon the construction of the existing type of vessel.

(*The Commissioner.*) I gather that you do not think it is desirable in all cases of emigrant and passenger ships that sufficient boat accommodation should be carried to accommodate all the people that under the certificate that vessel is authorised to carry? - What I mean, my Lord, is this, that where it is practicable for a passenger ship to carry boats - I say *practicable* - for all persons on board, this is passengers and crew, I see no reason why the ship owner should not provide them. But there are certain cases in my mind of certain ships of a structure where it might not be practicable, and I do not think it is practicable in the ships I have in my mind to carry boats sufficient for all on board. 23177. Do you think the "Titanic" was one of them? - No, I think not. I think the "Titanic" could have carried boats sufficient for all on board; but it would have necessitated the piling up of one boat on top of another.

And when you talk about all on board, are you speaking with reference to the number that she actually carried, or are you speaking with reference to the number she was authorised to carry? - I do not quite appreciate your question.

Well, she did not carry nearly so many passengers as she might have carried? - No.

And I want to know whether, when you are talking about boats that you think she could have carried, are you speaking with reference to the number of passengers and crew actually on board, or the number of passengers and crew that might conceivably be on board? - The latter, my Lord.

She was certified for 3,547 passengers and crew? - Yes.

She only carried 2,000 odd? - Yes.

(*Mr. Butler Aspinall.*) Have you calculated how many boats would be necessary to carry her full complement? - About 63.

In your view would it have been practicable for the "Titanic" to have had placed upon her 63 such boats? - Well, certainly, yes, it would have been *practicable*.

You put emphasis on the word "practicable"? - Yes.

What do you quite mean by putting on that emphasis? - Well, I do not think it would have been altogether desirable, for certain reasons which I have.

*(The Commissioner.)* Will you tell us the reasons? - In the first place, my Lord, you have to consider the method of getting boats that are placed inboard out to the ship's side. You have to have a certain time for that process. You have to take into consideration that you may not have daylight to assist you in that. In all probability, when a disaster arises it would be at nighttime and under adverse conditions. If the ship had any movement at all, it would be rather difficult to get the inboard boats to the ship's side with any degree of safety. It might not be difficult under ordinary circumstances, I may say, to go through the process of getting boats to the ship's side with deckhands properly trained for that purpose, but what I had to consider was the prevailing degree of training in the Mercantile Marine, of which I had no very high opinion. I have witnessed, if I am not taxing your patience too much, my Lord -

Not at all? - I have witnessed in the course of my duties as an Emigration Officer methods of putting out boats which were a disgrace to the service; and during the time that I was carrying out my emigration duties I did the best I could to remedy that defect. I was imbued with the knowledge that since that period when I was an Emigration Officer things have not materially improved in the Merchant Service with regard to the training of deckhands. I may as well say at once that it is not the fault of those deckhands themselves; it is simply due to circumstances, the lack of opportunity, the lack of time in the hustle of the passenger service of the present day, which precludes those men from getting the training that they ought to have.

Do you mean the ships do not remain in port long enough? - That is the reason, my Lord.

There are not sufficient facilities for the exercise of the deckhands in the boats.

There are in some ports, but not in others.

I do not know whether you have exhausted what you wanted to say, but you were giving us your reasons why you did not think it desirable to put upon the deck of the

"Titanic" so many boats - 63? - Yes.

Have you any other reasons? - Yes.

What are they? - The other reason is the height at which those boats would necessarily be placed. It is well known to seamen - and, of course, in my position as advisor to the Marine Department of the Board of Trade I rely upon my experience and service as a seaman - that in the majority of cases of accidents at sea, the difficulty of lowering a boat from a height is very great; and it is not only a difficulty, but the greater the height the greater the danger. The least movement of the ship laterally - that is rolling from side to side - is a great danger to the boat that is being lowered. Of course, it is well known that that boat acts as a pendulum and with a very small degree of angle in a rolling ship, if it has any people in the boat at all, the weight of that boat is enhanced and the danger when it comes into contact with the ship's side at the second roll is a very great one. I had all this in my mind when I advised the Board to do what I did advise them to do, which I have embodied in the various memoranda which I laid before them. 23193. *(Mr. Butler Aspinall.)* Certain witnesses who have been called here said

that in their opinion if you put a large number of boats, probably as many as 63, on the boat deck it might render the ship tender. What is your view with regard to that? Have you considered that point of view? - It depends, of course, largely upon the form of the ship itself, the weight of cargo in the vessel, the facilities for increasing the ballast in the bottom of the vessel, and also the height at which the boats are placed. Of course you must realise that these boats of 600 cubic feet capacity range at a weight of about two tons, and if you have 60 boats up there, it is not a light weight to be at such a height as 60 to 65 feet.

**Page 641**

Dealing with a ship like the "Titanic," if you put that weight on the boat deck, in view of the quantity of the cargo that class of vessel does carry and is likely to carry, do you think it would make the ship tender or not? - I am not sufficiently acquainted with the "Titanic" to judge. As I say, it depends a good deal upon the circumstances in the ship itself and her statical stability. It is more a matter for a naval architect.

Surely it is a matter you will have to consider, is it not, in your position as Advisory Member of this Department? - Undoubtedly.

Probably you have considered it? - Oh, I have considered it, yes.

What is the result of your consideration? - Well, still that I do not consider it advisable to pile up a great number of boats at such a height. It may be all very well in fine weather, but when the ship is rolling heavily, then the ship begins to feel it; she may be tender or otherwise; I do not say that she would be seriously tender, but I think that under certain circumstances she might be tender; it is according to the way in which they work their bunkers out.

**Examined by Mr. SCANLAN.**

Could not you correct tenderness by ballasting? - Well, you can to a certain extent, yes.

That is the recognised way of doing it? - It is the usual method, yes. 23200. I observe your opinion is that the deckhands of the Mercantile Marine are not properly trained in the handling of boats? - That is my opinion.

I suggest to you, as I have to a number of Witnesses here that there should be some method of training by boat drills? - I quite agree with you.

Do you think a more thorough system of boat drills would be effective? - I think it would very probably answer the purpose.

Now it was pointed out in the course of this Enquiry that in New Zealand it is compulsory to have boat drills. Do you think it would help you in carrying out your idea to have boat drills made compulsory? - I would not resort to compulsion until I had exhausted every other means of inducing the shipowner to carry it out. 23204. Have any means been taken by the Board of Trade to impress upon the shipowners the desirability of having effective boat drills, so as to give a training to the whole of the crew? - No, I think not; not to the entire crew.

Do you agree that it would be desirable to make such a recommendation? - No, I do not think it is absolutely essential.

You have heard the questions put to Sir Alfred Chalmers, your predecessor, as to a standard of efficiency? - Yes.

Do you think it would assist materially if a standard of efficiency were set up which would include competency in the handling of boats? - Well, perhaps you would first of all, before I answer that question, give me some idea as to what your opinion is with regard to the standard you wish to set up?

My opinion is not very material to the Court, and I am afraid it would not be to you. Have you any idea yourself? - Certainly I have.

Well, give us your ideas? - Pardon me, after you!

I think you mistake our relative positions. You are a Witness, you know? - Yes. I think you might materially assist me if you give me some idea of the standard you have in your mind, because I do not think we are altogether in disagreement as to the fundamental principle.

Very well, I am glad we agree about something. You say you have an idea as to what would be the training? - Yes.

We may agree further if you just tell me what that idea is? - Well, undoubtedly the primary training that I have in view for a sailor is that he should first of all be sufficiently competent to handle a boat in every form, whether to steer or to pull, or to detach the tackle, or to hook them on again, or to get that boat out from the ship. 23212a. In your opinion would it be desirable to make the possession of that knowledge a condition of giving a certificate of efficiency as a seaman? - If it were deemed necessary to have a certificate for that purpose I should say yes.

With your own considerable knowledge and experience, do not you think it would be desirable? - I do most decidedly.

You agree that it would be desirable? - Yes.

Oh, we are getting on. It has been suggested to me that a way of testing the efficiency of seamen would be to examine them in their knowledge of the compass, steering, splicing of wire and rope, tying the ordinary knots, and the marks and deeps of the lead-line? - Yes.

Would it be desirable to have that incorporated as the standard of efficiency? - You want too much I think for your money.

Ah! But you do not know the price I am willing to pay? - Well, I have a shrewd idea of it.

That rests with the shipowners, you know? - I certainly think that a certain proportion of the qualifications that you have just foreshadowed ought to be embodied in a certificate. We want certain qualifications, but what those qualifications should be, I am not prepared at the moment to say definitely, or decidedly at all events.

But you think a standard of efficiency should be set up and certificates given? - If it is possible to set up a standard of efficiency, I do not think the able seamen of the present day would be hurt by it.

*(The Commissioner.)* Do you think they would reach the standard that you would set up? - They might after a course of considerable training.

*(Mr. Scanlan.)* Still, of course, a beginning must be made? - I quite agree with you there. It is desirable.

(*The Commissioner.*) Sometimes it is desirable that an ending should be made? -  
Undoubtedly.

(*Mr. Scanlan.*) Do you agree also that there should be some training of the men in the  
stokehold? - Well -

You have heard it suggested that before a man should be regarded as an efficient stoker,  
he should have served from three to six months as a trimmer? - I think you could  
very well leave that degree of training to the judgment of the firemen with whom  
the new fireman has to work.

This matter came up quite recently in the experience of your Department as a practical  
question, did it not? - Yes.

At Southampton? - Yes.

I do not want to press it further than this, that seeing a recommendation was made by a  
Committee which investigated this, do not you think it is time now that something  
should be done to secure efficiency? - No, I think, after a man has been for a short  
time as a trimmer on board a ship he would very soon fall into the duties of firing.  
23228. That is exactly what is suggested is it? But to say that a trimmer shall have  
so many months' training as a trimmer in order to qualify him as a fireman, I say  
is altogether nonsense.

In regard to your views as representing the Board of Trade as to the number of boats for a  
ship like the "Titanic," I want to ask you specifically, do you or do you not  
consider it desirable to make regulations compelling such a ship to carry either  
sufficient lifeboats or sufficient boats with rafts, to provide accommodation for all  
persons carried, including the crew? - I have already replied to that question in the  
statement that I made to his Lordship, in that I consider that where it is practicable  
for a shipowner to carry boats or rafts for all persons on board, they should carry  
them.

I think you said in the case of the "Titanic" you thought it would be practicable?

- So far as I can judge from the construction of the

## **Page 642**

vessel I think it would be practicable, and that you could find room by piling up one boat  
on top of another.

(*The Commissioner.*) Have you considered to what extent the lifeboat accommodation  
could be used in a rough sea? - Yes, my Lord, I have considered it very seriously.

To what extent do you think the lifeboat accommodation on both sides of the ship could  
be used in a rough sea? - Of course that would depend in the first place whether the  
vessel was so disabled that when she got the boats on one side down into the water, she  
would be able to slew round and make a lee-side of the other side and get the other boats  
down.

I am not a nautical man and I have not quite grasped that. You would not in such  
circumstances contemplate lowering the boats simultaneously on both sides of the ship? -  
If it could be done, of course it would be an advantage.

Could it be done in a rough sea? - No, I do not think it could, my Lord. 23235. Then you could only lower the boats on the lee-side and then turn the ship round? - Yes, that is it.

And make the other side of the ship the lee-side? - Quite so.

And get the boats down? - Quite so.

That would be the only way of doing it? - That is so.

And if you could not do that, that is to say, turn the boat round, the boats on one side of the ship would be quite useless or nearly useless? - Practically useless, unless there were means on board such as ways provided, that is, skids on which the boats were chocked so that you could slide the boats across.

Across the deck? - Across the deck. It is not an impracticable measure that could be provided for.

Is that ever done? - It is done, yes. 23242. On what boats? There was no such provision on the "Titanic" so far as I know? - Some of the inboard boats that are carried on certain vessels have this arrangement; they are chocked on skids right across the ship, and they could be used for either side. 23243. Are the lifeboats chocked in the middle of the deck? - Quite so, right across.

Then those boats are not hanging on davits? - No, they are not; they are inboard boats. Those boats are additional to the boats under davits.

Additional? - Yes, additional.

Has it occurred to you that if you can only utilise one side of the steamer, subject to this observation about the chocked boats which you have spoken about, you must have double the number of boats; you must have sufficient boats each side to accommodate the passengers? - That would not be practicable on a passenger steamer, not to have boats on each side for all.

Does it then come to this, that it is not practicable to have boats on board a ship such as the "Titanic" which would be sufficient for all passengers if the vessel was in a rough sea? - Quite so.

Is that so? - That is so.

You follow my question? - It is not practicable.

So that, except in the case of a calm sea such as we know the "Titanic" was in, however many boats you had, you could not possibly save all the lives in the boats? - Of course, under the calm conditions of the sea when the "Titanic" went down, it would be hard to say whether all the boats, if she had had the boats that are contemplated, could have been put down.

I do not think you are quite following my question. It is in fact a statement of what I understand your evidence to be: If the sea is rough so that it becomes impracticable to lower the boats upon one side of the ship, and you cannot get the boat round in the way you have suggested, is it then practicable to have sufficient boats on board the vessel to save all the lives? - It is not practicable.

*The Commissioner:* I think, Mr. Scanlan, the evidence seems to point to that, more or less, that there may be conditions when it is not possible to meet the difficulty by means of lifeboats.

(*Mr. Scanlan.*) I agree, my Lord; there has been a good deal of evidence to that effect.

(*To the Witness.*) With regard to the placing of lifeboats on a ship like the

“Titanic,” had you submitted to you the design of Mr. Carlisle, a member of your Advisory Committee, who gave evidence here? - No, I have not seen that design. This is a design showing three or four boats to be operated by each set of davits. Is that practicable? - I suppose it is, but at the same time I have not seen that design, and I do not know whether it was a design that he produced when he was sitting on the Advisory Committee, or whether it was afterwards? - We have it here in Court.

*The Commissioner:* Yes, I saw it.

*(Mr. Scanlan.)* And it was stated by Mr. Carlisle that it was submitted to the Advisory Committee, so I think we may take it, if you saw the plan submitted to the Advisory Committee, that that is what we are referring to? - I do not remember seeing it.

Did you see any plan submitted by him? - No, I did not.

You have referred to something he submitted to the Advisory Committee. What were you referring to? - I have not seen that.

But you did refer to it? - I only asked you whether that design of Mr. Carlisle’s was submitted when he was sitting on the Advisory Committee or afterwards. What I meant was whether it was before the “Titanic” disaster or after. 23258. Yes, before the “Titanic” disaster? - Because I have not seen it. 23259. It would not have been brought under your notice? - No.

But you agree such a design would be practicable? - Yes.

Your view when you considered the boatage of the “Titanic” was that she should carry 26 boats? - Yes, that is right.

Do you mean 26 boats under davits? - Yes, 26 boats under davits. 23263. Apart from that provision, do you contemplate also that she would carry a certain number of collapsibles of the Englehardt type? - As additional, or they might be open boats, wooden boats. She could carry the additional boats as wooden boats, not necessarily as collapsible boats.

When had you arrived at that conclusion? - When the “Titanic” was under course of construction.

*The Commissioner:* You are alive to the fact, of course, Mr. Scanlan, that when you talk about collapsible boats, you may be including two kinds of boats.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* The Berthon boats and the Englehardt boats.

*Mr. Scanlan:* Yes.

*The Commissioner:* They are different, although they have been frequently in this Enquiry referred to as collapsible boats.

*(Mr. Scanlan.)* I appreciate that, my Lord. The boats I speak of are the boats which you in the Board of Trade got specially tested at Liverpool and a number of other ports? - Granted.

And these are the kind of collapsible boat which as a point of fact were carried? - Yes, a form of Berthon, better known as Berthon boats.

The Englehardt boats, and not the Berthon boats? - The Englehardt boat is not a collapsible boat.

The sides are collapsible? - No, the sides are not collapsible.

*The Commissioner:* That is where the confusion is. The collapsible boat is the Berthon boat, which doubles up; but the Englehardt, as I understand, is in the nature of a raft with sides of canvas which can be put up perpendicularly.

*Mr. Scanlan:* Yes.

## Page 643

*(The Commissioner - To the Witness.)* Is not that so? - That is perfectly right, my Lord. In fact it is altogether a misnomer to call an Englehardt boat a collapsible boat; it is not a collapsible boat.

*(Mr. Scanlan.)* The Englehardt boats were, I think, recommended by the Board of Trade? - Quite so.

As being suitable boats to carry in addition to the wooden boats? - Undoubtedly, yes.

23271a. If your ideas had been given effect to, that is, if you had 26 boats with a capacity of -

*The Commissioner:* 600 cubic feet?

*(Mr. Scanlan.)* Yes. *(To the Witness.)* 600 cubic feet would give carrying capacity according to your scale for 60 persons? - Yes.

Then you would have provided for 1,560 in your wooden boats? - Yes. 23274. And in your Englehardt boats how many would you give to each? - I did not recommend any Englehardt boats. The Board of Trade Rule with regard to three-fourths of the capacity carried under davits would be added. It did not matter to us whether it was an Englehardt boat or an open boat.

If that is so, I take it you would have 1,560 carried in your wooden boats and three-fourths of that number in that additional accommodation? - Yes.

Will that come to 2,730 altogether? - It will come to 14,350 cubic feet.

*The Commissioner:* I am not following these figures. There are 26 boats under davits.

*Mr. Scanlan:* Yes.

*The Commissioner:* Of a capacity of 600 cubic feet each.

*Mr. Scanlan:* Yes, my Lord.

*Mr. Laing:* That is an error; I am sure there is an error.

*The Commissioner:* There is some mistake.

*Mr. Laing:* He said 8,200 feet capacity. He said 26 boats with a capacity of 8,200 feet.

*The Commissioner:* But that is wrong.

*Mr. Scanlan:* I think we should allow him to give us this information, my Lord.

*The Commissioner:* Oh, by all means.

*(Mr. Scanlan - To the Witness.)* Will you just calculate it yourself? What cubic feet capacity would you have in your 26 boats under davits? - It might be 500 cubic feet or it might be 600 cubic feet. As a Rule shipowners would carry the larger figure, 600.

That is the usual practice now.

Will you just calculate what you mean by 26 boats under davits, and then we will get the additional boats? - The boats under davits would be equivalent to 15,600 cubic feet.

*The Commissioner:* Now that seems right.

(*Mr. Scanlan.*) That will be a carrying capacity for 1,560 persons? - Yes. 23280. Will you work out for me what the three-fourths additional accommodation gives in cubic capacity and in passenger accommodation? - That would bring us up to 27,300 cubic feet.

And the carrying capacity? - 2,730 passengers - with a divisor of 10.

(*The Commissioner.*) How many do you make the three-fourths? - 11,700.

Then you get a total of 27,300? - Yes.

And how many people would that accommodate? - 2,730.

That is irrespective of the Englehardt boats that might be carried? - That is including the Englehardt or any other boat in addition.

That is included in the 11,700? - They are included in the 27,300.

And they are in fact the 11,700? - Yes.

Supposing all that has been put on board, it would have been more than sufficient for the number of passengers carried on the "Titanic," but it would not have been nearly sufficient for the number that might have been on the "Titanic"? - I quite agree, my Lord.

(*Mr. Scanlan.*) The number actually carried, my Lord, is 2,208 or 2,206; that would have given full accommodation, with a margin over for 522? - Yes.

*The Commissioner:* Yes, it would.

(*Mr. Scanlan.*) When did you come to this conclusion with reference to the boatage for the "Titanic"? - I did not specially consider the "Titanic" before the disaster. *The Commissioner:* You do not follow what Mr. Scanlan means. When did you come to this conclusion with reference to these big boats? - Some months back, my Lord; in fact, when the Report of the Advisory Committee was presented, and I went into the matter, I had this in my mind. But it was complicated by a matter which was of a very serious import, and upon that matter hangs the whole of the so-called delay which has taken place between the 4th July and the 4th April.

4th July, 1911, and the 4th April, 1912? - Yes, my Lord. The import of that was I had several matters to consider. In the course of my experience I had realised that the boats that were supplied to ships as lifeboats had been steadily deteriorating in form. I may say that is my opinion. And it appeared to me not only undesirable, but it would have been wrong in my opinion, with those ideas, to advocate a very large extension of the boat scale; in other words, piling up a large number of boats on to a ship with the knowledge that I had in my mind at the time that those boats were not well adapted for that purpose. In other words, I was impressed with the view that in anything but the calmest weather those boats would not be able to carry in safety the number of people for which they measured; and therefore it was unnecessary under those circumstances to associate with the Report of the Advisory Committee this question of the proper form of the ship's lifeboats. That is the object that I had in view. That is the sole cause of the delay which has been attributed to the Board of Trade in this matter.

Do you wish us to understand that the boats of the “Titanic” were not in a proper form? -

I am not alluding to the “Titanic,” my Lord; I am alluding to the general question of the boats. I believe from what I have seen of the boats that have been turned out from the yard of Harland and Wolff that those boats are of the proper form. They are of very good form. But there were many ships’ boats turned out, and still are, of a form which is not the best form that can be used on board ship. I may as well say while I am on this subject, that the Marine Department of the Board of Trade naturally would not take my assertion simply as an assertion, but they felt it was necessary that that assertion should be verified, and therefore they issued instructions for boats to be experimented with around the coast with a complement of persons for which the boats measured. I have no hesitation in saying that the results of those investigations and experiments have fully justified the action which I took on receipt of the Advisory Committee’s report. 23293. I have never heard of those experiments. Were those experiments actually made? - I have them here, my Lord.

Perhaps you will answer the question first. Were they actually made? - They were.

Where were they made? - Mainly London, Liverpool and Glasgow. 23296. That is quite enough. Now when were they made? - May I read a short statement of the particulars, my Lord.

Yes, but do not forget that I want to know when the experiments were made? - I will give you the dates, first, February the 6th.

What year? - 1911. I am only starting with that in order to get the proper sequence. “In connection with the revision of the Rules for Life-saving Appliances, the Board early in 1911 asked the Principal Officers at London, Liverpool and Glasgow for their observations on the extension of the Boat Table. The two former referred in their replies to the advisability of limiting the size of lifeboats, as the depth would be unduly increased; and the actual accommodation lessened, as compared with the calculated capacity. The London Principal Officer forwarded on April 19th a report respecting defective boats on certain vessels after only a few months’ use, and it was

## **Page 644**

mentioned that there was a tendency to build boats with too great a depth in order to increase the cubic capacity. The Board thereupon wrote to the Advisory Committee on 17th May, asking whether it would be advisable to prescribe a maximum depth for boats, compared with their breadth, and, if so, what that proportion should be.” I may state here this is the preliminary investigation which preceded the experiments which were inaugurated after my assertions. “On the 19th May, the Advisory Committee applied semi-officially for particulars as to the length, breadth, and depth of various kinds of lifeboats in use in the mercantile marine, and on the 24th May the Board forwarded reports from Principal Officers giving the desired information for the various kinds of boats on typical ships. The Advisory Committee replied to the Board on the various matters under consideration on the 4th July,” - that is the 4th July, 1911 - “and, as regards the proportions of ship’s boats, recommended the alteration of the Life-saving Appliances Rules to provide that, in future, the depth of lifeboats should not exceed 14 percent of

their breadth.” We had this the other day, my Lord. “This recommendation was submitted to the Principal Ship Surveyor on the 8th July, and on the 11<sup>th</sup> July he suggested that Principal Officers might test different types of boat with a full complement of persons, and report the result of the tests with reference to height of gunwale, stability, and the use of the oars.” This second series of experiments was in consequence of the assertions which I have referred to. “This suggestion was approved on the 15th July, and a minute was sent to the Principal Officers at London, Liverpool, and Glasgow on the 21st July requesting that practical tests should be made with a view to determining - (a) a standard type of boat, (b) a maximum depth, (c) a maximum proportion of depth to breadth, and that full details should be given, with drawings of the best and worst forms tested, and notes on the height of gunwales, use of the oars, and the question of stability. The first report was received from the London Principal Officer on August 25th, and related to two boats that had been tested. (a) A Section A boat, calculated accommodation for sixty-six persons. This boat, when fully loaded, was overcrowded and top-heavy, and could not have gone outside the dock gate. It would have been well loaded with ten men less.” That is one of the first experiments, my Lord. “(b) A Section D boat of similar dimensions, to carry eighty-two persons. The test showed that even if such a number could have been put into the boat it would have been unsafe. A further report from the London Principal Officer was received on September 19th, and gave results of tests as follows: (a) September 3rd, Captain Clarke, at Southampton, examined one of the strongest and roomiest boats he could find. When fully loaded, it was very crowded, and a little tender. (b) September 5th, Captain Clarke examined a D boat, with very fine lines; a poor type. This boat had calculated accommodation for 29 persons; with the divisor 8 this number was excessive, and even with a divisor of 10 the calculated number would have been too large. The gunwale was put awash by one man moving from port to starboard. Captain Clarke considered the boat would capsize in a moderate sea with only 24 persons. (c) September 12<sup>th</sup>. Mr. Cheyney, at Yarmouth, found a D boat, built to hold 10 persons, unstable with that number in it. (d) September 15th, Captain Griffith tested a Section A boat in one of the London Docks. This boat was 4.1 feet deep, and was calculated to hold 66. In order to get the men in, they had to sit on the gunwale, and the boat was unstable in perfectly still water. (e) On September 16th, Mr. Penney, of London, suggested the divisor 12, instead of 10 or 8, for determining the number of persons a boat would accommodate. On November 3rd the Glasgow Principal Officer forwarded reports of tests as follows: (a) Mr. Gemmell’s report, dated 25th October, referred to the inspection and testing of eight boats of various types. They were all found to be satisfactory. (b) Mr. Sullivan, on 3rd November, reported having examined five boats, of which four were quite satisfactory, affording ample space, and the other, a steel Section A boat, was unstable, being built on fine lines. The report from the Liverpool Principal Officer (which was dated the 11<sup>th</sup> November) was stated to have been delayed owing to the recent labour troubles. The Principal Officer forwarded details by Mr. Jenkins, the Senior Ship Surveyor, of eight tests that he had made. Of these, four were quite satisfactory, three were not good, and one was bad owing to the fact that the fullness of the form of the boat tested was not carried sufficiently toward the ends. The Surveyor remarked on the dangerous nature of the tendency towards excessive depth in boats. A further report was received from the Liverpool Principal Officer, dated November 15th, with remarks by

two nautical Surveyors, Messrs. Rice and Jenkin. They recommended a minimum depth of 3 ft. 4 in. or breadth by 4, and a breadth of length of 3.5. This was a mere matter of discussion which we went into, and did not quite agree with. "A summary of all these reports was drawn up and completed on January 4th, 1912, and the Principal Ship Surveyor was asked for his observations on the whole question. The Principal Ship Surveyor was away ill at this time and the matter was taken up by Mr. Daniel, an officer in his department acting as his deputy, who reviewed the reports of the Surveyors and their suggestions. He replied on the 27th January. The substance of his report is as follows: - "The question of the Form of Boat is important. Boats are generally built 'to the eye' with simply a midship mould. It has been found that boats of the same dimensions differ considerably in *actual* carrying capacity. Mr. Daniel therefore suggested the following method: - A boat should not be regarded as capable of accommodating the number of persons for which it measures according to the Rules unless it has  $\frac{1}{2}$  inch of sheer per foot of length, and unless the half girth amidships is at least 90 percent of the sum of the depth and half breadth, and the mean of the half girths measured at one-quarter of the boat's length from stern to sternpost is at least 80 percent of the sum of the depth and maximum half breadth. If these conditions are not complied with, the number of persons is to be determined by practical test in the water. A draft amendment of the General Rules on these lines." I desire this to be perfectly understood, as I have no doubt your Lordship will perfectly understand it. "A draft amendment of the General Rules on these lines was prepared on February 1st, and it was decided to submit the matter again to the Advisory Committee. Memoranda on other subjects were at the same time being prepared, and eventually the whole of the subjects that had been under consideration were, on the decision of Sir Walter Howell (4th April), embodied in one letter, which was addressed to the Committee on April 16th."

That leads up to the two letters of the 4th and the 16th of April? - Yes, my Lord. 23300. (*Mr. Scanlan.*) Would you mind saying when it was that you came to the conclusion that with respect to ships of the size of the "Titanic" you should have boat accommodation for 2,730 people? - I came to that conclusion in the month of February, 1911.

23300a. (*The Commissioner.*) You mean 1911? - Yes, my Lord. I first went into the subject when I was Principal Officer and Emigration Officer for Liverpool.

What was your position then? - I was Principal Officer and Emigration Officer for the Port of Liverpool.

Residing in Liverpool? - Residing in Liverpool.

You were not at the Board of Trade? - I was not at Whitehall; no, my Lord.

(*Mr. Scanlan.*) You have entertained this opinion constantly since 1st September, 1911, when you attained to this present position? - I have continued of that opinion.

## **Page 645**

If effect had been given to your opinion the "Titanic" would have been boated up to that extent to give accommodation for 2,730 persons? - She would, possibly. I do not say that she would, because I was not the only one concerned in it.

You were the principal authority? - At one time, latterly.

I mean from September, 1911? - Yes, that is right.

You were the Principal Officer and you were the man to give advice? - Exactly.

I gave that advice.

To whom did you give that advice? - I gave that advice to the Marine Department. The advice that I refer to was the advice that the form of boats could not be dissociated from the increase in their number.

When did you give to the Marine Department of the Board of Trade this advice that a boat of the size of the "Titanic" should have accommodation for 2,730 persons? - That advice was given - I forget the precise date, but it was during the course of February, 1911, before I was appointed to my present position.

To whom was it given? - It was reported to the Board of Trade.

Do you mean to Sir Walter Howell? - Exactly, the Assistant Secretary. 23313. (*The Commissioner.*) How was it given? - I might as well lay this matter out quite straight. The reason for the report -

(*Mr. Scanlan.*) That is not the question. You were asked in what form was your advice given? - It was given in the form of a report.

A letter? - A letter that was asked for by my own department. That is what I want you to understand.

(*The Commissioner.*) Now where is that letter? - That would be included in the Minutes, my Lord.

Where are the Minutes? - They can be brought here, no doubt.

*The Commissioner:* Mr. Aspinall, I must see that minute.

*Mr. Butler Aspinall:* Yes, I was just asking about that.

*The Commissioner:* Is Sir Walter Howell here?

*Sir Walter Howell:* Yes, my Lord.

(*The Commissioner.*) Do you remember this letter, Sir Walter?

*Sir Walter Howell:* Only generally, my Lord.

(*The Commissioner.*) I do not know what that means.

*Sir Walter Howell:* I do not remember the terms at all.

(*The Commissioner.*) Do you remember a letter from this Witness to your department of the Board of Trade, stating that for vessels of the size of the "Titanic" there ought to be lifeboat accommodation calculated to take 2,730 persons?

*Sir Walter Howell:* No, I do not remember it.

*The Witness:* It was not put into that form, my Lord; it was not based on the capacity; it was based on the number of boats, 26 boats.

(*The Commissioner.*) It seems to me to come to the same thing, and if you like I will put the question in another way. Did you send anything in writing from Liverpool to the Board of Trade in or about February, 1911, which would or ought to convey to people at the Board of Trade that vessels of the size of the "Titanic" ought to be furnished with lifeboat accommodation for 2,730 people? - Yes, up to 50,000 tons.

Very well. That is beyond the size of the "Titanic." Now I want to see that letter? - That can be furnished, no doubt.

*Mr. Butler Aspinall:* Your Lordship shall have it.

*The Commissioner:* You will get it, Mr. Aspinall?

*Mr. Butler Aspinall:* Yes, my Lord.

*(The Commissioner.)* And then I want to know this, if you can tell me. I assume for the moment that it was sent. Why was it not acted upon? - I believe it was acted upon to a certain extent in that it was compared with the reports that the Marine Department of the Board of Trade receive at about the same time from the Principal Officers of London and Glasgow. 23324. Do you know what I mean by "acted upon"? By that expression I mean this: Why was the communication not sent to the builders of the "Titanic" - I do not know what position the "Olympic" was in at this time - to say that they would be required, or ought to provide this accommodation? Do you follow my question? - I do, perfectly. I am not in a position to say why that recommendation of mine was not acted upon, in that I was a subordinate officer of the department residing at Liverpool at the time, and consequently when that letter left my hands it was laid before the Marine Department, and I had nothing further to do with it.

Then you are not able to tell us the history of your letter after you sent it in February, 1911? - I am able to give you some idea as to what transpired. As I say, it was compared with the recommendations of other officers in the Board's service, and it was not acted upon.

Do you want me to infer from that that other officers did not agree with you? - They did to a certain extent. It was only a question of difference of degree.

I do not know what that means, quite. Do you mean that other officers thought your requirements or suggestions were excessive? - That I do not know. I do not think so particularly, excepting that the Principal Officer at Glasgow, by recommending to the Board a smaller number of boats, one would infer that he disagreed. But that was not expressed to me. I only gathered that from the fact that he sent in a recommendation which was lower than mine.

*(Mr. Scanlan.)* When you sent in this report in February, 1911, I presume it would go directly to Sir Walter Howell? - Yes, it would be addressed to the Assistant Secretary. Then you are able to tell us, because, of course, you know? - Oh, precisely - yes. 23330. It did go to Sir Walter Howell, and the officer who would be in a position to deal with it at that time was Sir Alfred Chalmers? - Yes, he was the Professional Officer, the principal member of the Marine Department at that period.

*The Commissioner (To Sir Alfred Chalmers):* Now, Sir Alfred, do you remember anything about this?

*Sir Alfred Chalmers:* Yes, I remember.

*The Commissioner:* Now stand up, please, and tell us what you remember.

*Sir Alfred Chalmers:* 8,200 cubic feet for the 26 boats, plus the 75 percent, which was 6,150, bringing the total to 14,350 cubic feet.

*The Commissioner:* That would not accommodate 2,730.

*Sir Alfred Chalmers:* No, 1,435. That is how I understand it. The reason it was not acted upon I cannot say.

*The Commissioner:* You see, your recollection of what the report conveyed is quite different from the recollection of this gentleman here.

*Sir Alfred Chalmers:* But the report will clear that up. I do not want to set my memory against his. My memory is clear that that was it.

*Mr. Laing:* Your Lordship will remember where this Witness gave evidence in chief he said 8,200 - 26 boats of 8,200.

*(The Commissioner.)* The figures I took down were 15,600 for the 26 boats. *The Witness:* We are on a different tack, my Lord. Mr. Scanlan asked if I would recommend boats of 600 cubic feet, and I said "Yes." And 26 boats of 600 cubic feet would amount to that. But as I said just now, when I referred to my letter from Liverpool, I did not advocate that same capacity in my Liverpool letter. I did not remember at the moment what that capacity was, but I did remember what the number of boats was that I recommended, and that was 26.

*(The Commissioner - To the Witness.)* I am sure it is not your fault, but I have entirely misapprehended what you were saying. Do you mean to say that when you recommended in your letter of February, 1911, or your Report, whichever it was, that there should be 26 boats under davits, they were smaller boats than the 600 cubic feet boats? - Apparently they would be, my Lord.

## **Page 646**

Then there seems to be very little in it? - I can tell you in a moment what it would come to.

*The Commissioner:* I cannot blame you, Mr. Scanlan, because I have taken the same view of it that you have taken, up to the present time.

*Mr. Scanlan:* Of course, I take it we are getting the Report and the Minutes?

*(The Commissioner.)* No doubt; we shall have it tomorrow.

*The Witness:* Practically 316 cubic feet they would come to.

*(The Commissioner.)* Instead of 600? - Yes.

How many people would they accommodate? - Thirty-one persons each. 23337. How many is it? - They would accommodate 820 people. That is boats under davits. And then add on the 3/4ths? - 1,432.

How many people does that make altogether? - That would be 1,432 people.

Now let me see whether I understand it properly. The boats that the "Titanic" carried were calculated to accommodate 1,178 persons. That is right, is it not? - Yes. 23341. If you are right about your recollection, the boats that you suggested a vessel of that size should carry would have accommodated 1,432? - That is correct.

*The Commissioner:* Is not that right?

*Mr. Scanlan:* That is how I calculated it on the new data, my Lord.

*The Commissioner:* I was making a very great mistake in my figures.

*Mr. Laing:* If your Lordship allowed for dispensation for the bulkheads you get down to a figure below that for which we had accommodation.

*(The Commissioner.)* Yes, that is right, is it not, Captain Young?

*The Witness:* The figure you are alluding to?

No, you heard what Mr. Laing said, that allowing for the dispensation that the

“Titanic” would be entitled to under the Rule, because of the bulkheads, your recommendation for boat accommodation would be less than what the “Titanic” actually carried? - Precisely.

*The Commissioner:* I have been occupying a great deal of time about something which appears to me now to be very immaterial. But I think perhaps, Mr. Scanlan, it would be better if we waited until tomorrow morning. We will rise now and then you can see the documents tomorrow.

*Mr. Scanlan:* Yes, thank you, my Lord.

*(The Witness withdrew.)*

*(Adjourned to tomorrow, at 10.30 o'clock.)*

# In the Wreck Commissioners' Court.

SCOTTISH HALL,

BUCKINGHAM GATE,

*Friday, 14th June, 1912*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### TWENTY-FOURTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K. C., M.P. (*Attorney-General*), SIR JOHN SIMON, K. C., M.P. (*Solicitor-General*), MR. BUTLER ASPINALL, K. C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K. C., M.P., MR. F. LAING, K. C., MR. MAURICE HILL, K. C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.) MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K. C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K. C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## Page 648

*The Commissioner:* I am very anxious, Mr. Attorney, to bring this Enquiry to an end as soon as we can. I was thinking of sitting tomorrow.

*The Attorney-General:* Very well, my Lord, I do not mind. If your Lordship thinks so, certainly. The one difficulty which strikes me about the evidence - we have been considering it this morning and that is why I asked your Lordship to give us a few minutes - is that the Captain of the "Carpathia," whom we intended to call, cannot possibly be here until the week after next.

*The Commissioner:* So I understand.

*The Attorney-General:* I was going to suggest that we should go on, finish the evidence, and begin speeches, deal with the speeches notwithstanding that the Captain of the "Carpathia" has not been called. It would save a lot of time.

*The Commissioner:* Yes, certainly.

*The Attorney-General:* And then, my Lord, a further point that has occurred to me is, I would like to know, and I am sure your Lordship would like to know, what evidence is to be called, if any, by any of my friends. I have called everybody.

*The Commissioner:* I am afraid of asking those questions, for I shall be told to wait and see.

*The Attorney-General:* By this time, at any rate, I think your Lordship has waited and perhaps we might now see.

*The Commissioner:* I have waited, but I have not seen.

*The Attorney-General:* I wanted to know. I am not asking so as to bind anybody, but I think it would be of assistance. I am prepared to call anybody who can throw any light on the Enquiry for any of my friends, but I cannot call anybody merely at the request of either of my friends or any of them without knowing what it is the Witnesses are to say, because that would be useless.

*The Commissioner:* Now, if you will sit down, I will wait and see if anyone rises.

*Mr. Scanlan:* Speaking for myself and my clients, I do not purpose calling any Witness. I did make a suggestion to the learned Attorney-General with reference to one Witness whose proof I had sent to me yesterday. I leave it entirely in his discretion whether he calls that Witness.

*The Commissioner:* I have no doubt, unless he thinks there is some very good reason for not calling him, he will call him.

*The Attorney-General:* I intend to call him.

*Mr. Scanlan:* That disposes of me.

*The Commissioner:* You are my difficulty, Mr. Edwards.

*Mr. Edwards:* I am sorry, my Lord, to act purely as a bogey-man to your Lordship.

*The Commissioner:* I do not feel in the least resentful.

*Mr. Edwards:* I do not know quite what I said that should lead your Lordship to that conclusion.

*The Commissioner:* We will not argue that question. I want to know whether you want to call any Witnesses.

*Mr. Edwards:* I wish to ask your Lordship's guidance; I am not certain whether from the point of view of the Enquiry somebody ought not to be called from one or other of the registration societies like Lloyd's. If your Lordship thinks not, then I have no desire to call evidence.

*The Commissioner:* I think that we can get all the information we want. We shall find it all in the evidence that we have already had and the evidence which is to be added by the few Witnesses still to be called. Will you give me the 26th question and let me draw your attention to it. I want to read it with you, Mr. Edwards. "The Court is invited to report upon the Rules and Regulations made under the Merchant Shipping Acts 1894 to 1906 and the administration of those Acts and of such Rules and Regulations." Now I stop there for a moment, and then draw your attention to how that is cut down: "So far as the consideration thereof is material to this casualty." Now, if I thought that those words unduly cut down what we ought to do I should not regard them, but I do not think they do. I think they are very important words, and define our task as well as it can be defined; that is to say we are invited to report so far as the consideration of the Rules and Regulations and the Acts of Parliament is material to this casualty; "and to make any recommendations or suggestions that it may think fit, having regard to the circumstances of the casualty with a view to promoting the safety of vessels and persons at sea." Now, it seems to me, we are not intended - and I said some time ago that I should never be in a position to undertake the task - to enter upon an Enquiry and to report upon all questions affecting the stability and safety of ships. We cannot do that. We must limit ourselves to making recommendations, and they will be nothing but recommendation, upon the matters that really are relevant to the Enquiry into this casualty.

*Mr. Edwards:* May I say, my Lord, upon that that I am quite sure that your Lordship in coming to your decision, will be faced with what I will call the relation between the sinkability of the ship and the question as to the extent to which there should be boating accommodation. Quite an essential element in what I may call the sinkability of the ship problem, of course, is this question of the number and character and strength of the bulkheads. Of course, it will be possible, if I may say so with respect, for your Lordship to take cognizance of the fact that already an expert Committee has been set up for the

consideration of this problem of the bulkheads, and your Lordship may perhaps take the view that there is an insufficiency of evidence for you to come to an absolute and definite determination here on the question and may rather leave it open to that Committee. If that were so, I think that probably it would, if I may say so with respect, be inexpedient to go very extensively outside the evidence already obtained into the question of bulkheads, and, therefore, into the question of calling Witnesses from Lloyd's.

*The Commissioner:* That is the view I tried to express some days ago to the Attorney-General, and I requested him to limit the evidence to what I called evidence of a general character and not to attempt to go into detail, because I do not think this is the right tribunal to deal with questions of detail. They will be dealt with, I hope, and I expect, by the Committee that has been already appointed.

*Mr. Edwards:* Perhaps it is not quite the right moment, but as it will probably save time, may I suggest that your Lordship should consider with your Assessors a suggestion that the terms of Reference to this Advisory Committee which has been set up should be extended so as to consider the relation of boating accommodation with regard to bulkheads and sinkability.

*The Commissioner:* I think I have heard them, but I do not remember the Terms of Reference to that Committee.

*Mr. Edwards:* The Terms of Reference are, my Lord, to advise - "(1) As to what in their opinion would constitute efficient subdivision with regard to each of the classes of vessels included in the Rules for life-saving appliances, made by the Board of Trade under Section 427 of the Merchant Shipping Act, 1894, having due regard to the nature of the service in which they are respectively engaged, and, whether, independently of the foregoing, the Committee desire to make any recommendations with reference to the subdivision of vessels already built, or of new vessels, which would, in their opinion, contribute to the safety of life at sea." I very much doubt whether those Terms of Reference are wide enough to allow them to consider or to deal with what I will call the relation of boating accommodation to sinkability.

*The Commissioner:* There appears to be a good deal in that, Mr. Attorney. I think there is a good deal in what Mr. Edwards says, that it is desirable that the Committee which is to Enquire into the question of bulkheads should, as a question pertinent to that one, enquire also into the provision of life-saving apparatus. You will, perhaps, think about it. *The Attorney-General:* Yes.

## **Page 649**

*The Commissioner:* I will not ask you to answer the question now.

*The Attorney-General:* I quite appreciate what your Lordship means.

*The Commissioner:* I suppose the Board of Trade fixed the Terms of Reference to that Committee?

*The Attorney-General:* Yes.

*The Commissioner:* If the Board of Trade see no objection to it, I should myself like to see the Terms amended by including the matter mentioned by Mr. Edwards.

*The Attorney-General:* It is sufficient if your Lordship says that unless there is some insuperable objection of which I do not know at the present moment.

*The Commissioner:* Then, Mr. Edwards, I understand that neither you nor Mr. Scanlan will call any evidence?

*Mr. Edwards:* That is so, my Lord. There is one point I ought to clear up. I inadvertently, I am afraid, rather misled the Court the other day. In the mass of evidence it is a little difficult to tell what has come formally before the Court and what has come before me in another form, and I did say that Barrett in his evidence, as far as I remember, had spoken about a hole being bored in a watertight compartment between sections 5 and 6. That was not given in evidence. I have caused very careful enquiries to be made, and even supposing the statement to be correct, I am given to understand it would not in the least degree interfere with or detract from the strength of that bulkhead as affected by the fire.

*The Commissioner:* Very well. Then, in any event, it becomes immaterial.

*Mr. Edwards:* Yes.

*The Commissioner:* Now, do you desire to call evidence, Mr. Harbinson?

*Mr. Harbinson:* No, my Lord. I have considered this question very carefully, and the survivors of the class I represent are in America, and, of course, it would, under the circumstances, be impossible for me to call evidence. I shall confine myself to comment.

*The Commissioner:* That is sufficient.

*Mr. Laing:* Sir Robert Finlay mentioned to your Lordship some time ago that we had two Captains, simply about the practice of navigation, and one of them is important, because he was navigating at about the time when this accident happened.

*The Attorney-General:* Will he be here on Monday?

*Mr. Laing:* Oh, yes.

*The Commissioner:* I do not see Mr. Dunlop here, who represented the "Californian."

*The Attorney-General:* May I say this with reference to that, because that brings us to another point which I was going to raise at the end of the evidence, but I might raise it now, because it is convenient. There are questions, and at the end of the evidence, according to the practice, it would be my duty to submit to your Lordship any further questions which ought to be put in addition to those I placed before the Court at the beginning of the Enquiry. According to my view at present - and I do not think anything is likely to occur which will alter it - the only question which should be added is one relating to what I may call compendiously the "Californian" incident. There is no question in the twenty-six before you which would cover that. It does occur to me and to my friend the Solicitor-General associated with me in it, that it is important that the question should be specifically put and that your Lordship should take it into account, and that it ought not to be passed over merely as a matter throwing some general light upon the Enquiry. It has been already examined into, and my friend Mr. Dunlop has been here representing the "Californian," and, therefore, we ought to put the question and ask your Lordship to answer it.

*The Commissioner:* Quite so. I do not suppose I have any jurisdiction to direct that the Captain's certificate should be interfered with?

*The Attorney-General:* No, I think that only arises in a collision between two vessels. Then there is jurisdiction.

*The Commissioner:* Assume that I take a view adverse to the conduct of the Captain of the

“Californian,” all I can do is to express an opinion about it?

*The Attorney-General:* Yes. What we were going to ask your Lordship to do was to express your view upon the evidence which you have heard, and to give us the benefit of your

Lordship’s conclusions of fact.

*The Commissioner:* Quite.

*The Attorney-General:* And then we shall be able to consider it.

*The Commissioner:* I think that disposes of that.

*The Attorney-General:* May I say one thing more with the object of clearing the ground? I say this with special reference to my friend Mr. Duke and his appearance in this Court, which your Lordship will remember, for Sir Cosmo and Lady Duff-Gordon. The view I take of that incident, as I indicated to your Lordship before I called the Witnesses, is that the conduct - I am not making any comment upon it - of Sir Cosmo and Lady Duff-Gordon is quite immaterial in this Enquiry. The only point of calling them was that it threw some light upon a suggestion which might appear to underlie or might underlie one part of Hendrickson’s statement about the bribery not to go back; therefore, it became very essential to call them; and the only way in which I propose to comment upon their evidence or deal with it is, not in reference to any personal part, neither to ask for nor to express any opinion whether they were right or wrong in the view they might have taken, but only to use it in reference to the conduct of the man in charge of that boat, Symons, and that only in connection with the boats which we have to deal with both generally and specifically. That particular boat, of course, must form the subject of a good deal of comment and a good deal of criticism. It is only in reference to that I wish to say anything. I say that now so that my friend Mr. Duke, who appeared for them, may know that, so far at any rate as I am concerned, I intend to make and shall make no further comment or criticism upon Sir Cosmo and Lady Duff-Gordon.

*The Commissioner:* Well, I have been thinking about it also, and at present I am of opinion that I am not required, and ought not to express opinions upon the conduct of individuals in the position of passengers.

*The Attorney-General:* Quite.

*The Commissioner:* Different considerations may arise with reference to Mr. Ismay.

*The Attorney-General:* Yes.

*The Commissioner:* I will say nothing about that at present. There is one other matter. I wish to know in what order you intend to address me.

*The Attorney-General:* The practice is that I should address you last. I have been thinking about it and considering whether any useful purpose would be served if we departed from that practice. My view is that we should save no time, but, on the contrary, in the end probably it would take more time, there would be a greater expenditure of time if we departed from that course, because, as your Lordship sees, the questions which have been put and which are in writing state quite clearly what the points are to which my friends representing the various interests would have to direct their observations and arguments to your Lordship. I was thinking of this to see what assistance could be given

to the Court, and whether there was any useful purpose in departing from the usual practice. If I were to sum up the whole of the evidence the difficulty would be that upon that we should have, no doubt, argument as to the inferences which were to be drawn by my friends in reference to their various clients; and then, of course, I should have to reply to that, and that would mean again going through the evidence. Therefore, that seems to me the proper course to follow, subject to anything your Lordship may say; I am not intending to state any definite view that I take about it, except that, as the result of consideration, that is the conclusion I have arrived at. Then my friends will, in the ordinary course, and I think in the order in which they have been

## Page 650

conducting the Enquiry so far as their clients are concerned, address your Lordship, and only, of course, in reference to the particular interest which they do represent; and then Sir Robert Finlay will address your Lordship for the White Star Company - he knows exactly what points are raised by us - and then I should have to sum up the whole case, because I have to deal, of course, with the twenty-six questions. I think that would be the proper course to take. *The Commissioner:* Well, I am not sure that you are not right. It occurred to me that it might be convenient that I should hear you first, and that I should hear the others afterwards, finishing with Sir Robert Finlay, and then that you should reply.

*The Attorney-General:* I think your Lordship would find that it would take up much more time than the other way.

*The Commissioner:* I would very much rather take your guidance in that matter than my own. *The Attorney-General:* We have considered it carefully, and my impression is it would be more useful that we should follow the usual course, and certainly it would save considerable time.

*The Commissioner:* Very well, I daresay that will inflict no hardship upon the other people. *Mr. Laing:* I was just considering that. Sir Robert Finlay will address your Lordship upon the points that appear to him to be relevant, and then the Attorney-General will reply, and if that practice is pursued we shall have no reply.

*The Attorney-General:* It is the invariable practice.

*The Commissioner:* That is why I suggested it would be convenient if the Attorney-General began first, and finished.

*The Attorney-General:* I do not understand why the invariable practice should be departed from.

*The Commissioner:* I do not know what it is.

*The Attorney-General:* I am telling your Lordship, and you will find it both in the statute and in the Rules and Regulations.

*The Commissioner:* Is there any one here who knows the procedure?

*The Attorney-General:* It is provided for; there is no question about it. I referred to it in opening, but I will give your Lordship the reference again. It is the invariable practice, and it is also the prescribed practice.

*The Commissioner:* Oh well, if it is the prescribed practice that is an end of it.

*The Attorney-General:* We have been following rather a convenient course in this case of adopting your Lordship's suggestions; but it is provided for. I will call your Lordship's attention to it a little later.

*The Commissioner:* Mr. Laing knows all about this?

*Mr. Laing:* Oh yes, I know the usual practice.

*The Commissioner:* Is that the usual practice?

*Mr. Laing:* Oh yes, as a Rule; when these enquiries are conducted into wrecks and so on, charges are formulated against particular people and the Counsel representing the particular people know what to deal with; but, so far as I understand these twenty-six questions, there are no specific charges made at all.

*The Commissioner:* Oh yes - not in the shape of a charge, it is true, but questions are asked which point to my possibly deciding that you have been guilty of negligence in the matter of speed and in the matter of look-out, and, possibly, in the matter of track

*Mr. Laing:* That is quite clear; I have no difficulty about that; but what I have in my mind is that the Attorney-General suggested the other day, in a discussion between him and Sir Robert Finlay, that he was going to make (I think his words were) strong comment on the conduct of Mr. Ismay.

*The Attorney-General:* I did not use those words.

*Mr. Laing:* I am not quite sure what the words were, but he indicated he was going to put forward some charge against Mr. Ismay, and was going to ask the Court not to accept his evidence. That is how I understood the words which fell from my friend, the Attorney-General.

*The Attorney-General:* Not quite that.

*Mr. Laing:* Of course, it would be very desirable we should know what is going to be said before Sir Robert has to deal with it.

*The Attorney-General:* I remember the passage perfectly well.

*The Commissioner:* I remember it, too.

*Mr. Laing:* May I read it?

*The Attorney-General:* My Lord says he remembers it, and so do I.

*The Commissioner:* And if it is any consolation to you, Mr. Laing, I do not think there was very much in the point.

*Mr. Laing:* I do not think I shall offer any further opposition to the course suggested to be adopted.

*The Attorney-General:* All I wish to guard against is, whatever comment I am going to make I have suggested in the course of the case. What your Lordship will think of it you will determine when you have heard it, but my friend, Mr. Laing, must not take this course; he must not, in consequence of what your Lordship said, say, "Very well, I will take no notice of it," and then, when I come to deal with the case, if your Lordship thinks anything of it, say that he has not had notice of it. That is the point.

*The Commissioner:* Oh, no, the notice was clearly given a few days ago by you.

*The Attorney-General:* Quite.

*The Commissioner:* And, therefore, there is ample notice.

*The Attorney-General:* If my friend wishes it, I have no objection, we will put a specific question in regard to Mr. Ismay.

*The Commissioner:* No, no.

*The Attorney-General:* But it did not seem to be necessary, because what I have to say is covered entirely by the questions.

*The Commissioner:* After all, the question of the conduct of Mr. Ismay is only material to the extent to which he was said to have improperly influenced the conduct of the Captain. *The Attorney-General:* Yes, and so far as it affected the navigation of the ship, and what was done on the ship. I will say at once, so that my friend may know, that I am not going to make any comment with regard to Mr. Ismay's conduct in leaving the ship on the boat at that particular moment. I make no observation, and I intend to make no observation with regard to that. I only say this, that I think it is always a very difficult thing to determine in the special circumstances whether or not he took the right course; and I rather suggest also, with respect, that it involves considerations which are not quite those which ought to guide the Court in this Enquiry.

*The Commissioner:* I absolutely agree with you.

*Mr. Laing:* After what my friend has said I think Sir Robert Finlay will have ample grounds on which he will be able to address your Lordship before my friend, and, therefore, I offer no further opposition.

*Mr. Edwards:* With this one consideration, my Lord. It is said by the Attorney-General that there is no reason why there should be any departure from the ordinary practice in relation to these Enquiries; but there is this distinction between this Enquiry and others, which I would suggest to your Lordship, and that is this, that not only is there a question here of the conduct of the owners of the "Titanic," but there is also a question here as to the conduct of the Marine Department of the Board of Trade. Now, the learned Attorney-General is here, of course, in a dual capacity. He represents the Board of Trade, as he represents those who are responsible for formulating the charges. Now, I do suggest if he does not begin the address to your Lordship on the general question, he at least ought to be in the position of addressing your Lordship on behalf of the Board of Trade, so that those of us who stand in a position somewhat adverse to the conduct of the Marine Department of the Board of Trade should have an opportunity of replying to whatever defense is set up.

*The Commissioner:* I do not think I should allow that, Mr. Edwards. I regard you and Mr. Scanlan

## **Page 651**

and various others - but you two mainly - as the accusers of the Board of Trade, and I shall expect you to put forward your case against the Board of Trade, and to explain to me what it is you allege against the conduct of the Board of Trade, and the Attorney-General will deal with that, not in the spirit of an advocate for the Board of Trade, but as a man trying to assist me, and nothing else; and I think, myself, if I may say so, that he has taken that course, so far, quite impartially.

**ALFRED YOUNG, Recalled.**

(*The Commissioner.*) You were to bring us something this morning? - Yes, a recommendation of mine made from Liverpool.

During the tenure of office of Sir Alfred Chalmers? - Yes, my Lord.

Have you got it? - I have it here.

Is it very long? - No, not at all.

Then perhaps you will read it? - Before I read that letter, may I have your permission to read the original letter from the Board of Trade desiring me to make these recommendations?

Yes. - The Minute runs thus: "The Board have under consideration the question of amending the present requirements of the Statutory Rules for life-saving appliances as regards the boats to be carried on passenger steamers of over 12,000 tons gross. The amendment would consist of an extension of the Table in the Appendix to the Rules specifying the boats to be carried under davits on vessels up to 50,000 tons gross and over."

What is the date? - The 18th February, 1911. "It is suggested that the extension should proceed by divisions of 5,000 tons as indicated on the accompanying sheet, and Captain Young is requested to be so good as to indicate on the sheet a draft of the extension which he considers would be practicable, and would provide in a satisfactory and reasonable manner for the conditions of the large passenger steamers. It is not intended that the boat capacity on vessels included in the extension should necessarily increase in a regular proportion according to the increase in tonnage, the object being rather to arrive at a scale which may be regarded as satisfactory, but will also be entirely practicable and reasonable. Attention is also directed to the Rule of 19th April, 1910, as to the stowage of boats required to be placed under davits." That was a Rule allowing one-fourth of the boats that the Table required to be placed under davits to be carried inboard abreast of the davits. "It will be borne in mind that the capacity of the additional boats or rafts required to by Clause (*d*) of Division (A.) Class 1 of the Rules is governed by the capacity of the boats required to be placed under davits. Captain Young is also requested to furnish the Board with his views generally on the question of the boat capacity which should be provided on these large vessels taking into consideration the present methods of ship construction, the filling of watertight compartments, the provisions of separate boat decks and winches, and any other point which may be regarded as bearing on the subject." That is a letter addressed to me by the Marine Department of the Board of Trade when I was in Liverpool and desiring me to reply.

Signed by whom? - Signed by the Assistant Secretary, Sir Walter Howell.

#### **Further examined by Mr. SCANLAN.**

Is this a circular letter sent to all the superintendents? - It is a circular letter individually sent on separate Minutes, not to superintendents, but to certain of the Principal Officers of the Board of Trade.

I suppose everybody replied as you did? - They replied practically in the same way.

*The Attorney-General:* There are three. Two were asked besides this Witness.

*The Commissioner:* At what ports; this gentleman was Liverpool.

*(The Attorney-General.)* I can only tell by the names, Captain Parke and Mr. Harris.

*The Witness:* At Liverpool, London, and Glasgow.

*(Mr. Scanlan.)* You advised from Liverpool? - Yes. 23356. From your experience at Liverpool? - Yes.

23356a. Now, what did you advise? - My letter runs thus: "3rd March, 1911. - Sir, - I have indicated on the above minute, as desired, what I consider a reasonable addition to the scale for boats hitherto provided for by the Rules. It may at first sight be thought that the increase recommended is too small to be satisfactory, but various considerations have led me to fix upon the proportions shown. It occurred to me that it is manifestly impracticable to provide boats sufficient in number and capacity to accommodate the entire number of passengers and crew that the modern large liner can carry. Owing to the enormous expense involved in running such high-speed steamers as the 'Lusitania' and 'Mauretania' shipowners are arriving at the conviction that new vessels - particularly for the North Atlantic service - should be of less speed and carry more cargo, and it may be, therefore, that vessels of the type and size of the 'Olympic' may be of 50,000 tons gross, and more, and yet carry fewer passengers and crew than vessels of 20,000 tons to 30,000 tons gross. The question may also be viewed in conjunction with the Manning Scale for Emigrant Ships, as of what avail would a large number of boats be if there were not enough deckhands to properly tend them when launched in an emergency, i.e., not enough seamen trained to pull an oar and to steer? But even supposing there were enough sailors to man the boats, assuming for this purpose a proportion of firemen and stewards able to handle an oar, the question still remains - what number of boats would be deemed reasonable, and why should any particular number above the present scale be deemed necessary - seeing that the 'Lusitania,' say, has been running for some time provided with boats sufficient only for 978 persons, leaving about 2,000 persons unprovided for save by lifebelts? Taking it for granted, however, that a considerable number of persons must be excluded from the boats under any circumstances, what we have to do apparently is to seek for a number of boats which will afford a greater assurance of safety to the travelling public. While the scale as it stands requires vessels up to 10,000 tons to provide boats which may be regarded as fairly adequate for the number of persons usually carried on such vessels, it should not be lost sight of that vessels greatly exceeding this tonnage have at present unintentional preferential treatment due to the sudden termination of the scale, and from a competitive point of view are bound to score over the vessels of scale tonnage, and this in itself apart from other considerations, shows the need, I think, for an extension on reasonable lines. By the additions to the scale herewith submitted I have endeavoured to meet this point as well as the primary one of ensuring means of safety for a greater number of persons. For this purpose I have drawn up the comparative statement (attached) of the number of passengers and crews usually carried on vessels of different tonnages by which it will be seen that the greatest increase in the total number of persons carried is apparently in vessels ranging between 15,000 and 25,000 tons, hence the greater increase in boat capacity suggested for vessels between these tonnages."

*(The Commissioner.)* That is 25,000 tons? - Between 15,000 and 25,000 tons, my Lord, that is where we find the greatest number of passengers are carried. "Following this line

of argument and referring also to my remarks, page 1, last paragraph, it appears natural to recommend a smaller increase to the number of boats to be

## Page 652

provided after 30,000 tons has been reached, and I think I am to some extent justified in assuming the probability that vessels in the future exceeding a size of 30,000 tons will increase their cargo-carrying capacity in greater proportion than their passenger accommodation. In consideration, however, of the comparatively small increase in the number of boats suggested for the extension of the scale, I have had in view the desirability that a condition should be attached making for such a construction of watertight bulkheads as will effectually resist the greatest pressure of water that such bulkheads would be liable to with a compartment full of water and the ship down by the head or stern. It will be seen in the comparative statement referred to that if the total boat capacities there shown are divided by the total number of persons on any vessel we have with few exceptions a quotient say of 5 cubic feet per person carried. However, this figure is a result rather than a basis for calculation. In any scale," I desire particular attention to this, "in any scale however that can reasonably be applied to the larger passenger vessels, there must usually be a large number of persons on board for whom there can be no boat accommodation, and therefore subdivision of the ship into real effective watertight compartments must be, in my opinion, the main factor to be relied on. Finally, in order to prevent abnormally-sized boats being placed under davits in an effort to cram the entire capacity required into the number of boats that a vessel must have under davits, I submit that a Rule might be made by which only one-half of the additional capacities shown in the threefourths column may be allowed to be included in the boats which a vessel must carry under davits as per scale. Any other boats which might be needed to contain the balance of the threefourths column may, of course, be placed abreast any of the davits as convenient. I may mention here that the 'Lusitania' and 'Mauretania' have their entire capacities made up in 16 boats, each with a length of 30 feet and equal to 600 cubic feet; they are very heavy, and difficult to handle. I further submit that those boats which may contain the three-fourths additional capacity should not be larger than 500 cubic feet, as it is very desirable that boats not regarded as being under davits should be of such a size as to be fairly readily shifted, and any boat longer than 28 feet would be cumbersome under such circumstances." That is the letter of recommendation that I sent to the Marine Department on March 3rd.

(*Mr. Scanlan.*) I think you said you had indicated on a Minute what increase you were to recommend, or the scale. Have you the scale? - Yes, I have it here.

What did you recommend in the scale for vessels of 45,000 to 50,000 tons gross? 23360.

(*The Commissioner.*) I do not understand his scale went that far? - Yes, my Lord, I attached a scale.

I thought you limited your consideration to vessels of 25,000 tons? - No, my Lord, that was in a comparative statement which I attached, showing how it was that although the tonnage of a passenger ship might very largely increase, it did not follow that the number of passengers increased in proportion, and, consequently, I made this table out to show that between 15,000 and 25,000 tons gross the

passengers carried were at a maximum. After 30,000 tons they decreased, relatively.

At a maximum compared with the tonnage? - Yes.

*(Mr. Scanlan.)* These are the reasons for the recommendations you made. What were your recommendations for ships of the size of the "Titanic"; how many boats in the first place? - For a vessel of the tonnage of the "Titanic" say from 45,000 to 50,000 tons gross, twenty-four boats under davits.

*(The Commissioner.)* Of what capacity? - With a capacity of 10,900 cubic feet. How much is that?

*Mr. Scanlan:* What cubic capacity for each boat?

*The Commissioner:* About 500, is it not.

*(The Attorney-General.)* Rather less.

*The Witness:* 454.

*(The Commissioner.)* Twenty-four boats under davits with a cubic capacity of 10,900 feet? - Yes.

What else did you reckon? - Then there would be the three-fourths additional to go on to that, which would bring it up to 19,075 cubic feet.

As much as that? - Yes.

*(Mr. Scanlan.)* You allowed three-fourths, regardless of the boats to be carried, to make up that three-fourths - collapsibles or rafts, or whatever the Board of Trade would approve of? - Yes.

But what would have been provided if effect had been given to your recommendation? There would have been lifeboat accommodation for 1,975 persons. Am I correct? - 1,090 for the 24 boats actually under davits.

Yes, and with the three-fourths additional? - Then we should have a space for 1,907 persons. That is up to 50,000 tons gross. Then for 50,000 tons and upwards, 26 boats, with a capacity of 11,000 cubic feet.

*The Commissioner:* You need not trouble about that.

*Mr. Scanlan:* No, my Lord. *(To the Witness.)* Can you give us the views expressed by the other officers. Two other officers were appealed to besides you.

*(The Commissioner.)* Let me be clear about this. Do the figures you have just given us relate to boats of 45,000 or to 50,000 tons? - 45,000 tons to 50,000 tons.

Then the figures relate to boats of 45,000 tons? - Yes, they do, from 45,000 to 50,000.

And therefore would relate to a vessel of the size of the "Titanic"? - They would, my Lord, yes.

*(Mr. Scanlan.)* Now, with regard to the other recommendations made, from London and Glasgow. Perhaps you will tell me how their recommendations compare with yours, if you can give us the figures? - I have not got the figures here. But I may as well say that the London Principal Officer agreed very fairly with these figures, but the Glasgow Principal Officer was considerably below.

*The Attorney-General:* I will have these documents got, the reports of the other officers. I had not intended to call them, and I do not think it is any use to call them, because the only point is what report they made.

(*Mr. Scanlan.*) I will take it that one officer agreed with you, and the estimate of the other was lower. Now on those reports what happened, to whom were they submitted? - They were submitted to the Assistant Secretary of the Marine Department and also from him to the Professional Advisor.

(*The Commissioner.*) Will you give those gentlemen's names? - Sir Walter Howell and finally to Sir Alfred Chalmers.

(*Mr. Scanlan.*) Have you the minute relating to the submission of those reports and stating what effect, if any, was given to them? I want to know how those reports were dealt with? - They were commented upon by the professional member, Sir Alfred Chalmers, and it was decided to make certain recommendations to the Advisory Committee; but in order to give the Advisory Committee a free hand and get an unbiased opinion, which would assist us in the matter, we did not deem it desirable to hand on the reports of our officers.

I want to know what those gentlemen you have told us of decided on those reports? - The Advisory Committee or the Department?

The Department of the Board of Trade? - As I say, they decided that it was a matter which should be submitted to the Advisory Committee.

You agreed to produce the minute. Does the minute which you were asked to produce and which I understand you have there? - Yes.

## **Page 653**

Contain the decision of those gentlemen? - I do not think it does; no, I have not it on these minutes.

(*The Attorney-General.*) I think I have it. Just look at this. It looks to me like Sir Walter Howell's initial, 24th March, beginning: "We may now send this matter to the Advisory Committee" (*Handing same to the Witness.*)? - Yes, this is quite correct. This is the minute dealing with the matter.

(*Mr. Scanlan.*) Read to my Lord the portion of the Minute which gives the decision arrived at by Sir Alfred Chalmers and Sir Walter Howell on this matter, on the report submitted? - Certainly. On the 24th March, 1911, Sir Alfred Chalmers wrote: "I have gone carefully into all these reports and tables submitted by Mr. Archer and the Principal Officers of Liverpool, London and Glasgow, and on full consideration of all the particulars, and bearing in mind that the scale of the original Life-saving Appliances Committee, which was required to be extended, should be extended consistently and with due regard to the capabilities of the large ships, which do not increase at all in proportion to the increase of tonnage, I am of opinion that the scale submitted by the Principal Officer of Glasgow should quite meet the necessities of the case" - 23385. (*The Commissioner.*) That is the smaller scale? - Yes.

*The Commissioner:* Therefore, it is a little important that we should know what that gentleman did recommend.

*Mr. Scanlan:* I was going to ask for that now.

(*The Attorney-General.*) Let him finish what he is reading first.

*The Witness:* "And should be the one submitted to the Advisory Committee for their guidance. As it is framed, it is entirely consistent with the demands made on vessels of smaller tonnage which at present work out so that the full boat and raft capacity required by the scale is equal to about 50 percent of the persons carried when full of emigrants and cabin passengers and with the full crew. For instance, the 'Corsair' and 'Zeeland,' both of just over 11,000 tons gross, are, by the present scale, fitted to carry boat and raft capacity which is equal to a little over 50 percent of the number of persons carried. According to the extended scale, as proposed, the 'Adriatic,' of 24,500 tons, the 'Lusitania,' of 31,500 tons, and the 'Olympic,' of 45,000 tons will also have boat and raft capacity equal to a little over 50 percent of the number of persons carried. We should also suggest the advisability of recommending the revision of Rule 12 in the direction of exempting those vessels which are subdivided in accordance with the Bulkhead Committee's Report from carrying any of the additional boats and rafts, as in such subdivision there exists far greater safety than increased boat capacity. With regard to what is said in the reports of the Principal Officers in the matter of extending the manning scale of emigrant ships under Section 305 of the Act, as soon as the Advisory Committee have dealt with the boat capacity scale and the Board have decided to adopt a certain amended scale, we can then deal with the re-arrangement and extension of our present manning scale, which should be done on the lines laid down by Captain Parke." Captain Parke was the Principal Officer for London. This Minute was passed into the hands of the Assistant Secretary of the Marine Department, Sir Walter Howell, who wrote: "We may now send this matter to the Advisory Committee"; and then it is dated March 24th. Sir Hubert Llewellyn Smith signed it on the 28th of the same month, 1911.

*(The Attorney-General.)* Will you let me have that? - Yes. *(Handing same to the Attorney-General.)*

*The Attorney-General:* We will have the tables printed in a convenient form, so that they may be on the Notes.

*(Mr. Scanlan.)* Have you the scale recommended by the Glasgow Officer? - I have not. You will produce it? - It can be produced certainly.

*Mr. Scanlan:* Perhaps it will be sent for and produced - the scale recommended by the Glasgow Officer.

*The Attorney-General:* I think I have it; I will read it.

*The Commissioner:* This is Glasgow.

*(The Attorney-General.)* Yes. *(To the Witness.)* Mr. Harris is Glasgow? - Yes. *The*

*Attorney-General:* The 45,000 to 50,000 tons is the only one material at the present moment. The minimum number of boats to be placed under davits is eighteen; total minimum cubic contents of boats placed under davits 9,700 feet.

Then under davits plus additional boats 16,975 cubic capacity. That is, of course, with the addition of the supplementary three-quarters.

*The Commissioner:* That would be sufficient for about 1,700 lives.

*The Attorney-General:* Yes, about.

*The Commissioner:* This gentleman's figures make provision for about 1,970 lives? 23391. *(Mr. Scanlan.)* 1,907? - Yes.

*The Attorney-General:* If you would like it on the Notes -

*Mr. Scanlan:* I think I should like it on the Notes.

*The Attorney-General:* Certainly.

*The Commissioner:* Then, Mr. Scanlan, there is a suggestion that if the bulkhead requirements were complied with, the three-fourths might be given up.

*Mr. Scanlan:* Yes.

*The Commissioner:* And if you give up the three-fourths, then you get the boat accommodation

considerably below the boat accommodation that existed in the

“Titanic.” *Mr. Scanlan:* Very considerably, my Lord.

*The Attorney-General:* Eleven thousand three hundred and twenty-five cubic feet capacity was actually supplied; providing for 1,178 persons, as against 9,625 cubic feet, which would have been the required provision. I am not quite sure whether you are right when I look at Captain

Parke’s table, which I am going to read. Your Lordship has so far Captain Young’s and Mr. Harris’s. The only other one which is wanted now of the three to whom the letter was sent is Captain Parke’s. That is London. His table for vessels of 45,000 to 50,000 tons is: Minimum number to be placed under davits 26 boats; total minimum cubic contents of boats placed under davits 9,500; and with the additional three-fourths 16,625. That seems to be a little less with a larger number of boats.

*The Commissioner:* But of smaller capacity.

23392. (*The Attorney-General.*) Yes, and carrying therefore less persons. I only want to call attention to it, because Captain Young said it was Glasgow which required the least. It was so in the number of boats, but not apparently the number of persons to be accommodated? - No, though there was not much difference.

*Mr. Scanlan:* I ask as I look upon those documents as important, that we should have them on the Notes.

*The Attorney-General:* I have already said that I would have the Tables of these three persons put on the Notes so that they shall be available for everybody in the case.

*Mr. Scanlan:* I am obliged.

*Mr. Edwards:* And the Reports themselves?

*The Attorney-General:* If you like, but I think that is too much.

*The Commissioner:* The points have been read, and you will find what has been read will be on the Notes.

*Mr. Edwards:* I thought they were only passages from the Reports.

*The Commissioner:* I understood the whole Report had been read.

*The Attorney-General:* My friend is right in this, that the only Report which you have had read is Captain Young’s. You have not had the letters and Report of Captain Parke and Mr. Harris. We will have the Tables, and I daresay it will be convenient to have, and I will have, the whole three printed with the proper Table appended.

*The Commissioner:* Very well, but we do not want them read now.

(*Mr. Scanlan.*) It appears that the only report submitted to the Advisory Committee was the report submitted by Mr. Harris? - Yes.

Can you tell me when this report was submitted to the Advisory Committee? - On the 29th March, I think. It is on the Minutes.

Do you find in any of the reports any suggestion that the additional three-fourths under Rule 12 should be dispensed with?

(*The Attorney-General.*) I have a document here which looks to me like the document. Will you just see? This seems to be the letter (*Handing letter to Witness.*) - That was sent on the 3rd April.

(*Mr. Scanlan.*) Whose letter is that? - It is the letter from the Marine Department signed by Sir Walter Howell to the Advisory Committee in consequence of those reports. That letter was sent to the Advisory Committee on the 3rd April, 1911.

Is it a short letter? - It is not very long.

That may be the letter that we have had already.

*The Commissioner:* No, I do not think so.

*Mr. Scanlan:* Perhaps you will read it, Captain Young.

*The Commissioner:* This is a letter of 1911?

*The Attorney-General:* Yes, that is right. I think we have had it read. It is the letter which really constitutes the reference to the Advisory Committee which reported in July of 1911. It is the first document on the typewritten paper that was handed up, I think. I remember seeing the table, at all events.

*The Commissioner:* This is the letter that had the effect of producing the document that Mr. Carlisle signed when he was soft.

*Mr. Scanlan:* Yes.

*The Attorney-General:* I read the letter out, and the memorandum, and it is one of the letters which your Lordship will find copied in its proper place in the memorandum which we are having printed. It would be convenient to everybody to get this while we are upon it, as your Lordship has not the document before you. Your Lordship will find when you look at that letter which I have now before me - it is important to note this - that no scale was sent to the Advisory Committee. What was sent was a skeleton, leaving columns blank for the minimum number of boats and for the minimum cubic contents. I only say this because it will, perhaps, recall it to your recollection. I pointed out that when they did come to report they had adopted a different gradation from the one which had been suggested in blank by the Board of Trade.

*The Commissioner:* Yes; and now will you remind me again of what the provision made by the scale recommended by that Committee was?

(*The Attorney-General.*) 8,300; and then, of course, came the question of the additional accommodation: 45,000 tons and upwards 16 minimum number of boats under davits, and an additional 8 to be readily available for attachment, and total minimum cubic content of boats required, 8,300. What did they advise about the three-fourths; it is paragraph 6?

*The Witness:* Yes, that is the one referred to in Mr. Carlisle's examination.

*The Commissioner:* That vessels divided into watertight compartments to the satisfaction of the Board of Trade should be exempt from the requirements.

*The Attorney-General:* Yes, that is the one as to which Mr. Carlisle said it came to the same thing; you add something to the 8,300, and then in vessels of this kind you take it off again by paragraph 6. So that it works out, according to that, that the requirement would be 8,300 - that you really ought to compare, comparing like with like, with the 5,500 in the table as it existed at that time and at present.

(*Mr. Scanlan.*) From the minute of Sir Alfred Chalmers and Sir Walter Howell your recommendation was, of course, not submitted to the Advisory Committee? - No; no recommendations were submitted to the Advisory Committee.

Except that of Mr. Harris? - No.

(*The Attorney-General.*) No, that was not. That is why I was anxious to correct it? - We desired to leave the Advisory Committee an absolutely free hand.

*Mr. Scanlan:* The only direction given was that they should have regard to ships which were divided suitably into watertight compartments.

(*The Attorney-General.*) I do not think they say that.

*The Witness:* There is no recommendation of that nature.

*The Attorney-General:* Not quite in that form. My friend is right in this. It left it open absolutely to them. "I am further to state that the Board would be glad to learn whether the Advisory Committee are of opinion that Rule 12 should or should not be revised so as to exempt altogether from the requirements of additional boats and/or rafts those vessels which are divided into efficient watertight compartments to the satisfaction of the Board of Trade." They answered that by paragraph 6 of the report.

(*Mr. Scanlan.*) When you came to occupy your present position in the Board of Trade, did it come within your province to give any decision as to the number of boats which were actually carried by the "Titanic"? Was that matter referred to you? - No, it was not referred to me. 23405. Were you not the officer to whom it would be referred? - If it were necessary to refer it; had there been any doubt as to whether the vessel had complied with the existing requirements or not; not otherwise.

Were any plans at all submitted to you? - No.

No plans? - No.

Your opinion now in view of the "Titanic" accident is that a larger provision of lifeboats should be made. I take that from your evidence yesterday? - So far as it is practicable to carry it. 23409. And I think you have expressed the view that it is practicable in the case of a ship like the "Titanic" to carry a full complement of boats for all on board? - I do not say that.

*Mr. Scanlan:* "What is practicable," you said.

*The Solicitor-General:* "Reasonably practicable."

23410. (*Mr. Scanlan.*) What is the limit of practicability? - You would have to see what the arrangements of the boat deck were, and see what the space available was, and see whether it was essential in order to get the number of boats that you require stowed on that deck to pile them up indiscriminately one over the other, which is a practice the Board is extremely averse to. 23411. Will you tell me - and I wish you to be very short because I do not wish to detain the Enquiry - according to your view now, with the knowledge you have of the "Titanic" accident and of the construction of ships like the

“Titanic,” what provision do you think it would be desirable to make in the way of lifeboat accommodation in such a vessel? - I would certainly increase it considerably.

Give me the extent to which you would extend it. If you would not provide for all on board, for how many would you provide?

*(The Commissioner.)* Do not give us a guess about a matter of that kind. If you have not considered it, say that you have not considered it? - I have considered it.

Have you considered the number? - Yes, and I am still of the opinion that for all ordinary purposes, all ordinary cases of collision, which is what we are chiefly concerned with, she need not be required to carry more than about 50 percent. of the persons on board.

23414. Do you mean this, that notwithstanding the experience which you gained by the circumstances of this casualty, you think that the right thing to do for a vessel of this kind would be to carry lifeboat accommodation for 50 percent of the permitted number of crew and passengers? - I think, in accordance with the opinions I have formed and have had for some time, that for all ordinary cases of collision that would be sufficient, because I am relying upon the bulkhead system for ordinary cases of collision.

## **Page 655**

I am asking you something more than that; having in view this particular casualty, would you increase the 50 percent? - I think I should be inclined to do so; I think it should be extended.

How much would you increase it? - I would extend it in accordance with the merits of the ship itself. If I could stow the boats on the boat deck, so that one boat would not impede another, so that the crew would have easy access to them, and there would be no impediment in getting them out, then I should say by all means have a considerable extension. I would not like to say what it is at the present moment, because it requires much consideration.

That is a question I should like an answer given to, if you have considered it? - I have considered it.

Then have you formed an opinion? - I have formed an opinion.

Then will you express it? - The opinion I have formed is this, that you require boats more for transfer purposes than for the saving of people on board.

I mean on the question of number, or percentage, if you like? - No, I have not decided upon that.

Never mind whether you have decided; have you formed an opinion? - Certainly I have.

Well, what is it? - That the boat scale should be considerably extended.

But how far; have you formed an opinion on that point? - Not exactly; no.

If you have not, then I do not want you to express any opinion. You know, what occurs to me is this (and it will be my difficulty, I can see, in this matter), that to provide boat

accommodation to the extent of 100 percent of the numbers carried, or permitted to be carried, as I would really say, might be a burden upon the shipowner, which would be unnecessary and extremely expensive; and I want to know whether that is true or not, because it is no use having boats without having men? - That is one of the considerations

which has prevented me from arriving at a decision in my mind, or an opinion as to the precise number of boats that a particular ship should have. It is on account of those side issues, which are very important, and the necessity, as you remark, of having a proper number of qualified deckhands to deal with them - all these points tend to prevent one making up one's mind at the present moment as to what should be a reasonable and proper increase. The danger of getting boats down from a height in ordinary Atlantic conditions is so great that it would be, in my opinion, absurd to pile the ship's deck up with a whole heap of boats that you could not possibly handle.

*(Mr. Scanlan.)* With all those considerations, what I gather to be at the back of your head is that there should be a considerable increase on what was carried on the "Titanic" for such boats? - By all means, yes.

But you have not formed a definite idea of the increase which you yourself would be prepared to recommend? - Quite so; it has to be thought out yet. We have to get the various reports in from the different Committees that are sitting at the present time dealing with the subject.

As to any increase in boat accommodation, is it necessary that an increase should be provided of the crew for manning those boats? - Oh, most decidedly.

*The Commissioner:* It is of no use having boats if you have not men to manage them.

*(Mr. Scanlan.)* I want to get from the Witness how he would make up the crews. *(To the Witness.)* How many seamen do you think it would be necessary to have on board for each lifeboat? - I would not have less than two - call them sailors or what you like. I would regard them as men qualified to deal with boats.

Do you speak of deckhands now? - Well, yes, certainly, to a great extent; but, at all events, two boatmen - I will put it in that way.

*The Attorney-General:* May I say with reference to what your Lordship said just now - that was an expression of opinion which I know is not intended to be final - of course, your Lordship is not shutting out, and I am sure your Lordship did not intend to shut out, the considerations of unduly encumbering the deck or of impairing the stability of the vessel in any way by making it tender. Your Lordship, of course, will take all that into consideration. You were, I think, dealing with one aspect of it, as I understand?

*The Commissioner:* Yes, one aspect - the commercial aspect - which, I think, is a very important one.

*Mr. Scanlan:* Yesterday, while the learned Attorney-General was not here I think a Witness was asked questions on tenderness.

*The Commissioner:* Yes, I did ask him a question as to the boats making the vessel tender. *The Attorney-General:* I know your Lordship had it in mind; I was only anxious to have it on the Note in order that it should not appear that it had been left out of consideration.

*The Commissioner:* Yes.

*(Mr. Scanlan - To the Witness.)* I think it is quite within your knowledge that the shipowners of this country have expressed their willingness to provide accommodation for all on board? - Yes, they have, certainly.

In one of the documents which you read today reference was made to the manning scale for boats? - Yes.

Do you think it is desirable to set up a manning scale?

*The Commissioner:* When you come to deal with it, Mr. Scanlan, you will have to remember that, in point of fact, only a comparatively small percentage of the space in the boats on the "Titanic" was used. What I mean is this: If you provide boats for every soul that can be carried by the ship, it does not at all follow that would be sufficient for the purpose of getting the people from the ship.

*Mr. Scanlan:* Of course, my Lord. That is the reason why I have insisted so much on the manning scale, on the question of efficiency and boat drill.

*The Commissioner:* But even the manning scale would be no good. I am satisfied - and I am not astonished at it - that a large number of people would not go into the boats. They preferred to stick to the vessel.

*Mr. Scanlan:* I have grave doubts as to whether any person who believed this was their last chance, and who had the knowledge which some officers must have had as to the condition of the vessel, would have refused to take that chance.

*The Commissioner:* Perhaps you do not know what ladies will do and will not do, sometimes. 23433. (*Mr. Scanlan - To the Witness.*) It appears from what you have read from Sir Alfred Chalmers that the consideration of the manning scale was postponed? - Yes.

Can you say why it was postponed? - No, I cannot very well, excepting that naturally the manning scale would depend to a great extent upon the boats that would be recommended.

Do you think it is desirable to set up a manning scale? - What for?

For the crews of ships? - What ships in particular?

All ships? - We have scales for emigrant ships. That is already dealt with, and that we have under consideration for extending.

That is what I want? - It is under consideration now.

You think it is desirable to extend it? - Undoubtedly, under certain circumstances; only, if you increase your boats, then you must extend your manning scale; that is a foregone conclusion.

But even without extending your boats you have not a manning scale applicable to the stokehold and engine room? - No, not absolutely; not a compulsory scale.

I want to ask you, then, without having a long discussion about it: Is it desirable to have an exact or fairly exact manning scale or standard that will apply not only to the deck department, but to the engine department as well? - We have that scale, which is adopted for the stokeholds of large passenger vessels already,

## **Page 656**

but it is not a compulsory scale, excepting that with regard to an emigrant ship, if the Emigration Officer finds there is not a sufficient number of men in the stokehold in accordance with our Rule of three tons or of 36 square feet of fire-grate surface, then he would naturally require more, and he has the power to enforce it.

But there are no figures and there is nothing set up in the nature of a scale to guide him what he should insist on? - Pardon me, but there is.

On a ship like the "Titanic" what is to guide him? - As to the number of men in the stokehold?

Yes? - I can soon tell you that.

*(The Commissioner.)* We are getting a little wide of the mark. There is no suggestion that there were not sufficient men in the stokehold? - We had this the other day, my Lord, that there should be one fireman for every 18 square feet of fire-grate surface in the boiler room.

*(Mr. Scanlan.)* How many would you think, according to that, for the "Titanic"? - I have not got the fire-grate surface at the moment in my possession.

*The Commissioner:* Have you calculated it, Mr. Scanlan?

*Mr. Scanlan:* I have been told that the number carried was adequate.

*The Commissioner:* Then I do not want to go into it.

*Mr. Scanlan:* What I am informed is that the figures given here on page 10 of this Minute of Instructions give no guidance whatever for deciding how many men should be carried. *The Commissioner:* Well, that may be, but in this particular case, the fact that there was no guidance does not seem to have mattered at all, because you admit, and it appears to be the case, that there was a sufficient number of firemen carried.

*(Mr. Scanlan.)* Yes. I do quite agree to that, my Lord. Of course, it is one of the complaints against the Board of Trade that they have failed to set up the manning scale. *(To the Witness.)* Now, I want to ask you this question. Has the Board of Trade made any regulation as to the speed which ships should be permitted to go at in fog or at night in the presence of ice? -

There is a regulation with regard to fog and rainy weather in the International Regulations: "The ship shall then proceed at a moderate speed." That is the only reference to speed there is. 23448. There is no regulation about ice, and travelling at night in the presence of ice? - No, that is left to the individual discretion of the Master. 23449. Is it desirable, in your view, as a seaman, that there should be such a regulation? 23450. *(The Commissioner.)* Have you thought about that? - I have, my Lord, but I cannot say that I have quite made up my mind yet as to whether we should insist upon having ice included in the International Regulations. But I do not think there would be any great difficulty in doing it.

In what? - In including it.

Will you suggest to me so that I may understand it, what the direction would be; put it into words? - That when a vessel is proceeding in fog or thick weather generally - I forget the exact wording of the article at the present moment - but ice could be included.

*The Attorney-General:* It is Article 29.

*The Commissioner:* I think it quite unnecessary for my own part, but would there be any objection to amending Article 16 so as to include ice, "Every vessel shall in a fog, mist, falling snow, or ice-field, or in presence of icebergs, go at a moderate speed."

*The Attorney-General:* There is a regulation in the International Regulations for preventing collisions.

*The Commissioner:* I think it would be useless, because it says nothing more than that the Captain shall be careful.

*The Attorney-General:* Article 29 says the same thing, as your Lordship remembers from your experience of the Admiralty Court, the one which says you must take precautions, and that nothing in the Rules will excuse you failing to take the proper precautions.

*The Commissioner:* If you are going to suggest that there should be something additional will you, Mr. Scanlan, express your suggestion on the point and let me know what it is?

*Mr. Scanlan:* What is pressed on my mind is, that to run a ship at full speed on a track in which ice has been reported, is bad seamanship, and likely to prove disastrous.

*The Commissioner:* That I can very well understand.

*Mr. Scanlan:* It exposes passengers and crew to very grave risk, and I would suggest that the recommendation, whatever it may be, should relate to the modification of speed in such circumstances. I am not prepared to say to what extent the direction should go, how specific it should be, but I think it is desirable that there should be some recommendation as to speed in such circumstances.

*The Commissioner:* Do you mean to say a recommendation that it should be moderate?

*Mr. Scanlan:* At least that, my Lord.

*The Commissioner:* Well, that the ship should stop? I do not know what it is to be, you know. *Mr. Scanlan:* Evidently with respect to fog there is a recommendation that the speed should be moderate.

*The Attorney-General:* That would be the International Regulations for preventing collisions; it would not apply to this.

*The Commissioner:* I understand your point, Mr. Scanlan.

*Mr. Scanlan:* A recommendation on the lines of the Instructions to Captain

Moore. *The Commissioner:* Captain Moore of the "Mount Temple," you mean?

*(Mr. Scanlan.)* Yes. *(To the Witness.)* Do you think it desirable to make men engaged in look-out work submit to an eye test and to qualify by an examination, such as is prescribed for masters and officers? - I do not think that it need necessarily be as searching. I think that some form of sight-testing for men on the look-out should be obligatory, just the same as you have for an engine-driver. But you do not require it to such an extent as in the case of an engine-driver or in the case of an officer, for the simple reason that the man on the look-out has to report a light, and the officer decides himself as to whether that is a red or green light. That is one of the reasons why a seaman need not be subjected to precisely the same test as an officer. There is no reason why he should not be asked to distinguish boats at a certain distance. That would be a sort of form vision test rather than colour.

Have you applied your mind to the question of the use of binoculars? - I have applied my mind to it to a certain extent, and I cannot say I have been altogether satisfied.

Do you think the look-out man should be provided with binoculars? - It is an additional safeguard and by all means let them have it.

*(The Commissioner.)* Is it an additional safeguard? - It is an adjunct, and it may be so considered, but it is not absolutely essential.

No, but is desirable. I should say at present that it is not, but you may think differently, and I want to know what you think? - I do not think differently, because in my experience of binoculars I have far oftener relied on the unassisted eye than anything else.

It occurs to me that a man in the crow's-nest has nothing to do with binoculars; he has to use his eyes and pick up lights and report them to the bridge, and the man on the bridge uses binoculars if he wishes. I should have thought instead of being an assistance it is a distraction to have binoculars? - It is to a certain extent, but there is another feature connected with it, that when a man is looking through his binoculars his field of vision is necessarily restricted. A man may frequently pass a dark boat with his binoculars which he would readily pick up if his eyes were open to a wider field, because he would

**Page 657**

have a greater expanse of the atmosphere, say, or the horizon, to compare the object with, which would give him a distinct lead.

(*Mr. Scanlan.*) After all that, is it your opinion that it is desirable to provide binoculars for look-out men? - No.

**Examined by Mr. CLEMENT EDWARDS.**

There is one point I want to get cleared up at once. As I understand from what you have read, your report went to the Marine Department of the Board of Trade together with a report from the London District Official, and the Glasgow District Official, and that Sir Alfred Chalmers made a note to the effect that only the Glasgow scale recommendation should go to the Advisory Committee? - No, he did not make a note of that sort. He only made a note to the Department to the effect that he preferred that - not that that recommendation was to go to the Advisory Committee.

What I want to get at is that he made a note suggesting that the only one of the scales - that is to say yours, Glasgow's, and London - was the Glasgow one which should go to the Advisory Committee? - That it should be considered under those circumstances, but it was not, as a matter of fact, sent to the Committee.

Would you mind giving me the note?

*The Attorney-General:* I have it. This is not the thing apparently sent, but it is what my learned friend means: "I am of opinion that the scale submitted by the Principal Officer for Glasgow should quite meet the necessities of the case, and should be the one submitted to the Advisory Committee for their guidance."

(*Mr. Clement Edwards - To the Witness.*) Is it within your knowledge or not that that scale, and that scale alone, was submitted by the Marine Department of the Board of Trade to the Advisory Committee? - No, I do not think it was submitted to the Advisory Committee. 23463. Can you tell me what is the scale that is referred to in the letter to the Advisory Committee?

*The Attorney-General:* Will you look at it? - I have read it. You have not the document before you. It is a blank scale. The scale is at the bottom.

(*Mr. Clement Edwards.*) If that is so, it is all right, but I want to get it quite clear. (*To the Witness.*) Then that apparently is the scale referred to? - Yes.

Do you, of your own knowledge, know whether the Glasgow scale was submitted to the Advisory Committee? - No, I do not think it was submitted to the Advisory Committee.

Do you know? - To the best of my recollection the Committee were not sent any particular scale from us, because, after consideration, it was decided - I am only going from the previous history according to my recollection - that it was not advisable to influence them in any way.

Let us be perfectly clear and precise upon this point. Do you, of your own knowledge, know whether, in accordance with that minute, the scale from Glasgow was submitted to the Advisory Committee? - No, I do not know.

Can you tell me who would know that? - Yes, Sir Alfred Chalmers would know.

*(The Commissioner.)* Will Sir Alfred tell us?

*Sir Alfred Chalmers:* No scale was submitted. Although I advised that in my minute, and conferred with Sir Walter Howell afterwards, and we came to the conclusion that it was much better to leave the Committee a free hand altogether, and send nothing but a skeleton scale. 23470. *(Mr. Clement Edwards.)* May I ask Sir Alfred this: Did you, or did any other official of the Board of Trade give any evidence at all before the Advisory Committee before they came to their conclusions?

*Sir Alfred Chalmers:* None at all.

*(Mr. Clement Edwards.)* That is to say, the Advisory Committee on their recommendation were entirely unguided and unaided by the Marine Department.

*Sir Alfred Chalmers:* Entirely.

*The Commissioner:* Do you complain of that failure, if it be a failure, on the part of the Board of Trade to advise the Advisory Committee?

*Mr. Clement Edwards:* Not after the view I have formed.

*The Commissioner:* Do you complain of it?

*(Mr. Clement Edwards.)* No, I do not complain of it. *(To the Witness.)* The recommendations of the Glasgow official which Sir Alfred Chalmers approved gave, for boats under davits, less cubic capacity than that which in fact was provided by the "Titanic"? - Yes. 23473. You have heard the evidence of your predecessor? - Yes. And you heard him say that in his view there was no single regulation of the Board of Trade that should be modified in the light of the "Titanic" disaster. That, I gather, is not your view? - No, that is not my view.

This term has been used, and I suppose you regard the "Titanic" disaster, apart altogether from its colossal character, as being of an extraordinary nature? - Naturally; yes. 23476. What is there extraordinary about it? - This, that it was not what you may consider a fair blow. There is very little doubt that had it been an ordinary case of collision, or an ordinary running into an iceberg, the vessel would still be afloat; but when her side impinges against the side of the berg then something else is going to happen, and it is a matter which has not been provided for.

Let us come to that because it is leading up to something else. Do you not as a fact test the turning capacity of a ship to see within what space she can answer to her helm, so that she may avoid objects in front that are seen? - The capacity of vessels is put through a

course of experiments as a Rule before they have their passenger certificate granted. The Surveyor takes a note of it, but he does not demand it.

But is not that for the purpose if an object is seen in front of enabling the ship to be steered off to clear the object? - Of course that is the idea, no doubt.

Therefore, is it not a perfectly common thing that over and over again it happens in seeking to avoid an object immediately in front it is not entirely avoided, and you get your side or glancing blow? - Undoubtedly.

Do you see any reason in the natural course of things why that should not happen with an iceberg at any time in the future? - No; having happened once it may happen again.

So it cannot be on that ground that the accident was extraordinary.

*(The Commissioner.)* Oh, yes, it may be? - It is out of the ordinary altogether. 23482.

*(Mr. Clement Edwards.)* As I understand, you take the view that there may be boat accommodation less than that required to take every soul off a ship? - Yes. *The*

*Commissioner:* Have you left the last point - the question as to why this was an extraordinary accident?

*Mr. Clement Edwards:* Not quite. I am coming back to it another way.

*The Commissioner:* Because it occurs to me there is another matter - the fact that for some reason or another, assuming the look-out to have been good, this iceberg was not seen until it was too late. That was a most extraordinary thing to my mind, assuming that the look-out was good.

*Mr. Clement Edwards:* I am not quite certain that that is really extraordinary, because if objects could be seen there would be no collision.

*The Commissioner:* If they could be seen at a sufficient distance.

*(Mr. Clement Edwards.)* Quite so; I mean at a sufficient distance. *(To the Witness.)* I understand you take the view that there need not be a boat accommodation to carry away every soul, provided that the watertight bulkheads are as they ought to be? - Yes.

## **Page 658**

Watertight bulkheads in the case of the "Titanic" did not save her? - No, they did not. 23485. What I want to ask you quite specifically is this: Can you make any suggestion at all what should be done to save life under precisely the same circumstances, if they should happen, as have arisen in the case of the "Titanic"? - With the same system of subdivisions? 23486. No. Here we have this appalling fact that 1,400 lives have been lost, and if another "Titanic" disaster took place, according to your recommendation, we should only have a few additional lives possibly saved. I want to know have you any suggestion of precaution or remedy or provision that may avoid that in future? - I do not care altogether to anticipate the findings of the present Bulkhead Committee, which is sitting, but we should naturally go into the finding of that Committee very, very closely indeed before we decided as to whether we should increase the number of boats to the extent that is desired or not.

May I put it that your mind is being directed to the possibility of such bulkhead construction, perhaps transverse and longitudinal, as might in the event of a ship like this striking an iceberg under similar circumstances enable her to float? - Precisely.

I quite understand that you do not want to go into it too definitely, but your view rather is that opinion ought to be directed to that point than to the provision of boats after an accident? - Precisely. That has been my contention all along - the main principle which has guided me.

*The Commissioner:* Mr. Wilding said that if the "Titanic" had gone stem on to the iceberg she would in his opinion have continued to float, but all the men in the firemen's quarters would have been killed. No lifeboats would have saved them; they would have been killed there and then. 23489. (*Mr. Clement Edwards.*) If I may say so, with respect - and I am very much obliged to your Lordship for raising it - it rather suggests the question as to whether, in a case of this sort, the risk is to be taken even for a section of the crew or passengers. I can quite understand, in view of the very weighty opinion expressed by Mr. Wilding, one of the constructors, that if an iceberg is seen under similar circumstances again, the order being given to go dead straight ahead, and risk the smash up in front.

*The Attorney-General:* I hope I am not on it, that is all.

*The Commissioner:* I do not know that it may not be better in that case.

*Mr. Clement Edwards:* That clearly is the suggestion of Mr. Wilding.

*The Commissioner:* But I should be very far from saying that the man who put the helm hard-astarboard was wrong.

*Mr. Clement Edwards:* I am not suggesting it; but in the light of precisely what happened here, with the oblong stroke, and with the evidence of Mr. Wilding, the constructor, that if instead of the stroke being along the side it had been a direct blow, it would have killed the men in the fore-castle, but undoubtedly in his view the "Titanic" would have floated, and the others have been saved. I can understand that having a very great effect on the minds of officers who are responsible for the navigation of ships.

*The Attorney-General:* It would be telescoped 100 feet, according to Mr. Wilding.

*Mr. Clement Edwards - To the Witness:* I do not want unduly to press you on this point, but in your recommendation to the Marine Department you laid some emphasis upon the bulkhead construction? - Yes.

Have you yourself given careful and exhaustive consideration to this question of bulkheads? - I have given very careful consideration to it indeed.

As far as your opinion can now be expressed, do you think that much might be done with longitudinal bulkheads? - Yes, I daresay you could provide a form of longitudinal bulkheads which might under circumstances be of very great value to the ship, but you would have to proceed with very great caution. 23492. Are you familiar with the construction of the "Mauretania"? - I am.

As far as you can say, does that form of bulkhead on the "Mauretania" meet with your approval, and do you regard it as making fairly for safety? - I think it is an improvement for safety, inasmuch as the inner skin is very fairly well removed from the outer skin and the spaces occupied by bunkers.

*The Commissioner:* Three feet, is it not?

(*Mr. Clement Edwards.*) I think it is six feet.

*The Witness:* It is about ten feet, I think.

*(The Commissioner.)* What is the space between the outer skin and the inner skin of the “Mauretania”? - I should say about ten feet. I do not know for certain.

*(Mr. Clement Edwards.)* It must be fairly considerable. On the “Mauretania” the space between the outer skin and the inner skin is utilised, as a matter of fact, for bunker coal? - That is so.

*(The Commissioner.)* The space is utilised for bunker coal? - Yes.

*(Mr. Clement Edwards.)* I want to get your view upon this. Two things have been suggested with regard to these longitudinal bulkheads. One is that if you bunker the coal you may be giving a list to one side, because of the coal being worked out. Do you see any difficulty in trimming from either side pretty evenly? - I do not see any difficulty at all as regards the distribution of the bunkers.

It has further been suggested that with longitudinal bulkheads, if there is a blow on one side, with openings to the sea there may be very great danger of a ship heeling that side?

- It would depend, no doubt, to a certain extent.

*The Commissioner:* The suggestion was not that there might be a difficulty by reason of your taking coal from one side and not from the other, because you could easily regulate things of that kind. The suggestion was that you might get a great list on one side of the ship if the ship was holed on that side.

*Mr. Clement Edwards:* With respect, there were the two suggestions, and I have just put the question to this Witness.

*The Commissioner:* Who was it said there would be a difficulty because of the fact that you would take coal on one side and not on the other? *Mr. Clement Edwards:* I think it was Mr. Carlisle.

*The Attorney-General:* I think there is a little misapprehension with regard to that. There was something said about the coal, but it was not that. It was the difficulty of shutting down the watertight doors when you had been taking coal from the bunker. I think that is what my learned friend is thinking of.

*Mr. Clement Edwards:* I am coming to that. My recollection is that Mr. Carlisle spoke about the difficulty of coal being worked out on one side, and there was the difficulty put by Mr. Wilding as to the danger of leaving the bunker doors open in the case of the ship being struck, and the third point was put, which your Lordship is now on, that there was very great danger of a heavy list to one side, if on that side the outer skin was open to the sea.

*The Commissioner:* Yes, and that was the only point.

23500. *(Mr. Clement Edwards.)* That is the point I want to deal with. *(To the Witness.)* The suggestion was that there is very great danger in longitudinal bulkheads, because if the ship gets struck on one side there may be a big rush of water, with a consequent list to that side. What do you say as to that? - In the first place, it would depend naturally upon the quantity of coal in those bunkers in the compartment or compartments pierced as the case may be. Naturally you cannot rely upon all the coal being displaced by the water, and the water taking its place. Certainly the water will fill up the interstices of the coal and add considerably to the weight, but it is not going to add the full

value of that compartment if it is already occupied by coal, but undoubtedly it would give it a list. 23501. (*The Commissioner.*) And the compartment may be not full, or anything like full of coal. If the vessel is getting near the end of her journey the bunkers will be empty, or nearly empty? - Yes.

(*Mr. Clement Edwards.*) Can you say anything as to the point put by his Lordship that when there is not coal there she might get struck? - Yes; but even if she had two of the wing compartments filled under those circumstances it is quite likely that they would have means of running in water on the other side if she was taking a dangerous list. I do not know for certain, but I think it might be devised. It is quite within the province and within the skill of the marine naval architect to do so.

(*The Commissioner.*) Is there any greater advantage in transverse bunkers over side bunkers? - Not that I can see.

(*Mr. Clement Edwards.*) As I understand you are the responsible technical head of the Marine Department? - That is so.

If we are rather to travel in the direction of what I will call bulkhead precautions, do you think that the present staff of the Marine Department - the local Surveyors with their particular training - are a fully competent body to decide definitely as to the safety of bulkhead construction? - Absolutely. 23506. You think they are? - Yes, absolutely. Without any further addition? - We should like some more, and we are getting some more.

Some more what? - Surveyors.

Of what sort? - All classes - nautical Surveyors, engineering Surveyors, and what are termed ship Surveyors, but were formerly termed Shipwright Surveyors. 23510. Is there any suggestion that there should be very special attention paid to the experience and training of those men in the efficacy of bulkheads? - We are not making any express provision with regard to that, because it comes in in the ordinary course of their duties. If they are not qualified, in the first place, to deal with the question of bulkhead structures, then we should not have them in the Board of Trade at all.

I want to direct your mind for a moment from the question of bulkheads to the question of boat provision. You take the view that there ought to be an increase of boat accommodation? - Yes.

You have rather put it upon the question that the increase should be made as far as practicable? - Exactly.

And you have used certain expressions as to the height of decks in the construction of a ship? - Yes.

Have you any definite views as to the relation of boat accommodation to the erection of such superstructure as there is on the "Titanic"? - Yes.

Now, supposing there was less deck height from above the weather-line, would that in your view make any difference as to the practicability of carrying a less or larger number of boats? - Not much.

It would make some difference? - If the height, or difference in height, was very marked, yes.

Supposing what is now the boat deck were abolished and what is now the A deck - that is the deck immediately below it - became the boat deck, and supposing the whole of that deck were utilised for boat accommodation, what in your view would be the effect of that on the tenderness of the ship? - Very trifling.

So one may say if you had a complete sacrifice of, I will use the term, the luxury of that one deck, you could then without serious detriment to the strength and weathering capacity of the ship utilise one deck entirely for boat accommodation? - If it were necessary to do so, but I do not consider it necessary there as regards the stability of the ship.

*The Commissioner:* Would you diminish, by abolishing the boat deck, the registered tonnage of the ship?

*Mr. Clement Edwards:* Your Lordship will remember that I asked one Witness and he could not quite tell. (*To the Witness.*) Have you any idea what would be the weight of that top deck? 23519. (*The Commissioner.*) I am not thinking about the weight at all. I am thinking about the registered tonnage. I suppose there is something in the top deck that would measure in the registered tonnage? - The portion of the deck erections which come above the boat deck would naturally be measured.

23520. If you abolished the deck you would abolish those? - Yes, you might abolish them.

*The Commissioner:* This is outside this Enquiry, I think. These are details.

*Mr. Clement Edwards:* The full point is this. It has been put by certain of the Witnesses, and the term has been used - if you unduly increase the number of boats with the view to taking off all the passengers you thereby interfere with the weathering strength of the ship by making her tender.

*The Commissioner:* You need not ask such a question as this: If you put the boats lower down do you make the vessel less tender. Of course you do. You can go on putting them down until you get them on the Orlop deck.

*Mr. Clement Edwards:* Yes; but I am putting a specific question on lowering the ship.

*The Commissioner:* I am pointing out to you that I am of opinion that is a detail, and a matter that has to be taken into consideration, not by us, but by some other tribunal.

(*Mr. Clement Edwards.*) If your Lordship pleases. (*To the Witness.*) Anyhow, in your view, if you did abolish the one deck - that is to say, lower the boat deck - to what is now A deck, and utilise that entirely for boats, it would not make any great difference to the weathering capacity of the ship? - No, not in a distance of about nine feet, the height of the deck. It would make a very little difference at that height. It would be an appreciable difference, no doubt, but it can be provided for in most ships - not in all.

That is to say the relative weight of the one deck and a large number of boats, say, 60 boats, would not be very great? - You mean the total weight of boats and boat deck?

No, the total weight of boats and boat deck together would not be much greater than the total weight of what is now A deck? - The weight on the boat deck would naturally be the weight of the boats on it, and that is all.

*The Commissioner:* Pass on to something else, Mr. Edwards.

(*Mr. Clement Edwards - To the Witness.*) Have you thought of any plan of providing boat accommodation apart altogether from their being placed on what is now the top deck - the boat deck? - Yes, I have gone into plans.

Do you think there is any possibility of getting an effective system apart from having boats on the very top deck? - Yes. I think in certain ships it could be arranged for. 23526. What sort of suggestion would you make? - Naturally, if a vessel has two or three promenade decks, as the case may be, and she has rails round, you can have them not only on the boat deck proper, but on the deck below.

*(The Commissioner.)* Would that be a desirable thing? - Not altogether.

Would it be desirable at all, because if so, I do not know why the Board of Trade has not long ago recommended it? - We do not care about it.

Then you do not think it desirable? - No, I do not, but I say I have gone into those questions.

*(Mr. Clement Edwards.)* Why do not you think it desirable? - Because you would have one boat interfering with another. You would probably have two different sets of davits.

*(The Commissioner.)* Does any big liner carry any boats there? - Not to my knowledge. 23532. Did you ever hear of such a thing? - No, I cannot say that I have - not on two decks.

## Page 660

*The Commissioner:* Then leave it alone Mr. Edwards.

*(Mr. Clement Edwards - To the Witness.)* You are the supreme technical adviser at the Marine Department of the Board of Trade? - Yes.

What Mr. Archer might recommend would you have authority to override? - Certainly, if I objected to it.

What you recommend would the Assistant-Secretary have power to override? - Certainly.

*(The Commissioner.)* And I suppose in the days when Mr. Lloyd George was there he would have the right to override that again? - Yes, but whether he would be right or not is another thing.

*(Mr. Clement Edwards.)* But so far as the permanent staff is concerned the position is this, is it not, that Mr. Archer, the responsible adviser on, say, bulkhead construction can be overridden by you with nautical experience? - He can be.

And you can be overridden by an entirely non-expert person, the Assistant Secretary? - Yes.

*(The Commissioner.)* And then he can be overridden by the secretary? - Yes, but it is an extremely unlikely contingency.

*(Mr. Clement Edwards.)* I am coming to that. Presumably the Secretary can be overridden by the President, the President by Parliament, and Parliament by an election, and so we go on? - You cannot very well leave that out. *The Commissioner:* And that election by another election.

*(Mr. Clement Edwards.)* This is my last question. In your view do you think that any permanent official ought to be in a position on matters of a technical character, to override the advice and recommendations of technical experts? - That is not a matter which I need take into consideration at all, or you either, I think.

You will allow me to judge of that, unless his Lordship intervenes, and you will kindly answer my question if you do not mind, unless you think there are very special departmental reasons why you should not? - There are no departmental reasons at all. 23543. Then do you mind saying whether you think it a good plan that a permanent official who is non-expert should have the power to override the advice of technical experts? - It is a question as to whether he would accept that advice, or not. (*The Commissioner.*) Have you thought of the matter? - I have thought of it, naturally. You seem to have thought of everything. I give you so many opportunities of saying no? - It is not a matter I would give very much thought to, because it is hardly necessary. In my opinion it is a contingency which is remote.

**Examined by Mr. HARBINSON.**

I notice, as far as I can see, that in these Regulations the Board of Trade have framed no regulation as regards the location of lifeboats on steamers? - No. It has been given in evidence, I think, by Mr. Sanderson, in the course of this Enquiry, as an explanation of why the percentage of third class passengers drowned was higher than the first and second class that the reason was the inaccessibility of the boat; that is, that the boat deck was nearer the first and second class quarters than the third class? - Yes. 23548. Would you agree with that view? - I do not see how it can be avoided. That is exactly what I wanted to put to you. Have you considered the question of how the boat accommodation on these huge vessels could be made more accessible to third class passengers? - No, I have not. That is one question you have not considered? - No, I have not considered it. I do not think it necessary to consider it. In view of Mr. Sanderson's explanation? - I do not know precisely what his explanation was. I have not seen the whole of the evidence, but undoubtedly the boats will be carried as far aft as would be desirable, and as would be considered safe. If you have your boats too far aft you get under the counter, and it is not advisable. Then if it is not advisable you would consider it not advisable to place boats on the well deck and on the poop? - I think you could carry boats in the well deck, certainly, but you would be rather close to the counter in getting them over. Assuming you did not consider it desirable to carry boats so far aft as the poop, would not you think it proper that ample arrangements should be made and adequate notices posted fore and aft of the ship to notify third class passengers in times of emergency and danger the readiest and quickest way to find their way to the boats? - That is a matter of detail.

*The Commissioner:* That is an argument rather than a question.

*Mr. Harbinson:* I put it in the form of a question.

*The Commissioner:* Yes, but it is an argument, and you can argue it before me.

(*Mr. Harbinson.*) I hope to have the opportunity of doing so. (*To the Witness.*) You do not consider it necessary to make any further provision or provide any further means of access for third class passengers to the places where the boats are located? - Not beyond what is the ordinary practice. There are certain directions in

all these ships for the passengers to get on to the deck. At nighttime you have red lamps showing the passengers the ladders so that they have their means of escape, so I do not think there is any necessity for an amplification of those things.

Do your official regulations prescribe, as a matter of fact, emergency doors and other exits and means of ingress and egress? - Yes.

Is there any special instruction given to the Surveyors of the Board of Trade to see that these regulations are carried out in every detail? - No special instructions, because the instructions are laid down and the Surveyors have to carry them out.

And you assume they are carried out? - I know it - I do not assume it at all.

In your opinion, up to the present and in the light of the "Titanic" disaster, you do not think any further means of egress or communication from fore and aft of the ship to the boat deck should be provided? - No; from what I saw of the vessel's plans I consider they were quite adequate for the purpose.

The plans of the "Titanic" and the "Olympic"? - Yes. *Mr. Holmes:* I have no question to ask, my Lord.

### **Examined by Mr. LAING.**

Yesterday you told us that you had considered this matter in 1911, and 26 boats, with 8,200 cubic feet capacity was the result? - Yes, I had not all my figures with me yesterday. I was led to expect that I should be called not yesterday afternoon but today, and consequently I had not all my papers with me, and was not *au fait* with my figures. 23561. I did not understand it, that is all. May we strike out the 8,200? - In that connection, yes. The table that I had in my mind at that time was in accordance with my recommendation from Liverpool. I mixed up my figures rather.

*The Commissioner:* Do you want to ask any questions, Mr. Attorney-General? *The Attorney-General:* I only want to put one thing to prevent misconception.

**Page 661**

### **Re-examined by the ATTORNEY-GENERAL.**

According to the Minute you, Captain Parke, and Mr. Harris were asked to report on this matter, but I find on looking through the Papers that Mr. Archer also made some suggestions? - That is right.

*(The Commissioner.)* That makes a fourth? - Yes.

*(The Attorney-General.)* If you want a figure with reference to the 45,000 or 50,000 tons so that you may have it altogether, I see he recommended the biggest number of boats? - Yes.

*The Attorney-General:* Twenty-four was the number of boats he required - 14,250 cubic feet capacity under davits, 24,937 cubic capacity with the addition of the supplementary boats. I have all the documents here, which I think your Lordship ought to see in order that you should have everything before you. I have here a Table from Captain Parke, and

I see also some reference to German vessels which you will consider when it is printed. It is hardly worth stopping on it now. The Table shows he was making suggestions also in reference to the deckhands, and he made a rough sketch of the boat stowage, showing how he thought 32 boats actually under davits might be placed on the ship. If your Lordship looks at that you will see what is meant.

*(Handing document to his Lordship.)*

*The Commissioner:* What ship is this sketch for?

*The Attorney-General:* I think it is only a suggestion, and not with reference to any particular ship. The point being considered was whether they should have more boats on. He makes the suggestion there of how it might be carried out. Some were under davits apparently, and some with inboard boats - and as I followed it some of the boats where you have five in a row I should have thought could not be carried in davits. *The Commissioner:* No; there are six, and four of the six, of course, could not be.

*The Attorney-General:* I suppose the idea is that they should be with inboard, and that the davits at the side of the vessel could be used to put them into the water. That is what it means I expect. I did see - I do not know whether your Lordship did - when we went to see the "Olympic," a vessel with four davits on either side, and a deckhouse with two, three or four boats on it. I think it was the "City of Paris," but I am not quite sure. He also refers to the suggestion of a single wire rope instead of the manilla rope through various blocks. When we were on the "Olympic" we saw experiments made with a single wire rope for that purpose. It is very much in the experimental stage.

*The Commissioner:* I think I did see such a thing. I do not think I saw it in operation. It was shown to me.

*The Attorney-General:* I think the great point was that with this wire rope you would not require to have the number of reevings through the sheaves of the blocks, and therefore would not have so much difficulty in the recovery of your tackle, and moreover this particular kind of wire rope would not get the kinks and turns in it that there would be in a manilla rope. That was the idea.

*(The Commissioner - To the Witness.)* Can you tell me why the boat accommodation is based upon tonnage and not upon the number of persons carried? - My only idea about it is that when the tonnage basis was adopted, it was at that time taken as a better indication of the size of the vessel and her capacity or her capability for bearing the boats required at a height than anything else. It was, I think, based upon the question of the safety of the ship herself.

That was long before your time? - It was before my time; but that is what I have gathered from time to time as the only possible explanation of it.

*(The Attorney-General.)* There is one question I should like to put, if your Lordship is finished. *(To the Witness.)* We see what view you hold according to that report, but between that time and the "Titanic" disaster, did you modify your views at all? - I did. 23568. Were they put into writing? - Yes.

23569. Have you got the writing in which you express the modified views? - Yes.

23570. Will you let me see it? I only want to get the date and to see what the effect of it was? - You are alluding, of course, to a date prior to the "Titanic" disaster?

I said so - between your first report when you expressed your opinion in answer to the instructions of the Board and the foundering of the "Titanic"? - Yes. (*Handing a paper to the Attorney-General.*) That is my statement for brief.

Then perhaps I may put the question to you compendiously in this form. Did you from the time that you made that report, and before the "Titanic" disaster, inquire very fully and further into this question of boat accommodation? - I did, very considerably. 23573. Apparently there was a division of opinion or a difference of opinion between a number of you in the Board of Trade? - That is so.

Then you made a number of enquiries and went into the matter very fully as far as you could? - Yes.

Then, as a consequence of that, did you modify the view which you had expressed in the report? - I modified my view in consequence of a visit which I paid to the shipyards on the Tees, the Tyne, and the Clyde, in January last, for the purpose of seeing whether my ideas as to the improvements in ship construction, the subdivision of the ships, the strength of the bulkheads and their disposition - were right or not. From what I saw I was quite confirmed in my original opinion, as expressed in my letter from Liverpool, to the effect that we should rely upon an efficient system of bulkhead subdivision of the ship rather than on any large increase in the number of boats.

That is the substance of it? - That is the substance of it.

That was right according to your view. Did you, in consequence of that, think that a less number of boats might be required and demanded by the Board of Trade than you had actually put into your table? - Precisely. That is exactly the course.

*The Commissioner:* It does not say how many less.

(*The Attorney-General.*) No, only that in principle he formed the opinion, being strengthened in that view about the necessity of paying greater attention to efficient bulkheads, that in his view it would not be necessary to make demands for so many boats or so much boat accommodation. That is the effect of it.

*The Witness:* That is it precisely.

**(After a short adjournment.)**

*The Commissioner:* I understand it will not be convenient to sit tomorrow, and therefore we shall not come back till Monday morning.

(*The Attorney-General.*) There is one question I want to put to Captain Young, because my reference to the minutes and documents is a matter which I think your Lordship ought to know. (*To the Witness.*) You said just now, before the adjournment, that you had not actually formulated your views as to the number of boats or the cubic capacity which would have to be provided, but you had modified the opinion which you had formed originally, when the table we have had before us, or to which I have referred, was made by you? - Yes.

You will remember that? - Yes, that was an error.

I find by reference to it that there was a scale which you, Captain Young, had formulated, and that scale, I understand, did go before the Merchant Shipping Advisory Committee? - Quite correct.

**Page 662**

*The Attorney-General:* So that your Lordship will see it is quite right, as we said before, that on the report made by the three gentlemen whose names I gave you, and Mr. Archer, those tables did not go before the Merchant Shipping Advisory Committee, but a table did, and that was the modified table which Captain Young had made in consequence of the opinion he had formed after visiting these various places.

*The Commissioner:* Very well.

*(The Attorney-General.)* To make it quite clear, that was after the report had been made by the Merchant Shipping Advisory Committee. Your Lordship will remember they made their report in July of 1911. *(To the Witness.)* Just follow this, please, Captain Young, I have only just got it. At the time that the Committee made its report in July, 1911, no scale had been placed before them? - That is perfectly correct.

But subsequently, I see, on the 28th March, 1912, and on the 30th March, 1912, a scale was put before them? - That is so.

Your Lordship will remember we had the reference to these dates in the evidence of Sir Walter Howell, when we were enquiring as to whether he had given the direction on the 4th April for the letter which subsequently was written on the 16th April, 1912. A reference was made to a Minute of Captain Young, under the date of the 28th March, 1912, and the 30th March, 1912. Those documents, Captain Young says, did contain a scale. It is before the "Titanic" disaster, but after the report.

*The Commissioner:* But after the report?

*The Attorney-General:* Yes. I was anxious your Lordship should understand exactly how the matter stood. I see the proposed extension of boat scale which he then put forward, gave for the 45,000 tons and under 50,000 tons, twenty-six boats with a minimum cubic capacity for boats under davits of 7,900 feet. It was less actually than in the report which was put forward of 8,300.

*The Commissioner:* Less than his original?

*The Attorney-General:* Yes, and less also than contained in the report of the Advisory Committee of July, 1911, a little less - 400 cubic feet less.

*(The Commissioner - To the Witness.)* Can you recall an instance of the wreck of a ship where the boats have not been sufficient for the purpose of saving life? - No, my Lord, I do not know that we have any case on record.

There is no case like the "Titanic"? - I think not, my Lord. Have I your permission, my Lord, to make a very brief statement?

*(The Commissioner.)* What is it about? - About the allegations that have been made against the Marine Department with regard to their degree of energy. It has been said, and great publicity has been given to it, that the Marine Department did nothing between the 4th July, 1911, and the 16th April, 1912. With your

Lordship's permission I would just like to make this point perfectly clear that no blame can be attached to the Marine Department for the supposed delay which has occurred in that interval of time. If any blame can be attached to anyone it must be put upon the right shoulder and that is the Professional Officer of that period, that is myself. The question of the experiments which have been made with regard to the suitability and the safety of boats prior to the increase in their number, I think fully justified me in taking the time that I did to form my conclusions, and in making my deductions which I consider was highly necessary before we could advocate, with any degree of honesty the degree of increase which we should consider advisable. I can assure you, my Lord, that had I chosen to take the line of least resistance when I took up my post at Whitehall, acting first as Deputy in July, I should have referred the Report of the Advisory Committee back to them without any alteration, practically without any comment, and carried on the enormous mass of work which I found awaiting me at that particular time. But I was so impressed from my knowledge and experience of ships and shipping in general of the importance of the point of having proper and safe boats, which I very much doubted we had, before we could advocate any large increase in the number, that it was imperative this matter should be looked thoroughly into. Consequently time was occupied in that, and I do not think that any blame can be legitimately attached to the Marine Department for going so thoroughly into that work as they did, hampered as they were by a great many pressing subjects of legislation, work with foreign Governments and negotiations of all sorts, and a very considerable amount of revision of the whole of our Rules. Under the circumstances I wish it to be thoroughly understood that no blame can be attached either to Sir Walter Howell, or the President, or anybody else in the Marine Department beyond myself, as it was entirely upon my representations to the Marine Department that the boats took up so much of our time. That is the only statement I have to make.

*The Commissioner:* Very well. I think you are quite entitled to make that statement.

*(The Witness withdrew.)*

*The Solicitor-General:* Your Lordship asked yesterday whether we would furnish a chart which showed this new southern track, and, more particularly, the turning point. I am indebted to my friend Sir Robert Finlay's clients for having had it put upon a chart, and I will hand it in, if I may.

*The Commissioner:* Does that show the old track?

*The Solicitor-General:* Yes, because it is the North Atlantic chart, and it also shows the new one.

*The Commissioner:* And does it show the track that the "Titanic" in fact took?

*The Solicitor-General:* Subject to this, that she ran on, as we know, for an hour.

*The Commissioner:* She did not quite adhere to the track?

*The Solicitor-General:* No, it is a matter of a very few miles to the South. I think your Lordship will see what we are handing in shows it. There has been marked on the chart which is now being handed in in a dotted red line the new outward track, and in a dotted

blue line the new homeward track; and the new turning point your Lordship will find is at latitude 38, longitude 45.

*The Commissioner:* The turning point is almost due south of the old turning point. *The Solicitor-General:* No, my Lord, I think not due South. It involves going 4° of latitude further South and 2° of longitude further East; because the old turning point was 42° 47'. The latitude is 38° whereas it was formerly 42°; that is a difference of 4°, about 240 miles; and as to longitude, instead of the turning point being 47° it is now 45°, that is 2° of longitude more to the East.

*The Commissioner:* And how far to the South?

*The Solicitor-General:* Measured from one point to the other point that is about 260 miles, I think.

*The Commissioner:* To what extent does the change of track lengthen the voyage?

*The Solicitor-General:* In miles?

*The Commissioner:* Yes.

(*The Solicitor-General.*) I have no doubt Captain Bartlett will be able to tell us that, my Lord.

*Captain Bartlett:* About 220 miles.

(*The Solicitor-General.*) Perhaps I may just add this; that new track which is marked there in colours, as I understand from Captain Bartlett, is a track for British and German steamers, whether they are going to New York or to Boston or to Philadelphia. *Captain Bartlett:* That is right.

*The Commissioner:* I suppose, if this new track had been followed by the "Titanic," she would have been out of the ice track altogether.

*The Solicitor-General:* She would certainly have been out of the region to which those wireless

## Page 663

messages referred, but what there was further South one has not the same detailed information about. One would assume she would be out of it.

*The Commissioner:* I do not see on this chart any intimation that icebergs are found as far South as this turning point.

*The Solicitor-General:* Perhaps I may tell your Lordship this - Captain Bartlett gives it to me. If one does not put it graphically, but in words, it will get on the Note. The present track since the disaster, going West, may be thus described: From Fastnet or Bishop's Rock on the great circle to latitude 38 N., longitude 45 W., then to 38 N., 50 W. (that is going due West), and thence to the port of destination. Then, if one is returning on the easterly course it is proceed to latitude 37° 40' N., longitude 50° W.; then to 37° 40' N., 45° W., and thence by the great circle to Fastnet or Bishop's Rock. I think the Admiral will say that is right.

*Sir Robert Finlay:* With reference to the question your Lordship asked just now, I am informed that ice has been reported on the new track. The ice seems to be passing further South for some reason.

*The Commissioner:* Since the new track has been adopted.

*Sir Robert Finlay:* Yes.

*The Attorney-General:* We had some evidence about it, my Lord.

*The Solicitor-General:* Your Lordship will remember I asked Mr. Sanderson to search the reports he had had from his Captains to see whether they had had occasion to diverge from the track they were upon, and he produced one or two since the disaster. That would be in reference to the new track.

*The Commissioner:* Where they have had to depart from the new track?

*The Attorney-General:* It certainly is after the disaster.

*Mr. Laing:* It is on page 477.

*The Commissioner:* What questions?

*Mr. Laing:* 19294 and 19295.

*The Attorney-General:* That is right. Then your Lordship will find if you look at page 497 he was recalled and produced reports which they had had from other vessels. If you look at Question 19776, when I am examining him, you will see "what I wanted to know was whether there were any reports of deviation on account of ice being encountered or reported on the track from Queenstown to New York," and I pointed out "the only ones that I see are these two, and they are both after the event, the 24th April, 1912, and the 27th April, 1912." And my friend, Sir Robert Finlay, there points out, "You see the ice has been coming so much further South," because Mr. Sanderson had already given in evidence at page 477 that they were on this more Southerly track when they had received these two reports. Those are the two pages that make up the evidence. (*After a short pause.*) I think we must look into it a little more closely. It is not quite clear that those two reports of the 24th and the 27th April, 1912, were reports of ice on the new more Southern track. My friend Sir Robert Finlay, was under the impression that they were, I see, because he says, "You see the ice has been coming so much further South," but it does not appear clear by the evidence.

*Sir Robert Finlay:* I think it is clear if you look at Question 19293. "*(The Solicitor-General.)* Can you help us about this new arrangement? We have got the old one. Is there a formal agreement and a chart? (A.) No. (Q.) Then in what form is it? (A.) We arrive at it in this way. The only tracks which are fixed are those two which you have marked on the chart. But it occasionally happens, rarely however, that on this Southern track we do come across ice in considerable quantities. It is then understood that as soon as that information reaches us, word is passed round and we go to the Southern track, which is South of that one on the chart. Since 1898 I think only three times, to the best of my recollection, have we had to do that. We have gone down to this specially Southern track which is not marked, by agreement, but on this occasion we went South even of that track. (*The Commissioner.*) Which track? - (A.) After this 'Titanic' accident we went South even of that track, and only a couple of weeks ago we got word that ice was on that track, and we went South of that again; and in communicating with the Hydrographic Office at Washington, we got word from them only as late as this morning that it is practically impossible to go sufficiently far South to avoid all risk of meeting ice, because icebergs have been sighted from Bermuda." Then he goes on to say that in a short time it would be safer to go North.

*The Attorney-General:* Yes, at any rate, it is not clear that those two reports of the 24th and 27th of April, 1912, were referring to this more Southern track, but what my friend

has called attention to is this, that he did distinctly say that since they have been on the more Southern track they have had reports of ice. But as you see the date is a couple of weeks ago, it would be brought up to the third or fourth week in May.

*The Commissioner:* I do not know when the new track was adopted.

*The Attorney-General:* I am afraid we do not.

*The Commissioner:* I should fancy these two dates, the 24th April, 1912, and the 27th April, 1912, refer to the old track.

*The Attorney-General:* I should think so, but this is easily ascertained. The White Star can tell us. The reason why I connected the two was because they were the only ones produced, and he was referring to reports which he had had.

*Sir Robert Finlay:* Captain Bartlett informs me that the new track further South was adopted on the 24th April.

*The Solicitor-General:* That means the ship had started then, and was not in midAtlantic then.

*Sir Robert Finlay:* No, not unless it was communicated with.

*The Commissioner:* This is the report of the 24th April. I think it must refer to the old track.

*The Attorney-General:* It must, I think.

*The Commissioner:* On the American hydrographic chart the new routes are said to have been adopted on the 19th April, 1912.

*The Attorney-General:* If that is right then Mr. Sanderson, when he said a couple of weeks ago must have been referring to those two of the 24th and 27th April, 1912. It does not quite fit in, but that is what he must have had in mind, I think.

*Sir Robert Finlay:* We will have it looked up.

*The Attorney-General:* If it was on the 19th April it would be right.

*The Attorney-General:* There are two Captains whom my friend Sir Robert Finlay would like called. Your Lordship will remember we have called two already. As they have to sail it is necessary to call them at once.

**RICHARD OWEN JONES, Sworn.**

**Examined by the SOLICITOR-GENERAL.**

Are you Master of the steamship "Canada"? - Yes.

I think that is a vessel belonging to the Dominion Line? - Yes. 23592. Have you been her Master for some nine years? - Yes.

Of course, you hold a Master's certificate. How long have you held it? - Twentyeight years.

And I think we may assume you have been going to sea longer than that? - Yes.

Have you been for the last 27 years with the Dominion Line? - I have.

Is that a line of steamers between this country and Canada? - Yes.

And have you been in that Canadian service for some years? - Twenty-seven years.

Let us take April, 1912, the month in which this calamity happened, did you sail as Master of the "Canada" from Portland (Maine) in that month? - Yes.

I think on the 7th of April? - On the 7th of April I left Portland.

Bound for Liverpool? - Yes.

Did you get any messages on your voyage about ice? - Yes, several.

Which was the day? - On the 9th I had a message from the "Tunisian." 23603. That is an Allan Line steamer, is it not? - Yes.

A wireless message, I suppose? - Yes.

Just tell us what it was shortly? - I have a copy in my pocket.

*The Solicitor-General:* The "Tunisian" was bound East, my Lord.

*The Commissioner:* I understand the "Canada" was going to Liverpool.

*(The Attorney-General.)* No, the "Tunisian" that sent the message was going East. This vessel was bound West, so that they were crossing ships? - They were both bound East.

*(The Solicitor-General.)* It is my mistake entirely. They were both bound East. Will you read the message?

*The Witness:* At 8.45 p.m., G.M.T., 43° 22' N. and 54° 12' W.

*(The Solicitor-General.)* Cannot we limit it to the ice message, because it complicates it so.

*The Commissioner:* What are you going to do?

*The Solicitor-General:* I understand this gentleman will tell you he had a message about icebergs in a particular locality.

*The Witness:* We received a message from the "Royal Edward" reporting bergs in 42° 48.'

*The Commissioner:* What did you do?

*(The Solicitor-General.)* I think I understand what your Lordship wants. *(To the Witness.)* You told us you got several messages - more than one? - There were two from the "Tunisian."

Never mind; you got more messages than one about ice? - Yes.

Did you come up to the ice; did you see it? - Yes.

Tell us what you did when you found yourself in the neighbourhood of the ice.

That is what we want to know? - It was some hours later when we came to the ice.

Whenever it was, what did you do? - When I saw the ice I stopped.

*(The Commissioner.)* This was pack ice? - Yes.

*(The Solicitor-General.)* What sort of ice? - Pack ice.

You stopped altogether, did you? - Yes, I stopped altogether. I let my ship run her way off, and then I gave her a touch ahead, so as to get close to the ice, so as to inspect it.

Was this in daylight or at night? - At night, 11 o'clock at night.

Then you say you gave your ship a touch ahead to get close to the ice to have a look at it? - Yes.

What did you find? - Broken ice and lanes between them, so I decided it was safe for me to go through.

*(The Commissioner.)* To go through? - Yes, my Lord.

*(The Solicitor-General.)* At what speed did you go through? - Oh, very slow; I picked my way clear of the broken pieces.

And did you succeed in getting through? - Yes, I was through about daylight the next morning, about six o'clock.

After you got the messages about the ice did you continue going on full speed ahead until the ice was reported by the look-out? - Yes, certainly.

*The Commissioner:* Now I see the object.

*(The Solicitor-General.)* That is the point. *(To the Witness.)* Is that in your opinion the usual practice? - Certainly, always.

*(The Commissioner.)* What speed were you going at? - 15 knots.

*(The Solicitor-General.)* Is that your full speed? - Yes.

What was the weather? - Dark and clear.

*(The Commissioner.)* Suppose you had had a 22-knot boat would you have gone 22 knots? - I should think it would be just as safe to go full speed with 22 knots.

*(The Solicitor-General.)* What was the distance at which the ice was picked up. You are going your 15 knots, and it is reported, and then you say you stopped and ran on to reach it. Do you know how far ahead of you it was seen and reported? - Well, I saw the glare of it; I should say about three miles off.

You did yourself? - Yes, and I saw the ice itself fully a mile and a half. 23631. Then I understand you stopped, let your vessel come to a stop, and then felt your way on to inspect it? - Yes.

*The Commissioner:* I think there was some evidence that it was inadvisable to go up these lanes.

*The Attorney-General:* Unless you can see your way through.

*Sir Robert Finlay:* It is in the Regulations issued for vessels of the Canadian line by the White Star particularly, and I have it in my hand. It is to this effect: It is unsafe to enter lanes because you never know whether there may be an exit or not. I will just read the material words: "The ice is often very heavy, and should not be entered" - that is field ice - "unless it is obviously in loose patches. Lanes in the ice often come to an end, and it is unwise to enter them unless clear water can be seen beyond."

*The Commissioner:* You get into a *cul de sac*.

23632. *(Sir Robert Finlay.)* Yes, you may.

*The Witness:* I do not mean I followed the lanes, my Lord, but I cut across. 23633.

*(The Solicitor-General.)* You went up to get close to the ice and to see what it was like? - Yes, and there the ice was in streaks stretching North and South and the lanes between.

23634. *(The Commissioner.)* And you had to cross the lanes, not follow them? - Yes.

23635. *(The Solicitor-General.)* You would be about seven hours in amongst the ice altogether, I make it from what you have told us? - Yes, nearly seven hours.

And of course going slower and picking your way? - Yes.

Did you come to the conclusion that it would be safe to cross the ice-field? - Perfectly safe. The fact remains that the paint was not taken off the ship's bow. 23638.

Nobody suggested that. Perhaps you might tell us this. I think, my Lord, will think it is relevant. You have been crossing the Atlantic year after year

constantly. What do you say in this period of the year in the month of April, as to the probability of meeting ice? - How far East do you mean?

23639. Do you expect to meet it? - Oh, certainly.

*Sir Robert Finlay:* He is on the Northerly track; he is in the Canadian trade. 23640. (*The Solicitor-General.*) Where was it you met the ice, about? - On this occasion? Yes? - In 40° 20' W. and 42° N.

*The Solicitor-General:* I appreciate it was not necessary to get the details of bearings before but I think this last bearing is worth having.

*The Commissioner:* He was very much North of the spot where the "Titanic" came to grief.

(*The Solicitor-General - To the Witness.*) Will you give it to me again. What is the latitude? - 42 N.

*Mr. Laing:* 43 N.

(*The Solicitor-General.*) You said 42, did you not? - It is 42 N.

(*The Commissioner.*) Someone has written on this chart 43° 22'?

*The Witness:* I made a mistake my Lord a moment ago; it is 43 N.

*The Attorney-General:* He means 43 N.; he made a mistake just now when he said 42.

*The Commissioner:* It is considerably North of the "Titanic."

(*The Solicitor-General.*) Yes, my Lord; he is 60 miles North. (*To the Witness.*) I think you said your longitude was 49° 20' W.? - Yes, when we got out of the ice.

23646. With your experience on a clear night, have you always been able to detect ice by this ice

## Page 665

blink? - No, not by the ice-blink; the ice-blink does not always occur.

23647. Then if it is not the ice-blink which enables you to see it, what do you see it by? - You see the ice itself.

Can you suggest to us at all why it should be, if a good look-out is kept, that a ship would not see ice until she is close upon it? - No.

You cannot imagine? - No; I have always seen ice in plenty of time on a clear night.

### Examined by Mr. SCANLAN.

(*Mr. Scanlan.*) There is one point I wish to ask this Witness. (*To the Witness.*) In clear weather what distance ahead can you see an iceberg at night? - It depends upon the light. If it is a moonlight night you might be able to see it six to twelve miles.

Supposing it is not moonlight, but the stars are clear? - I should say at the very least a mile and a half to two miles.

You would not say six or seven? - No, it depends on the berg, too. 23653. And what provision had you for a look-out on your ship? - Two men on the look-out.

Where? - One in the crow's-nest and one on the stem head.

Was your one man on the stem head put on at night? - Yes, he was put on that night just as we got on to the ice track.

Did you consider it a proper precaution to put a man at the stem head when ice was reported? - It had been always our custom; we have always done that for the last twenty-seven years.

At night? - Yes.

Whether ice is reported or not? - In the ice track.

Are your look-out men supplied with binoculars? - No, they are not.

Not in the crow's-nest? - No.

(*The Commissioner.*) Nor at the stem head? - No, my Lord.

**Examined by Mr. CLEMENT EDWARDS.**

Your boats are controlled by the International Mercantile Marine? - Yes.

Have you any sailing directions? - Yes.

Do they say anything about navigation in the ice region? - Yes.

Have you a copy of them with you? - No, I have not.

Can you remember broadly what these directions are? - We have special instructions with regard to ice.

What are they? - I deviate according to my own discretion to avoid ice. 23668. You have a general discretion with regard to the navigation of a ship under any circumstances, have you not? - Yes.

Can you remember what are the particular directions with regard to ice? - Yes, we have instructions to deviate from our course.

You have instructions to deviate? - Yes.

Under what circumstances? - To avoid ice.

Are there any special circumstances set forth in the directions under which you may deviate? - If ice is reported? 23673. If ice is reported? - Yes.

Is it possible to get a copy? Is your ship in London now? - No, she is in Liverpool.

*The Commissioner:* I have no doubt a copy of the sailing directions can be obtained at the office of the International Marine.

*The Attorney-General:* We have got that, my Lord.

*Sir Robert Finlay:* I believe it has this direction.

*The Commissioner:* Will you read it? (*To the Witness.*) Just listen and see if it is the sailing direction.

(*Sir Robert Finlay.*) This is supplied to me as an extract from the instructions given to the Commanders in the Canadian service respecting field ice: "Field ice may be met off the eastern end of the Bank across the Bank and along the south coast of Newfoundland. Thin ice is often very heavy and should not be entered unless it is obviously in loose patches. Lanes in the ice often come to an end, and it is unwise to enter them unless clear water can be seen beyond. It is usually the safest course to go South to get round the field ice, and Commanders have permission to use their discretion to deviate from the track under such circumstances? - Yes.

Are those your directions? - Yes.

(*The Commissioner.*) Are those the directions you were talking about? - Yes.

*The Commissioner:* Very well; then there they are.

(*Mr. Clement Edwards.*) You were in the service of the Dominion Line before it became acquired by the American Trust? - Yes, for 27 years.

Are those sailing directions as to navigation in the ice-fields the same as or different from the instructions which you had when the Dominion Line Company had control? - Practically the same.

Not quite? - Perhaps not worded exactly the same. The meaning is the same.

**Examined by Sir ROBERT FINLAY.**

You were asked as to the Dominion Line vessels being under the control of the International Mercantile Marine? - Yes.

That was formed, I think, in 1902? - Yes.

Ten years ago? - Yes.

You have been in that trade for 27 years? - Yes.

Was your practice before 1902 exactly the same as it has been since? - Exactly the same.

Now, I want to know what those messages were; what sort of ice did they report? - Field ice and bergs.

Perhaps you will refer to the messages and just tell us? - Shall I read it out? 23688. If you please, so far as it relates to ice. What vessel is this from? - This is from the "Tunisian" from the "Royal Edward."

Reporting a message which they had from the "Royal Edward"? - Yes. "The 'Royal Edward' this morning reports bergs 42-48 N., 49-40 W., and passed through icefield in 42-35 N. and 50-18 W., extending N. and S. as far as visible. Some of this ice is heavy and dangerous."

Where were you at the time you got that message? - Between 52 and 53 W. and 43 N.

Did you receive another message later on from the "Bulgaria"? - Yes.

What was that? - "Nine p.m. hazy, pack ice in 42-24 N. and 50-6 W."

The weather is "hazy." I thought it was "heavy"? - Well, it is "heavy." "Heavy pack ice in 42-24 N. and 50-6 W., large bergs in 42-31 N. and 40-50 W."

*Sir Robert Finlay:* It is 49, is it not?

*The Commissioner:* What is this for?

(*Sir Robert Finlay.*) To show the nature of the message he received, reporting not only field ice, but also bergs and pack ice? - It is 49.50. It is a mistake in the telegram here.

What was your position when you got your second message about the ice? - About 51 W. And N. - Forty-three N.

Forty-three N. and 51 W.? - About that.

Were you still going East at full speed? - Yes.

What was the state of the sea? - Calm and clear.

Was there any swell? - There might be a light swell, yes; but the sea was smooth.

If there was any swell it was moderate? - Yes; I mean to say there was no wind, the surface of the sea was calm; there might be a little swell.

Then you got through the ice across the lanes in the way you have described? - Yes.

Now, will you just explain to me about this ice-blink. That is not always seen? - No, not always.

What is it; how is it produced? - By a reflection of the light. I suppose it is the reflection of the light on the ice.

The reflection of what light? - It might be a star.

Is it a sort of shimmer? - Yes, a kind of a flicker.

Is the lowering of the temperature, in your experience, a sign of icebergs or produced by them? - It is no guide to the vicinity of icebergs, none whatever. 23708. Where you have ice about, in your experience, are you liable to have fogs? - Very liable.

Does that, in your judgment, afford any reason for the practice you have always pursued as to speed? - Yes, we always make what speed we can.

Just tell us, in your own way, what effect that fact has on your practice as to speed? - Well, we always try to get through the ice track as quickly as possible in clear weather.

If fog came on while you were there? - It would increase the danger very much.

We have to slow down or stop.

With regard to this question about glasses for the look-out men, the binoculars, do you think it is desirable to have them? - No, I do not.

What is your reason for that? - In the first place, it is very difficult to focus the glasses, and if the glasses are not properly focused the man might as well have a blank tube to look through.

*(The Witness withdrew.)*

**EDWIN GALTON CANNONS, Sworn.**

**Examined by the ATTORNEY-GENERAL.**

You have been a Master Mariner for over twenty years? - Yes.

Holding a Master's Certificate, and have been thirty-six years going to sea? - Yes.

You have been in the service of the Atlantic Transport Company for nearly twenty-five years? - Yes.

And in command for about twenty years? - Over twenty.

And during the whole of that time have you been sailing in the North Atlantic? - The whole of the time.

London and New York, Boston, Philadelphia and Baltimore? - Yes. 23720. And before that at times you were sailing in the North Atlantic? - Yes, quite a time.

23721. In the course of your experience have you met icebergs and also field ice? - Yes.

23722. Have you ever met ice-fields on the southern outward and homeward tracks which were agreed in 1898? - No, I have never seen field ice on the southern track.

You have never seen field ice? - No.

Have you ever seen icebergs? - Yes, several.

On the outward track or the homeward track? - On both tracks.

At this time of year, we are speaking of in April? - Yes.

Often? - No, not often, they do not get down as early as that as a Rule.

I only want to understand. Do you mean you have met them now and again. Give us an idea how often it is that you have come across icebergs on the track, either the outward or the homeward track? - Well, you may run three or four years clear; then again you get an exceptional ice season and the ice comes down both earlier and more rapidly. 23729. So that in that exceptional season you would expect to meet icebergs on that track? - Yes.

It has got further South, at an earlier period? - Yes.

Presumably it is a matter to which your attention is always directed when you are crossing? - Oh, yes.

It is the sort of thing I suppose that an experienced captain always has in mind when he is on the North Atlantic track at this time of year? - Oh, yes, we are always on the alert for it for many months.

There is only one further question I want to put to you. When you do sight an iceberg do you reduce your speed or do you keep your speed? - I keep my speed.

What is the speed of the vessel? - Sixteen knots.

You keep your speed - that, of course, is, I suppose, in the day or it might be at night? - Both day and night.

The question I put to you, and you have answered, is when you have sighted an iceberg? - Yes.

Then you have time, I suppose, from what you said, to get clear of the iceberg going at the speed at which your vessel then is? - I have never had any difficulty to clear when I have met ice ahead.

Does that mean that you see the ice some distance ahead? - Yes.

How far as a Rule? - Well, I have seen it over three miles and at less distances.

Are you speaking of the day or night? - At night.

Do you mean you would see it further in the daytime? - Yes, decidedly, in clear weather.

At night you have seen it at three miles and sometimes less? - Yes.

And supposing that your look-out is properly kept and that the night is clear is there any difficulty in your sighting an iceberg at sufficient distance to enable you to steer clear of it? - None whatever.

And supposing you received reports of icebergs in a latitude and longitude which you would expect to be crossing during the night would you take any precaution as regards speed? - I should maintain my speed and keep an exceptionally sharp look-out until such time as I either had the ice-blink or some sight of ice ahead or in the track of the vessel.

What would be the exceptionally sharp look-out you would keep? - I mean with reference to everybody concerned by my cautioning them and giving my officers instructions to inform the look-out to be on the alert.

Where is your look-out stationed? - In clear weather under ordinary circumstances in the crow's-nest.

How many do you carry there? - One.

Would that be the only man on the look-out in clear weather except the officers on the bridge? - That would be the only one.

And supposing you were sailing at night and had to keep this exceptionally sharp look-out which you have told us of because of having had ice reports, would you increase the numbers of men on the look-out or not? - No, not in clear weather. 23750. Do you mean that you would go on steaming at the same speed with your man in the crow's-nest, and that is all? - That is all.

You do not put anybody apparently in the stem head? - No, not unless the weather becomes hazy or any difference to ordinary clear weather.

If the weather does become hazy it would be better to put a man on the stem head, I understand? - A man goes there immediately.

You have heard the distance at which it is said that this iceberg was first seen on the "Titanic." Do you know it? - I do not know it.

### **Page 667**

At any rate not further than half a mile. The exact distance I agree is difficult to state, but not further than half a mile it is said to have been.

*The Commissioner:* I should have said not so much.

*(The Attorney-General.)* I am putting it at the extreme purposely. That is the extreme distance at which it is put. *(To the Witness.)* Suppose it was a little less than half a mile, can you account for the look-out man not having seen it if it was a clear night? - No.

And supposing it was a clear night, no haze, ought the look-out men in the crow's-nest to have seen it? - They should have done, I should imagine.

And if the iceberg is 60 to 80 feet high from the water level, at what distance do you think it ought to have been seen? - My experience would be that you would see it at least two miles.

At least two miles? - Yes.

*(The Commissioner.)* Then ought not the men on the bridge to see it? - Yes.

They ought to see it? - Yes.

At the same distance? - Yes.

Have you seen black ice? - No, my Lord; I have not seen black ice, but the ice varies considerably in its appearance.

Have you seen many icebergs? - Yes, my Lord.

And you have never seen a black iceberg? - No.

### **Examined by Mr. SCANLAN.**

If there is any difficulty at all in seeing ahead at night, would it be in accordance with your practice to double the look-out? - Yes.

You think that would be the proper thing to do? - If there was any haze at all, yes, immediately.

Apart from haze, if there was what has been described here as a flat calm and the conditions were such that it would be more difficult than on an ordinary clear night to see an iceberg ahead, would you double the look-outs? - Not in perfectly clear weather.

If it is calm is it more difficult to see an iceberg? - I have not found it so. 23769. (*The Commissioner.*) Do you think it is more difficult to see an iceberg when the sea is flat and with the weather quite clear? Do you think the flat sea prevents you from seeing an iceberg as readily as you would do if the sea were rough or rippled? - No.

You do not believe in that? - No.

(*Mr. Scanlan.*) If any condition of the weather prevented you from seeing clearly you would double the look-out? - Decidedly.

If at night ice was reported ahead of you in the track which you were taking would you double the look-out? - No; not if it was clear.

Then you do not agree with the last Witness?

*The Commissioner:* What did the last Witness say?

*Sir Robert Finlay:* The last Witness is in a different trade.

*Mr. Scanlan:* I think he said if the weather was clear, if ice was reported to him at night, he would put a man on the stem head. *Sir Robert Finlay:* No, he said the opposite.

*The Commissioner:* What he said was he would tell the officer and the man on the lookout to be alert.

*The Attorney-General:* It is not quite what this Captain has said, but I think my friend is right, according to my recollection of it. He did say in the ice region. He would put a man on the stem head.

*The Commissioner:* Is Captain Jones here, or has he gone away?

*The Attorney-General:* It is on the Note, my Lord.

*The Commissioner:* What did he say, Sir Robert, according to you?

*Sir Robert Finlay:* I rather think that he said that he doubled the look-out, but I am not quite positive as to whether he said he did that in clear weather.

*Mr. Scanlan:* I have a very distinct recollection of his saying that.

*The Commissioner:* My colleagues seem to think you are right.

*The Attorney-General:* When he gets to the ice region.

(*Mr. Scanlan - To the Witness.*) I wish you to understand what I am putting to you. The time I am speaking of - night, no moon, but stars - it is reported to be more difficult to see than in ordinary circumstances, and yet it is said to be clear. Would you, in those circumstances, put a look-out man on the stem head? - If there were the slightest haze or any indication of any other different weather than the clear weather, the look-out would be immediately increased.

When you speak of increasing the look-out, what you refer to is putting a man on the stem head? - Yes.

You carry one man in the crow's-nest, do you? - Yes.

And one man on the stem head? - No.

I mean when you double the look-out? - Yes.

*The Commissioner:* He would, when he doubles the look-out.

(*Mr. Scanlan.*) That is what I mean. (*To the Witness.*) Is it considered that the position of the stem head is a good commanding position from which to see low-lying ice? - Yes, it is a position of advantage. *Mr. Scanlan:* It is a position of advantage.

**Examined by Mr. CLEMENT EDWARDS.**

Is your company owned and controlled by the International Mercantile Marine? - Yes. You have heard the sailing directions read out by Sir Robert Finlay when in the ice region. Are those similar sailing directions?

*Sir Robert Finlay:* These were the Canadian directions. This gentleman is not in the Canadian service.

*Mr. Edwards:* I misunderstood you.

*Sir Robert Finlay:* The last Witness was on the Canadian route, and the directions relate to that.

(*Mr. Clement Edwards.*) Very well. Thank you, Sir Robert. (*To the Witness.*) You have sailing directions from your company? - Yes.

Does your book of sailing directions make any mention at all of what you are to do in the ice region? - I have not the book with me. I could not exactly say now. *Mr.*

*Edwards:* May I ask here quite formally, my Lord, if those representing the International Company will please produce the sailing directions for the different lines controlled by that company?

*The Commissioner:* I do not know that there is anybody here that does represent that line.

*Sir Robert Finlay:* As far as I know, my Lord, there is nothing except what is already in evidence, and it has been stated that there are no specific directions as to ice.

*The Attorney-General:* I do not think my friend Mr. Edwards had in mind that the Rules we have produced are the International Marine Company's.

*Mr. Edwards:* I quite understand, but you will remember there is no mention here at all of ice. What I am trying to get, and got from the last Witness, was that he belonged to a company controlled by the International, and he had sailing directions for the ice-field.

*The Attorney-General:* That is in accordance exactly with the evidence Sir Robert produced. What it means is that where they are on this track, the North Atlantic track, between the United Kingdom and New York and Boston and so forth, they do not get those directions as to ice. There are no special directions as to ice; but when they

**Page 668**

are in the Canadian service then they do get the directions as to ice which were read by Sir Robert just now with the last Witness, who was on the Canadian service. That is how it stands.

*Mr. Edwards:* This Witness is a little vague as to whether in his instructions there is anything at all about ice.

(*The Commissioner.*) Do you have this book which I have here?

*The Witness:* I have it on board the steamer, but I have not the regulations in my mind, every one of them.

*The Commissioner:* There is no reference to ice. "He must remember that his first duty is to keep a good look-out and avoid running into danger."

(*Mr. Edwards - To the Witness.*) Will you kindly look at that book (*Handing book to the Witness.*) is that what you call your sailing directions? - Well, it looks similar.

23785. Just look at it a little carefully. Have you any directions from your owners other than that? - None.

*The Commissioner:* I should like to know if he received the letter that we were told was given to every captain, but the letter did not carry it any further.

*Mr. Edwards:* There can be no difficulty if Sir Robert Finlay will allow us to have a copy of the sailing directions on the Canadian trade, so that we may see exactly what they are.

*The Commissioner:* This gentleman is not on the Canadian trade.

*Mr. Edwards:* That I understand, my Lord.

*The Commissioner:* The last Witness was.

*Mr. Edwards:* May I ask quite formally that we have produced from the Dominion Line a copy of the sailing directions which they issue to their Captains in the Canadian Trade.

*The Commissioner:* You are not satisfied with that piece of paper; you want the book.

*Mr. Edwards:* That is so, my Lord.

*The Commissioner:* Very well, you can get it I daresay, Sir Robert.

*Sir Robert Finlay:* Oh, yes. Certainly, my Lord.

*The Commissioner:* I am sure there is no difficulty in getting it, it will be in the office.

*Sir Robert Finlay:* The extract contains what relates to ice.

### **Examined by Sir ROBERT FINLAY.**

How long have you been navigating the North Atlantic?

*The Commissioner:* This track?

(*Sir Robert Finlay.*) This track.

*The Witness:* In command? - 20 years.

(*The Commissioner.*) Either as officer or Captain? - Over 25 years. 23788. (*Sir Robert Finlay.*) Has the practice been the same during the whole of that time? - No.

Now tell me what difference has been made? - When I was a young officer there were no tracks laid down. Each Master followed his own course - what he considered was a safe track at any time of the year.

Then in 1898 these tracks were agreed upon as we have heard? - Yes, and came into force at the beginning of January, 1899.

But before 1898 had you any system of reporting ice; did passing vessels report ice to one another before the Marconi system was introduced? - Yes, we had an ice code by which by one signal you could communicate with any other passing vessel the position of ice seen, or by a number of flags whether ice had been seen or not, whether the weather was clear or whether it had been hazy.

So that long before Marconigrams were heard of you did get those signals from and gave those signals to passing vessels? - Yes.

When you got those signals did you slacken speed? - No.

Has the practice in that respect been the same the whole time you have known the trade?  
- Yes.

(*The Commissioner.*) What is the speed of your vessel? - Sixteen knots.

(*Sir Robert Finlay.*) That is her top speed? - Yes.

(*The Commissioner.*) Now, assume you had under your command a vessel of 22 knots, would you slacken speed then? - Not in clear weather.

(*Sir Robert Finlay.*) Now, would you describe to us the appearance of the icebergs in your experience; what do they look like as regards colour? - In day or night?

Well, take first day? - In the day they appear as a white glistening mass, irregular in shape, white.

Then at night? - At night they throw off an effulgence that can be seen. I have seen the outlines of an iceberg by taking a bearing over seven miles.

It is what is called ice-blink? - Yes, it is an effulgence thrown off the berg or ice because the ice absorbs the light by day, and throws it off at night. It would look like a large mass of luminous paint. That is the description one might venture upon.

23802. It has taken in the light of the sun during the day and throws it off at night? - Yes.

Anyhow, that is the effect you see? - Yes.

Have you ever seen a black berg? - No.

In your experience are icebergs dark or black? - I have seen them much darker. Might I explain an experience of mine some years ago which will give you possibly an idea of the difference in the colour.

If you please? - When I was Chief Officer of our "Michigan" I saw an iceberg capsize in the daytime. What appeared prior to the iceberg capsizing as a white glistening mass, after the sea had subsided and the water run off the portion that was then exposed, was apparently dark blue.

Have you ever come across an iceberg that looked of that colour. You say you saw this one capsize? - Yes, in the daytime.

And then did you notice its colour? It was quite different from what it was before? - It was different in outline and different in colour.

Very well. Before it capsized it was white, I suppose, as you have described? - Yes.

Then after that it was dark blue. Have you ever seen another iceberg of that dark colour?  
- No, only that one that capsized.

Where there is a swell or a little wind does the water break at the foot of the berg? - Oh, yes.

Now supposing you had a dark blue berg such as you have described, dark in colour, what would the effect of the water breaking at the foot of it with a swell or wind be as regards what you would see? - Well, it would show whiter at the base.  
23813. But in your experience the bergs have been white except with this one exception? - With the exception of this one which I saw in daylight and noticed the difference in the colour; all of them have been discernible at nighttime, and of course in the day.

23814. In addition to the look-out you have the officers on the bridge? - Yes. 23815.

And if you hear of ice do you tell them all to be on the look-out, to be on the alert? -

Yes; the watch is mustered on the bridge, the officer inspects them, and instructs them specially to keep their eyes open.

In your experience is the practice of all as regards speed, though ice has been reported, the same that you have stated, to keep up speed? - Yes, to maintain speed until the ice is seen.

What do you think of binoculars for the look-out men? - I do not think they are any advantage at all. In the North Atlantic trade they would not be of much use because they are so easily blurred.

**Page 669**

**Re-examined by the ATTORNEY-GENERAL.**

There is only one thing I want you to explain to us a little more fully. According to the view that you have expressed, you may have passed dark bergs quite close without seeing them? Is that right? - Well, it would be possible.

It would follow from your evidence? - We are not looking out for the ice that is out of the steamer's particular track.

According to your view, an iceberg that had capsized might present a dark blue appearance? - Yes, that is as I saw it in the daylight. I could not say what it would look like at night.

You have never seen such a thing at night? - No.

You have never seen this dark coloured iceberg at night? - No; some are certainly more effulgent than others.

When you saw this one which you have spoken of which had capsized, how high was it out of the water? - I should say it was 60 feet high.

I suppose it is not a rare thing for an iceberg to capsize? - No; as soon as they lose their gravity they turn over.

And if the ice is melting in coming further South there comes a point at which it does capsize? - Yes.

And, of course, in the night if it is going to present a dark appearance like that such as you have described you said in the daytime, it would be particularly dangerous? - Yes.

So that it would be necessary if you expected to meet icebergs at that time of night to proceed with great caution, would it not? - By my experience I have always been able to see them on a clear night.

You see the difficulty from what you said that strikes me is that of course in all your experience you have always been able to see those that you have actually seen; but there may have been some that have passed you that you have not seen? - It is quite sure there have been some pass which I have not seen.

It has been your good fortune that you did not strike them or they strike you? - Yes, but they would not be on my track.

I do not quite follow. Do you mean that you would not expect to see one in your track? - Oh yes, I should be on the alert for it.

It does come to this, does it not, that you would be on the alert looking out for these icebergs which you could see? - Yes.

*(The Commissioner.)* Do you believe there are icebergs that you cannot see? - No, my Lord.

*The Commissioner:* Will some one describe to me - perhaps you can do it, Sir Robert - how an iceberg capsizes and what comes up on the surface after it has capsized? *Sir*

*Robert Finlay:* From some cause or other, breaking off the ice below it gets topheavy, it turns over, and what was previously under water is presented above. *The*

*Commissioner:* Does it ever happen when that takes place that the ice which is under the water and comes up to the surface may be higher, and in that sense larger than the ice that was at the top before?

*Sir Robert Finlay:* I should have thought not, my Lord.

*The Commissioner:* Well, I think not.

*Sir Robert Finlay:* I should have thought not, but I speak with deference.

*The Commissioner:* I am wondering whether you could have a low-lying mass of ice, with possibly a spike underneath, and the thing turns up, and the spike appears higher than the low-lying mass of ice that you had before. I was wondering whether this iceberg can be said, in a sense, to have appeared suddenly.

*The Attorney-General:* There must have been something there before.

*The Commissioner:* Of course, it must have been there before in some shape or another, but could it have appeared suddenly, as a considerably high thing out of the water, whereas before it was not?

*Sir Robert Finlay:* I will consider very carefully the question your Lordship has put. At present, as it occurs to me, I should not have thought it would have been higher out of the water than it was before; in fact, I should have thought it was rather the other way. *The*

*Attorney-General:* It must be, to some extent, a question of configuration. I should say I am going to call some evidence which, I think, will give you all the information you want on this.

*(The Commissioner.)* I understand Captain Jones has gone. *(To the Witness.)* Do you know the circumstances in which this collision is alleged to have taken place? - Only from what I have read in the Press.

Very well. Just assume this: A perfectly clear night, a perfectly flat sea, and no wind, and therefore nothing in the nature of surf round the edge of the iceberg. Would those circumstances, in your opinion, make the sighting of an iceberg difficult? - Yes, it would increase the difficulty of seeing it. 23835. Are those circumstances very rare? - Yes.

A perfectly flat sea, no swell, no ripple? - They are extremely rare in the North Atlantic. But still such circumstances are sometimes found? - Yes, my Lord.

How far do you suppose you would see an iceberg in those circumstances? - I should say a mile.

A vessel going 22 knots an hour, sighting an iceberg a mile away, can, I suppose, clear it? - Yes.

Now can you explain to me why the “Titanic” did not clear this iceberg? Have you formed any theory? - It is possible for the iceberg to extend under the water a considerable distance from the portion seen above.

But that scarcely agrees with the facts here, because some ice fell on the deck? - That could easily occur with the concussion, my Lord. She was going at high speed; it may have crushed against the vessel’s side, and come up on deck. *The Attorney-General:* No, everybody says it fell on the deck.

*(The Commissioner.)* I understand your suggestion to be that the part of the berg that they saw was not that which struck the vessel, but that it was part of the berg underneath the water that struck the ship? - I say that is possible.

Which extended some way from the berg which stood up? - Yes, it is quite possible. I have only read the newspaper reports.

Have you any other explanation? That does not satisfy me very well. Do you think a bad look-out would account for it? - I think they had a good look-out there, my Lord.

Never mind whether you think they had a good one or not. Would a bad lookout account for it? - Yes.

Can you account for it in any other way - a bad look-out and going at the rate of 22 knots an hour? - They should have seen the berg in time to have cleared it.

You think they should? - Yes.

That means to say, taking you as a skilled man in navigation, you think there must have been bad navigation somewhere? - No, I do not think that, my Lord.

*The Commissioner:* Perhaps I ought not to have asked that question.

*(The Attorney-General.)* There is one question on what your Lordship has said.

*(To the Witness.)* Before this accident to the “Titanic” had it ever occurred to you that on a specially calm night and a specially clear night it would be more difficult to detect an iceberg? - Oh, yes.

So that a skilled navigator would expect that it would be more difficult on a specially calm night and on a specially clear night? - Yes, it would be more difficult in the calm. You see the sea causes an extra warning, breaking against the berg.

*The Commissioner:* “Specially clear” does not add to the difficulty; specially calm does.

*The Attorney-General:* Yes, but you have to take into account also that it is specially clear.

## **Page 670**

*The Commissioner:* It is easier to see then.

*The Attorney-General:* Yes. You must take the two into account. If you say it was not a specially clear night -

*The Commissioner:* Oh no, the evidence was it was specially clear.

*The Attorney-General:* That is why I am putting to him the particular conditions with which we have to deal. As I understand, your Lordship’s view of the evidence is, at any rate at present, that you discard the evidence with regard to haze.

*The Commissioner:* That is right.

*The Attorney-General:* That therefore eliminates that from consideration; and then what you have to deal with is the specially calm night and also the evidence that it was a specially clear night. You have those two things.

*The Commissioner:* Yes. I thought you were putting to the Witness the suggestion that the clearness of the night detracted from the power of detecting an iceberg.

*The Attorney-General:* No, I was putting the circumstances we are dealing with in the particular case. That is what I wanted to do.

*(The Witness withdrew.)*

**FRANCIS CARRUTHERS, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

*(Mr. Butler Aspinall.)* We are now going to Belfast, for a very short time I hope.

The two following Witnesses have supervised the building of the ship at Belfast. *(To the Witness.)* Are you a member of the Institute of Naval Architects? - I am.

And are you an engineer and ship Surveyor to the Board of Trade at Belfast? - Yes.

I believe you were for 13 years a sea-going engineer, and you have been for some 16 years in the service of the Board of Trade? - Yes.

I think your experience with the Board of Trade has mainly consisted of superintending the construction of new steamers? - Yes.

And you were engaged upon that work during the time the "Titanic" was being constructed at Belfast? - I was.

That extended over a space of what time? - About two and a half years.

Did you give her careful attention? - I did.

I believe the practice is that as she is being built you make yourself informed of whether or not the builders are complying with the Board of Trade Regulations and Instructions? - Yes.

That is your duty. And in addition to that I believe either you or the owners have to send over to London either to Mr. Archer or Mr. Boyle, whom we have heard of, certain sections, certain plans, and so on? - Yes, they were sent through our office.

That is the practice? - Yes.

Also I believe in the event of there being any difference of opinion between you and the builders as to whether or not the Board of Trade instructions are being given effect to you communicate with the London office and get the benefit of their views? - Yes, we do.

And then you put these views before the builders, Messrs. Harland and Wolff, as they were on this occasion? - Yes.

There were certain matters which you did have to refer to London for, but as far as I can see it is quite unnecessary to trouble my Lord with those matters. If any of those Gentlemen want them you can give them particulars? - Yes.

I do not propose to trouble you about them. Eventually the ship was finished? - Yes.

Did you then give your declaration of survey? - Yes.

When you gave your declaration of survey had she in fact complied with all the requirements of the Board of Trade? - Yes, she had.

*Mr. Butler Aspinall:* My Lord, it was put in through the medium of Mr. Sanderson; it follows the day's evidence which ends on page 479. At the end of that there were certain appendices or exhibits put in.

*The Commissioner:* Yes. I have the document.

*(Mr. Butler Aspinall.)* It is quite unnecessary to trouble you with it, Mr. Carruthers. It is on page 10 of those documents. That declaration is signed by you and you say it is in order and accurate, and then did you hand that declaration over to the owners? - To the builders.

Yes, you are right, to the builders; then in the ordinary course of business the builders sent that on to the head office in London. Perhaps you do not know? - They sent it on to the Assistant-Secretary.

*(Mr. Butler Aspinall.)* Your Lordship will see that what next happened is at page 13, a document is issued to the owners entitled "passengers certificate," and that is signed "Walter J. Howell." *(To the Witness.)* That is how it is done? - Yes.

After you have given your declaration of survey so far as you are concerned you have done with the ship? - Yes. I have finished with her then.

*Mr. Scanlan:* I have no question.

#### **Examined by Mr. CLEMENT EDWARDS.**

What precisely are your qualifications, Mr. Carruthers? - For what purpose? 23872. For the purpose of a Surveyor of ships; what experience have you had? - I have been surveying ships for a little over 20 years.

Before you entered the service of the Board of Trade what were you doing? - Surveying ships.

For how long? - For about four years.

So that you have been in the service of the Board of Trade 16 years? - Sixteen years, yes.

And before that you surveyed ships for four years? - Yes.

For whom? - First of all I was Assistant-Superintendent to Robert Baird on the Tyne, and assisted him; then I became assistant for F. Scudamore and Company, London.

After that, I went as assistant to John Baxter, at Newcastle-on-Tyne.

This was surveying ships was it? - Yes.

What previous experience had you? - Prior to that I was at sea thirteen years.

As what? - An engineer.

What experience have you had on the constructional side except as a Surveyor?

Have you had any experience at all on the constructional side of shipbuilding, except as a Surveyor? - When I went to serve my Apprenticeship, about 12 months was spent in a Whitehaven shipyard as a shipbuilder.

Apart from your experience at sea and your experience as a Surveyor, is that the whole of the experience you have had on the practical side of constructional work? - That is practically all.

In the declaration you issued, in the one case you certify that the boats D of the "Titanic" were capable of accommodating 80 persons, and in another declaration you make it only 64? - Yes.

How do you account for the disparity in the numbers in your certificate? - It was a clerical error in the declaration, but it was put right on the survey. It was discovered very shortly after the declaration was issued, and corrected.

*The Commissioner:* We have had that explained before.

*Mr. Edwards:* With respect, my Lord, I asked the Assistant-Secretary of the Board of Trade, and he said he was unable to explain it, but that the Surveyor would explain it.

## Page 671

*(The Commissioner.)* No, but it was stated to me that it was a clerical error.

*The Witness:* It was corrected almost immediately after the declaration was issued.

23886. *(Mr. Edwards.)* Then boat section A. In the one declaration the number of persons supposed to be accommodated is 910, and in the other declaration it is 915? - That is the same thing.

That is also a clerical error? - Yes.

Do these clerical errors very often happen? - No, very rarely.

You told my friend that there were certain particulars in the case of the "Titanic" which you referred to London? - Yes.

Now what were the matters that you referred to London? - The first thing I referred to London was the position of the collision bulkhead.

Did you make any suggestion as to that? - Yes.

What was the suggestion? - I sent a sketch showing the position of the bulkhead, and pointed out that it was carried forward on what is marked there "E Deck" six frame spaces instead of being carried right up to D Deck.

Did you suggest that that should be altered? - No; I submitted it, and asked for instructions. Messrs. Harland and Wolff were contending that they were right and I thought they were wrong.

Who would that have been submitted to in London? - It was sent to the Assistant Secretary, and from him it went to Mr. Archer, the Principal Ship Surveyor.

23895. And beyond him? - It came back to me, I think.

Did he agree with Messrs. Harland's view? - No, he thought I was right.

And it was altered? - No, another arrangement was made on another bulkhead.

A compensating arrangements? - Yes.

What was the compensating arrangement? - In the long run it resulted in the second bulkhead being carried up to D deck.

Was that submitted to London too? - It was.

And did you agree that that might be done? - Yes.

Did London agree that it might be done? - London agreed first.

Was that decided by Mr. Archer? - Well it would be submitted by Mr. Archer to the Assistant Secretary as a right provision.

Would the Assistant Secretary in your view decide whether it was the right provision? - No, Mr. Archer would decide it.

Then what would be the purpose of submitting it to the Assistant Secretary? - I cannot tell you that; I have nothing to do with that.

Was there anything else submitted to London? - There was a question of the side scuttles and a question as to the height the bulkheads might be carried. These were all practically involved in this first thing.

Were those bulkheads other than the collision bulkhead? - Yes.

Did you submit sketches of these other bulkheads to London? - I got drawing from Harland and Wolff's and they were forwarded to London.

In those drawings which you got from Harland and Wolff's for the intermediate bulkhead to which deck was it proposed that should be carried? - To E deck as far aft as the forward engine room bulkhead and to the D deck abaft that.

Did you make any recommendations with regard to the height of those bulkheads? - No, this was settled automatically by a rearrangement of the freeboard. 23911.

Automatically, in what way? - If they took table C freeboard they could stop at the bulkhead measured from the upper deck - they could by the Rules stop them at E deck. 23912. What Rules are you referring to? - The freeboard tables and Clause 16 in the instructions.

Clause 16 in your instructions says this: "An efficient and watertight engine room stokehold bulkhead, as well as a collision watertight bulkhead, and an afterwatertight compartment, to enclose the stern tube of each screw shaft, should be fitted in all sea-going steamers, both new and old, and in the absence of any of these the case must be specially referred to the Board of Trade before a declaration is given. As regards other bulkheads, although a thorough subdivision of the ship is desirable, the Surveyors should not, for the present, refuse to grant a declaration because these are not fitted." Will you refer me to the Rules by which you are guided in the case of other bulkheads than those specifically mentioned in that Rule? - The circular 1401, which overrides this Clause 16, which you have read.

It says, "In all sea-going steamers coming under survey for passenger certificate for the first time the following requirements regarding the height of the bulkheads should be complied with. The collision bulkhead is in all cases to extend to the upper deck. If an iron or steel watertight deck or flat is fitted below the upper deck at the afterend of the vessel and forms the top of the after watertight compartment, the aftermost bulkhead may terminate at the said watertight deck or flat, but if no such watertight deck or flat is fitted, the aftermost bulkhead should extend to the upper deck. When the loadline disc of the vessel is placed at least as low as is required by Table C of the Freeboard Tables for awning deck vessels" this is not an awning deck vessel, is it? - You will find a little further on it says this is a shelter deck vessel. We look upon the top deck as the shelter deck, and the next deck below is called the upper deck.

It is only to get clear as we go on. This is not an awning deck vessel? - No; I would not call it an awning deck.

(*Sir Robert Finlay.*) May I ask which you call the shelter deck and which the upper deck on this model? - The top deck is the shelter deck.

Will you point to it, please? - Yes, (*Pointing on the model.*) this deck; the next deck next below it is the upper deck. 23918. That is C and D? - C and D.

(*Mr. Edwards.*) “When the loadline disc of the vessel is placed at least as low as is required by Table C of the Freeboard Tables for awning deck vessels the remaining bulkheads may terminate at the deck next below the upper deck.” That would be in this case? - D deck.

If this were an awning deck vessel that would be D deck? - Yes.

“But when the disc of vessels other than those of the awning deck type is placed higher than required by Table C all the bulkheads should extend watertight to the upper deck.” That would be the upper deck here? - The deck next below the shelter deck, deck D. Just read two lines on and you will get the Rule which guided us with regard to the ship.

Very well. “In interpreting the above Rule, in the case of vessels of the shelter deck type, the deck next below the shelter deck may be regarded as the upper deck, and accordingly the collision bulkhead, as well as the other bulkheads, may terminate at the deck next below the shelter deck.” That would be which deck here? - D deck. 23923. And that is the Rule that should apply here? - Yes.

23924. Will you explain why, if that is so, the bulkheads in this case only came up to deck E? - Because when “the loadline disc of the vessel is placed at least as low as is required by Table C of the Freeboard Tables for awning deck vessels,” that is, the Table for awning deck vessels. This does not necessarily require to be an awning deck vessel if she has a freeboard equal to the Table C for awning deck vessels. 23925. When do you get that from? - It is here.

I may have misunderstood, but I think you will find that is not so. “When the loadline disc of the vessel is placed at least as low as is required by Table C of the Freeboard Tables for awning deck vessels”? - There is no comma there; “Freeboard Tables for awning deck vessels” is a certain table.

## **Page 672**

This is not an awning deck vessel? - No, I do not think she is.

“The remaining bulkheads may terminate at the deck next below the upper deck”? - Yes.

“But when the disc of vessels other than those of the awning deck type” - this is one of those vessels other than those? - Yes.

“Is placed higher than required by Table C, all the bulkheads should extend watertight to the upper deck”? - Yes. Then it tells you next how to interpret it.

“In interpreting the above Rule, in the case of vessels of the shelter deck type, the deck next below the shelter deck may be regarded as the upper deck” - Yes.

“And accordingly the collision bulkhead, as well as the other bulkheads, may terminate at the deck next below the shelter deck”? - That is right.

That is deck D? - Yes.

If that is the Rule by which you were guided as Surveyor why were not they brought above deck E? - Because they took a freeboard which was slightly greater than Table C.

Do you say this Rule was complied with? - Yes.

Will you explain it, then, in your own way, because I fail to understand that answer in view of your two previous answers? - In measuring the freeboard down from the upper deck, if their freeboard exceeded that over Table C, it says that the bulkheads may terminate at the deck next below the upper deck. She had that freeboard. They took it specially for that purpose.

That brings you to deck D? - The deck next below the upper deck is deck E. 23938. Then I have misunderstood your answer. I understood you to say several times over that was deck D? - Yes, the upper deck is deck D, I take it.

Do you mind making it perfectly clear, because here comes a very important question as to the carrying out of the duties by the Marine Department of the Board of Trade and its Surveyors. Here you say you have a Rule which guides you, and your answers are not quite consistent. Now, will you show here on this model exactly what are the decks in this vessel? - This is the shelter deck. (*Pointing.*)

That is deck what on this vessel? - C. The deck next below this one is the upper deck; that is deck D. The collision bulkhead terminated at the upper deck in accordance with that Rule. Then she had a freeboard measured from that deck down, which was in excess of table C. Therefore the other bulkheads may terminate at the deck next below the upper deck, that is deck E.

Now, will you look carefully at this Rule. In interpreting the above Rule in the case of vessels of the shelter deck type, the deck next below the shelter deck may be regarded as the upper deck? - Yes, it was in this case.

That is deck D? - Yes, that is deck D.

“And accordingly the collision bulkhead, as well as the other bulkheads, may terminate at the deck next below the shelter deck.” Now the shelter deck here is deck C? - Yes.

And you are, under certain circumstances, permitted to make a variation, and that variation is that you may allow the bulkhead to terminate at the deck next below the shelter deck. In that case it would be deck D? - Yes.

Now what I am putting to you is this, that in the “Titanic,” as passed by you, the bulkheads came to the height of deck E, and not to the height of D deck, as required by this variation which you are permitted to make under this Rule. I want you to explain it? - I can only explain it by pointing out what is plainly stated here. “When the loadline disc of the vessel is placed at least as low” - it is placed a little lower. I think the margin was three inches - at all events, it was almost three inches; and when it is placed “as low as is required by Table C of the freeboard tables for awning deck vessels the remaining bulkheads may terminate at the deck next below the upper deck.” The upper deck was defined as D deck, and if she has freeboard equal to table C, or slightly greater, then they may terminate one deck below.

(*The Commissioner.*) That is at G deck? - Yes, my Lord. *Mr. Edwards:* Has your Lordship the Rule before you?

*The Commissioner:* No, but I am listening to you, more or less.

*(Mr. Clement Edwards.)* I shall have to seek the shelter deck, my Lord. *(To the Witness.)*

So your reading of this Rule - the Court will have to interpret it by and by - is that in the case of the "Titanic" they would be complying with the conditions, if you so agree, if they brought the bulkhead to the height of deck E, and no higher? -

Yes, the bulkheads abaft the collision bulkhead.

*The Commissioner:* It has taken a long time to arrive at this point, but at all events I understand him now to say that if the bulkhead is carried up to deck G that complies with the requirements.

*(Mr. Clement Edwards.)* That is his interpretation of this Rule, but I shall submit that the Rule does not bear that construction. But that is another point which I shall deal with at the right time. *(To the Witness.)* Were you ever asked to certify as to the efficiency of these bulkheads apart from the question of the relation of the strength of the ship. Do you follow me? - No.

*The Commissioner:* It is not material, but I do not.

*(Mr. Clement Edwards.)* Were you ever asked to certify as to the watertight character of these bulkheads? - By whom?

By Harland and Wolff? - The vessel was submitted to be certified as a passenger steamer.

They never said anything to me about the bulkheads any more than putting the plans before me and expecting they were going to get the certificate at the end of the survey.

You probably know that in the Rules as to life-saving appliances, you can make a declaration allowing a ship to go to sea with a less amount? - Yes, no application was made for that.

Were you ever asked by Harland and Wolff to certify as to the bulkheads in relation to their watertight character and in relation to their efficiency to satisfy those Rules?

*The Attorney-General:* Rule 12, do you mean?

*(Mr. Clement Edwards.)* Yes.

*The Witness:* You mean did they apply for any reduction of life-saving appliances on board on account of the watertightness of the bulkheads?

Yes? - No.

Was there any discussion between them and you as to the efficiency, or I will put it as to the watertight character of the bulkheads? - No, not from that point of view.

23956. But only from the point of view as part of the structure of the ship for purposes of strength? - Yes, and for watertightness of course, but not from a life-saving appliance point of view.

I did not ask you that. My last question was as to their watertightness. There was a discussion as to whether they were or were not watertight? - I do not think I ever had any discussion with them on the subject.

*The Commissioner:* No, he did not; but it was part of his duty, I suppose, to see they were watertight.

*(Mr. Clement Edwards.)* I will put that. If you are not asked by the builder or by the owner to certify as to the efficiency of bulkheads for the purpose of Rule 2, do you then consider it your duty to see if the bulkheads are watertight? - Yes.

You do? - Yes.

*The Commissioner:* That is not quite the way to put it; does he, nevertheless, consider it his duty to ascertain that the bulkheads are watertight. I should have thought it was obviously his duty to do it.

(*Mr. Clement Edwards.*) You heard his Lordship's variation of the question? - I have.

What is your answer? - Yes, I think it is my duty.

You do think it is your duty? - Yes.

Would you tell his Lordship precisely what you did to test whether the bulkheads were watertight? - As these bulkheads were built I

### **Page 673**

followed their construction. When they were riveted I inspected them to see how they were riveted and if they were well riveted; and when they were finished I went round and tested the caulking of the bulkheads and at the end of the survey, a few days before she was finished I went round the bulkheads to see that all the small holes that are drilled for carrying through the heating pipes and the electric light wires were all properly made fast, and the boiler pipes -

*The Commissioner:* I do not know what you are doing, Mr. Edwards; you have been doing it a long time, but I do not know what it is quite you are doing. Are you going to suggest that this gentleman did not execute his duties properly, because I do not think you ought to suggest it unless you have some charge to make against him?

*Mr. Edwards:* My Lord, with respect, the matter does not quite stand in that position.

*The Commissioner:* Tell me how it does stand?

*Mr. Edwards:* What I do want to get at is this. The official attitude of the Marine Department of the Board of Trade now stands thus: that because you may have watertight compartments and efficient bulkheads, therefore you may have less boat accommodation. Now, what I want to get from this Witness is to see exactly what steps are taken by him as a responsible officer to see that the bulkheads are efficient. That is all. (*To the Witness.*) You have explained in reply to the last question that you did a lot of things.

*The Commissioner:* I do not see what Rule 12 has got to do with it. Neither Harland and Wolff nor the Oceanic Steamship Company ever applied to be relieved of the obligation of finding lifeboat accommodation under Rule 12.

*Mr. Edwards:* Quite, my Lord, with respect, I have disposed of that, and now, accepting your Lordship's variation of the question. I am asking him whether, nevertheless, he deemed it his duty to test bulkheads.

*The Commissioner:* He has told you that he did. Then you began to examine him as to what he did? *Mr. Edwards:* Yes.

*The Commissioner:* Are you laying a foundation for some charge against him that he neglected his duty or what?

*Mr. Edwards:* No, my Lord. What I want to get at is what amounts to the fulfillment of the requirements of the Board of Trade, because if I may say so, we are not here merely in the nature of an inquest, to discover why the "Titanic" went down; we are here also for the purpose of ascertaining what things ought to be done to prevent future "Titanic's"

going down. And what I do want to get at from this Witness is precisely what tests he applies.

*The Commissioner:* Very well. I do not say you may not do it, but has it been suggested that these bulkheads were not watertight?

*Mr. Edwards:* No, my Lord; what is perfectly clear is this, that in spite of the existence of bulkheads, this ship went down.

*The Commissioner:* Yes, that is because she had holes knocked along her side. It has nothing to do with bulkheads.

*Mr. Edwards:* It may not have anything to do with bulkheads *qua* bulkheads, but it may have a very great deal to do with bulkheads *qua* part of the strength of the ship relied upon for resisting a shock of this kind. I will be very short.

*The Commissioner:* I am not sure about that.

*Mr. Edwards:* Your Lordship has rather a suspicious mind. (*To the Witness.*) I asked you whether you deemed it your duty to test these bulkheads for the purpose of seeing they were watertight?

(*The Commissioner.*) And let me interrupt you for a moment. (*To the Witness.*) Suppose you found some of the bulkheads were not watertight, would you have refused your certificate? - I do not know; it would have depended which bulkhead it was, my Lord. I think if I had found any of the bulkheads not watertight I would have submitted the question to London.

Did you find any of the bulkheads not watertight? - No, I found them all very good indeed.

(*Mr. Edwards.*) Now, what I want to get is what was the test you applied to see the bulkheads were watertight? - I went over the bulkheads with a feeler, a small-bladed knife, round the caulking, and saw there were no rivet holes left unfilled.

Is that the only test you applied for watertightness? - Yes.

*The Commissioner:* Now suggest to him some other that he ought to have applied.

(*Mr. Edwards.*) You did contemplate the possibility of these compartments between the bulkheads, or some of them, being flooded? - Yes.

Did you apply any test of any kind to see the resisting strength of the bulkheads? - You mean to resist that which would be placed upon them by the place being filled with water?

Yes? - No, excepting the collision bulkhead. I saw it filled with water up to the level of the forepeak tank top.

That is the only one you saw tested with water? - Yes.

(*The Commissioner.*) Is it customary to test any other bulkhead except the peak bulkhead with water? - No, my Lord. *The Commissioner:* I am told it is never done.

(*Mr. Edwards.*) What are the grounds upon which and the method by which you arrived at the conclusion that the bulkheads are efficient? - Are strong enough to resist this pressure?

Yes? - There is a standard Rule -

*The Commissioner:* Is there any reason to suppose that the bulkheads in the "Titanic" broke down?

*Mr. Edwards:* I think there is some evidence.

*The Commissioner:* Well, will you tell me what it is?

*Mr. Edwards:* There is the evidence of Barrett, my Lord.

*The Commissioner:* What is that, that he saw some water coming in?

*Mr. Edwards:* No the evidence of Barrett is this that in Section 6 he saw water coming in, and in Section 5 he saw it trickling in and that afterwards when he skipped up out of section 5 he did it because there was a great rush of water as if something had given way.

*The Commissioner:* Is that all? The side of the ship had given way?

*Mr. Edwards:* No.

*The Commissioner:* Yes it had, and the water was rushing in?

*Mr. Edwards:* Not in that section; this is section 5.

*The Commissioner:* The ship was holed to between Sections 4 and 5, was it not?

*Mr. Edwards:* No, my Lord, there is no evidence of that.

*The Commissioner:* Was not it holed in No. 5?

*Mr. Edwards:* Slightly, and the bunker on the starboard side.

*The Commissioner:* You are not helping me much.

*Mr. Edwards:* I am very sorry.

*The Commissioner:* You are trying very hard, no doubt.

*Mr. Edwards:* I am proceeding upon the principle that if at first I do not succeed I will try again.

*The Commissioner:* You do not give the quotation correctly. It is "try, try, try again." 23975. (*Mr. Edwards - To the Witness.*) Were you very frequently on the "Titanic" inspecting her? - Yes, about every day.

Did you apply any actual tests to anything on board the "Titanic" - any test of strength or anything - or did you proceed merely upon your general knowledge and experience by general observation? - Do you mean the hull or the equipment?

Yes, any actual test of strength.

*The Commissioner:* Help us by telling us what sort of tests.

(*Mr. Edwards.*) If he says he did not, there is no need to go into the particular kind? -

Yes, I did.

Did you apply any test to the plates in the bottom of the "Titanic"? - No; I saw the double bottom tested with water.

## **Page 674**

Have you any views with regard to the advantage of longitudinal bulkheads? - Of course I have views.

Have you had any experience? - I have had no experience of longitudinal bulkheads.

No experience at all? - No, I cannot recall it.

Have you any views of what ought to be the height of transverse bulkheads? - I am guided by the regulations.

I asked whether you have any views apart from the regulations? - Do you mean in my private capacity?

No, as Surveyor, with 20 years' experience. *The Commissioner:* I hope you will say no.

(*Mr. Edwards.*) This is very great incitement, my Lord.

*The Witness:* Well, I am satisfied if I get them as high as I got them in the "Titanic." 23986. That is as high as you say the regulations required? - Yes.  
That satisfies you? - Yes.  
*Mr. Edwards:* Very well that will satisfy me for the present.

**Examined by Mr. HARBINSON.**

My point is simply about the steaming tests. Did you on behalf of the Board of Trade see the "Titanic" was subjected to steaming tests? - I was on board the ship when she went through her steam trials and she made some tests.  
Where was this? - Outside Belfast Lough.  
Before she left for Southampton? - Yes.  
What steaming tests was she submitted to? - She went from slow to full speed. She was put astern and the engines maneuvered and she was put through a number of circling trials.  
Was she put through any trial with the port propeller going astern and the starboard propeller going ahead? - She was.  
What speed was she going at when she was put through that test? - I could not tell you.  
About full speed she was supposed to be going.  
Going full speed with propellers going in that way within what distance would she turn? - I do not know.  
Do you know within what distance she did turn? - No.  
Could you give us any light? - Well, she made a very small circle, I observed, and it was noticed.  
How many lengths of herself? - I have no idea.  
You could not furnish it? - I could not tell, I do not know.

**Examined by Mr. HOLMES.**

For the purpose of the Emigration Survey and the Passenger Declaration, it was your duty to inspect, amongst other things, the boats and the life-saving appliances, the compasses and other deck equipment? - Yes.  
Have you ever served at sea in any capacity outside the engine room? - No. 24001. Have you any sea experience at all to qualify you for the surveying of deck equipment? - I was qualified when I came ashore to inspect deck equipment, I think. 24002.  
Have you had, for instance, any practical experience of compasses? - Do you mean making them?  
Using them? - No, except in a small boat.  
Have you, since you joined the Board of Trade, had any training under sea conditions as to the use of deck equipments? - I have seen boats put out, of course, hundreds of times.  
Have you ever had the handling of a boat in rough weather at sea? - Yes. 24006.  
Amongst other things the certificates of masters and two mates are part of your duty for passenger declaration? - I inspect it and see that it is in order.

24007. Your object is to see that the Merchant Shipping Act is complied with? - Yes.  
24008. Do you ask for any other certificates besides those of the Master and two officers?  
- We get a certificate from the compass adjuster that the compasses are good. 24009. I  
am talking of the master and two mates' certificates. You asked for those certificates? -  
Yes.  
Did you ask for others? - And two engineers.  
Any others? - No.  
So long as the requirements of the Merchant Shipping Act are satisfied, you are satisfied  
that the ship is seaworthy? - Yes, that is all I have to do with it.  
If the "Titanic" had them you would not - ? - I would not have withheld the declaration.  
Do you think it improper to allow a ship of that size to go to sea with two officers? - I  
would consider if I had got the certificates I had to enter on my declaration that I  
had got all that was required by me.  
You simply tie yourself down to the regulation? - I must.  
The same thing applies to the Emigration Survey for clearance? - I measured those  
spaces.  
I am still talking of the officers' certificates? - I did not give the clearance of this ship,  
not as Emigration Officer.  
You sign this report? - I did certain things.  
You signed a report, and amongst other things it gives a list of master and officers; it only  
contains the names of the master and two officers and two engineers? - Yes.  
That satisfied you? - Yes, as far as the certificates are concerned.

*(The Witness withdrew.)*

*(Adjourned to Monday next, 11 o'clock.)*

## In the Wreck Commissioner's Court

SCOTTISH HALL,

BUCKINGHAM GATE,

*Monday, 17th June, 1912.*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.

*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

LOSS OF THE S. S. "TITANIC."

**TWENTY-FIFTH DAY.**

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURNE (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P., (instructed by Mr. Smith, Solicitor) appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes, of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder, Roberts and Company) appeared as Counsel on behalf of the dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

MR. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

*The Commissioner:* Are you getting us the turning circle of the “Titanic”? *Mr. Laing:* Yes, my Lord; we have it prepared.

*The Commissioner:* It is suggested to me that the turning circle, having regard to the rudder, was probably very large.

*The Attorney-General:* This is it, my Lord. (*A diagram was handed to the Commissioner.*) *The Commissioner:* Can anyone tell us whether this diagram is made upon the supposition that both engines are going ahead.

*Mr. Wilding:* Both engines full ahead and the rudder put hard over.

*The Commissioner:* Then we should like to know what the turning circle would be if one engine were reversed.

*Mr. Wilding:* I can get the information for you, my Lord.

*The Commissioner:* What is the “position when bell rung”?

*Mr. Wilding:* That is when the signal was given from the crow’s-nest.

*The Commissioner:* Is that the gong from the crow’s-nest?

*Mr. Wilding:* Yes.

*The Commissioner:* Or is it the bell to the engine room?

*Mr. Wilding:* No, the one from the crow’s-nest.

*The Commissioner:* The gong.

*Mr. Wilding:* Yes; it is a big bell, really.

*The Commissioner:* Meaning something ahead.

*Mr. Wilding:* Yes.

*The Commissioner:* What we want is to see at what point, what is called the transfer, that is the movement in answer to the helm, would commence and how speedily it would develop, in order to see when this ship would have escaped a berg in its way?

*The Attorney-General:* At what distance from the time it is sighted, assuming the helm was put hard over?

*The Commissioner:* Yes, I daresay Mr. Wilding will understand it. If Mr. Wilding will come up here, we can explain to him at once what it is we want. (*Mr. Wilding explained to the Commissioner on the bench.*)

*The Attorney-General:* I understand the result of what has taken place is to ask for some further plans; otherwise we ought to have on the note what has taken place?

### **FRANCIS CARRUTHERS, Recalled.**

#### **Examined by Mr. COTTER.**

*Mr. Cotter:* May I ask Mr. Carruthers a question or two?

*The Commissioner:* Yes.

(*Mr. Cotter - To the Witness.*) When you surveyed the “Titanic” at Belfast did you notice what kind of lifebuoys she carried? - Yes.

What were they? - Solid cork.

Did you notice whether she had any lifebuoys with acetylene gas attachments to them? -

No, she had not any at Belfast.

Have you seen those kind of lifebuoys? - No, I have not.

Have you seen the Admiralty lifebuoys? - No, I do not think so.

Did you notice whether she had two large buoys fastened to the after-bridge? - No, I did not see any. I know the Admiralty lifebuoys.

Will you tell my Lord what they are, and how they are worked? - Well, if it is the kind that I have seen on the war vessels, they are attached to the side ready for slipping off. When they slip off and get into the water there is a light; the water makes a light.

You did not notice whether she carried any of those? - No, I am almost sure she did not.

*Mr. Cotter:* My object in asking this question my Lord is this. We know the difficulty of the boats turning back; they would not know their way to where she had sunk. If she had carried these buoys and had been lost they would have been floating and a light burning from them.

That is the reason I am asking these questions.

*The Commissioner:* I am told this vessel had lifebuoys which ignited a lamp when they fell into the water. "Holmes Lights," they are called; they are not the same as the Admiralty lifebuoys, but the same effect.

*The Witness:* She had these Holmes lights attached to the lifebuoys.

And the effect is the same as that of the Admiralty buoys? - When they strike the water.

When they strike the water the light springs up? - Yes.

*Mr. Cotter:* There is another buoy with a small tin canister attachment containing calcium phosphate, and they have to be knocked with a kind of spring bit, to knock holes, and they are used for throwing over the side at night supposing a person fell overboard.

*The Commissioner:* I have seen them myself; I have never had to use them, I am glad to say. *Mr. Cotter:* Very good, my Lord.

*(The Witness withdrew.)*

**WILLIAM HENRY CHANTLER, Sworn.**

**Examined by Mr. ROWLATT.**

You are a ship Surveyor in the Marine Department of the Board of Trade stationed at Belfast? - Yes.

Your duties are to survey ships for various purposes, but in connection with the "Titanic," I think your only duties were with regard to the boats? - Yes.

All you did was with regard to the boats? - To inspect the boats while building in the boat builder's shop.

You have served your Apprenticeship as a shipwright? - Yes.

Including boat building? - Including boat building.

Then you were an Admiralty draughtsman? - Subsequently to my Apprenticeship, yes.

And you have been ship Surveyor to the Board of Trade at Belfast from the 1st March, 1895? - Yes, from the 1st March, 1895, up to the present.

On the 19th May, 1911, did you receive special instructions to look closely into the construction of all new boats? - From the Board of Trade, yes.

That was the 19th May, 1911? - Yes, the 19th May, 1911.

Did you begin to inspect the "Titanic's" boats on the 30<sup>th</sup> May, 1911? - Yes.

After this? - Yes, ten days after.

Did you inspect them carefully? - Yes.

Fourteen lifeboats and the two other boats? - There were 14 section A boats and two of section D.

Were they well made and of good material? - They were well made and of good material.

Would they be safe to lower from the davits full of passengers? - I made a calculation and came to the conclusion that they would be.

Now, what is the full capacity of those boats? - I think it was 618 cubic feet. 24047. How many people ought to be lowered in one of these lifeboats? - Under the statutory Rules they should carry 65.

### **Page 677**

The boats that you saw, how many people would they take safely from the davits, in your judgment? - Well, as many as the statutory Rules would allow.

How many; cannot you give me a number; it would save a lot of time? - A matter of 70.

24050. Is that marked on the boat in any way? - No, I do not think it is. I did not see the boats on leaving the ship, but my impression is it was not.

24051. You could produce the scantlings of the boats and the materials? - Yes, I can.

*Mr. Rowlatt:* I do not think it is necessary to go further.

*The Commissioner:* I do not think there has been any suggestion that the boats were not well built and of good material. Their capacity may be another thing.

*Mr. Rowlatt:* It was with regard to their strength to carry down the passengers. *The*

*Commissioner:* There is a suggestion that somebody thought there was a danger of buckling, but there was no buckling, and one of the boats is said to have gone down with seventy people in it?

*The Attorney-General:* Your Lordship is quite right; that is the only explanation we have got of why some of the boats were lowered with comparatively few passengers; that is to say, they were not loaded with their full complement, and the explanation is what your Lordship says. *The Commissioner:* That is one explanation; but another is that they could not get the people into them.

*The Attorney-General:* Yes; it does not apply to all, I agree.

(*Mr. Rowlatt - To the Witness.*) Have you made a calculation to find what strain the boats would bear in being lowered? - Yes, I made such a calculation. The results I arrived at were that the stress at the gunwale would be 2 cwts. to the square inch, and at the keel about 2  $\frac{1}{4}$  cwts.

When did you make that calculation? - After the casualty occurred. 24054. Is that more than the stress which would be brought to bear by the boat being lowered with 70 people in it? - That is the stress that would be brought to bear with 65 persons in the boat, and with the boat suspended from the davits, not water-borne. 24055. Do you say that you made a calculation that shows the boat would stand a greater stress than that produced by the people being in it or not? - The result of my calculation was that -

That it would bear a greater stress? - That it would bear a greater stress.  
Much greater? - Considerably greater.  
Can you give us a percentage? - Twice as much.

**Examined by Mr. SCANLAN.**

Was it part of your duty to test the stress on the falls? - No.  
And you did not, in point of fact, do that? - No; my inspection did not extend further than the period during which the boats were constructed in the builders' shop. *The Commissioner:* None of the falls gave way?  
(*Mr. Scanlan.*) No, my Lord; this is the Board of Trade test. (*To the Witness.*) Did you make any calculation as to the sufficiency of the falls, or the capacity of the lifeboats until after the accident? - It was not my duty to do so.  
Is it usual to mark on lifeboats their carrying capacity - I mean the content of passengers? - I have seen the dimensions marked upon the boat, and also the capacity, but I am unable to say whether this was done.  
Or whether it is the usual thing to do? - It is not compulsory; in some cases it is done and in others not.

**Examined by Mr. CLEMENT EDWARDS.**

You spoke of making a calculation. Did you make any actual test, or see any actual physical test made of the strength of these boats? - I did not. As I explained a few moments ago, my inspection did not extend beyond the period during which the boats were constructed in the shop.  
Were you, for the purposes of the "Titanic," the responsible Surveyor for seeing that these boats were sufficient? - I was not.  
Who was? - The Surveyor that issued the declaration.  
(*The Commissioner.*) Then what was your duty? - I had special instructions from the Board of Trade to take care and watch the construction of boats being built in our district for use on ships.  
And what was the duty of the other gentleman you told us of? - To measure the capacity of the boats and of the air cases, see the equipment is in order and issue a certificate to that effect.

**Examined by Mr. HARBINSON.**

Was it you who measured the capacity of the boats? - I measured them simply for the purpose of my strength calculation.  
Can you explain to me the discrepancy in the numbers given in the two appendices? - I am unable to do that. I was not responsible for that.  
*The Commissioner:* That has been explained; it is said to have been some clerical error.  
*Mr. Harbinson:* That is between 1,167 and 1,178.

*(The Witness withdrew.)*

**ALFRED PEACOCK, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

24071. Are you an engineer and ship Surveyor at the Board of Trade? - Yes. 24072.

Are you stationed at Glasgow? - Yes.

24073. And were you stationed at Glasgow during the building of the "Titanic"? - Yes.

24074. And was it your business to survey the four Englehardt boats which were fitted to the ship later? - Yes.

Did you survey them? - I did.

And did you put one in the water? - I did so.

And were they good and efficient boats? - They are good and efficient boats. 24078.

How many people would the boats, in fact, carry? - They would carry 47.

**Page 678**

**Examined by Mr. COTTER.**

Would you think the roof of one of those houses the right place to put an Englehardt boat?

*(The Commissioner.)* Do you know anything about where boats are placed on the deck? - Not as they were placed on the "Titanic."

Have you any experience of the stowing of Englehardt boats on the deck of a steamer? -

No, these were the first Englehardt boats, I think, that were used that I have had to do with.

*The Commissioner:* I do not think it is worthwhile to ask him.

*Mr. Cotter:* Very well, my Lord.

**Examined by Mr. HOLMES.**

When you say they would carry 47, did you see that from an actual test of putting them in? - Yes, an actual test in the water with weights equivalent to the people. 24083. How about the space? - The space is specified in a Board of Trade circular.

*(The Witness withdrew.)*

**MAURICE HARVEY CLARKE, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

24084. Captain Clarke, I believe you hold a master's certificate? - Extra master.

24085. Are you Assistant Emigration Officer under the Board of Trade, stationed at Southampton? - I am.

I believe you have been for some 13 years with the Department? - I have.

Were you the officer whose duty it was to clear the "Titanic" as Emigration Officer? - I was.

For that purpose, after her arrival at Southampton before she sailed on this voyage, did you visit her? - I did.

And did you visit her and go over her generally for a period of about three days?

- I did.

To inform yourself of her accommodation and all the other matters that it is your duty to inform yourself of? - Quite correct.

You can give us all the details of this if they are wanted? - Certainly.

I do not propose to ask you. Amongst other things, did you make a plan of the boats? - I made a sketch.

Is that your duty? - Well, it was just a guide for me. As I should be visiting that ship a considerable number of times, I thought it was as well for me to have a sketch.

Now, turning to a matter about which a good many questions have been asked, did you on the day of sailing muster the crew? - I did.

What do you do when you muster a crew? - Well, we have all the hands mustered on the various decks. In a ship of the size of the "Titanic" it was necessary to muster them on more than one deck. The firemen are usually mustered on one deck by themselves, and the sailors on another deck, and the stewards on another deck. The articles are then brought out by one of the Ship-Masters attached to the Company and their names are read out, and as their names are read out they pass before us; that is to say, I have associated with me two medical officers attached to the Board of Trade who medically inspect them, and I see that the numbers are correct. They each pass before us and they are tallied off on the articles.

Were the boats swung out? - They were.

How many? - Only two.

Is that in accordance with the practice? - That is the usual practice.

Were they lowered into the water? - They were lowered into the water, and the crews exercised under their respective officers.

Was that done in a manner that commended itself to you? - Entirely.

What do you mean by saying that the crews were exercised? - The boats' crews; about eight men and an officer in each boat.

Those are sailormen, are they not? - Yes, always sailormen.

(*The Commissioner.*) No firemen or stewards? - No firemen or stewards.

(*Mr. Butler Aspinall.*) I think you also inspected the third class passengers' quarters? - I did.

Were they in proper order? - Yes, they were in a very good and cleanly condition.

24106. This inspection lasted, in all, for how many days? - I visited the ship one day on her arrival for a very short time, and the next day I visited her was just before sailing, and then on the morning of sailing. Of course, it is a very busy day.

I start somewhere about half-past 7 in the morning and I carry on till the ship sails at noon. My time is very fully occupied on that day.

24107. As the result of it all, did you, in fact, give this vessel her clearance? - I did.

24108. And was she in proper order to go to sea as an emigrant ship when she sailed from Southampton? - Undoubtedly.

**Examined by Mr. SCANLAN.**

Was it your duty to see whether all the lifeboats on the "Titanic" were equipped in accordance with the provisions of the Rules and Regulations made by the Board of Trade under the Merchant Shipping Acts? - That had already been done at Belfast.

It did not fall to your duty? - No, it did not fall to me.

Have you any idea as to what would be an efficient method of drilling crews to man lifeboats in case of accident? - Yes; I think that all hands that form the crew should be exercised in handling the ship's boats, both firemen and stewards.

I take it that up to the time of the "Titanic" disaster that had not been the practice? - Not in the White Star Line.

Not in the White Star Line? - No.

Had it been the practice on other lines to have boat drills in which all the crew of the different grades would take part? - No, that has not been the custom. It has been the custom to muster them and muster them at the various boats in accordance with their boat stations. 24115. There was not even a muster on the "Titanic"; nothing but the lowering of the two boats you have told us of? - Except my muster - the muster to see whether the numbers were correct. 24116. Do you think in having boat drills such as you have described where the different branches of the crew took part, that it would be desirable to lower more than two boats? - Possibly; in view of the "Titanic" disaster, perhaps it would be.

The whole of the boats, Captain? - Well, I would not say the whole of the boats; I would say a larger number than two.

**Page 679**

**Examined by Mr. CLEMENT EDWARDS.**

Are you responsible Surveyor for testing the strength of the boats? - Not in this case, no. 24119. Was there any report made to you about a fire having taken place in the bunker in Section 5? - No.

24120. In the ordinary case ought such a report to have been made to you if there was a serious fire before the ship sailed? - Yes, if it was a serious fire it ought to have been reported to me. 24121. If it was sufficiently serious for it to be reported - if it was regarded as so serious by the officer that it ought to be reported to the makers, would it, in your view, be sufficiently serious for a report to be made to you? - Hardly, it is not an uncommon thing to have these small fires in the bunkers.

**Examined by Mr. HARBINSON.**

Did you make an examination of the doors and the ladders leading from the third class quarters? - Yes, I did.

That is, the means of ingress or egress? - Yes, I did.

At the time you made the examination were those doors locked? - Some of them were.

And were the barriers in any way obstructed? - Well, they were locked.

How long before the ship left Southampton did you make your examination? - I started about 8 o'clock in the morning. I started to make my examination then, and she left at noon. 24127. So far as you know, when she left were these doors locked? - No doubt some of them were, but those are only emergency doors that are locked, not the doors to the third class passengers.

Quite; that is the emergency doors that led to the boat deck? - Yes. Would you like to know the reason?

I do not mind? - Well, the reason for having those doors locked is to keep the firemen and stewards and other people from passing through into the different places on sailing day. They are very congested. The ship is very congested from a lot of visitors - something like a thousand visitors.

*Mr. Harbinson:* I think it is quite fair you should give that explanation.

**Examined by Mr. HOLMES.**

I suppose you have had considerable experience at sea as a master mariner? - Yes, I have had 22 years at sea altogether.

And that would make you eminently qualified for the surveying of deck equipments, boats, and that kind of thing? - Well, I should think so.

Better than an engineer? - Well, you had better ask my Department about that. 24133.

The deck equipment would be your department, and not the engineer's. And are you the only nautical Surveyor so far as you know who ever went on board the "Titanic"? - I am the only nautical Surveyor, but there was another nautical Surveyor that visited after me, Captain Sharp, at Queenstown.

24134. And was your examination limited to what was necessary for the emigration clearance?

- Yes. I followed up Mr. Carruthers's survey; he took the first part and I took the second part. 24135. Supposing this had not been an emigrant ship, would you have had to go on board her at all? - No.

Would there have been any nautical Surveyor? - No.

Are you satisfied that the present method of measurement of space for persons in boats according to the Board of Trade Regulations is satisfactory? Do you think there really is room in the boats for all the people? - Do you think that is a question I should answer before my superior officers, my Lord?

*The Commissioner:* I am sure I do not know.

*The Attorney-General:* There has been a question raised about the proportion of depth to breadth.

*Mr. Holmes - To the Witness:* As a practical man, you ought to know.  
*(The Commissioner.)* If you are going to ask everybody whether he cannot suggest anything better, we shall have endless suggestions. I never knew a person in his position who had not ideas of his own, which differed from the ideas of everybody else. We shall have endless suggestions. *(To the Witness.)* But I see no objection to your answering the question. Do not you take exception to the way in which these measurements are taken? - I think the Board - my department - are already considering the subject.  
*(The Commissioner.)* That is not the question at all. First of all, will you answer me one question? - Yes.  
Do you think the method employed at present is right? - No.  
*The Commissioner:* I knew he would say "No," and if you called a dozen other people they would all say "No," and they would all differ from him.  
*(Mr. Holmes.)* Not necessarily, my Lord. *(To the Witness.)* Is your department taking steps to amend that measurement? - Yes, I believe they are going to make the divisor 12 instead of 10.  
*(The Commissioner.)* Are they going to adopt your plan? - My plan?  
Yes? - I am not consulted in those matters.  
Do answer me? - No.  
Are not you living in hopes that they will? - Yes.  
And if they do not you will still think they are wrong? - Yes, undoubtedly.  
*(Mr. Holmes.)* Is it your idea that the divisor should be 12? - Instead of 10, yes.  
And that, you say, is the idea which the Board of Trade are considering adopting? - Yes; I based that on this, that the Board have given very much attention to the question of these lifeboats long before the "Titanic" disaster, and I formed that opinion.  
That is why I ask you? - The Board have gone into this question very fully - long before the "Titanic" disaster.  
And worked out upon that computation, the boats would be considered fit to hold less people than now? - Undoubtedly, and probably that will be made law.

**Examined by Mr. COTTER.**

You have taken part in the survey of other companies besides the White Star, have you not? - Yes.  
Is it not a Rule in other companies that the whole of the three departments - the deck, the steward, and stokehold departments take part in the boat drill? - Yes, in some of the companies they do, and the men like it.  
You never saw any difficulty with the firemen? - No.  
Those who had to take part in this? - No.  
*(The Commissioner.)* Have you ever heard it said that the firemen object to the boat drill?  
- Yes, I have heard it objected to.  
I thought you said just now that you had not? - Mr. Cotter is speaking of other companies.

Is it only in the White Star Line that the firemen object to boat drill? - Yes, in Southampton.

And why do they object to it in the White Star Line and not in the other lines? - I do not know; I could not tell you.

**Page 680**

They have some dislike for the White Star Line? - I could not tell you at all. 24160. But is it the fact that in the White Star Line the firemen object to take part in the boat drill? - Well, I believe they have.

And it is not the fact in any other line? - Well, not to my knowledge; I have never heard it.

And you cannot explain to me why they should dislike the boat drill in the White Star boats and submit to it in the other boats? - I could not tell you, my Lord.

It seems peculiar. I am asked to ask you if you have ever seen firemen assisting in a boat drill in boats in Southampton? - No, not in my muster.

In any boats? - No, but they do it before I go to the ship.

But you have never seen it? - No; I only ask for two boats to be lowered. On sailing day I will have nothing else but sailors. Since the "Titanic" disaster we have very extensive boat drills, and the Companies have been very pleased to allow me to examine them much more.

Then you do not think your system before this disaster was satisfactory? - No, not very satisfactory.

Well, was it satisfactory? - Well, I think we might with advantage - 24168. Will you answer the question; was it satisfactory? - No.

It was your plan, nevertheless? - My plan? No, it is the custom.

Never mind about the custom; it is what you did? - Yes. 24171. And you now do not think it is satisfactory? - No.

24172. Did you think it satisfactory before the "Titanic" accident? - Well, no.

24173. Then why did you do it? - Because it is the custom.

But do you follow custom, although it is bad? - Well, you will remember I am a Civil servant. Custom guides us a good bit.

*The Commissioner:* Perhaps that is the answer.

*(Mr. Cotter - To the Witness.)* Has the bulkhead door drill anything to do with you? - Yes.

Did you see any bulkhead door drill taken part in that day? - Yes; I had three watertight doors closed in my presence.

Is it not the fact that where there is a properly disciplined drill on board ship a bugle goes, and everybody goes to his station? - Yes, in some Companies that is the case.

*The Commissioner:* Is that in port or at sea?

*Mr. Cotter:* In port.

*The Witness:* In port, my Lord.

*The Commissioner:* And at sea?

*Mr. Cotter:* If necessary, my Lord.

*(The Commissioner - To the Witness.)* Have you ever been present at a drill of that kind?

- Oh, yes, but not in my official capacity. This is all done before I go to the ship.

Sometimes if I am a little earlier I see it.

Whose duty is to do it? - The marine superintendent of the Company. 24180. It has nothing to do with the Board of Trade? - No, nothing at all.

*(Mr. Cotter.)* If you ordered a thing and said, "I want that boat lowered," it would be done? - Yes.

If you said you wanted the bulkhead doors closed it would be done? - Yes.

So that it rested with you what kind of drill took place? - Yes, perhaps so.

Have you had any drill with collision mats? - I never heard of them, not in merchant ships. I have had them in the Navy.

*(The Commissioner.)* It is the first I have heard of collision mats? - We have them in the Navy.

*The Commissioner:* I am told we had some evidence about them before.

*(Mr. Cotter - To the Witness.)* You saw no collision mats on the "Titanic"? - No.

*The Commissioner:* Do these lines carry collision mats?

*Mr. Cotter:* Some of them, my Lord.

*The Commissioner:* I was asking the Witness.

*The Witness:* No, not to my knowledge.

*The Commissioner:* You see, he differs from you, Mr. Cotter.

*(Mr. Cotter - To the Witness.)* I put it to you that there are not enough Surveyors in Southampton now they are introducing these large ships?

*The Commissioner:* You do not represent the Surveyors' Union, do you?

*Mr. Cotter:* No, my Lord. The Surveyors are there to see to the safety of the ship, and I am putting it now to this Witness that there are not enough Surveyors to survey the ships in a proper manner.

*(The Commissioner.)* What do you think of that now?

*The Witness:* Well, of course, undoubtedly we are getting very congested, because all foreign ships now have to comply with the English law.

Will you answer a simple question? Are there enough Surveyors in your opinion? - No.

That is an answer. Have you ever represented to the Board of Trade that there are not?

- That would not be in my province.

Have you ever represented it? - No.

The answer is you have not? - Yes.

Let me tell you in my opinion, if that was your view, it was your duty to say so? - I should get a very severe snub if I did.

*(Mr. Cotter.)* Is it the Rule in Southampton for you to see the boat lists? - No, it is not.

You do not see them? - No, I do not; I know they are there.

You know they are there? - Yes.

*(The Commissioner.)* Can you tell me is there any branch of the service in the Board of Trade which, in the opinion of those who are in that branch, is sufficiently manned? - I do not know.

Do you think there is? Do you understand my question? - I do not quite gather it. 24199.

Very well, I will tell you again. Is there, in your opinion, in any branch of the

service of the Board of Trade a sufficient number of men, in the opinion of the men who are in that service? - No, none of us think that.

No, I am sure you do not; you all think there ought to be more? - Yes, undoubtedly.

How many more; would you say double? - Well, it is getting on for that.

Or perhaps treble? - Oh, no.

Well, double; the whole staff of the Board of Trade, in your opinion, ought to be doubled? - I think so.

*The Commissioner:* Now, Mr. Scanlan and Mr. Cotter, there you have it. I felt sure you would get it.

*Mr. Scanlan:* Captain Young said they were going to increase the number, my Lord. *The Commissioner:* I have no doubt they will have a great deal more work to do after the "Titanic."

### **Re-examined by the ATTORNEY-GENERAL.**

Is there any practical difficulty in your demanding a boat drill with firemen in the boats according to their boat list? - No.

It could be done before the ship started? - Oh, yes, we are doing it now.

That is what I wanted to know. Then I suppose each man would have to take his station? - Yes.

According to the list? - Yes.

And go out in the boat? - Yes.

Then you would not have only deckhands rowing, would you? - Oh, no, we fill boats with stewards and boats with firemen; in fact, the men like it now I have instituted it.

You do it now? - Yes.

### **Page 681**

Since the "Titanic" disaster? - Yes, since the "Titanic" disaster they like it.

*(The Commissioner.)* It is a peculiar change of taste. How many lifeboats are the davits constructed to carry? - Those davits - the Welin davits - are constructed to carry two boats.

On the "Titanic"? - On the "Titanic," inside and outside.

On the "Titanic" were they intended to carry more than two boats? - I do not think they were intended to carry more than two boats.

Were they constructed to carry more than two boats? - Yes, they could have carried three.

Could they have carried four? - No, I do not think so.

Were they intended to carry four? - Well, may I explain?

No; answer the question. Were they intended to carry four? - They might carry 10. If you have got the chocks and the skids so arranged you might put out boats either from the starboard side to port side or from port side to starboard side.

Now, I want to know this: If those davits got out of order and were intended to carry three or four boats, that would make three or four boats useless? - It certainly

would. 24220. However, nothing of that kind happened on this occasion so far as we know? - No. 24221. Can you tell me why passenger ships are not surveyed in the same way as emigrant ships? - No.

Is it the fault of the Board of Trade? - I suppose it is.

Is it their fault to begin with? - Well, it is not my fault.

No, I know it is not; I did not suggest it was, because I feel quite sure that you would tell me that it was not; but can you tell me why passenger ships are not surveyed in the same way as emigrant ships? - I think it is due to the number of one class being so much greater than the other. We are a very small body; there are only 17 of us.

Who do you mean by "we"? - The Nautical Surveyors of the Board of Trade. We do the bulk of the emigration work. There are only 17 of us, and there are a very large number of engineers, and they do the passenger certificates. There are 80 engineers.

*The Commissioner:* That does not appear to me to be an answer.

*The Attorney-General:* There are different statutory requirements.

*The Commissioner:* Oh, there are, no doubt; but the question I put was, and what I wanted to know was, why the passenger steamers are not surveyed in the same way as the emigrant ships are.

*The Attorney-General:* Yes; why Parliament did it.

*The Commissioner:* Yes.

*The Attorney-General:* We can see why Parliament was more careful, because it was thought emigrants might be put in any kind of ship, and, therefore, Parliament's attention was specially directed to see there was proper accommodation, and proper food and properly constructed ships.

*The Commissioner:* That, I think, is the proper explanation.

*The Attorney-General:* It was thought that passengers could look after themselves and emigrants could not.

*The Commissioner:* That is exactly the truth. Emigrants are, very properly, treated as if they were children or sick people, and have to be looked after.

*(The Witness withdrew.)*

**WILLIAM DAVID ARCHER, Affirmed.**

**Examined by Mr. BUTLER ASPINALL.**

Are you Principal Ship Surveyor to the Board of Trade? - I am.

How long have you held that position? - Since the year 1898.

I believe your offices are in London? - In London, yes.

And for the purposes of this Enquiry what you have to do is this, is it not? You are consulted by the Ship Surveyor at Belfast with regard to certain matters? - Yes.

And I believe you have certain plans sent over to you from Belfast? - Yes, I had certain plans sent.

And I think they are sent to you for the purpose of enabling you to determine what the freeboard of the ship should be? - That is so.

I believe, incidentally, in connection with the assigning of the freeboard the question of the bulkheads is considered by you? - They were.

And did you have adequate information to enable you to give this vessel a safe freeboard? - Yes.

And you did so? - Yes.

I do not know if you were consulted by Belfast in regard to other matters in connection with this ship, were you? - Yes, several other matters; for example, such questions as the ventilation of emigrants' quarters.

I do not think they are matters which would assist my Lord in any way? - Not in the least. They are small matters of detail, but you had all these matters before you; you gave them your attention? - Yes.

And you acquiesced finally in the declaration that was made at Belfast by Mr. Carruthers? - Yes.

He, having had throughout the benefit of your advice and assistance when required? - Yes.

That is what it really comes to, does it not? - Yes.

(*Mr. Butler Aspinall.*) I do not know whether it will assist your Lordship; it has been suggested to me that I should put in the loadline (*handing in a diagram*). So much for the work that was done by the Board's officers at Belfast. Now, I want to direct your attention to another matter. During the progress of this Enquiry certain questions have been asked as to the action of the Board of Trade with regard to increasing the boat accommodation? - Yes.

And your name was mentioned as one of the gentlemen who had considered the matter, and given the Board the benefit of your views? - Yes.

We were told that you had made a Minute in 1911. That is so, is it not? - Yes.

Have you got the Minute before you? - I have it.

It will have to be read; it is short. Will you read it? - Yes.

What is the date? - 28th February, 1911. "In accordance with the Board's instructions by telephone, I attach an extension of the boat scale which has been made by continuing the scale at the same rate, which exists at the upper end of the present scale, viz., 250 cubic feet boat capacity for every 1,000 tons, or 1,250 cubic feet for each 5,000 tons. For a vessel of 50,000 tons gross the scale requires 26 boats under davits of 15,500 cubic feet. The number of boats has been arrived at by dividing the aggregate capacity by 600 cubic feet, this being about the capacity of the 30-foot boats fitted in the 'Lusitania.'" The adoption of

## Page 682

the scale would imply the following boat equipment in a vessel of 50,000 tons by Division A, Class 1, of the Rules: -

	Cubic Feet.	Persons.
13 Lifeboats under davits	7,750	775
11 C and " " "	7,750	968
2 D boats " " "		
Say 20 additional boats or rafts	11,625	1,453
46 " " "	27,125	3,196

“If, however, the vessel be divided into efficient watertight compartments to the Board’s satisfaction, the total boat equipment would be, say, 36 boats of 21,313 cubic feet.”

(*The Commissioner.*) Accommodating how many? - I could not say right off, my Lord, without figuring it out, because some of the boats are reckoned at eight cubic feet, but, roughly, it would accommodate 2,131 persons, taking them at ten cubic feet.

That is near enough. Now go on? - “I would suggest, however, that an alteration could usefully be made in No. 12 of the Rules in the direction of making a larger concession in the case of vessels which are efficiently subdivided. Owing, no doubt, to the very small reduction of lifesaving appliances at present sanctioned by this Rule, none of the large vessels recently constructed have complied with the recommendations of the Bulkhead Committee, although they are thought to be most reasonable in the case of vessels which have boat capacity for only a proportion of the persons carried. In the case of the ‘Lusitania’ and ‘Mauretania’ application was received for inspection and approval of the bulkheads, but was afterwards abandoned. These vessels are, however, understood to comply with Admiralty requirements. It is suggested that in the case of vessels divided into efficient watertight compartments in accordance with the

Committee’s recommendation, the additional boats or life-rafts required by division A, class 1 (d) might be dispensed with altogether, provided the boat scale is maintained at about the values shown by the diagram. This would imply in a vessel of 50,000 tons: -

	Cubic Feet.	Persons.
13 Lifeboats	7,750	775
11 C and 2 D boats	7,750	968
	15,500	1,743

*The Attorney-General:* It will be rather difficult to follow all this on the Table. This is one of the Reports which your Lordship will remember - one of the four with the Tables which I said I would have printed in a Memorandum. I have the Proofs, if I may hand them up. I do not know whether there will be anything to alter, but I have not had time to revise them; they have only just come in. I propose to hand up to your Lordship now this Print, so that it may be followed while the Witness is in the box. It may be necessary to

revise them, and, if so, your Lordship will let us have them back. The Witness had just read to the bottom of page 17 and was going to the top of page 18.

*The Commissioner:* He has referred to the 13 lifeboats and the 11 C and 2 D boats. 24249. (*The Attorney-General.*) Yes. Now we are going to the top of page 18.

*The Witness:* "According to the Rule of 19th April, 1910, this would require 10 sets of davits on each side of the vessel, which would probably not be impracticable in a vessel of 50,000 tons, but if any difficulty is experienced in this respect, one-third of the total number of boats might be allowed inboard. Probably the chief difficulty in adopting the above scale may be found in providing sufficient hands to launch and man 46 boats in the case of a vessel which is not subdivided to the satisfaction of the Board; I have, however, no information as to the usual number of the various ratings in very large passenger vessels." 24250. (*The Commissioner.*) That is the end? - Yes.

*The Commissioner:* What is the next table of figures?

*Mr. Butler Aspinall:* I thought that was a sort of Appendix, because it seems to give effect to the views he has expressed.

*The Attorney-General:* I think so.

*The Commissioner:* "Minimum number of boats to be placed under davits"? 24251. (*The Attorney-General.*) Yes.

*The Witness:* My report contained a diagram, and that is substantially this table, although I see a slight alteration has been made.

*The Commissioner:* Very well.

(*Mr. Butler Aspinall.*) The outcome of it is that, apart from this question of the shipowner getting any exemption by reason of having efficient watertight compartments, your view is that in the case of a vessel of 50,000 tons and upwards, she ought to have a sum total of cubic contents amounting to 27,125 feet? - That is so.

That is in the neighbourhood of 2,500 people? - Yes.

That is what it comes to? - Yes.

Your report is dated 28th February, 1911. In view of the disaster to the "Titanic," do you still hold the same opinion, or has it been in any way altered or modified? - No, my opinion has been to some extent modified.

Will you tell me in what respect? - In the first place, I think the Rule No. 12 which grants a certain exemption to vessels when efficiently subdivided should be discontinued.

*Mr. Butler Aspinall:* That is page 16 of the book on "Life-Saving Appliances," at the bottom, No. 12.

*The Attorney-General:* That is the Exemption Rule.

(*The Commissioner.*) Yes, I remember it.

*The Witness:* In the second place, I think that the total boat capacity required should no longer be regulated on a tonnage basis, but rather that a boat capacity should be required in all for a certain proportion of the total number of persons carried on board the vessel, including passengers and crew.

(*Mr. Butler Aspinall.*) Anything else? - I think, further, that before the definite percentage of boat capacity to the number of persons on board is determined it would be wise that a committee of experts should be appointed to endeavour to devise some

better method of putting boats into the water than at present exists, the present method being to lower them from davits by falls, so that the boat is free to swing about and is very liable to be dashed against the side of the vessel. That is all I have to recommend.

**Examined by Mr. SCANLAN.**

I see, Mr. Archer, that this minute of the 28th February, 1911, is signed by you? - Yes. 24260. It was the view, then, you had expressed to the Marine Department of the Board of Trade? - Yes.

If effect had been given to your view, the "Titanic" would have been provided with boat accommodation for how many people? - Roughly speaking, about 2,493, I think. (*The Commissioner.*) Where do you get that figure from? - In the Table, my Lord, the second line from the bottom.

**Page 683**

*The Attorney-General:* He is taking 10 percent of the cubic capacity. That is the last figure but one on the extreme right-hand column of page 18.

(*The Commissioner.*) I do not quite see how that fits in with this statement on page 17:

"If the vessel be divided into efficient watertight compartments to the Board's satisfaction" - as the "Titanic" was - "the total boat equipment would be, say, 36 boats of 21,313 cubic feet." That would represent 2,130 people, would it not? - Yes, my Lord.

Then how do you make it 2,493? Are the two statements consistent? - The vessel had not been divided into watertight compartments to the satisfaction of the Board of Trade, my Lord. *Mr. Scanlan:* May I suggest that this is how the difference arises? If you take 10 as the divisor for all the boats, you would have accommodation for something like 2,131; but I rather gathered from this gentleman that he says some of them would be boats of a class for which 10 is the proper divisor, and in other cases eight is the proper divisor.

(*The Commissioner.*) Is that so? - I beg your pardon, my Lord, that is so. That is where the difference comes in.

That makes the difference? - Yes.

*The Attorney-General:* I have not seen that before.

*Mr. Scanlan:* In his evidence he has stated so.

*The Attorney-General:* That will not account for the difference between the two tables.

(*Mr. Scanlan.*) You would have, altogether, 24 boats? - 24 boats.

Some of them would be of Class A and some of Classes B or C? - They might be of Class C or Class D.

*Mr. Scanlan:* Perhaps you would work it out for me - it is very easy to compute it in figures - and let us see how you get at the accommodation for 2,493 persons. (*The Witness commenced to compute the figures.*) *The Commissioner:* What is happening now.

*Mr. Scanlan:* The Witness is making up a calculation, your Lordship.

*The Commissioner:* How long is it to take?

*Mr. Scanlan:* Perhaps he will be able to tell your Lordship.

*The Commissioner:* Cannot you ask some other questions in the meantime?

*Mr. Scanlan:* He cannot calculate, my Lord, on one subject and answer questions on another.

Perhaps he might give it afterwards.

*The Commissioner:* I suggest that you should pass on to something else.

*(Mr. Scanlan.)* Very well, my Lord. *(To the Witness.)* This Report of yours, this Minute of yours, was submitted to Sir Walter Howell? - Yes.

Can you tell me why this Report was not acted on? - No, Sir.

*The Commissioner:* Was Sir Walter Howell asked about this Minute?

*The Attorney-General:* Your Lordship will remember how it stands, if I remind you. This is all a matter that precedes the reference to the Committee on the 4th of April, 1911. Several Reports were obtained - four altogether - and Mr. Archer's was the one that made the biggest demands on the vessel. Your Lordship will remember that I said we would have all four of them printed. Then those Reports were referred to the Committee without the tables being sent at all; the Committee had to decide for themselves, and they reported in July.

*The Commissioner:* Forgive me for asking you, but what did Sir Walter Howell give as a reason for doing nothing upon those four reports?

*The Attorney-General:* He would not agree that they did nothing. On the contrary, what they did was to get the Reports in February, 1911, and thereupon they are discussed and considered, and the result of them is that they differ - those four Reports, as your Lordship will see; and the consequence was that the whole matter was referred to the Advisory Committee, which is constituted under the statute.

*The Commissioner:* And then came the Report.

*The Attorney-General:* Then the Committee upon the 4th April, 1911, had the Reports before it had the matter referred to it in the letter of reference, and in July of 1911 the Committee reported. Your Lordship will remember that the Reports had dealt with a figure of 8,231.

*The Commissioner:* That was the Report Mr. Carlisle signed.

*The Attorney-General:* Yes, that is how it stood.

*The Commissioner:* That was the 8th of July, 1911. Then they began to act upon it, or did move in regard to it in March, 1912, was not it, or February?

*The Attorney-General:* No, they acted upon it long before that. There was a series of experiments made, it appears, from the evidence of Sir Walter Howell and Captain Young. There were various things enquired into. One thing which was exercising them particularly was as to whether it was necessary to deal with the proportion of depth to breadth, upon which a good deal appears in the Memorandum that has not been read in detail; and experiments were made upon boats by, amongst others, Captain Clarke, the last Witness who was called, and in the result, in March, 1912, there is a Minute of Captain Young's of the 28th March, I think it is, and then there is another one on the 30<sup>th</sup> March; and then on the 4th of April, 1912, Sir Walter Howell gives directions as to the letter that is to be written.

*The Commissioner:* The letter is dated the 16th.

*The Attorney-General:* The letter is, in fact, dated the 16th, but that was cleared up by the reference to the Minute. The way the evidence stands is that none of these four Reports went before the Committee. Rightly or wrongly, what was thought right was to refer the matter without including these tables.

*The Commissioner:* There was what you might call a skeleton scale.

*The Attorney-General:* Yes, but it did not fill in any of the details.

*The Commissioner:* In order that they might exercise their own judgment and make a scale of their own.

*The Attorney-General:* Yes. That is how the evidence stands till the 30<sup>th</sup> March, 1912, and then later on there is a scale which does go before the Committee.

*Mr. Scanlan:* I am anxious, of course, to have it made clear that this Report, this Minute, was not submitted to the Advisory Committee.

*The Attorney-General:* Certainly not - neither that nor the other three Reports. *The Commissioner:* None of the four was submitted.

(*Mr. Scanlan.*) In your capacity of Principal Ship's Surveyor, were the plans for the boating of the "Titanic" submitted to you? - Yes.

Were any plans submitted to you of the "Titanic"? - Oh, yes.

But none of them dealt with the equipment? - Not so far as I remember.

There is just one other point I want to clear up. You stated that your opinion has been modified since you made this Report in view of the "Titanic" disaster, and you think now that the lifeboat accommodation should be in proportion to the passengers carried? - In a certain proportion.

Do you mean the passengers for which a ship is certified? - Excuse me, not passengers, but passengers and crew - the total persons on board, yes.

(*The Commissioner.*) Do you mean the number certified? - Yes, my Lord. 24277. That is to say, the number the ship may carry? - Yes, my Lord.

(*Mr. Scanlan.*) For a ship of the size of the "Titanic," on her certificate, what lifeboat accommodation, in your view, should be provided? - I have formed no opinion on that matter. As I said, I think a conclusion on that point should be preceded by an Enquiry as to a better method of putting boats into the water.

## **Page 684**

I think you want another Advisory Committee? - Yes.

Have you not formed some opinion as to the proportion between passengers and crew and lifeboat accommodation? - No definite opinion.

*The Commissioner:* You know, if other matters had not to be taken into consideration there ought to be no proportion at all, but the whole number ought to be provided for. But, then, other matters have to be taken into consideration, and they must be taken into consideration. What this Witness means, as I understand, is this: He has not the material to enable him to say, if less boat accommodation should be carried than sufficient for the whole number certified for the ship - he has not sufficient information to enable him to say for what number, less the boat accommodation ought to be provided.

*Mr. Scanlan:* I quite agree, my Lord. That is what he means.

*The Commissioner:* I understand that is what he means. At present, if you are going to contend, as I daresay you are, that sufficient boats should be carried to accommodate every person that can by law be on board the ship, you will have to satisfy me as to that.

*The Attorney-General:* That is 3,500.

*The Commissioner:* Before I could think of making any such recommendation - I do not know that I should in any case make such a recommendation - I think it is a matter that has to be much more carefully considered than we can consider it.

*Mr. Scanlan:* Yes, my Lord. I have brought out from all the Witnesses what their opinions are.

*The Commissioner:* You are quite right on that.

*Mr. Scanlan:* Leading to this, my Lord - and that is my submission - that there should be accommodation for all carried on board, at all events.

*The Commissioner:* That may be a very different thing, you know. There is a distinction between that and the other.

*The Attorney-General:* And a very material one in this case.

*The Commissioner:* It is very material, of course. I do not know, Mr. Scanlan, that on the German boats the accommodation is not regulated in accordance with the number of people actually carried - I am not sure about that. I doubt whether the German boats - in fact, I am satisfied that they do not carry sufficient boats to accommodate all the people that they can carry. *Mr. Scanlan:* I would have to concede that it would be an unreasonable proposition to ask that there may be boats for more than the people that were being actually carried.

*The Commissioner:* I have never contemplated that, although I can contemplate that being argued.

*The Attorney-General:* I thought by the way it stood in the German Regulations that the limitation is that in no event need the vessels carry more boats than were required for the full number of persons on board, but it does not follow at all that they carry sufficient boats for the full number on board. That does not follow at all. But, if according to their tonnage they had to carry more than would be required for the full number of persons on board, then to that extent there is a dispensation that the number would be reduced so as to cover sufficient boats only for the number of persons carried. That limitation there is, but you will not find in the German Regulations, I think, that there is a requirement to this effect - that there shall be a sufficient number carried for all the passengers on board. The standard is the tonnage - in the same way as it is with us, as your Lordship will remember, and not the number of passengers. As you will find from some figures that I am going to give you, you will see that they do not carry sufficient - I will not say that in some cases they may not - but generally speaking from those we have examined they do not carry sufficient to accommodate all on board. That is how it stands. I have had a table prepared which will be proved a little later on, which will show your Lordship what the percentage was before the "Titanic" disaster and what the percentage is after the "Titanic" disaster, in the German requirements.

*Mr. Scanlan:* Your Lordship will also have in view the American regulation for lifeboats

required on ocean steamers; it is, "11: Each and every steamer" -

*The Commissioner:* Are these the *ex post facto* regulations?

*Mr. Scanlan:* Yes, my Lord.

*The Attorney-General:* That is after the disaster.

*Mr. Scanlan:* Any regulations made by your Lordship will necessarily be -

*The Commissioner:* I shall not make any regulations at all. I think those American requirements came into existence about a fortnight after the "Titanic" disaster.

*Mr. Scanlan:* That is so, my Lord, on the 24th April.

*The Attorney-General:* You have not had time to see the memorandum we have prepared, but it might be useful, my Lord, if you looked at page 37 of this proof that we have handed up. I have not examined the figures in detail yet. You will see there details as to "Foreign requirements as to boats. Note of the foreign requirements as to boats, etc., on passenger steamers. The annexed Table enables a comparison to be made between the British, French, American and German requirements as to boats and rafts on passenger steamers of 10,000 tons and upwards." And then it states what the requirements are. Then if you turn over to page 38 you will see there the requirements given in a comparative Table. The Germans are worked out on a cubic metre capacity. We have translated that into tons so as to get the same English unit. If you look, for example, at the very bottom of the page, you will see what I mean - the last figure.

*The Commissioner:* Where you convert it into English units.

*The Attorney-General:* Yes. The last figure - which is for Germany - is 45,942, and up to 49,476 tons - that is our unit - and for that the cubic capacity would be 21,328. Then that is doubled according to the additional craft, collapsibles and rafts, that may be required, which would be 42,656. The actual figure, if your Lordship will remember, is between the one just above that. If you look at the one just above that in the extreme right-hand column, you will find the figure of 39,830.

*The Commissioner:* What is that figure?

*The Attorney-General:* That represents the cubic capacity for which boat accommodation would have to be provided according to the German requirements without making any allowance for efficient watertight compartments. They have the same Rule as we have - Rule 12, on page 16.

*The Commissioner:* That is important.

*The Attorney-General:* That gives you this: 19,915 cubic feet would be required for vessels under davits for a vessel of the tonnage of the "Titanic" according to German law. Then you must double that in order to get the total of the boats required under davits - and what they call the supplemental craft and collapsibles, rafts, etc., which have to be provided. That gives you the figure of 39,830.

*The Commissioner:* What was the tonnage of the "Titanic"?

*The Attorney-General:* There has been just a little discussion about that. We have worked it out at one time as 45,600, but I am told it is 46,000, and, if it is 46,000, you have to take the last line.

*The Commissioner:* I am told it is 46,000.

*The Attorney-General:* The last line was the one I first gave you. I will tell you why it was taken as 39,830 - because in the course of the evidence on the last occasion we had some discussion, and it was taken as between those two.

*The Commissioner:* What was the exact tonnage of the "Titanic"?

*Mr. Laing:* Forty-six thousand three hundred and twenty-eight.

## **Page 685**

*The Commissioner:* Then you take the last line.

*The Attorney-General:* It is the same thing, only it comes to a little more; it is 42,656 cubic capacity.

*The Commissioner:* Then is that accommodation for 44,205?

*The Attorney-General:* Approximately, yes. It does not follow, of course, that they all have a divisor of 10, but approximately that is the case.

*The Commissioner:* How many could the "Titanic" carry altogether?

*The Attorney-General:* Three thousand five hundred and forty-seven passengers and crew. *The Commissioner:* And this would give a boat accommodation of more than the carrying capacity.

*The Attorney-General:* Yes.

*Mr. Laing:* If the "Titanic" had been fitted as an emigrant ship she could have carried something like 10,000.

*The Commissioner:* Yes, I know. The Attorney-General was going to draw my attention to the difference between the carrying capacity of the German boats and the English boats. What I mean is the German boats of the size of the "Titanic" would be certified to carry a good many more, as

I understand, than the "Titanic" was certified to carry. Is not that the case?

*The Attorney-General:* Yes, that is right. I am not sure that I have sufficient material to do the sum or to get it done; I do not think we have, but we can give you some idea of what the requirements are. The proposition is right.

24281 (*Mr. Scanlan - To the Witness.*) Mr. Archer, from your practical experience as a shipwrights' Surveyor, do you see any difficulty in placing on the boat deck of a ship like the "Titanic" sufficient boats to accommodate 3,547 persons? - May I ask if you mean a new vessel which is under construction, or in the "Olympic" that is already constructed? Yes, a new vessel under construction? - No, there is no reason why. It is quite possible to put boats on board such a vessel to accommodate 3,500 persons.

If you were asked to give a recommendation as to the boats, what proportion of wooden boats and what proportion of rafts or boats like the Englehardt would you have? - I would not have rafts at all.

Take Englehardt boats? - The Englehardt boat is a somewhat new type of boat, and we have not had a very large experience of it. I would not suggest that more than about half of the boats should be of that Englehardt type, which I call a deck boat, with collapsible bulwarks. 24285. Do you think that boats sufficient to accommodate so many people could be carried, and leave at the same time sufficient working space on the boat deck? - Yes, so far as I am in a position to judge. I am not a nautical man; I do not know much

about lowering boats, but so far as I am in a position to judge, I think there would be sufficient space around the boats.

Might some of the boats be carried inboard? - Yes, they must be.

Have you any idea as to any arrangement for changing lifeboats from the starboard side to the port side, or from the port side to the starboard side in stress of weather? - I know that some such plan has been mooted, but personally I have never seen such an arrangement.

Is that one of the matters that you think should be submitted to the Committee that you desire? - It is one of them, yes.

*(The Commissioner.)* Would it be of any use to carry motor-boats? - I think, my Lord, that motor-boats would be useful, a certain proportion of them.

What will be the advantage of them? - The chief advantage, I suggest, would be their greater speed, which would enable them to -

Reach another ship? - Yes, reach another ship.

Would they require as large a crew to navigate them as the lifeboats? - They would require, I think, as large a skilled crew; they could not be navigated with less than two skilled men.

But, with two skilled men, would they require any other men at all? - I should think with two skilled men they could be worked.

Satisfactorily? - So far as I am in a position to judge, my Lord; I am not a nautical man; I have no nautical experience.

*The Attorney-General:* Just before my friend proceeds, my Lord, may I supplement what I was saying just now to you about the German requirements. I wanted to refer your Lordship to a passage of the Notes. Your Lordship will remember I gave you upon the last occasion the figures agreed between my friend representing the White Star Line and ourselves, of the cubic capacity which would have been required in boating accommodation according to the German requirements for the "Titanic." The difference is that in the figures which we have given here at page 627 of the Note that we allow there that the "Titanic" would have received the dispensation on account of efficient watertight bulkheads in the "Titanic," and therefore would have only been required to supply a supplementary half and not the total figure. The difference, therefore, between the figure which you find here of 42,656, which is the total required under davits, and a similar cubic capacity required not under davits, that is altered at page 627 by bringing the figure to a cubic capacity of 31,992, giving accommodation for 3,198 persons. That is how it stands. If you add what I have called your attention to here on page 627, you get the figure which is an agreed figure of calculation, and which corresponds with this figure, although it does not appear at first sight to do so, because in the last columns on the right-hand side you will see the vessel is treated as not having efficient watertight bulkheads, and therefore you get the double cubic capacity required, amounting to 42,000 odd. If you treat her as having efficient watertight bulkheads then the figure is the one I gave at page 627 of 31,992, giving a person accommodation of 3,198. That is what is agreed would have to be provided by the "Titanic" according to the German requirements.

*The Commissioner:* Being 300 or 400 less than the number which would by law be permitted.

*The Attorney-General:* Yes, the total number was 3,547.

**Examined by Mr. CLEMENT EDWARDS.**

I would like, first of all, to get from you precisely what your position is in the Marine Department of the Board of Trade in relation to the other officials. As I understand it, you are the

Shipwright Surveyor? - The Principal Ship's Surveyor.

*Mr. Edwards:* You are a Shipwright Surveyor, are you not?

*The Commissioner:* I understood him to say "Principal Ship Surveyor."

*(Mr. Edwards.)* I am only putting the question for the purpose of getting the distinction between a shipwright and an engineer? - My title is "Principal Ship Surveyor."

Having got your title, I should like to know your duties. In the case of the construction of a ship, where any question arose as to the construction, would it come before you?

- Any question regarding the construction of the hull of the vessel would come before me, either directly from the Surveyor or through the Assistant Secretary of the Marine Department.

With regard to questions of the machinery, would they come before you or the other officers? - They would come before the Engineer Surveyor-in-Chief.

You are the responsible officer in the matter of the construction of the hull of the "Titanic." Is that so? - Yes, that is so.

And any questions which were referred to the Marine Department by your Belfast Surveyor

**Page 686**

were questions which, in fact, came before you for the expression of your opinion and advice? - Yes.

Was there any question that came before you as to the number and character of the bulkheads in the "Titanic"? - As to the character of the bulkheads, yes.

Not as to the number? - No.

24302a. What was the question as to character that came before you? - The question as to character was with regard to the bulkhead which is marked A on that diagram.

*(Indicating.)* The Surveyor, Mr. Carruthers, wrote to me, pointing out that the upper portion of that bulkhead was constructed nearer to the stem of the vessel than the Board's instructions contemplated, and asking whether he should pass it or not.

*(The Attorney-General.)* Does that mean a step forward? - A step forward. 24304. *(Mr. Edwards.)* What other questions as to the character of the bulkheads came before you? - No question with regard to the bulkheads as bulkheads was submitted to me. 24305. Let us be perfectly clear upon this. We already have it in evidence that inasmuch as there was no application by the owners or the builders to get boat exemption under Rule 12 - that we quite understand - there was no question of bulkheads *qua* bulkheads coming before you, but only as to the questions of their strength and efficiency, so that we can clear that away right at once, and you can

address your answer to the questions I put? - An application was made by the builders for the assignment of a freeboard to the vessel.

24306. Have you their application; have you the correspondence relating to this? - Yes, I have most of it here. I have some letters from them.

*Mr. Edwards:* My Lord, may I say that in the view that I have taken of this matter, this is of very great importance, and I ask formally for the production of the correspondence between the heads of the Marine Department in London and their Surveyor in Belfast, and between Messrs. Harland and Wolff and the Surveyors of the Marine Department relating to the question of freeboard, and the construction of bulkheads.

*The Commissioner:* Is there any reason why that should not be given?

*The Attorney-General:* I have not seen it, and I do not know what it is. I cannot tell till I see. The only question that can arise here - I do not imagine that it will be so - is that there may be something against public interest in the production of the document, but I cannot say without seeing it.

*The Commissioner:* I do not suppose any difficulty of that kind will raise.

*The Attorney-General:* I cannot answer the question without satisfying myself that it is so - I mean that I cannot from the public interest point of view. As I say, I do not anticipate it will arise, but I cannot say that I will give him any correspondence without looking at it. But that will be the only objection.

*The Commissioner:* I think it would be better - I do not want the Note encumbered with a vast number of documents which may be of no relevancy at all - for someone for the Board of Trade and somebody for Harland and Wolff to get this correspondence together, and let Mr. Edwards see it.

*The Attorney-General:* I do not anticipate there will be any difficulty.

*The Commissioner:* That is all you want to see, Mr. Edwards, I suppose?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* If you find anything in it that is important, then you must draw my attention to it.

*Mr. Edwards:* Yes, my Lord. Probably I can get pretty nearly as much as I want from this Witness, but I should like to have the opportunity of looking at the correspondence because quite an important point turns upon it as to relative responsibility.

*The Attorney-General:* There will be no difficulty about it unless something occurs which I do not for a moment anticipate.

*The Commissioner:* I do not anticipate any difficulty of that kind.

*(Mr. Edwards.)* You said there was an application from Messrs. Harland and Wolff as to the freeboard. Just to make the position perfectly clear, the greater the freeboard under your Rules the less height is there need for the bulkheads to go. That is so, is it not? That is to say, with a variation in the freeboard there may be a variation in the height of the bulkhead? - Yes.

What was their application? - Their application, in the first place, was merely a formal one for the assignment of a freeboard.

In reply to that application you assigned them a freeboard? - Not at once.

I did not say at once? - Yes.

After some discussion you assigned them a freeboard? - Yes.

What was the freeboard that you assigned them? - Do you desire the freeboard in feet and inches?

*Mr. Edwards:* Yes, please, because I want to get the variation suggested.

*The Attorney-General:* I am told you have all the material correspondence that there is with reference to freeboard.

*Mr. Edwards:* I have the material correspondence, but there may be some other letters.

*The Attorney-General:* My friend, Mr. Clement Edwards, will see that he has got them there, and I make no objection to their being produced.

*The Commissioner:* Very well, you have them all now, so that you can look at them as much as you like.

*Mr. Edwards:* I think, perhaps, my Lord, it might be a saving of time, if Mr. Archer has all these letters, if they are simply handed over, and I will look through them during the luncheon interval, and get rid of the other points with Mr. Archer.

*The Commissioner:* I think that is a very wise thing to do, and there is no reason why you should not do it.

*Mr. Edwards:* Will Mr. Archer kindly hand me, then, the correspondence relating to the bulkheads.

*The Commissioner:* Just hand the bundle of correspondence, relating to the freeboard and bulkheads, to Mr. Edwards.

*(The correspondence was handed to Mr. Edwards.)*

*(Mr. Edwards.)* We will leave this bulkhead question entirely for the moment. I should like to ask you whether, when it was first suggested that there were going to be some ships of the type of the "Olympic" and the "Titanic" built, you were called upon or whether, in fact, you did give any special consideration to the problem of the much greater size in relation to safety? - No.

No special consideration of that sort took place at any time? - No.

Did you think that scantlings which were right and proper for ships of the size of the "Adriatic" would be right and proper in a ship of the size of the "Titanic"? - Pardon me, Sir, I thought you were referring to bulkheads.

No, I said I had left bulkheads entirely? - I beg your pardon.

I now ask you whether, as a responsible official for passing the construction of the hull of the ship you gave any consideration to the problem of the much greater size of ships, such as the "Titanic," in relation to safety? - Oh, yes, certainly.

In what form, did that problem come before you? - The matter came up in this way, that under the Tables of Freeboard, the loadline Tables, which we use for assigning the freeboard of a vessel, the strength of the vessel has to be taken into account. The question of strength came up in this way. Under the loadline Tables approved by the Board of Trade the question of strength has to be considered before a loadline or freeboard is assigned to a vessel, and there is a certain standard laid down in the Freeboard Tables.

Do the Freeboard Tables to which you refer lay down standards which would cover ships above 26,000 tons? - Oh, yes.

Have you a copy of those Tables? - Yes.

Was that Table C? - This is the whole book. Table C is included in it.

Are there scantlings in that book for ships between 26,000 tons and 46,000 tons? - Not scantlings, but a standard of strength.

How do you test your standard of strength - how do you arrive at your standard of strength apart from the question of scantlings? - We do this. We get from the builders the drawings of the vessel. One of these drawings is a midship section. That midship section is a section as if you cut the ship right through the middle. It shows the thickness of all the plates, the longitudinal members of the ship - for example, the thickness and width of all the plates forming the skin of the ship and the deck of the ship.

But those are the scantlings, are they not? - Those are the scantlings of the ship. We then make an estimate of what the stress on the gunwale of that ship in tons per square inch will be, on the assumption that the vessel is subjected to a bending moment equal to the whole displacement of the ship, in this case about 52,000 tons multiplied by one-thirtieth of the vessel's length. In that way we get at a certain figure of so many tons per square inch on the shear strake. We then, if I may so say, design another vessel, that is to say, we draw a midship section of a vessel having the scantlings of Lloyd's Rules. But it necessarily is a much smaller vessel, because Lloyd's Rules have no scantlings for vessels 850 feet long. We treat this smaller vessel in precisely the same way as we treated the "Titanic," the large vessel; that is to say, we draw her midship section and we get the thickness of her plates, and we find out what the stress in tons per square inch on the gunwale is on precisely the same assumption - that is, that the bending moment is equal to the whole displacement of that ship when laden as prescribed by the Freeboard Tables, multiplied by one-thirtieth of the vessel's length. We then compare those two figures.

Now, we will go back to my two questions. First of all, have you any means of testing the strength of the ship apart from the scantlings? - I do not quite understand that question. 24326. You spoke of these tests: they are purely theoretical tests, are they not? - Yes.

They are based upon the measurements; that is to say, "scantlings" is only the technical term for measurements? - Thickness of material.

What I want to put to you is this: Have you any other means of testing the strength of the ship except by reference to her measurements? - No.

Have you in that Table to which you refer any measurements for a ship above 26,000 tons? - No.

If you have no measurements for a ship above 26,000 tons, and if you have no means of testing the strength of a ship except by reference to her measurements, how do you test, and how, in fact, did you test, the strength of the "Titanic," which was a ship of 45,000 tons? - In the manner which I have described to you, Sir.

But where do you get your starting figures from? - My starting figures?

For the purpose of making your calculations to which you refer? - From Lloyd's Rules. 24333. Are there any of Lloyd's Rules which, in fact, give you particulars for any ship of this size, or anything like the size of the "Titanic"? - No. May I add one word of explanation? The whole thing is based upon this assumption, that the tendency to bend the ship will be in proportion to the displacement, that is, the total weight of the ship and her length will be a certain definite proportion of the total displacement - the weight of the ship and her length. If that is not true, then some fault may be found in the method, but you will see that by basing it on the total weight of the ship we do take account of the size of the ship.

In taking account of the size of the ship, do you take account of the detailed measurements in every part of the ship? - In every material part of the ship.

Was that done in the case of the "Titanic"? - Yes, so far as my judgment goes. 24336. I am not talking about your judgment. I am on a question of fact, Mr. Archer. Was that done by the Marine Department of the Board of Trade in the case of the "Titanic"? - May I ask you to repeat the question; perhaps I have not exactly followed you.

You say that you arrive at the bendability of the ship by reference to her breadth and depth and length? - No, Sir, I did not mention breadth and depth at all.

Length and weight? - Yes.

I wish you would speak just a little louder, if you will. I then asked you this question, whether in arriving at that, you took into consideration the strength of different parts of details of the ship? - Yes, I did.

Do you say that that was done by the Marine Department of the Board of Trade in the case of the "Titanic"? - It was done by me.

Have you the particulars in writing by which you made these different calculations? - Yes.

Can you produce them? - Yes.

Will you produce them? - Yes.

*(The Commissioner.)* Are they here? - I think so.

*The Commissioner:* Will you tell me what we are doing at present? What part of the Enquiry are your questions directed to, Mr. Edwards?

*Mr. Edwards:* They are directed to the question of seeing whether there were right tests made in the case of the "Titanic" as to the strength and efficiency; and, secondly, my Lord, whether, with a view to avoiding similar trouble -

*The Commissioner:* What do you mean by "similar trouble"?

*Mr. Edwards:* I would rather put it in this way, my Lord: Whether by way of reducing to a minimum the possibility of a recurrence of the "Titanic" disaster the Marine Department of the Board of Trade, by its methods as adopted in the case of the "Titanic," can be deemed a sufficient and an efficient body for applying tests to other ships that may be constructed?

*The Commissioner:* I am at a loss to understand what your present examination has to do with the disaster that overtook the "Titanic." It is not suggested that her scantlings were not right or that her scantlings had anything to do with the disaster. *Mr. Edwards:* Well, my Lord, with very great respect, when I come back to the bulkheads, your Lordship will see that there is a very great deal to do with the question of scantlings. I am really on the third question of the Enquiry: "In the actual design and construction of the "Titanic" what

special provisions were made for the safety of the vessel and the lives of those on board"; and so on?

*The Commissioner:* I only want to understand it. Are you going to suggest that if the scantlings had been different the iceberg would not have knocked a hole in her side? *Mr. Edwards:* I do not go quite as far as that, my Lord, but I think there is a ground for suggesting here - I mean, frankly, it is a matter which I shall comment upon to your Lordship with a view to your Lordship carefully consulting with the expert Assessors who sit by your side - that if there had been right tests to test the strength of the bulkheads (I am going to suggest that the bulkhead between 5 and 6, on the evidence, did give way) possibly that bulkhead might not have given way. I am further going to suggest to your Lordship that in this case the ship was not constructed according to the Rules as laid down by the Board of Trade. What I am going to call attention to is this, that either Messrs. Harland and Wolff the builders, defied the Board of Trade, or that there

## **Page 688**

was extraordinary laxity on the part of the officials of the Marine Department of the Board of Trade to allow, in the construction of this ship, a departure from those Rules which they have already laid down.

*The Commissioner:* Will you suggest to the Witness the particular Rules of the Board of Trade which you say they failed to enforce?

*Mr. Edwards:* Yes, my Lord; that is why I want the correspondence in the matter of the bulkheads.

*The Commissioner:* Then you are not speaking to it at the present moment. *Mr.*

*Edwards:* I can do it at once, my Lord, but I thought it would save the time of the Court if I did it after I had an opportunity of examining the correspondence.

*The Commissioner:* Then perhaps you had better adjourn your cross-examination of this gentleman at present.

*Mr. Edwards:* As your Lordship pleases. There were certain matters which are incidental to the other which I was trying to get at, because your Lordship will bear in mind that the question of the bulkheads arises here - not *qua* bulkheads for the purpose of Rule 12, but merely as part and parcel of the structural strength of the ship. What I was getting from this Witness preliminary to the other was exactly what was done to test the structural strength of the ship by the Marine Department of the Board of Trade.

*The Commissioner:* He has told you what was done. You will have, I suppose, at the proper time to tell me why it is not right. I tell you candidly at present I do not understand it. I daresay you do, but I don't.

*Mr. Edwards:* I think that as soon as ever we return to the bulkhead question this correspondence will disclose what I understand is the case.

*The Commissioner:* There are two gentlemen beside you to whom you have entrusted this correspondence, I suppose, with the object of their examining it. Is that so?

*Mr. Edwards:* That is so, my Lord. *The Commissioner:* I have not seen them doing their work.

*Mr. Edwards:* I take the responsibility for it. I do not propose putting them in the witness-box.

*The Attorney-General:* I would like to know where we are upon one point. My friend has raised a point again about the bulkhead between 5 and 6 boiler section. I am speaking from recollection. I have not looked at it for some time but I understood my friend had definitely given that up on the last occasion.

*The Commissioner:* So did I.

*Mr. Edwards:* I think that probably what the learned Attorney-General has in his mind is the reference which I made two or three days ago as to the suggestion that a hole had been made.

*The Attorney-General:* Yes.

*Mr. Edwards:* What I then said was that, from my information, this had not affected the strength of the bulkhead as affected by the fire; and that, therefore, I deemed it immaterial in any event; but I have not abandoned, and I do not abandon, the suggestion that this bulkhead was seriously damaged by fire on the evidence exactly as it stands before the Court.

*The Commissioner:* I do not understand that. You seem to be blowing hot and cold.

*(Mr. Edwards.)* That may be due to the fire, my Lord. This is what I said on Friday, my Lord; you will find it at page 649 of the Notes: “*(Mr. Edwards.)* There is one point I ought to clear up. I inadvertently, I am afraid, rather misled the Court the other day. In the mass of evidence it is a little difficult to tell what has come formally before the Court and what has come before me in another form, and I did say that Barrett, in his evidence, as far as I remember, had spoken about a hole being bored in a watertight compartment between sections 5 and 6. That was not given in evidence. I have caused very careful enquiries to be made, and even supposing the statement to be correct, I am given to understand it would not in the least degree interfere with or detract from the strength of that bulkhead as affected by the fire. *(The Commissioner.)* Very well, then, in any event, it becomes immaterial.” *(To the Witness.)* Have you those measurements? - Yes, I have some measurements here.

It is not a question of having some. Have you the measurements or not on which you based your calculations as to the strength of the “Titanic”? - Yes.

*Mr. Edwards:* And do those figures show what ought to be the measurements in different parts of a ship of the size of the “Titanic”?

*(The Commissioner.)* Have these measurements any reference to the strength of the bulkheads? - No, my Lord.

*(Mr. Edwards.)* Have these measurements any reference to the strength of the hull of the “Titanic”? - Yes.

What system did you adopt in arriving at measurements above and beyond the scale figures which you find for ships in your scale C, and which you find for ships of the size, within the limits of Lloyd’s measurements; in other words, there are measurements in existence for ships of a certain size - we know that - and there are scale measurements. What method did you adopt in arriving at figures and

measurements beyond that scale up to the size of the "Titanic"? - I have endeavoured to explain how I did it. It is a very difficult thing to explain.

*The Commissioner:* He did explain it. He gave what he considers, and what I daresay is, a good explanation, but if you want to know whether I understood it, the answer must be "No."

*Mr. Edwards:* Probably, my Lord.

*The Commissioner:* Did you understand it?

*Mr. Edwards:* I follow your Lordship's courageous example, and say "No."

*The Commissioner:* Did you understand it?

*Mr. Edwards:* I did not fully understand it, my Lord.

*The Commissioner:* I hoped you would say "Yes," and then I was going to ask you to explain it to me.

*(Mr. Edwards.)* One always sees the red light with you, my Lord. *(To the Witness.)* What I want to get at is this: Where do you take your figures or other measurements from for ships above what I call scale measurements? It is quite a simple question. As I understand you arrive at a definite conclusion as to the bendability of a ship of this size, and, therefore, to use an ordinary expression, you arrive at her total strength by a series of calculations? - Yes.

And those calculations in their turn are based upon a series of measurements? - Yes.

We know what the measurements are in the case of ships of a limited size. What I want to get at is, where do you get the measurements for ships and where does your Department get the measurements for ships, for the purpose of this calculation, for sizes above the scale size? - We got the measurements from the drawings of the "Titanic." 24353. You have got the drawings there, and I will take two or three examples. You took the drawings of the "Titanic," which show you that plates are of a given thickness in a given part of the ship? - Yes.

Those plates presumably will be thicker in the case of the "Titanic" than in a ship of 10,000 tons? - Yes.

What I want to get at is this. Take the case of the plates: by what system do you test the efficiency of the plates of extra thickness for a ship of this size as compared with the plates of a given thickness for a ship of 10,000 tons? - I do it in the manner I have already described. I treat the ship as a beam or girder. I assume that the tendency to bend the ship is equal to the displacement of the ship multiplied by her length and divided by 30, and I work out the stress in tons per square inch on the gunwale. Shall I give you the figure I arrived at, Sir?

If it will help, certainly do so, please? - I arrived at a figure of 9.9 tons per square inch on the shear strake of the bridge of the "Olympic".

## **Page 689**

As I endeavoured to describe I drew out a smaller vessel having the scantlings of Lloyd's Rules, and I treated her in exactly the same way, and I arrived in that case at a figure of 12.2 tons per square inch for a vessel having Lloyd's scantlings, the inference being that the "Olympic" was stronger than the Lloyd's vessel.

That is to say, the “Olympic” for 46,000 tons was stronger per inch than Lloyd’s for 10,000 tons? - That is so, yes.

*Mr. Edwards:* But you have no measurements of Lloyd’s for a ship of 46,000 tons.

*The Commissioner:* He has said No. He has told us that so often.

*(Mr. Edwards.)* And therefore there is no comparison between the two? - There is a comparison of stresses, but not of scantlings.

In relation to this general calculation of the ship as a girder, did you consider how far the strength of the ship was detracted from by that hollow space where there are spiral stairs running down to the firemen’s tunnel? - I do not quite appreciate what you mean by a hollow space.

You know the plan of the “Titanic”? - Yes, I have a general idea of it. 24361. In the case of the “Titanic” there are no decks running the whole length of the ship, are there? - I beg your pardon, I think there are.

24362. Have you a plan of the “Titanic” before you? - Yes, I have a plan here.

24363. I am not on the superstructure decks, but do not all the other decks for all practical purposes terminate immediately at the spiral staircase leading down to the firemen’s tunnel? - No.

Which do not? - C deck does not terminate.

That is the shelter deck? - The so-called shelter deck.

Is not that broken by the spiral staircase? - No, I think not.

How in the world does the spiral staircase find its exit, then? - I think the spiral staircase finds its exit apparently on D deck. But may I say in any case, whether it finds its exit there, it only makes a comparatively small hole in the deck, and does not stop the deck.

*Mr. Edwards:* That is what I am coming to.

*The Commissioner:* Are you sure it was that that you were coming to?

*Mr. Edwards:* Perhaps not, my Lord, perhaps I have put my foot in it.

*(After a short adjournment.)*

*Mr. Edwards:* My Lord, I have had an opportunity during the adjournment to go through a number of these letters, and, broadly, they disclose this. There are a number of letters missing, to which I shall make reference in a moment, but, broadly speaking, there was on the part of the Marine Department of the Board of Trade a series of suggestions made to Messrs. Harland and Wolff as to the greater height of the bulkheads, and it was pointed out that they were not conforming, in the plans, to the Regulations, and there appears to have been a good deal of discussion as to the height to which these bulkheads should come and as to the watertighting of the spiral staircase, and so on. If I may say so, I regard the correspondence as of the very highest importance in relation to this Enquiry and future safety, and I was going to ask that your Lordship should consider at once a request that the Board of Trade will cause copies of all the essential letters to be made, together with those letters, if they can get them, which are missing from this correspondence. *The Commissioner:* Very well, if you will mark those letters that you think are

important, I have no doubt that the Board of Trade will cause them to be printed. *Mr. Edwards:* There is one bundle here, my Lord, of some 25 documents in all. I think every one of them ought to be copied and the intermediate letters to which reference is made here, which are missing, ought, if possible, to be found and put in their right places. *The Commissioner:* You speak of 25. I have no idea how many there are. Do you want them all printed?

*Mr. Edwards:* All in the one bundle.

*The Commissioner:* Do you want any in the other bundle printed?

*Mr. Edwards:* Certain of them which I will mark as your Lordship suggests.

*The Commissioner:* There is no objection to printing them?

*The Attorney-General:* No, my Lord.

*Mr. Edwards:* I think, if I may say so, it is very important from the point of view of certain officials of the Marine Department of the Board of Trade that these letters should be made part and parcel of the proceedings. (*To the Witness.*) Now, Mr. Archer, there are here a number of letters with which you are familiar. But before I come to these letters I want to ask you one or two questions about the Rule and Circular 1401. I also want to ask you about the Report of the Bulkhead Committee of 1890.

*The Commissioner:* 1891, is it not?

(*Mr. Edwards.*) Yes, my Lord; it sat pursuant to a Minute of March, 1890. (*To the Witness.*) Had you anything to do with the drawing up of Circular 1401? - Yes.

Are you responsible for its draughtsmanship? - For its draughtsmanship, yes. 24370.

Apart from Messrs. Harland and Wolff, has any discussion arisen with any firm of shipbuilders and yourself as to the precise meaning of this Rule? - I cannot recollect that any discussion has arisen as to the meaning of it.

I will come to the discussion you had upon it with Messrs. Harland and Wolff in a moment or two; but take that circular in conjunction with Rule 16. What were those Rules based upon? Were they based upon the Report of the Bulkheads Committee of 1891? - No.

When you are asked to decide whether there is an efficient and watertight system of efficient and watertight bulkheads in a ship, to what do you refer? What is your standard? What is your test of efficiency? - I am not asked whether there is an efficient system. The question is not put to me.

By Rule 16 there is to be an efficient and watertight engine room and stokehold bulkhead, as well as a collision watertight bulkhead? - Yes.

What is your test of efficiency? Or, I will put it in this way; have you any standard by which to test the efficiency of a watertight bulkhead? - We have two standards; we have the standard laid down by the Committee of 1891, and the standard in Lloyd's Rules.

You do, then, sometimes refer to the Report of 1891? - Yes.

Is it not the fact that in that Report of 1891, part of the test of an efficient watertight system was that there should be watertight decks? - In the Bulkheads Committee of 1891?

Yes? - If there is any requirement in the Report of the Bulkheads Committee that there ought to be watertight decks, it has escaped my memory; there may be such a thing.

*The Commissioner:* Read it to us, Mr. Edwards.

*(Mr. Edwards.)* The Committee were asked by the Minute, my Lord, to report:

“As to the manner in which ships shall be subdivided, so that they may float in moderate weather with any two compartments in free connection with the sea; and what Rule there should be as to the proportion of freeboard of the watertight deck next above, to which such bulkheads are attached, as shall be sufficient to enable the ship so to float.” Upon which the Committee reported: “(1) Vessels may be considered able to float in moderate weather with any two adjoining compartments in free communication with the sea, if fitted with efficient transverse watertight bulkheads, so spaced that when two such compartments

## **Page 690**

are laid open to the sea, the uppermost watertight deck to which all the bulkheads extend, and which we will call the bulkhead deck, is not brought nearer to the water surface than would be indicated by a line drawn round the side at a distance amidships of 3/100ths of the depth at side at that place below the bulkhead deck, and gradually approaching it towards the ends, where it may be 3/200ths of the same depth below it. This line we may call the margin-of-safety line.” Do you know if in any of the ships it was insisted upon that they should have a watertight bulkhead deck? - Not watertight in the sense of resisting pressure from below.

Leave out the question of watertight in regard to pressure, but watertight in the sense of water not being able to percolate.

*The Commissioner:* To flow over.

*(Mr. Edwards.)* That is so, my Lord, yes, to flow over.

*The Witness:* No, we do not.

And do you insist upon a watertight deck in the sense that there should be no openings in the deck up through which the water may come? - No.

Can you say, in view of that recommendation, if you use that as a standard, why the Marine Department do not do so? - I think that the term “watertight deck” as used in this recommendation of the Bulkheads Committee has been used under a misapprehension.

You mean “watertight” does not mean watertight there? - Yes, that it was used by mistake.

Do you mean tight without the water, or what? - I mean the Bulkheads Committee never intended that the deck to which the bulkheads came should be an iron watertight deck all through.

*(The Commissioner.)* Then what did they intend? - As far as I can understand, my Lord, they were referring to the deck being watertight, so that water shipped above should not get through it from above.

It does not occur to me that is the way to read it? - I speak with great deference on the matter.

You may be right? - I can hardly think as a practical man they did intend that to be so. You do not think it is practical? - No, my Lord.

Are there any ships with watertight decks? - I do not know of any that are absolutely watertight; they are generally made practically watertight.

Practically watertight is near enough, you know. Why are they so constructed if it is not practicable? - They are so constructed to prevent water coming from above down into the cargo; but they always have hatchways in them which will not be watertight from below, that is, any pressure from below would force the hatch covers up. They cannot withstand any pressure from below, but they can keep water from going from above below through the hatch.

(*Mr. Edwards.*) You notice the term here is used "watertight bulkheads" and "watertight compartments." Can you conceive of a watertight compartment that is open on its top side? - It is not in one sense watertight; but, colloquially, it is termed a watertight compartment even though it is open at the top.

*The Commissioner:* I suppose you can have a watertight cistern, cannot you? *Mr.*

*Edwards:* When you speak of a watertight cistern, my Lord, I believe it is that cistern which is covered in at the top.

*The Commissioner:* Is it? Are there not watertight cisterns which are not covered in at the top?

*Mr. Edwards:* Not strictly, my Lord, I should think.

*The Commissioner:* By "watertight" I mean a vessel from which water cannot escape.

*Mr. Edwards:* But when you are speaking of the watertight compartment of a ship - *The*

*Commissioner:* You seem to have a notion that the word "watertight" could only apply to a vessel which has some sort of a watertight bulkhead or cover, or side, or bottom all round it.

*Mr. Edwards:* I was only treating it in reference to the Report of the Committee which clearly had it in mind that a watertight bulkhead was one thing, and that that watertight bulkhead was only part and parcel of another thing which was a watertight compartment.

*The Commissioner:* If you mean by "watertight compartment" a box, of course, you must have the top watertight as well as the sides and bottom. I only want to know. Is it customary to have in these big ships a watertight deck covering what are called the watertight compartments?

*Mr. Edwards:* I am told that in a number of cases it is so; I cannot say. I cannot give your Lordship definite information about it. But what I want to see is, what is the attitude of the Board of Trade towards it? - We have the words of the Bulkheads Committee.

(*The Commissioner.*) My attention is called to these two expressions, the one in the Minute and the other in the Answer to the Questions. The Minute, which issued from the Board of Trade itself, referred to a watertight deck in the first paragraph?

*The Witness:* Yes, my Lord.

Now, was that a mistake? - In my view it is a mistake.

It is dated 7th March, 1890. Do you see that the Board of Trade itself in the Minute which they sent to the Bulkheads Committee use the very expression "watertight deck next above"? - Yes.

Was that a wrong expression to use? - In my opinion it was.

Well, who was responsible for that? - I cannot say, my Lord; it was long before I entered the service of the Board of Trade.

Well, it is 22 years ago? - Yes.

Then there were two mistakes, one made by the Board of Trade in 1890, and the other made by the Committee in replying to the Minute of the Board of Trade? - Speaking with great diffidence, that is my view of the matter.

I am asking you a question now, which is suggested to me. Has it been the practice not to make the deck above the watertight compartments, at the top you know, watertight? - That has been the practice in the mercantile marine.

It is a practice which was not, I think, followed on the whole length of the two Cunard boats we have heard of, the "Mauretania" and the "Lusitania"? - I believe not, my Lord.

In those ships, I think in the case of all but one of the watertight compartments, most of the watertight compartments had a watertight deck at the top? - That is so, I believe.

And they, you say, were exceptions to the ordinary practice? - Yes, they were exceptions.

Now, will you take this plan of the "Mauretania" and the "Lusitania," which were exceptions from the ordinary practice. Just look at it, and tell me where the watertight deck is. (*Handing a plan to the Witness.*) Is it at the top of all the watertight compartments or at the top of some of them only? - So far as I understand the plan, it is not quite at the top of the compartments at all; it is shown lower down in the ship. I see they are marked in the foremost compartment in the next deck above the waterline, but the watertight bulkhead extends three decks above that again. In the next compartment I find a watertight deck situated at about the level of the waterline. In the next compartment there appears to be no watertight deck at all. The fourth, in a cross bunker, is situated a few feet above the waterline, and the bulkheads again go two tiers, about 16 feet higher up still. 24403. That is to say, the bulkheads in the "Mauretania" and the "Lusitania" in many instances, are considerably higher than the watertight deck? - Much higher.

*The Commissioner:* Have you seen these plans, Mr. Edwards?

*Mr. Edwards:* No, my Lord, but I have seen others.

## **Page 691**

*The Attorney-General:* I think it is so in all cases, from the plan.

*The Commissioner:* In all what cases?

*The Attorney-General:* The bulkheads are carried above the deck.

*The Commissioner:* The Attorney-General says, Mr. Edwards, that in all cases the watertight bulkheads are carried above what may be called the watertight deck so that you do not get a watertight deck at the top of what might be called the watertight compartment.

*Mr. Edwards:* That, of course, would be another reason for using the term "watertight," bulkhead is quite a distinct thing from the compartment.

*(The Commissioner.)* Just let me ask you this, Mr. Archer. Is it not better to have a watertight deck, even though it is below the top of the watertight bulkhead rather than have no watertight deck at all? - Yes, my Lord, it is an advantage to have a watertight deck.

*The Commissioner:* That, I think, is what you want, Mr. Edwards.

*(Mr. Edwards.)* Yes, my Lord. *(To the Witness.)* In your view there is nothing impracticable in running the whole length of the ship at some point a watertight deck. I am now using the term watertight deck in its literal sense? - When you say "impracticable," my answer is that it is not absolutely impracticable, but that in the majority of cases, especially in vessels which carry cargo, it would seriously impair the commercial efficiency of the vessel.

Is not that a point with which the Bulkheads Committee dealt, and did not they differentiate cases of the different classes of carrying capacity of vessels? That is to say, do you see why, in a vessel of the size of the "Titanic" there is any impracticability at all in a watertight deck going the whole length of the vessel - that is to say where you have the hatches with your watertight doors? - In my opinion it was not impracticable to fit a watertight deck in the "Titanic"; but I am not at all sure that watertight doors are the proper way of closing them. That is a detail.

Some battening or something of that sort could be made, whether it be a door or something else. I did not use the word "door" in the ordinary sense. That is to say, that any disadvantage through the loss of cargo space which you speak of as one of the elements of impracticability, could easily be got over by a system of watertight battening in the hatches? - No, not watertight battening, I think.

Casing or trunking, or what you will? - I am of opinion that it was practicable to fit the watertight deck on the "Titanic," but that it would have entailed difficulty in working the cargo.

Why do you say that? - Because if you are going to fit watertight shutters as you suggested, those watertight shutters would be very liable to damage when hauling cargo up and down, and they would also take a considerable time to close down watertight. Further, if, instead of fitting these watertight covers, the hatch is trunked up watertight as high as the top of the bulkhead, which would perhaps be a better plan; you would require, if you want to stow cargo, not only in the holds, but in the between decks, to have watertight doors in this trunk, and it would be difficult to pass the cargo through those watertight doors.

Did not you recommend the trunking of the hatchway in the "Titanic," as a matter of fact? - I recommended it in one case, yes.

I think you recommended the trunking of No. 1 hatchway? - Yes.

Would not that be open to precisely the same objection that you are now putting as to the interference with cargo of watertight decks? - No, I think not, because I think there was no cargo to be carried in the space to which the trunk went. That is my recollection of the matter.

*(The Commissioner.)* That was in the forepart of the ship? - That was in the forepart of the ship.

That went down to the engineers' accommodation? - To the firemen's passage. *Mr.*

*Edwards:* It is shown on the plan as cargo space, is it not, Mr. Archer? I think you will find it is shown as cargo space there.

*(The Commissioner.)* Can you find a trunk there on the plan? - No, my Lord, the trunk was not fitted.

*(Mr. Edwards.)* He asked for it, my Lord, but it was not fitted. It is shown as a cargo space? - No. If I may say so, the trunk was to be fitted from the E deck to the D deck, and there was no cargo stowed upon E deck.

You were considering the advisability of trunking the hatchway on the level of E deck? - Yes.

*(The Attorney-General.)* E deck to D deck, I think he said? - Yes, from E deck to D deck.

*(Mr. Edwards.)* But down there, that space which you propose to trunk, you would have had to have lowered and raised the cargo from No. 1 hold? - Yes, that is right. 24420. Now, what is the distinction between trunking a deck higher or lower where cargo is passed into a hold? What is the difference from this point of view which you are suggesting of making things impracticable? - There is no difficulty in passing the cargo down into a hold at the bottom, but if it passes through 'tween deck spaces in which you also require to stow cargo, you must have some way of passing the cargo through the side of the trunk into those 'tween deck spaces.

That is only a question of putting protections on the side, is it not, so that they do not get worn away? - That is it; I do not say the thing is insuperable, but I say there are practical difficulties.

Apart from that consideration, roughing the edges of the opening, do you see any other element which would detract from the practicability of a watertight deck? - No, I do not.

None at all? - No.

Now in the light of the "Titanic" experience, do you think that a very great advantage might be obtained from the point of view of greater safety, in having a watertight deck? - Yes, I do.

Now the relative sinkability of a ship which has had its side opened to the sea depends, does it not, upon the height to which water may be allowed to come in the so-called watertight compartment. That is to say, if you have two watertight compartments filled - that is, to the height of the waterline, still the "Titanic" might have floated? - Yes. 24426. Now, supposing you had had a watertight deck below the waterline here, the chances are that three or four of the compartments might have been filled, and still she would have floated? - That is so, but might I be allowed to point out the great objection to taking a deck below the waterline. If the damage had occurred not below the deck, but above the deck, there would be a danger in many vessels that they would capsize. 24427. Would you explain why? - Because, if I may put it in a rough and ready way, you have admitted water above this deck and you have a space in which there is no water, but a space filled with air, and there would be a big air bubble, which tends to turn the ship over.

There might be a possibility of getting a little top-heavy? - Yes, if you get a deck below the waterline.

But that could be easily relieved, could it not by a valve arrangement to let the water through. If that were the particular danger, you might get some compensation by having an opening in the floor? - In the deck, do you mean?

Yes? - Then your deck would be no use.

I am suggesting that it might be used under all circumstances except the particular one of danger which you point out? - Yes, if you can avoid that danger of a ship capsizing, the watertight deck below the waterline is useful.

*The Commissioner:* Mr. Attorney, the gentlemen who advise me on this matter seem to think that the Committee which is to take into consideration these matters, should among other things consider the desirability of having watertight decks either above or below the waterline. I do not know

## **Page 692**

whether you or Sir Robert Finlay would suggest that that is not a desirable thing to be submitted.

*The Attorney-General:* I think it would be quite right that it should be suggested for their consideration. It was occurring to me during my friend's examination, but I did not attempt to ask your Lordship's view about it. It would be obviously impossible to decide upon this question without a mass of evidence which we have not called.

*The Commissioner:* Oh, yes.

*The Attorney-General:* But it occurred to me that might be the right course.

*The Commissioner:* That is probably all you want at present, Mr. Edwards?

*Mr. Edwards:* Yes.

*The Commissioner:* I said long ago we cannot sit here - I should have to sit for months, or years, possibly - to decide a question of this kind; but the gentlemen who are with me are of opinion that the question of watertight decks either above or below the waterline is a matter that requires examination and consideration. That probably is all that you would ask, Mr. Edwards? *Mr. Edwards:* Yes.

*Sir Robert Finlay:* I quite agree with what the Attorney-General has said. Of course, there are a great many balancing considerations which need to be taken into account.

*The Commissioner:* Yes.

*Sir Robert Finlay:* That is without in the slightest degree prejudging the question which is undoubtedly one which deserves consideration. What the result may be of course will appear later.

24432. (*Mr. Edwards.*) That intimation is quite sufficient for my purpose. I shall not attempt to pursue it. (*To the Witness.*) Now I want to ask you one or two questions as to the correspondence which passed between you and Messrs. Harland and Wolff. First of all, may I just point out that apparently there is a letter of the 1st June, 1910, from either you or your Surveyor at Belfast, to Messrs. Harland and Wolff, which appears to be a very important letter. It is missing from this bundle? - I have not got it.

*Mr. Edwards:* Is Mr. Carruthers here?

*The Commissioner:* A letter from whom?

*Mr. Edwards:* I have a letter from Messrs. Harland and Wolff to the Board of Trade Surveyor at Belfast, and in that letter they say, "In view of the difficulties raised by your letter of the 1st inst. to the wording of your Regulation."

*The Commissioner:* A copy of that letter must be in the possession of the Board of Trade, and the original must be in the possession of Messrs. Harland and Wolff.

*Mr. Edwards:* Yes. Perhaps Mr. Carruthers will say whether he has a copy of that letter?

*Mr. Carruthers:* Yes, a copy can be got out of my letter-book at Belfast.

*The Commissioner:* Where is your letter-book?

*Mr. Carruthers:* At Belfast.

*Mr. Edwards:* I suppose that could be sent here?

*The Commissioner:* It must be possible to get the original letter, because Harland and Wolff would undoubtedly keep it.

*Mr. Laing:* I have just asked if Mr. Wilding has it here, and he has not.

*The Commissioner:* Well, but he could telegraph for it. *Mr.*

*Laing:* Yes.

*Mr. Edwards:* I would ask your Lordship to direct that Mr. Carruthers's letter-book be sent also so that we may see it.

*The Attorney-General:* There is no necessity to direct it; it shall be done.

*The Commissioner:* You must not assume that the Board of Trade are attempting to stifle things.

*Mr. Edwards:* I do not, my Lord. I was not suggesting that.

*The Commissioner:* And I hope, Mr. Edwards, you do not think so.

*Mr. Edwards:* I have a way, my Lord, of expressing quite frankly what I think. I am not thinking anything different from that which I am expressing when I say that I do not suggest for a moment that the Board of Trade are attempting to stifle things at all. On the contrary, I am rather inclined to think in this matter that the letter to which I refer will very considerably rebound to the credit of the Marine Department of the Board of Trade.

*The Commissioner:* Well, now cannot you leave the Witness alone.

*Mr. Edwards:* That might be taken, my Lord, as a declaration of clearance. *The*

*Commissioner:* I do not mean that you have not helped us, because I think you have very much, but I think you have had enough from him.

(*Mr. Edwards - To the Witness.*) I would just like to ask you this. Were you yourself satisfied when the question of the bulkheads was referred to you, that Messrs.

Harland and Wolff in the building of the "Titanic" were taking the bulkheads to as high a deck as you thought was required by your regulations in Circular 1401? - Yes.

You were satisfied? - Yes.

Mr. Carruthers was not satisfied? - I do not understand that at all.

*The Attorney-General:* No, I did not understand that.

(*Mr. Edwards.*) Then I will call your attention to your Minute. Take the collision bulkhead first of all. The plans of the "Titanic" and the "Olympic" were identical? - Yes, so far as bulkheads were concerned.

On the 30<sup>th</sup> April, 1910, you write: "Steamship 'Olympic.' Sir, the Surveyor's report requesting instructions regarding the collision bulkhead of this vessel is

forwarded. The Board's regulation Circular 1401 requires that the collision bulkhead is in all cases to extend to the upper deck, but there is a provision that in vessels of the shelter deck type the deck next below the shelter deck may be regarded as the upper deck, subject to the sheer being sufficient. The shelter deck stem deck, page 44 of Freeboard Table, may for this purpose be defined as one having a greater freeboard measured from the second deck than required by Table C, and having all openings in the second deck battened down as on a weather deck. The Surveyor reports that the freeboard of this vessel, measured from the so-called upper deck, will be about 10 feet 9 inches, but the freeboard required by Table C is about 11 feet 2 inches, as shown in detail on the attached sheet. The sheer will also be somewhat less than the standard, and there will be a large number of openings in the upper deck. As the deck marked 'upper' will be nearer the water than the main or second deck, with an awning deck vessel, it cannot be regarded as the upper deck within the meaning of the Circular. The Surveyor should, I think, be instructed to inform the builder that the collision bulkhead must be carried up to the deck marked 'saloon deck,' and that no part of the bulkhead below this deck should be nearer the stem than onetwentieth of the vessel's length, as required by the Circular referred to. It may be observed that in the event of the upper part of the bulkhead where marked in red being damaged by collision, there would be some danger of water entering the space above the upper deck, unless the weather conditions were unusually favourable, when it would pass below down the open stairway." So that clearly it was in your view at that time that the collision bulkhead was not being taken as high as your regulations required? - Pardon me, it was not a question of the height of the bulkhead. The height of the drawing then submitted to me was the same as it stands there in that drawing, that is to D deck. 24438. (*The Attorney-General.*) That is the saloon deck? - Yes, but the upper portion of it, that is the portion above the F deck, was crashed forward; it was too near the stem of the vessel. (*Mr. Edwards.*) You say that that had nothing to do with the height of the particular deck? - The bulkhead was quite high enough, but it did not go up in a straight line.

*The Attorney-General:* It was carried up to D deck; it was stepped forward and stepped aft.

(*Mr. Edwards.*) That is so; it did not go far up.

## **Page 693**

*The Witness:* No.

*The Commissioner:* It did not go straight up?

*The Attorney-General:* That is so.

(*Mr. Edwards - To the Witness.*) Now, did you on the 28th May, 1910, report this to your Department: "I do not think that the increased sheer now reported materially affects the question. As there will be open stairways in the upper deck, the collision bulkhead should, I think, extend to the saloon deck"? - That is right.

“No report has been received as to the height to which the remaining bulkheads extend”?  
- Yes.

“The Surveyor should note that as the intended freeboard measured from the upper deck appears to be less than given in Table C by Clause 16 of the Regulations *re* passenger steamers and Circular 1,401, the engine room and stokehold bulkheads at least should extend to the saloon deck”? - Yes, that is right.

As a matter of fact, in the “Titanic” they did not extend to the saloon deck, did they? - No.

The stokehold bulkheads did not extend? - No.

Why did you permit a departure from this view? That is to say, on the 28th May your view was that the stokehold bulkhead should come right up to the saloon deck. When the ship was finished they did not so extend; what was the reason for the alteration in your attitude? - I did not alter my attitude at all. The builder’s altered their attitude. They lowered the centre of the freeboard disc so as to make the freeboard a little greater than Table C.

And that slight lowering of the disc? - Pardon me for a moment. When I say they lowered the disc, they lowered the position that they had intended to put it in. The disc was never marked on the vessel in the position in which they originally intended to mark it, but they agreed to lower it a few inches, so that the distance from the centre of the disc to the E deck should not be less than Table C.

Did that alteration satisfy you? - Yes.

Was it after that that you reported this to your Department. On the 1st June Mr. Carruthers reports: “Since the builder’s were informed of the Board’s decision, I have had several interviews with them on the subject. They inform me that the arrangement of the vessel makes it very difficult for them to comply, and they point out” - apparently this is referring to your proposal about the trunking. There is a letter missing. Will you see if it can be obtained? It is somewhere about the 24th June. If you will kindly look you will see this report is stamped 25th June, and Mr. Carruthers’ report is the 1st of June (*The document was handed to the Witness.*)? - I notice Mr. Carruthers had interviews with the builder’s. I do not see any reference to a letter on the subject. It may be only verbal. 24450. Where would he get the Board’s decision from? And there is the reference there to what should be done in holds 1 and 2. What I am leading up to, and what I want to ask you about, is this. (Perhaps the letter can be found in the morning so that it can go on the Notes.) You advised that the cargo hold should be trunked, and you also advised that the spiral staircase in front of the firemen’s passage should be trunked? - Yes. 24451. Why did not you insist upon both those proposals? - Because the builder’s objected to do so, and they made a calculation which they handed to Mr. Carruthers, and which was forwarded to me, showing that even if the first compartment and the second compartment and the firemen’s passage were all filled with water simultaneously, the vessel would sink by the head only 2 feet 6 inches.

If the trunking had been carried out as you suggested - you know the evidence which has been given here - and the trunking had been effective, do you think that. might have had a very important bearing on the sinking of the “Titanic”? - Not the very slightest effect.

You do not think so? - Not the very slightest.

In the light of the "Titanic" disaster, do you still think it advisable that there should be trunking of what are now open stairways, such as the spiral staircase on the "Titanic"? - On the "Titanic," no.

Then why did you suggest it? - I suggested it for this reason. It is very difficult to explain it without pointing to the plan.

Well, you can go over and point to the plan? - Thank you. (*The Witness went to the Plan on the wall.*) The Board's Regulations require that *that* bulkhead should extend up to the D deck, and that the distance of *this* part of the bulkhead from the stem should not be less than one-twentieth of the vessel's length. As the builders were unwilling to carry it up like *that* I suggested they should carry it up like *this*, (*Indicating.*) but if it had been carried like *that*, and if *this* had been broken away by the vessel colliding with another, water might have got in *here*, and in order to prevent water going down *that* hatchway and going down *that* spiral stairway it would be necessary to trunk that hatch up like *that* and trunk *this* spiral stairway up watertight to the D deck.

Is not that a reason that exists as much today as when you recommended it to the builders? - Yes, quite. But when the builders said: "Supposing we do not do that; supposing *this* part of the bulkhead is broken away; supposing water does get over *there* and does go down *that* hatch, and supposing it goes down *that* spiral staircase and fills the tunnel, the vessel then will only go down by the head 2 ½ feet," and when I had ascertained myself that the top of *this* bulkhead would then be 15 ½ feet above the water, I felt I had insufficient ground for insisting that that should be done, and withholding the declaration.

Now, in the light of what has happened to the "Titanic," do you think that your view was the best one, or the builders' view was the best one? - I think that my view was the only right one within our powers under the Merchant Shipping Act.

And that applies today? - Yes.

I only want to touch on one other aspect. There has been something said here as to the difficulty that there might be in utilising the boat deck for a larger number of boats, and it has been suggested that if you put the number of boats there, an increased number, you increase the tenderness of the ship. It has also been suggested that you might correct such tenderness by increasing the ballasting. Do you take the view that any greater tenderness which may be caused by the larger number of boats may be corrected by a process of ballasting? - Yes, it may be corrected by ballasting.

*The Commissioner:* I think I can relieve you also in this part of the case. One of the matters which the Committee will be asked to consider - they will have, I think, to have the submission to them amended in order to enable them to do it - will be the provision of boats. It is quite obvious that it is a matter of importance, and ought to be taken into consideration and dealt with. I think you will probably agree with me.

*The Attorney-General:* Yes, my Lord. I do entirely.

*Mr. Edwards:* I purposely put it because of that.

*The Commissioner:* You are quite right to put it.

(*Mr. Edwards.*) I did say that I was going to ask Mr. Archer some questions on this matter, and you asked him to be prepared, but since then your Lordship gave the intimation which you did on Friday, and therefore having got this reply to a comprehensive question. I will not pursue it any further at all. (*To the Witness.*) You will see, Mr. Archer, that this correspondence is got into order for the purpose of being printed, and I will have the letters marked for you.  
*The Witness:* I will endeavour to get them.

**Page 694**

**Examined by Mr. HOLMES.**

We have been referred to you by Sir Walter Howell. We have been told that he relied upon you to satisfy yourself as to the capabilities of the Board of Trade Surveyors when they were appointed? - Yes.

Can you tell us exactly what test you put to them to satisfy yourself that they are capable of performing their duties. For instance, do you appoint a large number of Surveyors as engineer and Shipwright Surveyors? - They are appointed.

One man does the two things? - Yes.

They are in a great many cases men who have had nothing but engineering experience at sea? - They have had workshop experience as well as engineers. 24466. What test do you put to them as to their practical experience as shipwrights, or as nautical men? - As nautical men, none. I put to them a test as regards their ability to construct and repair - their knowledge of the construction and repair of iron vessels. 24467. Do you put them through examination? - Yes, both written examination and verbal examination.

Is that before their appointment, or after it? - That is after they have served a probationary period of about six months.

And during that six months, do they have any instruction from the Board of Trade? - Yes, they do.

In what form? - I do not know exactly in what form.

Do you give them a book to read, and then examine them on that? - Oh, no, so far as I understand the matter they go with a senior colleague and assist him in the performance of his duties.

And at the end of that time you consider they are competent. For instance, an engineer is competent to survey boats? - I do not consider that unless I find it so after I have examined him.

Do you examine him as to deck equipments, compasses and that kind of thing? - Not compasses, no; it is not part of my duty.

Is it not part of his duty when he becomes a fully qualified Surveyor? - He has to examine certificates with the compass adjuster and see they are in order.

Things like sea anchors and patent logs? - I do not examine him in sea anchors or logs because I am not a nautical man; I am a shipbuilder.

It becomes part of their duties to see that the ships are properly equipped with such things? - The ship is not equipped with a sea anchor; the boats are.

The ship's boats? - Yes.

But you put them through no test? - As to sea anchors, no.

*The Commissioner:* Can you tell me what a sea anchor is?

*Mr. Holmes:* Yes, my Lord.

*The Commissioner:* Describe it to me.

*Mr. Holmes:* I am not an expert, my Lord. I believe the one supplied to the "Titanic" was a canvas bag. It is required for riding in a rough sea.

*The Commissioner:* I know what it is for, but I thought you might be able to describe it to me.

*Mr. Holmes:* They can be made of all sorts of things.

*The Commissioner:* Have you ever seen one?

*Mr. Holmes:* I have.

*The Commissioner:* Well, I have not.

*The Attorney-General:* They were on the "Olympic" when your Lordship went to see it. 24479. (*Mr. Holmes - To the Witness.*) You have told us you made calculations as to stress and that kind of thing? - Yes.

Do you ever see that your recommendations are carried out yourself? For instance, did you ever survey the "Titanic" yourself? - I did not survey the "Titanic," but I inspected the "Titanic"; I visited her once.

And you rely, to see that your recommendations are carried out, on the local Engineer Surveyor? - I get a report from him.

There is one other matter in which we were referred to you by Sir Walter Howell, and that is as to the reason why the regulations only provide for four of the ship's boats being equipped with compasses and so on. Can you tell me why that is? - That is a matter upon which I speak with great diffidence as I am not a nautical man, but I imagine the idea is that the boats will keep in company.

And the four they had sufficiently equipped would guide the others; is that your idea? - That is my idea on the subject.

Do you suggest that four masts and four sails would be sufficient for sixteen boats? - I am under the impression that it would not be necessary to have a mast and sail for every boat.

You think four masts and four sails are sufficient for all the boats on the ship? - On the whole.

Four compasses for all the boats? - Yes.

Four lanterns? - I think I would be inclined to have a lantern in every boat. 24488. In that respect at least, you think the regulations might be with advantage altered? - Yes.

But you still think that four compasses and four masts and sails are sufficient? - Yes.

*Mr. Pringle:* May I ask a question, my Lord? I promise not to take long. I was referred by Sir Walter Howell to this Witness as to his experience as a naval architect.

**Examined by Mr. PRINGLE.**

Are you a naval architect? - Yes.

What experience have you as a naval architect? - I was for about seven years, or rather more, from 1891 to 1898, naval architect in the employment of Messrs. James and George Thomson, Limited, Clydebank, Glasgow.

*The Commissioner:* He comes from your country.

(*Mr. Pringle.*) It was in 1898 that you joined the staff of the Board of Trade? - Yes.

As a naval architect you will have an opinion upon the effect which would have been introduced, had the bulkheads been extended to deck D instead of only extending to deck E. Can you express an opinion on what would have been the effect in the case of this disaster if the bulkheads had extended to deck D instead of only extending to deck E? - I desire to point out first that many of them did extend to deck E.

Yes, the aft bulkheads did? - Yes. If the forward bulkheads had extended to deck D the vessel would have floated longer. I am not able to say how much longer.

You would not express an opinion as to the additional time. Would the extension of the bulkheads, together with the trunking of the hatchways, not combine to still further increase the time? - I do not think the trunking of the hatchways would be of any use. 24496. (*The Commissioner.*) Let me put this question to you, Mr. Archer. Do you think the "Titanic" would have been safer if the bulkhead B had been carried up to the next deck? - That would be to C deck, I think, my Lord; it already goes to D deck.

What do you say? - It would have been safer under certain eventualities, but not any safer under the damage that was done to her on this occasion.

You do not think so? - Not in the least.

Now, would she have been safer if No. 1 hatchway had been trunked up to the A deck? - I think not.

(*Mr. Pringle.*) You say that you did not insist on the extension of these bulkheads in view of the alteration of the loadline disc? - Yes.

## **Page 695**

What effect has that in relation to safety, the fact that there was an alteration of two inches or so on this disc? - It is this; the vessel is not allowed to load any deeper than the centre of the disc. Therefore, if you lower the disc a few inches, the top of the bulkheads is so many inches higher above the water than it was before.

Is that a consideration which would have any very material consequence in the case of a ship like the "Titanic," which is not a cargo steamer? - I do not quite understand the purport of your question.

I thought in a ship like that, which does not carry cargo, you are not in the habit of loading to the loadline at all? - I think passenger vessels very often load to the loadline.

**Examined by Mr. COTTER.**

In regard to boats, you stated you agree they ought to carry motor-boats? - I did not say they ought to carry motor-boats; I said they might under certain circumstances be an advantage.

Do you think the present system of lowering boats, especially from ships of the dimensions of the "Titanic," is a good system to go on with - I mean from blocks and tackles and davits? - I do not think it is the best system that can be devised.

If I were to suggest to you that they use a crane for that purpose now, a longarmed crane with a single fall, would it not be more expeditious for lowering boats and just as safe? - It all depends what you are going to put on the end of the fall. Are you going to do it by man power or steam power or electric power?

*Mr. Cotter:* Well, if I may be allowed to suggest it, I should certainly, with your permission, my Lord, suggest it should be oil engines independently absolutely of the machinery of the ship at all, attached to the crane.

*The Commissioner:* How long would it take to get an oil engine to work? *Mr.*

*Cotter:* I do not think it would take long, my Lord.

*The Commissioner:* I do not know I should think in the circumstances of the "Titanic," it would have been rather a disheartening job to have begun to light oil engines and work them. I should think men's hands were probably readier and quicker.

*Mr. Cotter:* We have had evidence that the boats took forty minutes to get ready and swing out.

*The Commissioner:* Yes, some of them, but not all.

*Mr. Cotter:* They were the first boats. It has been suggested, my Lord, that there should be more boats -

*The Commissioner:* Ask him a question, please.

*(Mr. Cotter - To the Witness.)* If there were more boats on the deck, and those cranes were got into operation, would it not be a quicker method than the present method of lowering the falls through blocks and tackles, and then pulling them up again? - It would be quicker if the oil engine is always there to do this work.

Now it has been stated here that there was a fear of the boats buckling. Can you suggest any way to strengthen those boats so that there would be no fear of buckling? 24509.

*(The Commissioner.)* They did not buckle, you know, and it was an ill-founded fear, it was only in the minds of people who did not know.

*The Witness:* I understand the boats had been tested with the full weight on board, and they did not buckle.

*(Mr. Cotter.)* I suggest to you it would be a good thing to let the Captain and officers know that the boats have been tested to carry a certain weight or carry a certain number of passengers, so that there should be no fear? - Oh, yes, it would be a good thing.

### **Examined by Mr. LAING.**

I only want to ask one question. On the freeboard, as fixed, of the "Titanic," did the height of these engine room bulkheads fully comply with your Rules? - Fully.

And with Lloyd's Rules? - I cannot quite speak as to Lloyd's Rules; I do not quite know how they interpret their own Rules. So far as I know they would comply with Lloyd's Rules.

So far as you know from your examination of the plans and what you know about this vessel, was she properly constructed and an efficient ship when she left? -

Perfectly efficient.

*(The Commissioner.)* I am asked to ask you this question. Are you satisfied that an engineer and shipwright surveyor is competent to survey nautical equipment and the hulls of passenger vessels? - As regards nautical equipment, my Lord, I am not a nautical man, and with your permission I would ask to be allowed to confine my remarks to the second part of the question.

Very well, the hulls of passenger vessels? - The hulls of passenger vessels, yes.

*(The Witness withdrew.)*

*(Adjourned to tomorrow, at 10.30 o'clock.)*

# In the Wreck Commissioner's Court

SCOTTISH HALL,

BUCKINGHAM GATE, Tuesday

18th June, 1912

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### **TWENTY-SIXTH DAY.**

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURNE (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P., (instructed by Mr. Smith, Solicitor) appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes, of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder, Roberts and Company) appeared as Counsel on behalf of the dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

MR. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.) MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

**Page 698**

**ALEXANDER BOYLE, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

24516. You are the Engineer Surveyor in Chief to the Board of Trade? - I am. 24517. How long have you held that position? - Three and a half years, since January, 1909. I think you have altogether been 28 ½ years in the service of the Board? - That is so. I believe before that you served your Apprenticeship as an engineer, and also served at sea for a number of years as a marine engineer? - I did.

For the purposes of this Enquiry your special department was connected with the machinery and mechanism of the "Titanic"? - Yes, all the machinery and mechanism in the ship.

And were certain matters in connection with the "Titanic" put before you? - Yes. Did you make tests of materials? - Oh, yes.

Steel and cast iron? - Yes, cast steel.

And matters of that sort? - Yes.

And I think amongst other matters, you had the material of the davits before you, had you not? - Yes.

*The Commissioner:* The material?

*Mr. Butler Aspinall:* I do not know the technical term.

*The Witness:* Yes, that is right, the material of which the davits are constructed.

What is it? - Cast steel.

*The Commissioner:* Nobody suggests the material was not good.

*Mr. Butler Aspinall:* I was merely proving, as we have done throughout, that the Board of Trade have dealt with the matters about which certain question have been asked.

*The Commissioner:* This appears to me to be rather beside the question.

(*Mr. Butler Aspinall.*) I will pass from it. (*To the Witness.*) With regard to one other matter that came specially before you, I think that was the mechanism of the doors in the watertight bulkheads? - That is so.

Did you consider whether or not the mechanism was good and efficient? - Yes, I did. And did you pass it? - We did pass it. The drawings were submitted to my office and carefully considered and passed.

In the event did you finally pass all the matters that had been put before you? - I did.

*The Commissioner:* And I am sure he thought them all right.

(*Mr. Butler Aspinall.*) I was going to ask him that next. (*To the Witness.*) Did you think they were all right? - Yes. 24532. And were they all right? - Yes.

*The Commissioner:* Now that will do. Do any of you gentlemen want to ask any questions?

*Mr. Edwards:* I do not.

*Sir Robert Finlay:* No, my Lord.

**(*The Witness withdrew.*)**

*The Commissioner:* Have you considered, or has anybody considered, the desirability of contrivances for the application of compressed air to a breach of the ship's side?

*Mr. Butler Aspinall:* No, my Lord, that has not been considered by any of us.

*The Commissioner:* I wish you would think about it.

*Mr. Butler Aspinall:* Yes, certainly, my Lord, it will receive consideration.

*The Commissioner:* It is a suggestion that I make. You may think there is nothing in it, but just think about it.

*Mr. Butler Aspinall:* Yes, my Lord. Would your Lordship develop it a little?

*The Commissioner:* Salvage.

*Mr. Butler Aspinall:* I thought that was what your Lordship had in your mind.

*The Commissioner:* Yes.

*Mr. Butler Aspinall:* Putting a pad, as it were.

*The Commissioner:* Yes, I will tell you what the suggestion is - making the deck above the leak watertight and then working compressed air into the place where the water is, and so forcing the water out, and by means of the compressed air keeping the water out.

*Mr. Butler Aspinall:* That will receive consideration.

*The Commissioner:* Have you ever heard of such a thing.

*Mr. Butler Aspinall:* Personally I never have.

*Sir Robert Finlay:* I am told it has been used in salvage operations sometimes under special circumstances.

*The Commissioner:* Is it done for the purpose of enabling the salvors to work? *Sir*

*Robert Finlay:* It is used for that purpose, my Lord, and also for the purposes of floatation.

*The Commissioner:* Lifting the ship?

*Sir Robert Finlay:* Yes.

*The Commissioner:* What you mean to say is, it is used only in connection with a ship that is sunk?

*Sir Robert Finlay:* I believe so, my Lord.

*The Commissioner:* Not in connection with a ship that is still afloat?

*Sir Robert Finlay:* That is my understanding.

*The Commissioner:* Well, it may be, but I wish you would think about it.

*Sir Robert Finlay:* Yes, my Lord.

**EBER SHARPE, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

*(Mr. Butler Aspinall.)* This is the gentleman who finally cleared the ship at Queenstown before she left for the West. *(To the Witness.)* Are you Board of Trade Surveyor stationed at Queenstown? - Yes.

Did you occupy the position of Emigration Officer? - Yes.

And was it your business to give a certificate of clearance to the "Titanic" before she left the United Kingdom for the United States? - Yes.

And did you do so? - I did.

And when she left was the ship, in your opinion, seaworthy, in safe trim and in all respects fit for her intended voyage? - Yes.

One other matter. I think his Lordship asked about this. Did you, before you gave your certificate of clearance, ascertain the exact number of passengers, divided into first and second and third class, and crew on board? - I took the passengers in two classes, cabin and steerage, and the crew.

*(The Commissioner.)* In cabin you include first and second class? - Yes. *Mr. Butler Aspinall:* The figures appear here, but I have added them up, and I can give my Lord a summary of them without going into the details. First and second cabin passengers, 606, third class emigrant, 710, making a total of 1,316; crew, 892, making a total, inclusive of all on board, 2,208. I think I have done it rightly.

*(The Commissioner - To the Witness.)* Now you have it in your head, or you ought to have it in your head. Is it right? - The crew should be 891. There was one fireman deserted at Queenstown and went away on another ship.

**Page 699**

It was a very lucky thing for him? - Yes, my Lord.

*(Mr. Butler Aspinall.)* Then it works out at a total of 2,207? - Yes, 2,207.

*The Commissioner:* Do you want to ask this gentleman any question?

*Mr. Scanlan:* No, my Lord.

*Mr. Edwards:* No, my Lord.

*(Mr. Butler Aspinall.)* There is one matter I might be allowed to ask him *(To the Witness.)* Does this figure of 891 for the crew include the eight bandsmen or not? - Yes.

*The Commissioner:* What is the significance of that?

*Mr. Butler Aspinall:* I do not know.

*The Commissioner:* Is that why you asked it?

*(The Witness withdrew.)*

**JOSEPH MASSEY HARVEY, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

*Mr. Butler Aspinall:* This is the principal Examiner of Masters and Mates, but he gives information which will be of value to your Lordship on other matters.

*The Commissioner:* Very well.

*(Mr. Butler Aspinall - To the Witness.)* Captain Joseph Massey Harvey, do you hold an Extra Master's Certificate? - Yes.

Are you Principal Examiner of Masters and Mates in the Board of Trade? - Yes.

Are you also the editor of "Notices to Mariners" and "Notices to Fishermen"? - Yes.

Have you held that position for some time? - Nine years.

For the purpose of compiling the "Notices to Mariners" is it your business to keep yourself informed of all the matters that are essential for mariners to know with regard to derelicts, ice, and matters of that sort? - Yes.

Reference was made in the "United States Pilot," I think as long ago as a fortnight, to ice which is to be met on what, according to the language of the book, is the direct route? - Yes.

*Mr. Laing:* What page?

*Mr. Butler Aspinall:* Page 34. The matter that my Lord was calling one of the Witnesses' attention to was this. There is a statement on page 34, your Lordship may remember it.

*The Commissioner:* If you will read it, I daresay I shall.

*(Mr. Butler Aspinall.)* The heading of the paragraph is "Ice." It commences thus: "This subject has been repeatedly dealt with and referred to in considering the general conditions of coastal navigation on the Atlantic seaboard of the United States; but quite another aspect of the case presents itself in treating of the ocean passages of the large Transatlantic mail and passenger steamers. To these vessels, one of the chief dangers in crossing the Atlantic lies in the probability of encountering masses of ice both in the form of bergs and of extensive fields of solid compact ice released at the breaking up of winter in the Arctic regions, and drifted down by the Labrador Current across their direct route." I wish to call your attention to those last words, "their direct route." Now, in view of the fact that we know vessels are directed to travel certain routes at certain times of the year in order to avoid ice, have you an explanation of those words that ice is in "their direct route"? - It would be in the direct route if they came the shortest course, which is the great circle, of course, South of Cape Race; but to avoid the ice, and for other reasons, the principal companies made these routes, lanes, chiefly to avoid the ice, and to avoid collision.

*(The Commissioner.)* Do you want me to understand that the route referred to in this book is not the route which was usually followed before the "Titanic" disaster? - I would not take it to be.

*The Commissioner:* Now, Mr. Aspinall, look at page 27. Are not the routes there actually given?

*Mr. Butler Aspinall:* Yes, my Lord.

*The Commissioner:* Are not the routes there given the routes which were followed by the Atlantic liners before the "Titanic" disaster?

*(Mr. Butler Aspinall.)* I do not know. *(To the Witness.)* Do you know? - Yes.

*(The Commissioner.)* Are they? - They are the routes.

Very well, then I do not understand your answer to me just now? - In that notice they say the ice extends down to 42 N. and 45 W., which is the same as given on the Admiralty chart.

Well? - The "Titanic" went South of that.

I daresay she did, but the "Titanic" followed the ordinary route, did she not, except that we know she went a little to the Southward before she turned the corner, but ordinarily the great Atlantic liners follow the route mentioned in that book, do they not? - Yes.

And what do you say is wrong in the book, if anything? - The great track of ice given does not extend down to that; it extends down to 42. Therefore I infer that they refer to the shortest tracks across when they speak of the direct route.

*Mr. Butler Aspinall:* I think what he means is the direct route is the shortest line between the two points.

*The Commissioner:* Yes, but that is not what this says; at least, I fancy not. The book, on page 27, sets out the outward route to New York or Philadelphia. The route described in the text appears to be exactly in accordance with the route delineated on the chart. Is there any reason to suppose that when they are talking about ice occurring in the "direct route" they are referring to anything but the route that they have already described in the text and delineated on the Chart?

*Mr. Butler Aspinall:* In view of what would seem to be a difficulty of understanding how it is that these vessels, if they are crossing by the route delineated in the Chart, should be meeting fields of solid, compact ice - in view of that difficulty, what this gentleman thinks is that the introduction of the word "direct" there takes it out of the routes which are mentioned on page 27.

*The Commissioner:* Just tell me where this word "direct" occurs.

*Mr. Butler Aspinall:* The word "direct" occurs here - under the heading of the subject matter on page 34, which is "Ice."

*The Commissioner:* Let me read that. "This subject has been repeatedly dealt with and referred to in considering the general conditions of coastal navigation on the Atlantic seaboard of the United States, but quite another aspect of the case presents itself in treating of the ocean passages of the large trans-Atlantic mail and passenger steamers. To these vessels, one of the chief dangers in crossing the Atlantic lies in the probability of encountering masses of ice both in the form of bergs and of extensive fields of solid compact ice released at the breaking up of winter in the Arctic regions and drifted down by the Labrador Current across their direct route." Now they have no route - I think I see what you mean - they have no route other than the route which is described at page 27?

*Mr. Butler Aspinall:* No.

*The Commissioner:* What he means I expect is that if you take a straight line cross the chart -

*Mr. Butler Aspinall:* That is what this gentleman means.

24558. (*The Commissioner.*) But then, that is not what the book means. Now, you are a skilled man, Captain Harvey, and you can help me.

## **Page 700**

What do you suppose the “direct route” which is mentioned in the book refers to? - I should think it refers to the shortest route from Fastnet to New York South of Cape Race. 24559. What is that? - It is the great circle track just South of Cape Race.

Can you come round here and show it to me on the Chart? - Yes. (*The Witness explained the position on the Chart to the Commissioner.*) The direct route would be the great circle from either Fastnet or Bishop’s Rock just South of Cape Race. Another thing I may tell you, I took notice that with regard to all vessels besides the Atlantic liners, other ships going across and going up to the Canadian ports, it was for their benefit as well. It is only certain ships that keep to these routes, and I take it that the information given in the Admiralty Sailing Directions is for all ships.

(*The Commissioner.*) The Admiral points out that they say here: “Auxiliary steamers and sailing vessels, Northern route.” That is the route you are talking about? - Yes.

“It used to be taken at all seasons; it should, as a Rule, only be taken in the summer and autumn months.” That is the route you are talking about? - Yes. The Admiralty says the ice extends down to 42. How do you account for the large masses of solid ice?

The Admiral thinks it is simply a saving clause that this ice does come down sometimes. There is evidence that it came down this time. It is a saving clause. But it is a warning? - Oh, yes, it is a warning; but I take it it is a warning right across *here*. *The Commissioner:* Now, Mr. Aspinall, will you tell me what the point of this examination is. What do you think it does establish when it comes out?

*Mr. Butler Aspinall:* The reason we are calling this Witness is this, that some 10 or 12 days ago your Lordship called the attention of the Attorney-General to the fact that apparently, according to the book, “The United States Pilot,” there was a statement in that that vessels traversing the direct route run the risk of encountering fields of solid, compact ice, and your Lordship asked us if we had appreciated that this statement had existed there, and whether there was any appreciation of it; and under those circumstances I wanted to ask Captain Harvey, who is the Editor of “Notices to Mariners” and gets information with regard to the dangers of traversing the seas, if he could explain how it was that there was a danger of encountering solid, compact ice; and the only way he could explain it was the way in which he sought to explain it, namely, that if you follow (if I may use the phrase) the routes prescribed on page 27, it is likely that in 80 cases out of 100, or possibly more, you will not meet solid, compact ice, but if you travel across the Atlantic Ocean by the shortest line between Great Britain and the point you are wishing to go to in America, then there is a risk of your encountering solid, compact ice; and his view was that “the direct route” meant that short route, the shortest distance that could be travelled.

*The Commissioner:* I do not know myself - what I am saying agrees with the Witness - why the adjective "direct" is used unless it is intended to distinguish the route there mentioned from some other route. *Mr. Butler Aspinall:* Yes.

*The Commissioner:* I do not know why "direct" is used. It would seem to point to this, that they have described some other route which cannot be called direct. Do you follow what I mean?

*Mr. Butler Aspinall:* Quite; that is the reason we called Captain Harvey. In addition to the explanation which he sought to give of the paragraph to be found on page 34 - I do not know whether it will assist your Lordship, but it may be of assistance - he has also done this (*Handing Chart to the Commissioner.*) *The Commissioner:* What is this document?

*Mr. Butler Aspinall:* That is a chart of the North Atlantic, and what Captain Harvey has put there is -

*The Commissioner:* Tell me what you want this evidence for. You shocked me by telling me that I have brought this down upon my own head by something I said 12 days ago.

*Mr. Butler Aspinall:* If I may say so, that is the reason why we had it prepared, in consequence of what your Lordship said. This gentleman has prepared this Chart, and has put upon it the original Southern track which existed in 1892.

*The Commissioner:* It may possibly affect Sir Robert Finlay - I do not know whether it does - when he comes to deal with the question of the Captain's conduct, but I do not think it will. Do you think it will, Sir Robert?

*Sir Robert Finlay:* I do not think so, my Lord. I think the "direct route" must be used as denoting that route more to the North which used to be followed, the great circle route, passing, it may be, within 30 miles to the Southward of the Virgins.

*The Commissioner:* They are sunken rocks - the Virgins?

*Sir Robert Finlay:* Yes. I am in a difficulty because I have not the book my friend is referring to, we have only the second part.

*Mr. Butler Aspinall:* The Chart shows how the route has been gradually Southing - that is what it comes to.

*The Commissioner:* Now, do you gentlemen want to ask this Witness any questions? Do not, unless you feel impelled to do it by an irresistible force.

**(*The Witness withdrew.*)**

*The Commissioner:* Who is the next Witness?

*Mr. Butler Aspinall:* I am in a little difficulty.

*The Commissioner:* You have no other Witness?

*Mr. Butler Aspinall:* Yes, I have, but I act under directions, and I am not even second in command here.

*The Commissioner:* Are not you Chief Officer?

*Mr. Butler Aspinall:* No, I am the First Officer, I believe he comes third.

*Sir Robert Finlay:* I think my friend is now in full control, as he is alone.

*The Commissioner:* I have been reading this morning in bed some sailing directions issued by the P. and O. Company, and I find that the Officer in charge for the time being has to take full responsibility.

*Mr. Butler Aspinall:* Oh, I have to do that.

*Mr. Edwards:* This might be a convenient time, so as to avoid your reading them in bed tomorrow, if the Sailing Directions were put in.

*The Commissioner:* I always read in bed. What is it you want?

*Mr. Edwards:* I suggest, so that you should avoid having to read Sailing Directions in bed, that this might be a convenient moment for the Sailing Directions of the Dominion Line with regard to ice, being put in.

*The Commissioner:* By all means.

**Sir NORMAN HILL, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

24564. Are you the Chairman of the Merchant Shipping Advisory Committee? - Yes.

24565. I think, since 1894, you have acted as secretary of the Liverpool Steamship Owners' Association? - That is so.

Since 1896 you have been a member of the Shipowners' Parliamentary Committee? - Yes.

I think the first Merchant Shipping Advisory Committee was appointed in 1907? - That is so.

**Page 701**

It was appointed for a term of two years, and did it in 1908 expire and cease to be? - Yes. Was it then reappointed in 1909? - Yes.

And again in 1911? - Yes.

I think all the members of the Committee are appointed by the President of the Board of Trade? - That is so.

But before each Committee is formed, does the Board of Trade invite the associations representing the shipping interests to submit names? - Yes.

And are any of the members selected and appointed by the Board of Trade? - There are four members appointed by the Board of Trade without being nominated by any association.

How many members are there in all? - There are 20 now.

And are they representative of the various shipping interests? - Yes. Five of the names are submitted by the Shipowners' Parliamentary Committee, I am one of those.

There is one name submitted by Lloyd's, one by the Liverpool Underwriters' Association, two by the Institute of Naval Architects, one by the Mercantile Marine Service Association and the British Shipmaster's Association (they are acting together and appoint one), one by the Imperial Merchant Service Guild, one by the Institute of

Marine Engineers, one by the Marine Engineer's Association, and three by the Seamen's Union.

Is it the fact that the President of the Board of Trade has always appointed the representatives of the various interests whose names have been submitted to him?

- Yes. If I may explain, the Associations asked that the Committee should only be appointed for two years, so that at the expiration of two years the Associations can re-select the names they submit, so that if the Committee does not represent the shipping interests as a whole, it is the fault of the shipping interests in the names they have submitted.

We have had reference made to the Advisory Committee of 1911 already, but since 1906, which was the appointment of the first Committee - ? - 1907 it is.

Yes, were you a member of that? - Yes, of the first Committee.

And the second? - Yes.

And the third? - Yes.

The Chairman of all? - Yes, I have been Chairman of all.

Has your Committee been amassing and collecting together information with regard to life-saving appliances and matters connected with making navigation safe at sea?

- Yes. The Committee only deals with the matters upon which the Board asks for its opinion. It has since 1907, consulted us on a number of points. At the present moment it has asked us to advise generally upon the Life-Saving Rules and also generally as to whether we can make any suggestions to increase the precautions that are taken to protect life at sea. It has only asked us since the loss of the "Titanic" to advise generally. 24583. Before that had you collected a great deal of evidence and information? - Oh yes, we have advised on many points connected with boats and manning, and such things. 24584. Reference has already been made to the Committee of 1911. I think you have got, as a matter of fact, a Shorthand Note of all that was said by the members of the Committee which met in 1911, at their various meetings? - Yes, there are Shorthand Notes taken of all meetings.

Was Mr. Carlisle a member of that Committee? - He was appointed a member of a Sub-Committee.

Did the Committee appoint a Sub-Committee? - It was on the 4th April, 1911, that the Board asked the Committee to advise as to whether it was desirable to extend the existing boat scale so that it might deal with vessels of upwards of 10,000 tons, and, if we thought it advisable, as to the manner in which the scale should be extended. The Committee appointed a Sub-Committee to enquire and report upon that.

*(The Commissioner.)* Was that a Sub-Committee consisting of members of the Committee itself? - There were seven members of the Committee itself. A further explanation is necessary. When the Merchant Shipping Advisory Committee is asked to advise on a matter affecting the Life-Saving Rules, then the Board adds to the Merchant Shipping Advisory Committee in order to comply with the 17th Section of the Act, a second member of Lloyd's, and one member nominated by the Institute of London Underwriters. The Committee to advise on the Life-Saving Regulations, as you know, my Lord, is a Statutory Committee, and on the Advisory Committee we have only one representative of Lloyd's, whilst on the Life-Saving Appliances Committee we are bound

to have two. Also on the Life-Saving Appliances Committee the London Institute of Underwriters are entitled to be represented. We only have a Liverpool underwriter, so we have to have a second, London, underwriter. The Sub-Committee that we appointed consisted of Mr. Cross, who is one of the representatives of the Liverpool Underwriters; Sir Theodore Doxford, one of the representatives of the Naval Architects; Mr. Rome, who was one of the representatives of Lloyd's; Mr. Spencer, one of the representatives of the Marine Engineers; Mr. Havelock Wilson, one of the representatives of the Seamen's Union; Captain Hampson, one of the representatives of the Imperial Merchant Service Guild; Mr. Ogilvie, one of the representatives of Lloyd's; and myself, one of the representatives of the shipowners. Then that Sub-Committee co-opted, as we had authority to do -

Before you come to what it did I want to understand its constitution. What authority has the Committee to appoint this Sub-Committee? - It is our common practice, my Lord, if we want further information - more detailed information.

But what authority have you. It is a statutory committee? - That is so, my Lord. 24590. Then where do you get your statutory authority to appoint it? - My Lord, we appoint our Sub-Committees to enquire and report. They can take no action themselves.

The action is taken by the Committee as a whole.

24591. Is the Committee, as a whole, a statutory body? - Yes. It is provided for in the Act of 1906 in very general terms. It says that the Board of Trade may appoint an Advisory Committee if it thinks fit. It is left absolutely to the Board whom it appoints.

24592. What section do you say that is? - I have not it in my mind, my Lord, at the minute; it is towards the end of the Act.

*Mr. Butler Aspinall:* It is section 79 of the Act of 1906, my Lord, "The Board of Trade may, if they think fit, appoint committees for the purpose of advising them when considering the making or alteration of any rules, regulations or scales for the purpose of the Merchant Shipping Acts, consisting of such persons as they may appoint representing the interests principally affected, or having special knowledge of the subject matter. *The Commissioner:* That seems to contemplate a Committee appointed by the Board of Trade.

*Mr. Butler Aspinall:* It does.

*The Commissioner:* And this Sub-Committee was not appointed by the Board of Trade; it was appointed at their request, but not by them.

24593. (*Mr. Butler Aspinall.*) Yes. (*To the Witness.*) The Sub-Committee really sits for the purpose of acquiring information for you - evidence and information? - That is so.

24594. They put it before the Committee, and then the Committee acts upon it? - That is so.

That is the machinery? - Yes. Perhaps I put it a little too high in saying that the Life-Saving Appliances Committee is a Statutory Committee. That, again, is merely an Advisory Committee; it has absolutely no power to make Rules. The Board of Trade, before it makes Rules, has to consult with certain people.

(*The Commissioner.*) I suppose the only body capable of making Rules is the Board of

Trade itself? - That is so, my Lord, and if I may make it quite clear, when the Advisory Committee was first appointed, Mr. Lloyd George was then President, and he addressed us, and he made it perfectly clear that we were only there to advise the Board on such questions as the Board sought our advice upon; that we in no way relieved or could relieve the Board from its responsibility; and he went further and made it perfectly clear that we had nothing whatever to do with administration. We are merely consultative, and we have never been anything else.

I am afraid the suggestion will be that the Board of Trade is always getting advice and never doing anything? - That is not the case with the Advisory Committee. *The Commissioner:* I do not say it would be a complaint well founded; I am far from saying that.

*(Mr. Butler Aspinall.)* One matter which was submitted to you was as to the manner in which the boat scale should be continued - whether it should or should not be continued upwards? - That is so. I did not quite finish with reference to our Sub-Committee. The Sub-Committee, whose names I have given you, co-opted Mr. Carlisle and Mr. Thomas Royden. We asked them to come in and help.

*(The Commissioner.)* First of all the Board appoints the Committee? - Yes, my Lord. The Committee then appoints a Sub-Committee? - Yes, my Lord.

Which includes people who are not members of the Committee? - They have been added to the Advisory Committee by the Board of Trade so I suppose, my Lord, we must take it that they were members.

And then that Sub-Committee co-opts? - That is so.

When does the series of operations stop? Does it stop at the co-option? - Well, my Lord, that rests with us. We are there to advise the Board to the best of our ability; and we find it is the most convenient way of getting all the skilled help we can get in giving that advice.

I have no doubt you are right; at all events you co-opted Mr. Carlisle? - Yes, and Mr. Thomas Royden.

*The Commissioner:* Mr. Carlisle does not give himself a very good character, you know.

*(Mr. Butler Aspinall.)* To finish with the composition of the Sub-Committee, were you appointed Chairman of the Sub-Committee? - I was.

You have told us that one thing that had to be considered was as to whether or not the boat scale should be continued upwards. You also had, I think, specially to consider whether what we call Rule 12, that is, the additional boats, assuming the cubical contents required by the scale will not carry everybody on board - you had to consider whether Rule 12 should or should not be revised so as to exempt altogether from the requirements of additional boats and/or rafts, those vessels which are divided into watertight compartments to the satisfaction of the Board? - That is so.

Those were the two matters you applied your minds to? - And there was one further matter, a question with regard to the particular construction of the best type of lifeboat.

Very well. Now I think you held two meetings on the 19th and the 26th of May, 1911. Was Mr. Carlisle in attendance at both those meetings? - At both.

As you told us, you have a Shorthand Note of the Proceedings. I do not want to trouble my Lord with it, but you can verify these statements by reference to the Shorthand Notes, and I have no doubt you have looked up the Shorthand Notes to enable you to give this evidence? - I have been carefully through them.

Mr. Carlisle told us this, that your Sub-Committee had arrived at certain conclusions with regard to boats before his appointment. Is that right or wrong? - If Mr. Carlisle means that we had arrived at certain conclusions on the particular points we were then considering, he is absolutely wrong. We had previously had to advise the Board with regard to types of decked lifeboats such as the Englehardt boat. We there had had a SubCommittee, and we had made tests of the boats at sea; on other occasions we had had to advise the Board as to the stowage of boats, and there we had had a very careful Enquiry, and we had obtained a great deal of information. If Mr. Carlisle is referring to the fact that at this Sub-Committee we stated the conclusions we had arrived at on these other points, then he is right; but if he states that we had arrived at any conclusions in regard to the scale, he is absolutely wrong.

Mr. Carlisle also told us that his view was that it would not be fair to force an extended scale on existing vessels? - Mr. Carlisle has said what?

That his view, as stated to the Committee, was that it would not be fair to force an extended scale on existing ships, but that you ought to legislate or make Rules for would be future large vessels? - Mr. Carlisle made that statement during the discussion three or four times. It was raised first by another member of the Committee right at the beginning of our sittings, and I said that it appeared to me that whatever we thought was necessary for the safety of life would have to be enforced on all vessels, whether they were built then or whether they were going to be built. The Committee generally accepted that view, and I think the only member who raised the question again after my statement was Mr. Carlisle, and he, on two or three occasions, raised the point that it would be neither reasonable nor fair to extend any new Rule to existing vessels. 24613. I believe Mr. Carlisle submitted plans for a special davit to carry four boats, did he not? - Yes, he put in two plans; I have them here.

I think we have seen them; they have been before the Court? - He explained those plans in detail to the Committee; we went over them - I am speaking now from the Shorthand Note, because I could not pledge my own recollection. We went over the plans with Mr. Carlisle twice, and the Committee, as a whole, were not satisfied with them; in fact, they preferred the arrangement which they have embodied in their report, of stowing boats, such as decked lifeboats, under the ordinary type of open lifeboat. They thought that was infinitely preferable to Mr. Carlisle's plan of having nothing but open decked lifeboats to be launched by rotation from one set of davits. And I think, my Lord, I may add that at the end of the discussion, when we were getting to close quarters with our report, I asked Mr. Carlisle did he recommend his four-boat davit - did he press it; and his answer to me was, "No, I think you are right in sticking to the 16"; that means the eight a side which we embodied in our report.

In the event, did your Sub-Committee come to the view which is embodied in the report dated July, 1911? - That is so. I would like to explain the basis on which we arrived at the scale we embodied.

I was coming to that. I wanted to ask you that. You arrived at this conclusion, and we find the report presented to the Committee, and eventually reaching the Board of Trade? - Yes.

Was any pressure brought to bear on Mr. Carlisle with regard to that report? - Absolutely no pressure. We showed the greatest deference to Mr. Carlisle throughout the whole of the discussion, having regard to the fact that he had had more experience than any man on the Committee with regard to building this big type of ship.

Now to pass to another matter which I was coming to. You wish to put before my Lord your reasons which induced you to arrive at the Table, the scale which is to be found in that report? - Before I go to that, the Scale we recommended in the Report was based on the written scale which Mr. Carlisle produced himself at the meeting. The written scale Mr. Carlisle produced showed that he recommended the carrying of

### **Page 703**

16 boats under davits, and no more. But on this large type of vessel he recommended carrying in addition boats readily available for launching. That is the scale which the Committee recommended. As to the difference, if you test it, in the case of the "Titanic," Mr. Carlisle's scale would have shown 16 boats under davits, eight boats readily available for launching; minimum cubic contents of the whole, 8,250 feet. The scale the Committee recommended was for 16 boats under davits, eight additional boats, cubic contents 8,300 feet. With regard to the "Titanic," the scale that the Committee recommended was practically identical with Mr. Carlisle's scale, the small difference in the cubic contents being a matter of arithmetic according to the size of the boat that we were adding.

*The Commissioner:* What page is Mr. Carlisle's evidence on?

*Sir Robert Finlay:* Page 557, my Lord, in the second column, on this point Questions 21489-90, by my friend, Mr. Laing.

*(The Commissioner.)* I see he says: "I was asked to join that Committee two days before it finished." Is that accurate?

*The Witness:* No, my Lord; he was only asked to join that Sub-Committee. He was there from the beginning of the first meeting, and he was there throughout the whole of the meetings held by that Sub-Committee. There were only two of them.

How long did the Sub-Committee sit? - It sat on two days. I think we finished before luncheon on each day. We generally start at half-past ten, and we sit, if we can, to get our work finished, and between the two meetings I had drafted the rough heads showing the conclusions we had arrived at at the first, and this was the basis for further discussion at the second.

Then when he says: "I was asked to join that Committee two days before it finished," he was accurate? - Yes, my Lord, he was.

It was not quite right for you to say he was not accurate; he was accurate, but he might have added "Two days was all the time that the Committee lasted"? - With submission, I should have thought that made the difference between accuracy and inaccuracy.

Possibly; I am not going to discuss that. "They had come to certain conclusions on certain points." Well, that is true? - Not on the point submitted to us then. 24624. No, but on certain points? - Yes, certainly.

"They had come to certain conclusions on certain points, and the Chairman drew my attention to the fact that if I pushed my idea for all ships the Bill would have to go back" - I do not know what Bill he is talking about - "any Bill connected with shipping would have to go back on all those ships, and it would not be fair"; and he put the contention that it would be unfair to make the Rule apply to old vessels upon you, whereas you say it was his contention and not yours? - It was his contention, and I held exactly the opposite.

Yes, so I understand you to say - "and they had no doubt that big ships would fit more boats than were required by the Board of Trade." And then Mr. Laing puts this question: "Do you mean you signed this document without agreeing with it?" and then apparently he hesitated, because I said to him: "Answer that question; it is very simple"; and then he said: "I did not consider it satisfactory and I told them so, but I signed it." Now, did he tell you that it was unsatisfactory? - He did not, my Lord.

You are sure of that? - I am quite positive.

You have looked at the Note? - I have read the Note carefully through. 24629. Then I say to him: "It is a very strange thing to do, to sign something you are not satisfied with pretending, by signing it, that you are satisfied with it?"; and he answers: "Well, I quite confess that it looks very extraordinary, but from what occurred at the meeting, if any of you had been present you would have seen the exact reasons for agreeing not to force it, and to bring the whole thing up again that had been worked at for I do not know how long - weeks or months. (Q.) Do you want to go back on what you signed? - (A.) I certainly do not think it is enough, but I was not going to be a dog in the manger" - I do not know what that means, quite - "when a lot of gentlemen had come to the conclusion that this was satisfactory for the mercantile shipping." Now, I understand you to say, Sir Norman, that the scale adopted was suggested by Mr. Carlisle himself? - Produced at the first meeting, my Lord, in writing by Mr. Carlisle himself. And, my Lord, may I say, for the honour of my Committee, I believe we have done useful work. These kind of reflections are very difficult to sit down under. We have no opportunity of answering them; it is a condition of our service that our communications between the Committee and the Board are confidential. Might I ask if you can spare the time to read through those Shorthand Notes? Well, my Lord, may I ask some counsel who has read through them -

*(The Commissioner.)* I am personally quite satisfied with your statement as to their effect? - The account that Mr. Carlisle gave you of what happened on that Committee is pure invention. May I just refer you to one other question? You did not touch on it yourself. It is on the same page, 526. There is a question put to Mr. Carlisle:

“21488. Are you aware that if the conditions required by the Board of Trade had been carried out your recommendations would involve the carrying of fewer boats than was in fact carried.” Now, my Lord, at the Committee we intended and we did increase by 50 percent the boats that would have had to be carried on a vessel such as the “Titanic,” and we increased their cubic capacity by almost 50 percent. And we all knew it, and we all intended to do it, Mr. Carlisle and all the rest of us.

Then why did not you do it? - My Lord, we recommended it, and our recommendation was sent to the Board of Trade on the 4th July, 1911. 24632. You say it is included in that recommendation? - Yes.

(*Mr. Butler Aspinall.*) Since the disaster to the “Titanic,” have your Committee been further asked to advise the Board generally upon the existing life-saving appliances? - We have, and following our practice we have added other advisers who, we think, could help us.

I think you have co-opted to assist you the following gentlemen, Dr. S. J. P. Theirle, of Lloyd’s Register? - Yes.

Mr. J. Foster King, of the British Corporation? - Yes.

*The Commissioner:* What is the British Corporation? 24636.

(*Mr. Butler Aspinall.*) I do not know.

*The Witness:* That is in Glasgow, it is similar to Lloyd’s Register, in Glasgow. *The*

*Commissioner:* Very well.

(*Mr. Butler Aspinall.*) Mr. W. J. Luke, of John Brown and Company, who are they? -

They are big shipbuilders, the builders of the “Lusitania.”

And Mr. Trevisa Clarke, of Swan Hunter and Wigham Richardson? - They are the builders of the “Mauritania”; John Brown and Company are the builders of the “Lusitania.”

Mr. Royden - is he the same? - Yes. The Deputy Chairman of the Cunard Company.

And Captain J. B. Watt, the late Commodore of the Cunard Line? - Yes.

I think you have, since the “Titanic” disaster, given the boat scale very careful consideration, and have you, notwithstanding this disaster, resolved to adhere to the recommendations which are contained in the report of July 4th, 1911? - We have. I want to make that perfectly clear.

Certainly? - It is with regard to the boats to be carried under the davits. With regard to the additional boats to be carried, we have not yet made our report.

## **Page 704**

You are still considering that? - Yes, but with regard to the boats under the davits on the advice of these gentlemen we have asked to assist us, and it is a very representative Committee, we have adhered to the evidence we gave on the 4th July, 1911.

Would there be any difficulty in your Committee working together with the Bulkheads Committee? - You had better leave the Bulkheads Committee to itself.

You think so? - Oh, I am quite sure of that.

*(The Commissioner.)* I think I understand why Mr. Aspinall asks that question. It has been thought that the two matters may be more or less closely connected, that is to say, the provision of lifeboats and the construction of bulkheads; and for this reason, as I understand: If you could only get bulkheads of such a character as to make the ship unsinkable you would not want lifeboats at all for the purpose of saving people on the ship, and the nearer you get to that state of things, it is thought the fewer lifeboats would be required; so that the two things go, so to speak, side by side. Now, do not you think it might be advisable that the two bodies should act together in some way, if not by sitting together, by communicating with each other? - Well, my Lord, we are sure to come in contact with one another. May I remind your Lordship it was in our Report of 4th July, 1911, that we asked the Board to review the Regulations with regard to these so-called unsinkable ships? The view we took was that the Regulations had been in force for 20 years; that for some reason which we did not know, they could not be commercially applied, the boats could not be built commercially to comply with the Requirements. Now, we did not want the standard of buoyancy to be lowered, but we did think that the particular mechanical contrivances by which that buoyancy could be best maintained should be reviewed after the 20 years, and it was because of our recommendation in July that the Board has appointed this Bulkheads Committee. Now, my Lord, we can advise with regard to boats, and we can say that certain modifications of the scale should be made when certain buoyancy has been maintained, but I do not think we are, and I do not think my Committee would claim to be an authority to advise on that question of buoyancy.

That I can quite understand. - We would like the skilled assistance of the - 24648. Of the Bulkheads Committee? - It is a very strong Committee the Board has appointed, and we would be guided by them on the question of buoyancy, I think. *Mr. Butler Aspinall:* I gather from the Report that in your view tonnage is the basis - *The Commissioner:* Yes, I wanted you to ask him about that.

24649. *(Mr. Butler Aspinall - To the Witness.)* Upon which you think it is possible to lay down a practical boat standard for passenger and emigrant ships. That is so, is it not? - I believe it is the only practical standard.

Will you tell my Lord the reasons for that opinion of yours? - Well, my Lord, the best way of testing the practicability of it is, I think, to apply it to the existing ships afloat. Of course, one knows that with regard to cargo ships the boatage is based on life, and cargo ships have to carry enough boats on each side to accommodate all the lives on board.

*(The Commissioner.)* If you based it on tonnage, you would provide a number of useless boats? - You would, a great many. On the other hand, if you are basing the boatage of the passenger ships, and still more of the emigrant ships, on the numbers carried, you should never have built the present class of passenger ship. May I take an example. The average size of the emigrant ship carrying 2,000 will be, say, 10,000 tons. Now if you are going to start from the numbers carried, 2,000, and you take 50 a boat, you have 40 boats. Now 40 boats on a 10,000 ton ship, 40 lifeboats, readily launchable boats, is an absolute impossibility; and you will find that still more so because it is not a difficulty only affecting the big

emigrant ships; the same difficulty is affecting a substantial number of passenger ships. You will go down, my Lord, and you will find that they are boats of 3,000 tons carrying well over 1,000 people, and carrying them very safely indeed.

Then it comes to this, does it Sir Norman, that it is practically impossible for an emigrant ship designed to carry 2,000 people, to carry lifeboats sufficient to hold those 2,000 people at one time? - With lifeboats readily available for launching, it is an absolute impossibility, I believe. Now, my Lord, if that is an unsafe ship then you could prohibit her sailing the seas; but our view is (and of course we had before us the records of these boats year after year, we have had in detail the 20 years' record) that we cannot say that that is an unsafe ship. If you compare the loss of life on that class of ship with a cargo-boat trading across the North Atlantic, with boat accommodation on each side for everybody on board, the loss of life in the emigrant ship, both amongst the crew and amongst the passengers, is a bagatelle compared with the loss of life on the other boat. 24653. I follow quite what you mean. I do not know whether there are any statistics published - we have had some - to show the comparative loss of life at sea in emigrant ships and in cargo ships? - Well, my Lord, I have worked them out very closely in detail. In the last 20 years we find that there have been, as near as we can estimate, 32,000 voyages made by passenger ships across the Atlantic. That is 1,600 a year. There have been casualties either resulting in loss of life, or resulting in the total loss of the ship without loss of life, in 25 cases.

24654. Out of how many? - Out of 32,000 in 20 years. Twenty-five voyages have met with casualties resulting in either loss of life or total loss of the ship without loss of life.

24655. Is that something less than one-tenth percent.? - Yes, it is less than one in a thousand. Now, in those 25 casualties the lives of 68 passengers and 80 of the crew were lost; that makes a total of 148.

But if you include the "Titanic" your figures, of course, would be greater? - That is so, my Lord. In the same period there were 233 casualties to other ships resulting in either loss of life or in total loss without loss of life, and in those casualties there were 17 passengers and 1,275 crew lost, giving a total of 1,292.

(*The Attorney-General.*) Will you give us the number of the ships as you did in the other case? - The total number of voyages?

Yes? - No, I cannot; the total number of casualties is 233.

Over what period? - Over 20 years.

We cannot get the proportion? - No, I am doing my best to get it. It is a difficult figure to get at, but I believe you will find that in the North Atlantic trade at least threefourths of the voyages are in the passenger and the emigrant ships; they represent nearly three-fourths of the total. If it can be found anywhere you will find it in the Annual Navigation Returns. The figures that I have got from there are so striking - I mean it shows so few voyages from the other ships - that I am asking the Board to verify them for me.

(*The Commissioner.*) Can you speak generally as to the percentage of loss of life at sea as against the loss of life travelling on land? - No, my Lord, I never compared those. I can give you the loss of life at sea.

*The Commissioner:* I do not suppose there are any reliable figures upon that subject. *Mr. Edwards:* The figures are available for railways and mines on land, and also for sailors at sea.

*(The Commissioner.)* Yes, but I am afraid they would be of very little use, because you could not find out what time the people on land had been travelling. *The Witness:* No.

## Page 705

*The Commissioner:* You could not find out what the length of their journeys was.

*Mr. Edwards:* That is true.

*The Commissioner:* And I do not think the figures would assist very much, but I have always had the impression - not so far as I know supported by any facts - that travelling by sea was safer than travelling by land.

*Mr. Edwards:* It is the old story of the chimney pot danger on land, my Lord.

*(The Commissioner.)* That is an old story that I do not know.

*The Witness:* If I am not wearying you on this question of tonnage, we have applied the figures to see how far the requirements of persons carried were met by boating on a tonnage basis. There were on the 23rd April last 521 passenger and emigrant ships with their certificates running. In 343 of those, that equals 66 percent, the boatage on the tonnage basis provided boats under davits for all on board. Now, with regard to 75 of the remainder when you brought into account the three-fourths' allowance -

The 12th Rule? - No, it is before that, when you have not got boats under davits sufficient for everybody then you have to increase it by three-fourths or one-half of their smaller boats. If you applied the Rule, with 75 of the remainder also, you found that the boat scale under the tonnage basis provided sufficient for all on board. The result is that under those two Rules, 428 out of your 521, that is 80 percent. of the vessels boated on the tonnage basis, provide sufficient boat accommodation or life-raft accommodation for all on board. Now, there is no other basis that I know of by which you could approximate any such results. The other important matter I take with regard to the passenger-carrying power of the ship, is the length. We have been working on gross tonnage. If you take length, and try any number of experiments, you cannot construct any general standard which would meet the object you have in view, which I take it is to provide boat accommodation for the greatest number of people. If you try to base on the standard of length you cannot get anything approaching these results.

I think I understand what you say up to this point; but will you try to tell me, if you can, why there could not be on a ship like the "Titanic," say the "Olympic," a sufficient number of boats conveniently carried on the boat deck, to accommodate every soul on board? - If I may say so, that is the point that my Committee are now going very carefully into, and they are not ready with their recommendation.

I quite understand what you say with reference to emigrant ships of 10,000 tons, and the impossibility from a practical point of view of carrying sufficient lifeboats to accommodate everybody on board such a ship; but take the "Titanic," a boat of 45,000 tons, designed to carry whatever the number may be: as I understand, the

“Olympic” is now carrying, whether wisely or not is another matter, boats sufficient to accommodate any number that the law will allow that vessel to carry. That is so? - So we understand. 24667. If the boats that are being carried now on board the “Olympic” do not themselves constitute a source of danger, which I quite understand may be the fact, I do not see why in respect to other boats of the size of the “Titanic” and the “Olympic,” Rules cannot be made to compel them to carry boatage accommodation for the whole number that the ship may be by law enabled to carry. That is a matter, you say, under consideration? - We are considering, if I may say so, the point you have named, that is, as

I understand it, the safety of the ship herself -

24668. Yes? - And, secondly, the availability of the boats that are immediately under davits for prompt launching, so that they may not be hampered and interfered with.

24669. There are many things to be considered, the feasibility, for instance, of some plan of shifting the boats easily from the port side to the starboard side, and vice versa? - Yes. So that if a ship is in a rough sea, or has a list the boats of the ship may all be available on one side of the ship? - That is so.

And there are other matters of that kind which ought to be considered? - And the distribution of the boats, my Lord, is a very important matter.

And another matter, it appears to me, you ought to consider is this: I will assume for the moment that the evidence which has been given before us is accurate, that there was no disorder on this ship, that everything worked well during the two and a half hours when the ship was sinking: there is the fact that the boat accommodation was only used to the extent of two-thirds or three-fourths - many of the boats went away partly empty, so that in truth the boatage accommodation, assuming that it was properly used, was too much? - One of the greatest difficulties in all these ingenious contrivances and ingenious inventions, of which my Committee has had a good many commended to its notice, is that they seem to forget the question that one of the greatest difficulties is marshalling the people into the boats.

Marshalling the people? - Yes; you have got a huge hotel, a hotel with thousands of people on board, and how you can marshall those people into the boats is one of the greatest difficulties you can think of. The substantial recommendation of our Report of 4th July last is that what you must do is to do everything you possibly can to secure the buoyancy of the ship.

It has never been suggested that the passengers should be drilled? - No, my Lord, you cannot do it; it is impossible.

So as to make it easy for them to get into the boats; not only the crew drilled to handle the boats, but the passengers drilled for getting into them? - My Lord, we should lose more passengers' lives by pneumonia, by turning them out at night, to have effective drills, than we should save in the boats.

*Sir Robert Finlay:* In regard to what was said by your Lordship just now, may I refer your Lordship to what Mr. Sanderson said on page 481, just below the middle of the page your Lordship will see this passage occurs: “(*Sir Robert Finlay.*) My Lord, Mr. Sanderson would like to make a correction with regard to one thing he said yesterday, if your Lordship will let him. (*The Commissioner.*) You need not go into the box, Mr. Sanderson, if you tell us what it was. (*Mr. Sanderson.*) Thank you, my Lord. In the report

of my evidence in regard to the boating of the 'Olympic' there is a possibility that I would be misunderstood in the record as it now is. I would like to say that after the accident to the 'Titanic' we started out with the intention of boating the 'Olympic' to the full extent of her capacity for passengers, that is to say, for about 3,500 people, 60 odd boats; and we found we were getting into such a ridiculous position, we were crowding the ship so with boats, that we modified those instructions and directed them to only boat the ship for the actual number of passengers and crew she was carrying at the time, and that is now the policy we are carrying out, which is a considerable reduction from the original intention."

*The Commissioner:* But, still one must contemplate the possibility of the ship carrying the total number that the law permits her to carry.

*Sir Robert Finlay:* Yes.

*The Commissioner:* And if she did, then you would require to have the 60 boats.

*Sir Robert Finlay:* Yes; it was only on the question of the practice on the "Olympic" that I desired to call attention to that passage.

*The Attorney-General:* The additional boats are mostly Berthon's, I think, folding boats; we saw them.

*The Commissioner:* Or are they Englehardt boats?

*The Attorney-General:* No, Berthon boats, mostly.

*(The Commissioner.)* You can tell me, Sir Norman, which boats do you prefer when you

## **Page 706**

come to what are called collapsible boats; do you prefer the Englehardt boats or the Berthon boats? - My Committee do not want to pin ourselves to any particular patent, but what we call the decked lifeboats, such as the Englehardt boats, we think are far the best; but we do not consider those are collapsible boats.

You do not think the Englehardt boats collapsible? - No.

You apply that term only to the Berthon boats that double up? - I do not want to deal with particular patents.

### **Examined by Mr. SCANLAN.**

Is it the case that this Sub-Committee dealing with life-saving appliances only met twice?  
- Twice.

I gather they occupied part of the forenoon of each day? - Probably from halfpast 10 to half-past 1 or 2.

Is that the entire time taken by this Committee to deal with the question of the increase of lifeboat accommodation? - The entire time taken by the Sub-Committee. 24682.  
Had the Sub-Committee when it met any recommendations from the parent Committee with reference to lifeboat accommodation, and how it might be increased? - No.

You complain of Mr. Carlisle's evidence as being unfair to his fellow members? *The Commissioner:* Inaccurate.

(Mr. Scanlan.) Inaccurate, and I think you also said unfair to the Committee? - Mr.

Carlisle's evidence, so far as the Committee is concerned, is an invention - a pure invention.

Do you think that is quite fair to him? - What I stated?

To characterise the whole of his evidence as pure invention?

24685A. (The Commissioner.) It is quite fair, if it is true, to say it.

The Witness: And that it is true is shown absolutely by the Shorthand Note that was taken of the whole of the proceedings.

(Mr. Scanlan.) We have had it from him that he only sat two days with you, and that is quite true? - Quite true.

There is no invention about that? - It is an invention to put it that he only sat for the two last days, or whatever the implication is.

The Commissioner: The impression that his evidence gives, I think you will see if you read it, is that he joined the Committee on the two last days of its sitting, as though it had been sitting for weeks before; and it was not, you know.

(Mr. Scanlan - To the Witness.) But had not you, at all events, a meeting at which you decided to co-opt Mr. Carlisle on to your Committee? - We did that at the general meeting at which the Sub-Committee was appointed.

So that it was not the Sub-Committee that decided on taking in Mr. Carlisle and Mr. Royden? - I believe it was the Sub-Committee, but we were all in the same room together; the Committee left it to the Sub-Committee.

At any rate, that was one meeting before Mr. Carlisle came.

The Commissioner: No, it is not. That was not a meeting of the Sub-Committee at all; that was a meeting of the General Committee. But it does not matter.

(Mr. Scanlan.) But there were all the members of the Sub-Committee there. You contravert the statement made by Mr. Carlisle that the scale you arrived at provides for no increase in the lifeboat accommodation for ships like the "Titanic"? - I say it does provide 50 percent increase.

Your evidence is it provides 50 percent increase. Now, I would like to refer you to paragraph 6 in your report which deals with the additional provision of lifeboats? - Yes.

Where you have ships divided into watertight compartments - ? - To the satisfaction of the Board of Trade.

Yes. Did not you propose there that the requirements of Section 12 of the original Rule should be departed from where the ships are provided with efficient watertight compartments? - I am afraid I do not quite follow, Mr. Scanlan. We exempt them altogether if they comply with the addition, certainly.

You exempt them from any addition? - We strengthen Rule 12 in favour of shipping which complies with the requirements of the Board of Trade.

You strengthen No. 12? - Yes.

But by strengthening No. 12 you weaken the provision for lifeboat accommodation? - If you have got a ship which the Board of Trade will pass as unsinkable - we know at that time that the "Titanic" did not comply with the Board's conditions; we knew at the time that the "Mauretania" did not comply with the Board's conditions; we knew at the time that the "Lusitania" did not comply with the

Board's conditions, and you may take it we knew there was no commercial ship afloat carrying these large numbers that did comply with the Board's conditions which are Sir Edward Harland's Committee's report.

Are you making a statement that the "Titanic" did not comply with the Board of Trade's conditions? - It did not comply with Sir Edward Harland's Committee's report.

I wish you to tell my Lord in what respect the "Titanic" failed to comply? - I could not, Mr. Scanlan.

Why do you say that it failed to comply if you do not know in what respect it did fail? - I could only tell you that Mr. Carlisle told us -

*(The Commissioner.)* May I interrupt you a moment. Do you say there is no commercial ship afloat which complies with the requirements of Sir Edward Harland's Committee? - Well, my Lord, no ship carrying these large numbers in the emigrant trade.

Perhaps there is one, my Lord.

What is it? - It is one of the Cunard boats, one of the older Cunard boats, but we had it in evidence that plans of the "Mauretania" had been submitted and rejected as not being in accordance with Sir Edward Harland's Committee.

Rejected by whom? - By the Board of Trade as not being in accordance with Sir Edward Harland's Committee, and the same as to the "Lusitania." And Mr. Carlisle told us it was no good submitting the plans of the "Titanic" because they were not in accordance with Sir Edward Harland's Committee, and that no commercial ship could be so built; and it was because of that recommendation that we advised a reconsideration of Sir Edward Harland's recommendations.

But I think we had some evidence that ships have been passed by the Board of Trade, I think four a year or something of that kind, that have complied with Clause 12? - The majority of them are quite small ships; some of them, I believe you will find, are ferry boats, and the majority of them I think you will find are small vessels. I think I am right in saying that there is only one emigrant ship which has complied.

Only one emigrant ship? - I think I am right.

Since the Rule came into existence? - Well, I will not say that; at the beginning for some years there were one or two.

*The Commissioner:* If it is true, Mr. Attorney, I am afraid I have misconceived the effect of the evidence as to what has been done under Rule 12. It never occurred to me that when an average of four vessels were said to have come under this Rule per annum since it was in existence the vessels included ferry boats. *The Attorney-General:* We will see what it really does mean.

*(Mr. Scanlan - To the Witness.)* Were you informed at the Board of Trade by some official

**Page 707**

of the Board of Trade that the "Titanic" did not comply with the Board of Trade's requirements? - No, by Mr. Carlisle.

Did you ask him in what respect was the failure of compliance? - Yes, there was a general discussion on that point.

Can you tell us generally, if you cannot tell us accurately, what are the particulars in which the "Titanic" was deficient? - I think it is mainly a matter of longitudinal bulkheads.

Longitudinal bulkheads? - I think so; that is my recollection.

*(The Commissioner.)* Am I right in saying that the objection was that the ship had not such bulkheads as the "Mauretania" and the "Lusitania" had? - No, my Lord, those had been rejected.

*(The Attorney-General.)* Is that quite right? - Yes, we were told, and the dates were given, that the plans of the "Mauretania" and the "Lusitania" had been sent to the Board of Trade and rejected as not complying with Rule 12. I have a Return, and I will give it to you, Mr. Attorney, giving all the names and all the dates.

*(Mr. Scanlan.)* Was it from somebody officially in the Board of Trade you got information about the "Lusitania" and the "Mauretania" failing to comply with the Board of Trade's requirements? - No, the information about the "Lusitania" and the "Mauretania" in June, 1911, came from Mr. Royden, who was a member of our Committee and the Deputy-Chairman of the Cunard Company.

I should like to ask you this to make it clear. Is there any official in the Board of Trade who is responsible for the statement that the "Titanic" did not come up to the Board of Trade's requirements? - Under Rule 12, no. I had the statement from no official.

*The Commissioner:* You are talking always of Rule 12?

*(Mr. Scanlan.)* Yes, my Lord. *(To the Witness.)* I think we had the statement made that no application was made under Rule 12? - Mr. Carlisle told us at the Committee that it was no use applying for the "Titanic."

Was it the case, then, that either the builders, Messrs. Harland and Wolff, or the owners, the White Star people, knew themselves that the ship was deficient in some particulars, and consequently did not make the application? - I do not think that is quite a fair way of putting it.

Just put it in any way you like yourself? - Rule 12 says that if you comply, or if you come up to the category of unsinkable ships - I am paraphrasing the Rule - - 24718.

*(The Commissioner.)* That is not what it says, Sir Norman? - That is too strong, my Lord.

24719. *(Mr. Scanlan.)* I will read it to you? - I have it, so that I can follow it. 24720.

"When ships of any class are divided into efficient watertight compartments to the satisfaction of the Board of Trade, they shall only be required to carry additional boats, rafts, and buoyant apparatus of one-half of the capacity required by these Rules, but the exemption shall not extend to lifejackets or similar approved articles of equal buoyancy suitable to be worn on the person? - Yes. The way the Board interpret that Rule is this in practice: Unless the ship comes up to the standard laid down by Sir Edward Harland's Committee of 1890 as practically an unsinkable ship it will not pass you under Rule 12.

*(The Commissioner.)* Will you repeat that explanation; I did not hear it? - My Lord, the way the Board interpret Rule 12 is this; that unless a ship comes up to the

standard laid down by Sir Edward Harland's Committee in all respects they will not give the exemption under 12.

Sir Edward Harland's Committee reported as follows: "Vessels may be considered able to float in moderate weather with any two adjoining compartments in free communication with the sea if fitted with efficient transverse watertight bulkheads, so spaced that when two such compartments are laid open to the sea the uppermost watertight deck to which all the bulkheads extend, and which we will call the bulkhead deck, is not brought nearer to the water surface than would be indicated by a line drawn round the side at a distance amidships of three-hundredths of the depth at side at that place below the bulkhead deck." That is what they reported? - Yes; and then there are detailed recommendations as to the mechanical arrangements by which that result is to be obtained, and the Board, as I understand it, insist on these particular detailed arrangements being carried out in all respects before they will give the certificate under Rule 12.

Rule 12 does not appear to me to contemplate the construction of a vessel which shall be unsinkable, otherwise there would be no occasion for any provision of lifeboats except for the purpose of communicating with another ship.

*Mr. Scanlan:* It seems to me to contemplate a standard of efficiency of the watertight compartments, and if this standard is to be insisted on for a matter which is so relatively small as the difference between  $\frac{3}{4}$  and  $\frac{1}{2}$  of the additional lifeboat accommodation, what it appears to me is that it should be insisted on for the general purpose for which watertight compartments are provided, that is, for the general security of the ship.

*The Commissioner:* It may be.

*(Mr. Scanlan.)* Do you follow? - Yes, I follow that.

And do you agree? - I can only tell you this. Lloyd's, as we understand it, and all the builders do not believe in the particular arrangements recommended by Sir Edward Harland's Committee. They think there is something better to be got. *The*

*Commissioner:* Did Sir Edward Harland's Committee recommend a longitudinal bulkhead?

*(The Attorney-General.)* No, I do not think so.

*The Witness:* I am not sure.

*(The Commissioner.)* They did not? The recommendation goes on, "With longitudinal bulkheads in combination with transverse bulkheads, the vessel should not, under the above conditions, list so as to bring the deck on either side below the water level." That seems to me to contemplate longitudinal bulkheads? - My recollection is this: we went into the matter very closely at the time that the longitudinal bulkhead was one of the difficulties.

*(Mr. Scanlan.)* Surely you must have considered this matter on those two mornings that you sat as a Sub-Committee of the Advisory Committee of the Board of Trade? - Yes, we made a recommendation about it.

I see you made a recommendation and you stated to me just now that you yourself did not understand what is meant by this requirement of the Board of Trade. Am I correct? - No, I think I do understand it clearly.

*The Commissioner:* I think he said just the opposite, Mr. Scanlan - that he understood it.

*The Attorney-General:* Has your Lordship paragraph 7 of that Committee's Report? I think that will supply the answer to your question, that they did undoubtedly contemplate it.

*The Commissioner:* "7. Owners desiring to take advantage of any exceptions made in favour of efficiently subdivided vessels, should furnish the Board of Trade with the following particulars and drawings: -

“(a) Longitudinal elevation in section showing the sheer, the bulkheads, the bulkhead deck and any other decks proposed.

“(b) Plan and elevation of each bulkhead showing recesses and doors, if any, with their positions marked, together with details of the appliances for opening and closing them.

“(c) Proposed bulkhead freeboard and corresponding loadline; also the lines of the sills of the sidelights between the bulkhead deck and the bulkhead loadline.

## **Page 708**

“Where bulkheads are constructed as specified in Appendix B they may be regarded as of sufficient strength without further calculation.” Is it necessary to look at the various things mentioned?

*The Attorney-General:* No, I do not think so; it only shows that they did consider it.

*The Commissioner:* You mean about the longitudinal bulkheads?

*The Attorney-General:* And the particulars and drawing they were recommended to require.

*Sir Robert Finlay:* There is nothing under 7 about longitudinal bulkheads.

*The Attorney-General:* Yes, “longitudinal elevation.”

*The Commissioner:* No, I do not think so - “longitudinal elevation in section.” *The*

*Attorney-General:* Will you look at No. 6?

*Sir Robert Finlay:* 6 does touch upon it.

*The Commissioner:* Yes, it does, but I do not think 7 contemplates it.

*The Attorney-General:* 7 was the point Sir Norman Hill was referring to - that they required certain particulars and drawings. I was referring to paragraph 7 to show that under that - and I think that is what Sir Norman had in mind - the Harland Committee did recommend certain particulars and drawings which had to be required and that apparently is what was guiding the Board of Trade. I have been enquiring about the “Mauretania” and the “Lusitania.” There is no real difference of opinion except that they were not actually rejected. What happened was that they supplied their drawings, and then they were asked by the Board of Trade to make certain calculations with certain compartments bilged, and then they withdrew their application. That is how the matter stands.

*The Commissioner:* Then they never did come within it.

*The Attorney-General:* They withdrew, that is all.

24729. (*Mr. Scanlan.*) May I take it that when your Committee decided on paragraph 6 of its Report: “That vessels divided into efficient watertight compartments to the satisfaction of the Board of Trade should be exempt from the requirements of additional

boats or rafts"? - Will you go on, Mr. Scanlan? The next part is the substantial part. 24730. "The Committee suggest in this connection that the Board of Trade should review the requirements designed to attain the standards as to watertight compartments at present enforced by them under Rule 12, having regard to the developments of shipbuilding since the report of the Committee on the spacing and construction of watertight bulkheads"? - That is right.

24731. Was this considered at those two forenoon meetings of the Sub-Committee? - With regard to vessels of 10,000 tons and upwards we understood that Rule 12 was not of any practical value at all. It was a Rule under which no vessels then worked. 24732. Was not the opinion of your Committee that the requirements of the Board of Trade should be modified - lessened? - No.

Made easier to qualify ships for getting the exemption given to ships regarded as efficiently divided into watertight bulkheads? - Our view was this, that the standard of buoyancy should be fully maintained. We thought that after twenty years an Enquiry should be held as to whether the particular mechanical arrangements required by Sir Edward Harland's Committee were still the best, and we wanted that reviewed. We did not want the standard of buoyancy lowered.

Did I catch you as saying just now that Lloyd's requirements were higher in some respects? - They are different, I believe.

From the Board of Trade's? - From Sir Edward Harland's Committee. I do not want to interject anything, but when we talk of the Board of Trade's Standard we generally mean, I think, the standard which the vessel has to comply with in order to get her passenger certificate or emigrant certificate, and, of course, this Rule 12 has nothing whatever to do with that. It is something far and above that standard.

It means a higher degree of efficiency in the watertight provisions than that which suffices to qualify a vessel for a passenger certificate? - That is so.

24736. If your recommendation had been given effect to in the case of the "Titanic," does not it come to this, that you would have provided only for 830 people? - If the "Titanic" had passed Sir Edward Harland's standard of buoyancy, yes, not otherwise.

24737. Did Mr. Carlisle make any suggestion to the effect that 64 boats should be provided for a ship like the "Titanic"? - No. He showed us some plans, one of which showed 32 boats, and the other was a plan of a single davit showing 4 boats suspended in the davit.

Have you in the Minute, which I take it you have got with you, any reference to the suggestions made by Mr. Carlisle? - Yes.

Have you a Note of what he said with reference to 32 boats or 64 boats? - I do not think there is anything about 64. The Note breaks off twice in this way: "Mr. Carlisle then showed his plan - explained his plan."

Did he not suggest that you might have 64? - I remember his suggesting four boats on each davit.

I see here in the Minute: "Mr. Carlisle: I think, if you will look at the model you will see there would be room in the 'Olympic' and the 'Britannic' for three or four more sets of davits on each side"? - Yes.

Then does he refer also to four boats on each davit? - He showed us a davit which would carry four boats.

There were 16 sets of such davits on the "Titanic"? - I am not sure if he told us they were for four boats each, or if they were for three - I am not sure which.

(*The Commissioner.*) If they were for four, that would be 64 boats? - If you will look at page 54 I think you will find that that does not unfairly summarise the result of a somewhat long discussion. I say to Mr. Carlisle: "But you would not recommend us to adopt this plan and only to have one set of davits covering all those 4 boats. - Mr. Carlisle: No, I would stick to your row of 16. I think this is perfectly correct." Mr. Carlisle, as I have stated, produced the scale showing the 16 boats under davits. You will find that on page 22. It begins with Mr. Rowe speaking. Mr. Carlisle handed his scale to Mr. Rowe, and Mr. Rowe sent it up to me, and then I summarised it: "I think Mr. Carlisle's suggestion comes to this, that for boats that are to be readily available from the davits in the case of ships of from 10,000 to 12,000 tons it stops as it is, 16, all of which must be under davits; 12,000 to 20,000, 18, 16 of which must be under davits. Then 20,000 to 35,000, 20, 16 always under davits; 35,000 to 45,000, 22, 16 always under davits; 45,000 to 50,000, 24, 16, always under davits. That is adding between 10,000 and 20,000 two boats"; and in the discussion we talked about it as Mr. Carlisle's scale. 24745. (*Mr. Scanlan.*) That is, Mr. Rowe did? - No. It was referred to, you will find, on many occasions or several occasions.

On this occasion it is Mr. Rowe you are talking of? - Mr. Carlisle handed it to Mr. Rowe, and Mr. Rowe, who was sitting nearer to me, handed it to me.

In fairness to Mr. Carlisle, I refer you to a passage on page 51: "I was asked if we were in a position to get boats. We could have got many more boats here if necessary, but there are only 16 required by the Board of Trade, and in getting out the plan we got it so as to work three or four davits under each set." I presume that is a misprint for "three or four boats under each set." "Whether he is going to fit in all this second lot of boats required by the Rule or not, I cannot say, but you could have it if you wanted it"? - Yes, he showed us the drawings of the davits.

## **Page 709**

On the whole, is it not fair to Mr. Carlisle to state that he did bring before the Committee a scheme for increasing the boat accommodation to 64 on such a ship as the "Titanic"? - He showed us the plans; we debated them fully with him, and he also showed us his other scale. We debated both fully, and we adopted his own scale with modifications without any protest from him in any shape or form.

And no doubt it is true, as Mr. Carlisle in his examination suggested to us, that he was influenced by the general discussion which went on and the persuasiveness of your argument amongst others? - That is absolutely incorrect, Mr. Scanlan.

He made the proposals anyhow? - It is absolutely incorrect.

It is correct that he made these proposals? - Yes.

25752. And it is also correct that your Committee did not adopt them? - It is correct that he placed two things before us. One was a scale based on sixteen boats under davits; one

were plans based on a special davit with special means of launching. The Committee, as a whole, did not believe in the special arrangements; they did believe in modifications in the other plan that he suggested. Throughout that Committee the greatest deference was paid to Mr. Carlisle, and there was absolutely no pressure of any kind brought to bear on him.

Great deference was paid to him but his suggested scale of 64 was not adopted? - His other one was.

But the 64 was not? - And, as I say, I put it to him at the end, and he said the 16 was right.

*Mr. Scanlan:* I see how you put it to him; I see the nature of the discussion. Did you state that your Sub-Committee still adhere to this recommendation of July?

*(The Commissioner.)* He did say so? - The Sub-Committee has never met since.

I say that the general Committee, supplemented with the additional names, adhere to it.

24756. *(Mr. Scanlan.)* Do not your Committee now think that there should be a considerable addition to the lifeboat accommodation for all ships? - Are you referring to the boats immediately under davits, or generally?

Generally? - That we are considering. Speaking generally, we consider there will have to be substantial additions to the bigger boats.

Is not this the generally accepted view, that there should be lifeboat accommodation for every person on board, passengers and crew? - I would much prefer not to go into this - not to express my own views on a point which is still before the Committee.

I mean I am the chairman, and I would much prefer not to express my own view.

But your Committee are still considering it? - They are, still.

Tell me how often have you met to consider it? You know you made these recommendations after two forenoon meetings? - We have met, I think it is, 21 or 22 times since the loss of the "Titanic."

You have given quite an amount of consideration to the matter since? - We always give all the necessary time, Mr. Scanlan. Time is never grudged by the Committee.

You have given yourself ample time since the "Titanic" in your 21 meetings - that is what I suggest, but the time you took before - two forenoon meetings - was, I also suggest, utterly inadequate? - We have been asked to review the whole of the life-saving Rules.

*The Commissioner:* What did you say, Mr. Scanlan?

*(Mr. Scanlan.)* I suggest to him that the two forenoons taken by the SubCommittee to review those Rules when they came to this recommendation was utterly inadequate? - Are you asking for my opinion?

I am suggesting that view, yes? - We gave ample consideration to it. I think you must remember that the members of the Committee are all experts. We do not have to examine witnesses - at any rate, I do not. I am the Chairman.

Just a question on that. You say that the members of the Committee are all experts? - Yes.

I will begin with the Chairman. You belong to the honourable profession of the Law, do not you? - I do; but since 1894 I have devoted a very great deal of my time to all

matters affecting shipping, and I do really consider I am an expert on the statistics of shipping, but not on the building.

*The Attorney-General:* I can vouch for that.

*The Commissioner:* You are not likely to persuade me, Mr. Scanlan, that Sir Norman Hill is not an expert on this matter. I know him to be an expert.

*The Attorney-General:* I know the assistance he has given us in some other matters.

24767. (*Mr. Scanlan.*) There are one or two other matters I should like to ask you about. Has the Advisory Committee of the Board of Trade made recommendations to the Board as to the Manning Scale for ships? - It has never recommended any Manning Scale, no. Has it considered whether there should be a Manning Scale set up? - Yes, it has considered it.

But it did not come to any conclusion? - It recommended the maintenance of an efficient watch scale, not the Manning Scale.

Has the question of the establishment of a Manning Scale frequently come before the Advisory Committee? - Yes, at a good many meetings.

But you mean to say that no decision has yet been arrived at? - We have decided against a Manning Scale based upon tonnage or anything of that kind. We have based our recommendations on the maintenance of efficient watches. The things that were read to my Lord were wrong; they are not extracts from any Minutes or any letters written. They wrongly represent it; in fact, they never came from the Committee.

Have your Committee considered the question of a standard of efficiency for seamen and men in the Engine Department? - Yes, it has been debated, and we have made recommendations.

You mean have made recommendations to the Board of Trade? - Yes. The recommendations are that a man should not be passed as an efficient deckhand unless he has satisfied a Nautical Surveyor of the Board.

That has not been carried out by the Board? - They assure us it is. They assure us that no man is passed as an efficient seaman if there is any question raised, unless he has been examined by a nautical Surveyor.

Have you ever heard of nautical Surveyors examining men? - Certainly. I have heard them stopping ships because they have had inefficient deckhands on board.

How often? - Not very often, but there are some every year.

Have your Committee considered the question of boat drills? - Yes, we have considered the question of boat drills, but I would much sooner keep absolutely clear of what we have still under consideration, if I might.

Yes, I respect the obligation? - If I express an opinion in public it is a little difficult for me, as Chairman, to hold an absolutely impartial hand.

That is one of the subjects you are still considering? - That is one of the subjects we are still considering.

Is the manning of lifeboats another subject which you are still considering? - Yes, another subject.

And the question of efficiency - is that still under consideration? - That arises on the manning. We never would man with inefficient people.

**Examined by Mr. CLEMENT EDWARDS.**

You are Chairman of this Sub-Committee that dealt with bulkheads? - No; I have nothing to do with the Bulkheads Committee. 24783. I mean of the life-saving appliances? - Yes.

You are also head of the firm of solicitors who are instructing Counsel for the White Star Line in this Enquiry? - I am the second partner in the firm.

Was the Sub-Committee of which you are Chairman a Sub-Committee appointed out of the General Advisory Committee? - Yes, subject to the point I have told you, that the Board had added to comply with the 17th Section -

*The Commissioner:* We have had all that - that there were some people co-opted. *Mr.*

*Edwards:* I did not quite catch what was said by this Witness. He did not speak very loudly, my Lord.

*(The Attorney-General.)* We had it before from Mr. Carlisle and Mr. Royden.

*The Witness:* I am very sorry. May I give you the names again?

*The Commissioner:* Oh, do not, please.

*(Mr. Edwards.)* I know the names? - The only point I wanted to make is this. On the Sub-Committee there were two members, Mr. Rowe, representing Lloyd's, and Mr. Ogilvie, representing the London Institute of Underwriters.

*(The Commissioner.)* Who were necessarily put on? - By the Board of Trade. We had nothing to do with that.

*(Mr. Edwards.)* In the Minute I notice you say, "We have added to our Committee representing the Merchant Shipping Advisory Committee Mr. Carlisle and Mr. Royden"? - That is right.

Then you did not co-opt them? - The Sub-Committee did.

*Mr. Edwards:* What I want to get at is this: Where is the power in the Sub-Committee to co-opt anybody?

*The Attorney-General:* It is page 21 of the Memorandum we handed up yesterday. That gives the names.

*The Witness:* The power, the basis upon which we work, is the speech that Mr. LloydGeorge made to us when we were formed. He told us that he thought our number was necessarily limited, and it would be very desirable when we were dealing with particular points that we should co-opt people having special knowledge on those points; and we have always worked on that basis.

*(Mr. Edwards.)* And that is the sole authority you have? - Yes. 24792. What I want to get from you is this: The Sub-Committee sat and the SubCommittee made certain recommendations? - Yes.

Were those recommendations ever submitted to the Committee as a whole? - Yes.

Were they adopted by the Committee as a whole? - Adopted unanimously.

Have you a minute to that effect? - Yes.

Will you, please, produce it? - Certainly. I have it here.

Will you, please, read it? - "The chairman submitted to the Committee the Report of the Life-Saving Appliances Sub-Committee on the proposal to amend the lifesaving appliances Rules as to the minimum number of lifeboats to be carried in vessels of more than 10,000 tons gross tonnage. The Report also dealt with a letter from the Board of Trade, raising the question whether the Rules should be amended so as to prescribe a maximum depth for lifeboats as compared with their breadth. On the motion of the chairman, seconded by Mr. Spencer, the Report of the Sub-Committee was unanimously adopted."

Have you had any experience yourself in the navigation of ships? - None. 24799. Why did you express the view that it would be impracticable to carry a large number of boats on the boat deck of a ship like the "Titanic"? - I do not know that I have expressed that opinion.

I understood Lord Mersey asked you whether you did not think it was practically impossible, and I understood you to say yes? - To carry them immediately under davits, it is impossible.

You do not think it is impossible, then, in ships of this great size? - Under davits it is impossible. I am distinguishing between what you carry under davits and what you do not.

*The Commissioner:* We know it is not impossible because we have been told that the "Olympic" has done it.

*The Attorney-General:* Not under davits, my Lord.

*The Commissioner:* No, not under davits.

*The Attorney-General:* That is the distinction Sir Norman Hill is drawing. He says that under davits it is impossible.

*(The Commissioner.)* I did not understand the question was limited to boats under davits. Was it limited to boats under davits?

*The Witness:* No.

*(Mr. Edwards.)* No, my Lord, it was not. It was a general question. *(To the Witness.)* Is there any difficulty in your view, and from the evidence which has come before you, in putting upon a ship of the character of the "Titanic" a larger number of davits? - On the evidence before me there are difficulties. It is not that I am afraid of giving my own opinion, but I am Chairman of the Committee which is still considering this point and I think, in the public interests, it would be better I should not express it. 24804. *(The Commissioner.)* Cannot you give us your opinion, if I may say so, without prejudice? - Well, my Lord, if I give you my opinion without prejudice, and I have got my Committee meeting in a week - and sometimes we are very much divided in opinion - I weaken my position as Chairman. I have tried my Lord, to pursue an impartial course in the Chair, and if that is so I think the less the Committee know of what your own opinion is the better.

*(Mr. Edwards.)* Are we to understand, Sir Norman, that the one real purpose for which you have come here is to correct the statement made by Mr. Carlisle? - That is the only purpose I asked to be examined for.

And you do not feel inclined to express any views as to the future unsinkability of ships, provision of bulkheads, boat accommodation manning scale, or any other of the points which may arise in the nature of recommendations out of this Enquiry? - I do not wish to express any opinion with regard to the future. My Committee asked me to place before my Lord any information he wanted with regard to our recommendations of July last, and our reasons for those recommendations.

If that is your attitude, I shall not ask you any questions as to the future, but I do want to get quite clear what you recommended last year. It is a fact, is it not, that you were informed by an Official of the Marine Department of the Board of Trade that there was not a single ship which complied with the Regulations of the Board of Trade as to efficient watertight compartments? - I do not think at that time we had any statement from any Board of Trade Official. The statements we acted on were Mr. Royden's and Mr. Carlisle's and our general knowledge.

I think I can refer you to a letter of the Board of Trade referred to in your Minute? - I have forgotten it if there is a letter.

I think you will find it on page 37 of your Minute? - Oh, yes, I remember.

Mr. Royden said: "No ship is unsinkable. You are never quite safe. Something might give way," to which you, the Chairman, said: "Our Secretary reminds me that there is now a Rule with regard to watertight compartments. It is on page 16." That will be Rule 12. "When ships of any class are divided into efficient watertight compartments to the satisfaction of the Board of Trade, they shall only be required to carry additional

## Page 711

boats, rafts, and buoyant apparatus of one-half of the capacity required by these Rules." He also tells me there is no ship that has yet succeeded in satisfying the Board that it comes under that Rule.

*(The Commissioner.)* That rather agrees with what he says, that he obtained his opinion from Mr. Royden, I think it is? - That is the Secretary, my Lord. Our Secretary is an official of the Board of Trade.

*Mr. Edwards:* "He also tells me" - that is our Secretary - "that there is no ship that has yet succeeded in satisfying the Board that it comes under that Rule." Then it goes on: "*Mr. Havelock Wilson:* I think I will give one to the Board of Trade there. *The Chairman:* We cannot suggest a stronger Rule than that, can we?" That presumably is Rule 12. "If the Board of Trade's requirements are unreasonable, then it is our builder friends who will have to satisfy the Board that they ought to amend their requirements, and not this Committee. *Mr. Spencer:* No; I think that is very definite. *Mr. Royden:* I do not know if anybody has tried to convince the Board of Trade. *The Chairman:* I am told the 'Mauretania' did approach the Board with a view of satisfying it, but for some reason even she failed."

*The Commissioner:* What happened apparently was, according to the Attorney-General, that the Board of Trade made some suggestions when the plans of the "Mauretania" were put before it, and the result of those suggestions was that the application was not persevered with.

*The Attorney-General:* They asked for certain calculations.

*(Mr. Edwards.)* If you turn to the next page you will see that Mr. Matthews, the Secretary, refers you to a letter on the subject. - I had forgotten that. It is just the last three lines of that page. "A copy of the Committee's Report is enclosed, and the recommendations which it contained were adopted at once by the Board of Trade as their requirements for the exemptions under Rule 12. These recommendations are still insisted on, but I may mention that during the past five years only one application (s.s. 'Mauretania') has been made in the case of a foreign-going steamer for the reduction of life-saving appliances allowed by the Rule, and as the recommendations of the Committee were not fully complied with in that case the application was subsequently abandoned."

*The Commissioner:* That seems to me to agree with what the Attorney-General has said. That is accurate.

*(Mr. Edwards.)* I notice that you, Sir Norman, in your remarks there, speak of these Board of Trade requirements, Rule 12, as being unreasonable? - No, I do not say that - I say "if it is unreasonable." We were told by the builders; we were told by Mr. Carlisle; we were told by Mr. Royden, whose ship, the "Mauretania," had not passed, that they did not think the particular requirements, the particular contrivances to attain the end, were the best possible, and that they were not reasonable.

Then you yourself, your Committee as I understand it, have not been required to advise the Marine Department of the Board of Trade as to the reasonableness of those requirements in regard to efficient watertight compartments? - No, we suggested that they should appoint a Committee of equal standing to Sir Edward Harland's Committee. We are not capable of dealing with that question.

There is just one point, in fairness to Mr. Carlisle, that I want to call your attention to, and that is this: Is it not a fact that you opposed his recommendations as to an increase in the number of boats, on the ground that it involved the employment of a larger number of crew? - That I did?

Yes, that you did? - I, personally?

Yes, you personally? - It is incorrect.

*Mr. Edwards:* I will refer you to the Minute in a moment.

*The Commissioner:* There must be a great many of them.

*Mr. Edwards:* This, my Lord, is the Shorthand Note, and I have only had an opportunity of glancing at it since the Witness went into the box.

*(The Commissioner.)* But somebody at the side of you had apparently found the passage. Is there a difficulty in finding it again? Do you know it, Sir Norman? - I have no recollection of it, my Lord.

*(Mr. Edwards.)* Will you turn to page 21? - Yes.

You will find it at the top of the page. "*Mr. Carlisle:* Yes, I think if you look at the model you will see there would be room in the 'Olympic' and the 'Britannic' for three or four more sets of davits on each side? *Mr. Ogilvie:* And it must be remembered that we are talking of boats to be constructed with these Regulations in view. *Mr. Rowe:* I should like to see that measured on the plan. The well openings and the hatchway openings in the ship would be increased in length, and that would take

off some of the space, and I have great doubts unless you go for a very small boat whether you would get the davits in. *The Chairman:* Then, again, we should be up against the crew question, and whether you want the bigger boats or more of the smaller boats. We are satisfied that it is not reasonably practicable - we will not say possible - to increase the number of davits, and then with regard to increasing facilities for additional boats to be launched from the same davits we should be up against the point, how do we think the number of boats should be increased in the case of ships not specially subdivided." In that question has the crew question any other meaning, in relation to these boats, except an increase in the number of the crew? - My remark refers to a question that you are always having in these manning discussions in regard to the boats - the size of the boat. If you have a big boat then you want fewer men to manage it as a Rule - I mean the number of hands does not increase in proportion to the increase in the boat, and my remark was only in relation to that. It has nothing to do with the point you are putting.

*The Commissioner:* It does not seem in the least to bear out your suggestion, Mr. Edwards, that he objected to Mr. Carlisle's suggestion on the ground that it would involve the employment of a larger number of men.

(*Mr. Edwards.*) With respect, my Lord, I was going to ask him what other point it referred to. I have just asked him what other meaning the crew question had. (*To the Witness.*) If Mr. Carlisle's suggestion had been carried out, would it not in fact have involved the employment of a larger number of deckhands? - Which of Mr. Carlisle's suggestions?

That particular proposal of putting on three or four more sets of davits on the "Titanic"? - I have not the number of the crew that the "Titanic" carried, but certainly I should say it would increase it.

*The Commissioner:* If you have more boats of the same size it involves the employment of more men to manage them, that is obvious, but I do not think that is what Sir Norman Hill means.

(*Mr. Edwards.*) That is what I want to get from this Witness? - May I go further and deal with what my Lord has said?

Certainly, if you will come back and answer my questions afterwards? - And if you have still more boats, but of a smaller size, you will still further increase the crew. That is what my remark goes to. It is the comparison between the small boat and the big boat.

Have you any views, having sat on this Committee as Chairman, as to the number of crew that lifeboats of a 65 capacity should carry? - That we are debating now.

You have no views? - I have views, but I would sooner not express them. 24826. Had you any views when that report was drawn up? - Yes, and I have got them still.

They are the same views, are they? - They are the same views.

*Mr. Edwards:* Have you any views - perhaps that is also in the future - as to motorboats?

*(The Commissioner.)* What do you say about motor-boats? Are you going to excuse yourself from saying anything by telling me that it is a matter of consideration for the Committee? - Well, my Lord, we recommended and the Board have adopted, a Rule which makes the carrying of a motor-boat optional, showing what our mind was. 24829. Do not you think it would be much better that it should be compulsory? - There is a very great division of opinion as to the use of the boats - as to the difficulty of launching the boats and such things, but the Committee as a whole are in favour of the motor-boat, and have recommended that it might be carried. We wanted to get a little more experience before we said it must be carried.

**Examined by Mr. HARBINSON.**

24830. I heard you refer, Sir Norman, to Mr. Lloyd George's address. That was delivered when your Committee was formed in 1907? - When we were first appointed. 24831. Did I gather accurately from you that at that time he indicated generally the scope of your functions? - That is so.

Did he in his address to you raise any question on that occasion of the consideration of life-saving appliances? - I have got a copy of his speech. I have not it in my recollection.

*The Commissioner:* Oh, please, do not read it! We must, you know, keep this Enquiry within some sort of limits. Is Mr. Lloyd George an expert on these matters?

*(Mr. Harbinson.)* No. I only wanted to find out why it was, if the question was raised in 1907, it was not until 1911 that a Report was presented? - This question about the 10,000 ton boats was referred to us at the end of May, 1911.

*Mr. Harbinson:* But nothing was done from the information of that Committee in 1907. *(The Attorney-General.)* April, 1911.

*The Witness:* With regard to the 10,000 ton boats, nothing. It was not referred to us until 1911.

*(Mr. Harbinson.)* I thought the whole question of merchant shipping was dealt with in 1906? - Not the whole question.

*Mr. Harbinson:* An Act was passed which pretty well covered the ground. You have told us the names of the sub-committee. I do not want to go through the names again - and the names of the General Advisory Committee. My recollection is that all the members of the Advisory Committee are either shipowners, underwriters, shipbuilders, or members of trade unions represented by my friends.

*The Commissioner:* What are you complaining of - that there was no representation of the Irish third class passengers?

*Mr. Harbinson:* No, my Lord - that there is no independent representative outsider on the Committee.

*The Commissioner:* What do you mean by an "outsider"?

*Mr. Harbinson:* I mean people, to put it briefly, representative of the general public - who are not connected either with the trade unions or the shipowners.

*The Commissioner:* Is the suggestion that the “man in the street” should be called in? Is that it?

*Mr. Harbinson:* I do not go so far as to suggest that the man in the street should be called in, but I do, my Lord, go so far as to suggest this, that the shipping companies live by carrying the general public, and it would strengthen the Committee and make it more representative if some outsiders of prominence were included on the Advisory Committee.

*The Commissioner:* How are you to select them?

*Mr. Harbinson:* That would be a matter, of course, for the Board of Trade, or for some other competent body.

*The Commissioner:* Oh, Mr. Harbinson, do not take up our time with such suggestions. 24836. (*Mr. Harbinson.*) What I am suggesting, my Lord, is that it would strengthen the Committee and increase public confidence. (*To the Witness.*) Is that your view? - No. 24837. (*The Commissioner.*) Would you like to get a man in the street from Water Street, Liverpool?

*The Witness:* No. The advantages of our Committee, if it has any advantages, are that we are all - speaking with submission with regard to myself - experts. We come there with our expert knowledge. It is not a Committee to sit and examine -

*The Commissioner:* That is enough. Do not let me hear any more of that. Is there anyone else?

*Mr. Harbinson:* I have not finished yet, my Lord, with great respect. I think, my Lord, I have been very frugal in the matter of asking questions.

*The Commissioner:* I tell you that I do not think this is a matter upon which you can usefully ask any questions at all. It has been entirely exhausted and very well dealt with by Mr. Scanlan and Mr. Edwards, and I think you can very well leave it alone. *Mr.*

*Harbinson:* There is one question they have not asked, my Lord, and that is as regards the placing or the location of boats on the various decks. I respectfully submit that that is a matter of some importance.

*The Commissioner:* Very well.

(*Mr. Harbinson - To the Witness.*) Have you or your Committee considered that question? - We are considering it now.

You do consider that is a matter worthy of consideration? - Certainly. 24840. And also the question of access, especially for third class passengers, to the deck, on whatever deck you decide the boats should be? - All classes.

Your Committee is also considering that? - Yes, for all classes - the crew and everybody.

### **Examined by Mr. COTTER.**

Are you making any recommendations in regard to the class of lifebuoys to be carried in the future? - We are inquiring into that also. 24843. And also into the means of launching the boats? - Yes.

Whether you will have electric winches or cranes or the old blocks? - We are going into that carefully. We have already got it under consideration and have discussed it in great detail.

You do not care to pass an opinion on it now? - I would sooner not, if you do not mind.

*The Attorney-General:* There is one question you asked, my Lord, that I should like to deal with as far as I can, and that is as to the applications that have been made under Rule 12. Your Lordship will remember it has been dealt with in evidence. It comes to this that 103 applications have been made since 1890, and 69 have been granted - roughly speaking, the applications have been five a year, and three to four a year have been granted. That is the position. I have got here the applications and the grounds, but it is rather difficult to classify them. They are down in four grades. *The Commissioner:* Will you tell me the biggest ship that has applied?

*(The Attorney-General.)* I see the "Campania." *The Witness:* That is the one that I wanted to recall.

*(The Commissioner.)* That is one of the smaller Cunarders? - That is one of the older Cunard boats.

*(The Attorney-General.)* She is not so very small? - She is a fine big boat, but she is not one of the biggest now.

*(The Attorney-General.)* 20,000 odd, I think she is? - 12,000, I think.

## **Page 713**

*The Commissioner:* Somebody said about 17,000. I do not know which is right. Which is the smallest?

*The Attorney-General:* I do not think I can tell you from this.

*The Commissioner:* The tonnage is not given?

*The Attorney-General:* No, the tonnage is not there, but the length is.

*The Commissioner:* That will do, if you can tell me the longest and the shortest. *The*

*Attorney-General:* There are a number that come under the longest grade, which is not less than 425 feet in length, or cross-Channel steamers irrespective of their length.

That is why it is so difficult to find out without analysing it. They both come in the same grade.

*The Commissioner:* Do you mean to tell me that the cross-Channel steamers comply with this Rule?

*The Attorney-General:* Some do, apparently. The "Brighton Queen" is an excursion steamer. Evidently there are some excursion steamers - quite a number. If your Lordship would like it can be classified by those who can turn up the particulars of each ship, but it is obvious that a number of them are cross-Channel steamers, and therefore do not really come within the class of ship we are dealing with as passenger or emigrant ships. How many there are I cannot say.

*The Commissioner:* Perhaps you can supplement that list which you have with some particulars of the boats and vessels in it so that we may see what the character of the vessel is?

*The Attorney-General:* That is what I am proposing to do.

*(The Witness withdrew.)*

**Mr. GUGLIELMO MARCONI, Sworn.**

**Examined by the ATTORNEY-GENERAL.**

24850. Mr. Marconi, you are the inventor of your system of wireless telegraphy? - Yes.

24851. I want to go at once to the date of the year when the first installation of wireless telegraphy was fitted on a large liner. Was that the "Kaiser Wilhelm der Grosse"? - Yes, in 1900.

That is a North-German Lloyd boat? - It belongs to the North-German Lloyd Company.

And in the following year, 1901, wireless equipments were fitted to the

"Lucania," the "Campania," and a number of other vessels? - Yes.

The exact number is immaterial. Has there been a form of agreement between your

Company and shipowners which was arrived at in the early stages of your system of wireless telegraphy, and which is practically still adhered to? - Yes.

In substance? - In substance, it is practically the same as the original agreement which was drawn up at the commencement of the business.

Your Lordship has had the agreement produced to you with this Company in respect of this vessel. I want to ask you just a few questions about your regulations with regard to signals of distress. Circular 57, I think, is the first one which in the form of a circular deals with this. I have the documents, but I propose to summarise them so as to save encumbering the case with more documents. CQ, as I understand it - you will correct me if it is wrong in summarising the effect of this document - is a call which means "all stations"? - Yes.

And then the signal CQD is, or was, at any rate, the distress signal that is to be used? -

Yes, the distress signal.

On and after the 1st February, 1904, was the call to be given by ships in distress or requiring assistance, CQD? - Yes, CQD.

And, according to the Regulations, that signal must not be given except by order of the Captain of the ship in distress - is that right? - Yes, that is right.

Or by other vessels retransmitting the signals which they have received on account of the ship in distress? - Exactly.

According to your Regulations I see all stations must recognise the urgency of this call and make every effort to establish satisfactory communication with the least possible delay? - Yes.

Then you have another Regulation - it is Circular 102 - which provides for the possibility of a signal of distress being given by ships fitted with other systems of wireless telegraphy? - Yes.

And are your instructions that, "should such signals be received equal attention shall be given them as to calls of 'CQD,' and any message received from the ship shall be at once forwarded to the addressees? - Yes.

That is notwithstanding that they are vessels equipped with other systems? - Any ship, however equipped.

In 1906 the International Radio-Telegraph Convention laid down some principles and regulations which were to govern wireless telegraphic communications at sea? - Yes.

Which came into force in July, 1908? - July, 1908.

And those are substantially, with certain additions of your own, the regulations which are still in force? - They are substantially the regulations still in force. 24868. The general orders? - They are really the only regulations in force. Any regulation of our own counts in so far as it is not contrary to the regulations of the Berlin conference.

That is for the purpose of discipline and regulation, you make your own regulations, but they must not in any way conflict with the Regulations laid down by the Telegraphic Convention? - That is so; they do not in any way conflict.

At that time was the distress call altered from CQD to SOS? - It was, but I might say that CQD, being so well known amongst the operators on the ships, has been used as well as the SOS as an additional sign.

That means that a number of operators were in the habit of using the CQD, or knew of it as a distress signal, and that sometimes that is used and sometimes the SOS? - I should say the SOS is always used, but also the CQD.

Is the SOS a very simple signal to give or receive? - Yes, it is simple. 24873. Can you tell us why the SOS was adopted? - I really cannot say. I think CQD is just as good, but they wanted to make a change.

(*The Commissioner.*) Who made the change? - The International Convention on Wireless Telegraphy held at Berlin in 1906.

They made the change? - They made the change.

Of CQD to SOS? - Yes.

What does SOS stand for, anything, or is it simply three letters? - Simply three letters, my Lord.

I understand that CQD stood for "Come quick, danger"? - It can be interpreted that way.

(*The Attorney-General.*) It really is an easy way to remember it, and SOS is, I am told, "Save our souls." It is simply an easy way to remember it? - That is so.

There is no mistake about it then; you remember it at once? - Yes.

Have the recommendations of that convention and the principles laid down by them been adhered to by the principal powers? - They have been adhered by all the principal powers.

Generally speaking, is the wireless installation licensed by the Government of the country whose flag the ship flies? - Yes.

You would get your license in this country from the Postmaster-General? - From the Postmaster-General of this country.

Will you just tell me about the wireless installation on board the "Titanic": the installation was your property under the contract? - It was our property. It was what we call a 5 kilowatt installation; it was of very modern type and guaranteed I think for a distance of about 350 miles.

*(The Commissioner.)* But it was capable of carrying a great deal further? - Yes, my Lord, it would be capable of carrying a great deal further.

*(The Attorney-General.)* In actual practice does it carry a great deal further? - In actual practice it did, I think, carry a great deal further.

The "Titanic," as we know, carried two operators? - It carried two operators. I might also add that the wireless apparatus was in duplicate, and also that it had a spare battery by means of which it could be operated in case of the current being cut off from the dynamos of the ship consequent upon the flooding of the engine room. 24888. As I understand, it would take it either from the dynamos or from the emergency dynamos on the ship, and if both of those failed then it could get it from the storage battery which you supplied? - Yes, from the storage battery which was put up in the wireless cabin on the top deck.

To meet any emergency? - Yes.

You made use of an expression just now - I am not sure that I heard it quite accurately - that the installation was in duplicate? - Yes.

What does that mean? - The essential parts of the apparatus were in duplicate. 24892. It does not mean that it was possible to transmit simultaneously two different messages? - No, my Lord.

*(The Attorney-General.)* Those precautions were taken in order to ensure that so long as the vessel remains above water it would be possible to transmit signals from it? - Yes.

That is the object of it? - That is the object of it. It was done in consultation with the White Star Line.

With reference to the two operators, you have regulations facilitating a proper watch being kept, have not you? - We have regulations to that effect, but I should also say that in our agreement with the White Star Line it devolves on the Captain to see that the proper watch is kept, and that the operators are advised when a communication is expected.

Do you make every month communication diagrams which are published and transmitted from your Company to the various lines, I suppose, using your system? - Yes, we do. We do it in order to facilitate knowledge of the times when communications are expected.

I am not sure that your Lordship has seen one at an earlier stage of the proceedings. Perhaps your Lordship will look at this, and you will see what it means. *(The document was handed to his Lordship.)* This is the one for April, 1912. As I understand, the object of those diagrams is this: For example, in dealing there with the North Atlantic route, you cover that trade route and show at what points vessels going one way or going the other way will intersect? - Exactly, what time they are expected to intersect.

That is to show approximately the time and position at which the ships may expect to be within range of each other? - Exactly.

*The Commissioner:* When are these things prepared?

*(The Attorney-General.)* Every month.

*The Witness:* On data collected from the shipping companies.

*(The Commissioner.)* They are prepared in your office in London? - They are prepared in our office.

And then copies are sent to the different ships? - To the different ships and stations - Governments, and anyone interested in the matter.

*(The Attorney-General.)* So that anyone can tell, for example, if he had that diagram in front of him, what ships he might expect to get within range of at a given date? - Exactly. Each day the operator, by looking at that diagram, can see which ships are likely -

*(The Commissioner.)* To be within call? - Yes, to be within call, and likely to get into communication with him.

*(The Attorney-General.)* And also coast stations? - And also coast stations. I might add that they have proved to be very useful.

*(The Commissioner.)* Had the "Titanic" one of these on board? - I am not certain that she had. I cannot say, as a matter of fact, I was aware that she had.

In the ordinary course of events she would have? - In the ordinary course of events she certainly would have one.

*Sir Robert Finlay:* Not a copy of this particular one.

*The Attorney-General:* No, not that particular one, because this is worked out after the accident.

*(The Commissioner.)* This is later than the accident. What I mean is, had she a plan of this kind on board which would give this kind of information, and I understand Mr. Marconi to say that in the ordinary course of things she would have one.

*The Witness:* Yes.

*(The Attorney-General.)* They can be produced for every month? - Yes. *The Attorney-*

*General:* This particular one is worked out to show what happened where the "Titanic" foundered, according to the diagram, and what vessels were close to it.

*Sir Robert Finlay:* If the Attorney-General can produce one of the ordinary ones I think it might be convenient.

*The Commissioner:* This, as I understand it, is prepared for this case. 24909. *(The Attorney-General.)* It is for that purpose. We will either have one produced, or we will get you one. I daresay Mr. Marconi can get one? - We have got them for each month.

*(Sir Robert Finlay.)* I simply want any one of the ordinary ones? - You shall have it after luncheon.

*(The Attorney-General.)* I was asking you about the watch which is kept at ship's stations which are manned by two operators, such as the "Titanic." Can you tell me, first of all; are there many vessels which are manned by two operators? - Yes, there is a considerable number of vessels. All the larger passenger vessels have got two operators.

So as to have a day and night operator? - Yes. They have a continuous watch when there are two operators.

When there are two operators, must one always be on watch? - One is always on watch. One has the telephone on his ears, on his head. It does not mean that he is necessarily under strain for a long period, but he can just hear if any call is made, or if any ship desires to communicate.

*(The Commissioner.)* He is listening for whatever the length of his watch may be? -

Exactly. Of course he may talk, and he may read and do other things.

There is no bell rings, or anything of that kind, he simply hears if he is being spoken to? -

Not at present, my Lord.

*(The Attorney-General.)* I am going to ask you some questions about that. Where there is only one operator, of course, it becomes more difficult to establish communication, because he is not always on watch? - He is not always on watch, he has to take rest at certain hours.

And for that purpose are there circular instructions which are issued - I think it is Circular 183, which provides that he shall be on duty at certain hours: "In order to facilitate the establishment of communication between one-man ships at sea, operators, when not taking rest shall call 'CQ,' and listen in for 30 minutes each two hours (G.M.T. to be strictly observed) in accordance with the following time-table." Then the hours are given. Every operator who is on what you call one-man ships would receive this circular, and consequently would have to comply with those regulations every two hours? - Yes.

## **Page 715**

*The Commissioner:* How long is he to listen - for two hours?

*The Attorney-General:* Thirty minutes.

*The Commissioner:* That means that he can never take sleep for longer than 1 ½ hours at a time.

*The Attorney-General:* No, I do not think so. It says "Operators when not resting." *The*

*Commissioner:* I beg your pardon.

*The Attorney-General:* It is in order to provide that a systematised time when they will all be listening. Now I want to ask you just a little about the priority of messages. I will take it quite shortly.

*The Commissioner:* That is a matter of importance.

24918. *(The Attorney-General.)* It all appears quite clearly, and that is why I am not going to take up much time with it. I have two books here, Mr. Marconi, and perhaps you will just follow me in what I read. One of them is called "General Orders Part I, Service Regulations." That appears to be dated October, 1903? - Yes. 24919. Another book I have is "Handbook for Wireless Telegraph Operators," and that is published in 1912? - Yes, I have got copies of them here.

Those are two distinct things, are they? - Yes.

The General Orders are in force as well as the Regulations under this Handbook? - Yes.

I see in the Handbook, at paragraph 7: "In case of distress the obligation to accept messages is absolute in the case of every ship and coast station without distinction, and such messages must be accepted with priority over all other messages, they must be answered with similar priority, and the necessary steps

must be taken at once to give effect to them.” Then there is another Rule which deals with it, Rule 73, which says:

“Ships in distress make use of the following signals” - and then does that mean the SOS?

- Yes, it would be SOS. These are the Government Rules - that is it.

The three short and three long and three short? - It is not exactly an SOS as shown here, but it is practically.

“Repeated at short intervals. As soon as a station perceives the distress signal it must suspend all correspondence, and must not resume work until it has made sure that the communication consequent on the call for assistance has been completed”? -

Yes, they must do their best to render assistance.

*Sir Robert Finlay:* What month of 1912 was this published?

*(The Attorney-General.)* I do not know. I will ask Mr. Marconi. *(To the Witness.)* I called your attention to the fact that this book was published in 1912. Was it before or after the “Titanic” disaster, can you tell us? - I cannot say definitely, because I cannot find a date in it, but I think it was published before.

*The Commissioner:* You are unable, then, to tell us whether there was a copy of this book on board the “Titanic.”

*(The Attorney-General.)* I think I can answer it. *(To the Witness.)* You probably would not know the exact details? - I certainly can say that I have read it before the “Titanic” disaster.

*The Commissioner:* What was the name of the young man who was on the “Titanic”?

*The Attorney-General:* Mr. Bride.

*The Commissioner:* Bride was not asked about this, was he?

*The Attorney-General:* No, I do not think so. I think he is in Court now, and perhaps he can tell us about this.

*The Commissioner:* Is Bride here? *(Mr. Bride stood up in Court.)* Bride, had you a copy of this book on board?

*Mr. Bride:* Yes, I had a copy on board the “Titanic.” *The*

*Commissioner:* Of this 1912 book?

*Mr. Bride:* No, Sir, I believe ours was 1911.

*The Commissioner:* That makes a difference.

*The Attorney-General:* I do not think it does from what I am told.

*(The Commissioner.)* If the same Rule is in the 1911 book that removes the difficulty, but I have never heard of this Rule before.

*The Witness:* I think, my Lord, if you will allow me to say so, so far as I can recollect, the same Rule does exist in the 1911 book. *The Commissioner:* That removes the difficulty.

*(The Attorney-General.)* Mr. Turnbull tells me exactly the same. The book that I have here happens to be the last edition. I did call attention, I think, to Rule 73, which shows what has to be done, and that it takes priority of everything? - Absolutely everything.

Everything else must cease until there is an answer to that call? - Exactly. *The*

*Commissioner:* Do I sum it up correctly when I say that the directions contained in these Rules to the operators orders them to give precedence to all messages affecting the navigation of the ship?

*The Attorney-General:* Your Lordship will forgive me, but it is not quite the same thing, if I may say so with respect. I will give it you from a Rule.

*The Commissioner:* Very well.

*(The Attorney-General.)* Your Lordship will forgive me, I am sure. *(To the Witness.)* Mr. Marconi, as I understand it, the message which takes priority over everything is the distress signal? - Yes.

Everything gives way to that? - Yes, everything gives way to that - Government and service and shipping messages, and everything else.

Then the next thing that would come would be the messages of the British Admiralty and the British Government Departments? - Yes. *The Commissioner:* We may omit those.

*(The Attorney-General.)* "Messages relating to navigation" - it is a special Rule - Rule 49? - Yes.

*The Commissioner:* Will you read it? *The Attorney-General:* I will, my Lord. It is "Priority of messages," paragraph No. 49: "In the transmission of radiotelegrams priority must be assigned, first of all, to messages of distress (see Section 73); then to messages of the British Admiralty and other British Government Departments and to the messages of other Governments (see Section 74). "As between the two communicating stations themselves, the following order should be maintained: -

"(1) Messages relating to navigation.

"(2) Service messages relating to the conduct of the Radiotelegraphic Service, or to previous radiotelegrams transmitted by the station concerned.

"(3) Ordinary correspondence."

*(The Commissioner.)* It does come to what I was trying to say. Messages connected with or affecting the navigation of the ship take precedence of private messages? - Yes, my Lord.

The messages of passengers and other people? - Yes, my Lord.

*(The Attorney-General.)* That is the order and those are the Regulations? - That is the order and those are the Regulations.

Have you also some special Regulations with regard to navigation messages? So far as I follow, you are particular about those, that they must be signed by the Captain? - We are particular that they should be signed by the Captain, and they should be entered on proper forms, so as to keep a record of them.

A navigation message, as I understand it, would have to be written on a form which is supplied for the purpose? - Yes.

Of course that is important, among other things, because of the priority which they get? - Because of the priority, and also as a record.

And then they have to be duly signed by the Captain? - Yes.

And then they have to be delivered? - They have to be delivered to the operator.

And that helps you, to the best of your ability, to fix the responsibility? - Yes.

You have the document, the record of what has taken place? - Yes; all telegrams should be kept that way.

Just before I ask you some general questions as to the future there is one point to which I should like to refer. My Lord, there is one question upon which, I think, you have had no evidence so far - so far as I know there has been none given; and I want to ask Mr. Marconi about it. It refers to part of Question 18, which I will read to you: "Were any vessels prevented from going to the assistance of the 'Titanic' or her boats owing to messages received from the 'Titanic,' or owing to any erroneous messages being sent or received"? So far as you know was any vessel prevented by any such message from going to the assistance of the "Titanic"? - As far as I know, none.

*The Attorney-General:* I have a chart here, my Lord, which I should like to explain to you. (*The chart was handed to his Lordship.*) This is a chart of the scale of three to one of the North Atlantic chart which we have been using. On it you will see marked the places and references to the vessels from which ice reports were received. The spots that you see marked are the places indicated by the message at which the ice was seen. Will you look, first of all, at No. 1? Does your Lordship see No. 1 on the pink rectangle there? No. 1 is the "Titanic." That is according to all the evidence which has been given here; I think it is

41.46 and 50.14. Then the next, No. 2, is of no importance in this case. Then there is the "Caronia," which gave the message on the 12th, and that is marked No. 3. You see that continues between 51 and 49 West.

*The Commissioner:* This plan shows where the ice was indicated by the telegrams. *The Attorney-General:* That is right, where the telegrams said the ice was. Then No. 4 is the "Amerika." I do not dwell on that. Your Lordship will remember that was the message that was sent to the Hydrographic Office at Washington. Then No. 5 is an important one; it is the "Baltic." That is marked with a cross. That is the spot at which, according to the message from the "Baltic," the ice was when the "Baltic" sent it. Just above that there is a new one, of which we have not heard anything yet - I do not think it is a very important matter - the "Nordal." It is referred to in a document I am going to hand up, or have handed up. Then there is the "Californian," which is No. 7, to the right of the rectangle. That is the one, according to the "Californian's" message. Then No. 8 is the "Mesaba," which is the one your Lordship will remember that has been shown to have reached the "Titanic," but has not been shown to have reached the bridge. That is how it stands. Those take in all the messages which can be of any importance, and the plan brings in one or two which I agree are of no importance.

*The Commissioner:* The only difference, so far as I understand, is that this contains the "Nordal."

*The Attorney-General:* That is right; and it is on a larger scale. It fixes the places, I think, very accurately, but it is all, of course, subject to any corrections which my friend may make. But I think it is right.

*Sir Robert Finlay:* It really depends on the messages themselves and the messages which were received; it depends on what the messages themselves were and which of them were passed on to the bridge.

*The Commissioner:* That is the really important point.

*Sir Robert Finlay:* It does not, of course mean that the whole of that oblong was filled with ice, I suppose, and icebergs. It merely suggests the limits.

*The Attorney-General:* Nobody has ever suggested that I thought it was perfectly clear. It is only a rectangle which marks the limits. That is all it is intended to do, as we have done before.

*The Commissioner:* The limits that the telegrams refer to.

*The Attorney-General:* Yes.

**(After a short adjournment.)**

*(The Attorney-General.)* Have you considered whether it would be possible on a ship which is manned by one operator for a person who is not an expert in wireless telegraphy, to receive some simple signal which could be devised so that he could then call the operator? - I have considered that, and think that if the International Regulations allowed it, a member of the crew could be instructed to stand by the instrument, to be in attendance at certain hours when the operator is off duty, and give the alarm and inform the Captain in the event of a danger signal being sent. I think that might be done. At the same time I have got a certain feeling that it might not in many cases be altogether reliable. I have another way that suggests itself to which I have given a great deal of attention since the "Titanic" disaster, and that is, of making the wireless apparatus ring a bell and thereby give warning that a ship in danger needs assistance. In order to make this system effective, given that the apparatus was all right, it would be necessary to alter the regulations of the International Convention so as to enable the danger signal to consist of, or to be accompanied by, a long dash as we call it, an impulse or sequence of waves which would last for a period of 15, 20 or 30 seconds. This would cause a bell to give a prolonged ring like that which is given on shore by a fire alarm, and that would be a signal to denote that a ship requires assistance. Of course following that signal particulars might be given of the position of the ship and everything else.

If a signal was once given, then the operator could be called and he could come and receive the particular message? - Yes. Some tests have been made with an apparatus such as I have referred to, and I have considerable confidence that it can be employed, although so far it has not been tested in actual practice.

You think that is more feasible than the first suggestion? - I think that is more feasible than the first suggestion.

*(The Commissioner.)* At all events, Mr. Marconi, at present the better plan is to have two men on board? - Yes, my Lord; that is the only reliable plan at present. 24949. You know nothing about bulkheads, I think, or boats on the deck? - No, my Lord. I have seen a lot of them, because I have crossed very often.

*The Commissioner:* Then you do not want to ask him any questions, Mr. Scanlan. *Mr.*

*Scanlan:* I do want to ask him one question, on manning.

**Examined by Mr. SCANLAN.**

Has it been suggested to you, Mr. Marconi, that on first class ships, where there is a good deal of traffic in messages, it would be desirable to have a messenger boy, like a

telegraph messenger boy, to assist the operator? - Yes, I think, that is provided on every ship on which I have crossed.

It is provided? - It is provided, and not only is it provided but it is in our agreement with the shipping companies and particularly in our agreement with the White Star Line.

**Examined by Mr. COTTER.**

Do you place much importance upon those charts which are issued to the ships each trip? - I think they are very important in regard to assisting the operator, and letting him know approximately at what time he may expect to be in communication with a certain ship.

**Page 717**

*Mr. Cotter:* We have evidence of one operator not having one of these charts. *The Commissioner:* Have we, which one?

*Mr. Cotter:* The operator of the "Californian," my Lord. *The*

*Commissioner:* I do not remember it.

*Mr. Cotter:* It is on page 192, my Lord.

*The Commissioner:* Will you read me the question and answer?

*Mr. Cotter:* I asked him at Question 9174, "Did you have a chart at all? - (A.) No. (Q.) Have you seen a Marconi chart? - (A.) I should think so. (Q.) Had you none on the 'Californian'? - (A.) I had got some. (Q.) When did you get it? - (A.) The other trip before. (Q.) The voyage you were on, I mean? - (A.) The trip before that." He had none on the voyage he was on.

*The Commissioner:* I am not at all sure about that; it does not at all follow. The voyage may be in the same month.

*Mr. Cotter:* I will read the whole of the questions, my Lord. "The voyage you were on, I mean? - (A.) The trip before that. (Q.) You got none for the last trip? - (A.) No. (Q.) Is it not the fact that you get them every trip? - (A.) Yes, it was an oversight on my part." *The Commissioner:* Then it would be an oversight of the boy.

*(Mr. Cotter.)* Would it not be advantageous to see that these men got one of those charts every trip? - I think that is always done.

This ship, the "Californian," played an important part in this Enquiry, and the operator had not a chart? - You take it he had not a chart?

It is admitted he had no chart. He took a trip down to New Orleans and he had one for the South Atlantic and not for the North Atlantic.

*(The Attorney-General.)* That is right.

*The Witness:* He certainly should have had a chart.

*The Commissioner:* Do you want to ask anything, Sir Robert?

*Sir Robert Finlay:* I only want to say we are very glad to have had the honour of seeing Mr. Marconi.

*(The Witness withdrew.)*

*The Commissioner:* Is there any other Witness?

*The Attorney-General:* There is the Captain of the "Baltic"; I will call him at once - Captain Ranson.

**JOSEPH BARLOW RANSON, Sworn.**

**Examined by the ATTORNEY-GENERAL.**

You are the Master of the "Baltic"? - Yes.

She sailed from New York on 11th April for Liverpool? - Yes.

And did you receive a report of ice on 14th April? - Yes.

Had you received any report before? - From several ships.

On Sunday, 14th April, did you receive more than one report? - No; I received one report from a steamer called the "Athinai."

Did you communicate with the "Titanic"? - Yes.

The reason I am asking you in particular about this is that we have got the message which you sent to the "Titanic" in an affidavit which you made. I only want to know is that correct? - Yes.

You said: "On Sunday, 14th April, reports were received by wireless from a number of steamships of having passed ice and bergs in positions varying from 49.9 W., to 50.20 W., on the outward Southern track"? - Yes.

Was that right? - They were not sent to me officially. The operator gets those, and he transmits those to the different ships as they are passing along. I get just a list. They were not official; they were simply sent by the different steamers as we passed to the operator, and he makes out a list of them and sends them to me. They are not signed at all by the Captains of the other ships; they were not official.

They were messages received from other ships to him to transmit? - To transmit to me. He would send to me. They were from the operators, but they were not sent to me specially, except this "Athinai" - that was. That was an official message signed by the Commander.

The message you are referring to is the one that has been mentioned a good many times, which is on page 2. That is the last one we gave his Lordship when we were giving the messages that were received before the disaster. That is the one "Have had moderate, variable winds and clear, fine weather since leaving. Greek steamer reports passing icebergs and large quantity of field ice today in latitude 41.51 N., longitude 49.52

W.. Last night we spoke German oiltank steamer 'Deutschland,' Stettin to Philadelphia, not under control, short of coal." Then you give the latitude and longitude. "Which is to be reported to New York and other steamers. Wish you all success." That is the one you sent to the "Titanic"? - Yes.

Passing on the message which you had received from the Greek steamer? - Yes. 24969. And that is the one which was acknowledged by the "Titanic," signed by Captain Smith? - Yes, that is the one.

*The Attorney-General:* Your Lordship will remember that is the one which was given to Mr. Ismay; that is the one in question.

*The Commissioner:* Yes.

*(The Attorney-General.)* That message had been received by you, and was addressed to you personally as the Captain of the "Baltic"? - Yes.

That is the one which you transmitted to the "Titanic"? - Yes.

Does that mean you did not transmit any of the others? - The operator sends all of them; he makes a list of all the different ships, and that was the only one I received that day, on the 14th. I had had several from other ships.

*The Commissioner:* This has all been proved.

*(The Attorney-General.)* Yes, this has. There is one question I want to ask him.

*(To the Witness.)* Did you receive a message from the "President Lincoln" on that day? - No, I do not remember it; not addressed to me.

You are quite right. I do not think we have heard of this one. I have only just heard of it myself. I think that is on the 13th.

24974-5. *(Sir Robert Finlay.)* He says he does not remember.

*The Witness:* I do not remember.

*The Commissioner:* What are you trying at present to establish?

*The Attorney-General:* I want to find out about another message of which hitherto we have heard nothing.

*The Commissioner:* I will tell you what occurs to me - perhaps I ought not at this stage to mention it. It appears to me that the Captain of the "Titanic" received undisputed evidence of quite a sufficient kind to communicate to him the fact that there were icebergs in this region.

*The Attorney-General:* Yes.

*The Commissioner:* And I do not think the matter is carried any further by showing that he received other messages as well.

*The Attorney-General:* If I may say so, I agree; but it was because we have said hitherto there was no other message. I do not say I can prove it, because

## **Page 718**

I have only just heard it, but it looked as if there was another message; but I will not bother about it. I quite agree with your Lordship's view, if I may say so. *The*

*Commissioner:* I do not want to say anything that may prejudice Sir Robert Finlay's position at present, but that is my feeling, Sir Robert, at present.

*Sir Robert Finlay:* There is no dispute as to the two messages, one from the "Baltic" and the other from the "Caronia."

*The Commissioner:* There is no dispute, you told me long ago, as to either of those two, and my feeling at present is those two were in themselves amply sufficient to apprise the Captain of the danger of icebergs.

*Sir Robert Finlay:* They inform him that there are icebergs in the latitude and longitude indicated.

*The Commissioner:* Whether he was right to steam straight ahead relying upon his ability to avoid an iceberg if he saw it is another matter altogether.

*Sir Robert Finlay:* Another matter altogether.

*The Commissioner:* But I am satisfied that he had ample information. *The*

*Attorney-General:* I am very much obliged to your Lordship; it will save a considerable time.

*Sir Robert Finlay:* It has been admitted a long time ago; as to the fact of those two messages there is no doubt.

*The Commissioner:* My feeling is the two messages are quite enough.

*The Attorney-General:* I do not think you are on the same point as I am, Sir Robert. This has not been admitted, and it has not been proved. That is the point I am on; but my Lord says it is unnecessary to prove any more.

*The Commissioner:* Did he receive any message, or would you be in a position to prove that he received any message indicating the existence of icebergs to the South of his course?

*The Attorney-General:* No.

*The Commissioner:* You see what I mean? *The*

*Attorney-General:* Yes.

*The Commissioner:* There was a course open to him when he received the "Baltic" and the "Caronia" message. That course was to go in a Southerly direction. *Sir Robert Finlay:* Yes.

*The Commissioner:* If he did in fact receive messages showing there were icebergs to the South of him that might possibly excuse him for not having taken the Southerly course, because he would simply be running into the same kind of danger that he was already in.

*The Attorney-General:* The message I am referring to is a little to the Northward; but I will not trouble about it.

#### **Examined by Mr. SCANLAN.**

What is the practice of your Company; what instructions do you get in regard to ice reported in the track you are pursuing? - Will you repeat that?

I think it is probably unnecessary. I will take it your ship belongs to the White Star Company? - Yes.

Very well; we know what their practice is. What is your individual practice if ice is reported? - How do you mean, clear weather or foggy weather?

At night?

*(The Commissioner.)* At night, in clear weather? - We go full speed whether there is ice reported or not.

As far as you know, is that the practice of all liners on this course? - It is.

*(Mr. Scanlan.)* Do you double the look-outs at night? - No, not in clear weather.

#### **Examined by Sir ROBERT FINLAY.**

With regard to your speed, you know the practice in the Atlantic; if the weather were clear and ice reported, do you keep up your speed? - We keep up our speed.

And is that your invariable practice? - It has always been my practice. 24984. (*The Commissioner.*) What is the speed of your boat? - Sixteen knots. 24985. (*Sir Robert Finlay.*) You said the speed of your boat the "Baltic" was 16 knots? - Yes.

Have you been on other boats in the Atlantic? - Yes.

Faster boats? - Yes, the "Oceanic," the "Majestic," and the "Teutonic." 24988. How many knots an hour would they make? - Twenty to twenty-one. 24989. Is the practice you have spoken of one which prevailed with regard to ships of that class as well as your boat the "Baltic"? - Yes.

You know, of course, the Atlantic well? - Yes.

Was that practice always pursued by all masters of liners? - Yes, for the last 21 years to my knowledge.

I think Mr. Ismay has more than once travelled by your boat? - Yes, he has travelled numerous times. I cannot say how often. Possibly half a dozen to a dozen times. I cannot remember.

Has he ever in any way taken part in directing the navigation of the boat or ever been consulted by you or by any of the officers? - Never.

(*The Commissioner.*) It would be very irregular? - He went out of his way to avoid it - he never came near us on board the ship.

It would be a very irregular thing for the Captain to consult Mr. Ismay or anybody else? - It would, very much.

(*Sir Robert Finlay.*) And he certainly never did it? - Never.

And none of the officers were ever so irregular as to consult him? - No. 24998. Now you have told us about the speed which was kept if ice was reported. Did you keep your course as well as your speed? - Yes, I always keep my course whether ice is reported or not, on the track.

(*The Commissioner.*) You know what the messages were - take only the "Baltic" and the "Caronia" - that were received by Captain Smith? - Yes, I know some of them.

I am taking those two, the "Baltic" and the "Caronia"; they indicated icebergs in the region through which he was travelling. Now, was it a proper thing, in your opinion, for him to leave the bridge, knowing that he was going through that region? - Well, if it was a perfectly clear night, my Lord, I think it would be perfectly right as long as he did not go too far away from the bridge. On a perfectly clear night I should certainly say it was all right. Certainly not if there was any doubt about the weather at all, as to coming on thick.

The evidence, as I remember it, is that before going into his own room, he said to the officer on the bridge, "If there is any change let me know at once" - I think something to that effect.

*The Attorney-General:* Yes.

(*The Commissioner.*) Do you think it was a seamanlike thing for him to go away from the bridge, merely leaving that message behind him? - Well, if he only went to his room, I think so, it is not very far away - the chart room is right on the bridge - he can be called immediately. The night was clear. I would do it myself.

*The Commissioner:* Was it into the chart room he went?

*(The Attorney-General.)* Yes.

*The Witness:* It is on the bridge.

*Sir Robert Finlay:* He was absolutely close at hand, my Lord.

*The Attorney-General:* Oh, yes.

## **Page 719**

*(The Commissioner.)* If he comes out in a hurry, summoned by the officer on the bridge from a comparatively light room in which he is, can he see as well from the bridge as he would do if he had been stationed there? - Certainly not, not when he first came out, till he got his eyesight.

How long does it take him to get his eyesight? - In a few minutes we get it, coming out of a white light.

Do you mean minutes or seconds? - Minutes sometimes it takes, if it is a very dark night. Minutes may make all the difference? - Yes, but an officer on the bridge can inform him what he sees when he comes on it.

*Sir Robert Finlay:* May I ask a question?

*The Commissioner:* Yes.

*(Sir Robert Finlay - To the Witness.)* You have been a good deal in the Atlantic trade. Have you been on the Northern route? - I have been on what we call the winter track up to August.

I was thinking for the moment of the route which takes you just to the south of the Virgins, in the Cape Race direction, you know that well? - Yes.

Are you sometimes for days there in the ice region? - No, we take a very short time to get through it there.

How long does it take? - About 12 hours.

Through ice in that region? - Yes.

I suppose there is more ice there than there is South? - Oh, yes, considerably more, it is melted before it gets there.

Where do you get most ice? - North - to the Straits of Belleisle, but I have never been there, I have never been to Montreal.

*Sir Robert Finlay:* I did not refer before to the message of the "Caronia," may I just at this point mention it. It has nothing to do with this Witness.

***(The Witness withdrew.)***

*Sir Robert Finlay:* The message from the "Caronia" was sent on the morning of the 14th, and it was this: "West-bound steamers report bergs, growlers, and field ice in 42° N, 49° 51' W., April 12th."

*The Commissioner:* Yes, I remember that. What occurs to me is this, that if they were there on April 12th, one might not unreasonably expect them to be there, not the identical icebergs, but others, on the 14th.

*Sir Robert Finlay:* That might or might not be.

*The Commissioner:* It occurs to me that a man reading that telegram would say: "They were here on the 12th, others may be here on the 14th."

*Sir Robert Finlay:* However, that is rather a matter of comment, my Lord. *The Commissioner:* It is a matter of argument afterwards.

**Sir ERNEST SHACKLETON, Sworn.**

**Examined by the ATTORNEY-GENERAL.**

You have had a large experience of ice? - Yes.

I want you to help the Court with your views, as a result of your experience, first of all with regard to the visibility of ice in clear weather. Take icebergs first? - That entirely depends on the height of the iceberg. Take an iceberg of about 80 feet high, and the ordinary type of iceberg that has not turned over, you could see that in clear weather about ten to twelve miles.

At night? - Not at night, no. I would say, providing it was an ordinary berg, about five miles on a clear night.

*(The Commissioner.)* At night? - Yes, at night.

*(The Attorney-General.)* You said provided it was an ordinary berg? - Yes. 25019. Are there bergs which present a different appearance in colour? - There are many bergs I have seen that appear to be black, due to the construction of the berg itself, and also due to the earthy matter and rocks that are in all bergs. In fact, in the South many of these so-called islands, and charted as islands, must have been big bergs with earthy matter on them. Again, after a berg has capsized, if it is not of close construction it is more porous and taking up the water does not reflect light in any way.

Have you had large experience of this particular track? - Not much, only four or five times I have seen ice in the North Atlantic.

Have you ever seen ice of this particular dark character to which you have referred in the North Atlantic? - Yes, twice.

*(The Commissioner.)* In the North Atlantic? - Yes.

*(The Attorney-General.)* Was that on the outward route to the States? - On the outward route, yes - once outward and once homeward.

Do you remember about what time it was of the year? - In about April, I think, 1897, and again in May, 1903, and again in June, 1910, but that was further North. 25025. Is this right that you have seen altogether on the North Atlantic track ice on four or five occasions? - Yes.

That is four or five voyages? - Yes.

Extending evidently over a very considerable period of time? - That is so.

Beginning in 1897? - Yes.

Out of those four or five times is it right that you twice saw these dark-coloured icebergs? - I would not like to say on the last two occasions. My memory will not serve me more than that. I have noticed on one occasion at least more than one berg that did not reflect light.

What I meant was - I want to follow your evidence - that of the four or five occasions of which you have spoken, two of them were occasions on which, as I understood you, you have seen ice of this dark colour? - Yes, but I would like to add that I have seen at the same time other ice - ice of a different colour.

Yes, I see what you mean - there would be other ice of a different colour, but amongst it you saw twice icebergs of this dark colour? - Of darker colour, yes.

*Sir Robert Finlay:* I understood him to say that once he was sure of only.

*The Attorney-General:* No, he gave dates, one in 1897 and the other in 1903.

*Sir Robert Finlay:* I thought he qualified that.

*(The Attorney-General.)* We will get it right. *(To the Witness.)* My friend thinks that you qualified what you said about the twice suggesting that you were certain of one, but not certain of the other occasion? - I was certain of the "other occasion," but I qualified it only inasmuch as that on the same occasion I saw different coloured ice. 25033. *(The Commissioner.)* Am I to understand that you saw several bergs on these five voyages that you have spoken of? - Yes, my Lord.

On only one berg on each occasion? - No, on one occasion there were several bergs. On the first occasion, I remember it was a low lying berg which was evidently a capsized berg.

You only saw one berg? - That is all I remember.

Then on the second occasion you saw several bergs? - Yes.

Did you see several on the other three occasions? - No, my Lord; some of them were just small pieces. I would not call them big bergs, not like the southern bergs. 25038. Are they called growlers? - I have never heard that term applied to them, but I believe it is a well-known term. I have read of such, but we never call them growlers, we call them floe bergs

## **Page 720**

when they were not the height of an actual big berg carved off from the land, but a berg that had capsized, having worn out underneath.

*(The Attorney-General.)* You have spoken of the distance at which you would see bergs.

You told us, I think I am right in saying, 10 or 12 miles in the daytime on a clear day, and 5 miles on a clear night? - Yes.

How far would you see one of these dark bergs on a clear night, assuming it to be 60 to 80 feet high? - It might be only three miles, depending on the night and depending almost entirely on the condition of the sea at the time. With a dead calm sea there is no sign at all to give you any indication that there is anything there. If you first see the breaking sea at all, then you look for the rest and you generally see it. That is on the waterline. I do not say very high, because from a height it is not so easily seen; it blends with the ocean if you are looking down at an angle like *that*. If you are on the sea level it may loom up.

That would rather suggest that your view would be that you could detect bergs of that kind better at the stem than you could at the crow's-nest? - Better, the nearer you

are to the waterline. When we navigated in thick or hazy weather there was always one man on the look-out and one man as near the deck line as possible. That is thick or hazy weather? - Yes, that is thick or hazy weather, or even clear just the same.

What I want you to tell my Lord is, do you think it is of advantage in clear weather to have a man stationed right ahead at the stem as well as in the crow's-nest? - Undoubtedly, if you are in the danger zone; in the ice zone.

And supposing you were passing through a zone where you had ice reported to you, would you take precautions as to the look-out? Supposing you only had men in the crow's-nest, would you take any other precautions? - I would take the ordinary precaution of slowing down, whether I was in a ship equipped for ice or any other, compatible with keeping steerage way for the size of the ship.

You would slow down? - I would slow down, yes.

And supposing you were going 21 to 22 knots, I suppose that would be the better reason for slowing down? - You have no right to go at that speed in an ice zone.

25046. (*The Commissioner.*) And you think that all these liners are wrong in going at this speed in regions where ice has been reported? - Where it has been reported I think the possibility of accident is greatly enhanced by the speed the ship goes.

We have been told that none of these liners slow down even though they know that they are going through an ice region - that is to say a region where there are icebergs? - I have been in a ship which was specially built for ice, but I took the precaution to slow down because you can only tell the condition of any ice you see; there may be projecting spurs and you may suddenly come across them.

What was the speed of the boat you were in? - She was only six knots at full speed. She was 40 years old.

Do you mean to say that you slowed down a vessel of six knots? - Yes, I always did.

Then what did you get to? - We got very near the South Pole, my Lord.

What speed did you get down to? - We slowed down to about four knots. At her best she did six knots.

At her best she did six knots; that was not the ship that you got near to the South Pole in? - Yes, that is the ship; she was very old; she was very small.

(*The Attorney-General.*) I still want you to give me your attention with regard to the look-out. You have told me your views with regard to speed. Suppose you had two men in the crow's-nest, and it was a clear night, and you were going through a region in which ice had been reported, would you put any person in the bow for a look-out? - I would put a look-out man in the bow or as near to the waterline as possible, even on a clear night, but I would only have one man in the crow's-nest.

Your idea would be that of the two men when coming into an ice region, one should go to the bow and one be in the crow's-nest? - My main reason for saying one man in the crow's-nest is that I think one man gives more attention to the work in hand than two men.

*The Attorney-General:* There is a good deal to be said for that.

*The Commissioner:* Yes, I think so.

(*The Attorney-General.*) If I follow you correctly your view is, it is better on a clear night passing through an ice region to have a man as near the waterline as possible? - Yes.

Which would be preferable, the bow or the crow's-nest? - I would have a man in both, one in the crow's-nest and one in the bow; and if I may say this, I would prefer in a liner to go where there is known danger than to go in a Southerly route where you may occasionally get a berg, because some of these bergs drift from the North, very big bergs drift down into navigable waters, where no one would expect to find them; and then a ship comes to damage; whereas if you are looking for danger you guard against it more, or ought to.

I think we have been told they drift from North to South? - Yes, by the Labrador Current. One other matter I wanted you to tell us about and that is with regard to the use of glasses for look-out men. You know the point. It has been suggested here that binoculars should be used by the look-out men, particularly if they have had a report of ice. Will you tell my Lord your view about that? - My Lord, I do not believe in any lookout man having glasses at all. I only believe in the officer using them, and then only when something has been reported in a certain quarter or certain place on the bow.

The man would pick it up with his eyes and the officer would find out what it is with the glasses? - Yes, you have the whole range of the horizon in one moment with your eyes and you localise it by using glasses.

I ought to ask you this. Is there any indication of the proximity of ice by the fall of temperature? - Unless the wind is blowing from a large field of ice to windward there is no indication at all by the methods that are used now, and it is a very poor thing to go upon, is the change of temperature. The film of fresh water that covers the sea is so thin that by dipping in a bucket you do not pick up that thin cold water; and if the temperature of the air is approximately the temperature of the sea there is practically no haze; it is only when the water is warmer or the air is warmer that the haze occurs. There are no methods that I have heard of before this that can really give you an indication of approaching ice by ordinary temperature methods.

Supposing you were approaching an ice region, that is a region in which you had ice reported to you, and you found the temperature getting colder, would that be any indication to you that you were getting close? - No, it depends upon whether there was a wind or not.

*The Commissioner:* On this occasion we were told that, at all events, from 3 o'clock in the afternoon there was no wind.

(*The Attorney-General.*) No wind, and the temperature fell very much. *The Witness:* Then if there was no wind and the temperature fell abnormally for the time of the year, I would consider I was approaching an area that might have ice in it. 25063. (*The Attorney-General.*) According to the evidence - I am only dealing with one part of it - perhaps the most striking part - during the afternoon on this particular occasion on 14th April of this year, the temperature was reported to be falling, so much so that the Captain ordered the carpenter to see that the water in his tanks did not freeze. Would that be any indication to you? - If I knew what the mean

temperature of that locality was for that month of the year and there was a great variation, then I would certainly think there was some abnormal disturbance in

**Page 721**

the ice to the North. Of course, that particular night was an abnormal night at sea in being a flat calm; it is a thing that might never occur again.

25064. That is what Mr. Lightoller says. You say apparently it is very rare to get such a flat calm as there was that night? - I only remember it once or twice in about 20 years' experience - the sea absolutely calm, without a swell, as it was recorded to have been.

25065. And if I followed correctly what you said earlier it would make it more difficult to pick up an iceberg with the eyes? - Decidedly.

If you had this calm sea? - Yes, decidedly so.

Although it was a clear night? - Yes.

There would be no indication of the water breaking round it? - No, there would be none in a condition like that. It takes very little sea and very little swell, with the Northern bergs which are submerged about seven times to one above, for what we call a splash to get up and give you an indication.

We have been told of the phenomenon of the ice-blink? - Yes.

Would that be effected at all by the night we have had described or is it a variable thing?

- On a night such as you have described, if there was a big field of ice, the blink would most certainly be seen very, very clearly. If there was really what we call big fields, miles and miles of ice, then you would see the edge, what we call the water-sky, that is where the ice-field ends.

But you would not expect to get the ice-blink with an iceberg? - No, I would not.

Does that mean it does not throw off any of its luminosity? - Well, it does not reflect any light that there may be, one single berg; it takes ice in the mass to do that; it is like a whole lot of deck lights along the side of a ship; they look one glare instead of isolated things.

**Examined by Mr. SCANLAN.**

Just one question, Sir Ernest: Do you frequently find a haze in close proximity to an iceberg? - Generally when the temperatures are different - the temperature of the water and the temperature of the air.

**Examined by Sir ROBERT FINLAY.**

What was the tonnage of the boat you went to the South Pole in? - Two hundred and twenty-seven.

How high was it on the fore-castle at the stem above the water? - When we were loaded it was about 14 feet, 14 feet from the fore-castle to the waterline. From the crow's-nest it was about 90 feet. 25076. About 90 feet? - Yes.

Then the comparison you are making is between the height of 90 feet in the crow's-nest on your foremast? - Yes.

And a height of 14 feet on your stem? - I do not make a comparison. I say from 90 feet, which is the crow's-nest of the "Titanic," we will say, which equals our crow's-nest, and from the waterline, as near as we can get it. If we could have got right down to the waterline we would have done so. The advantage lies in being as near the waterline as possible. You suffered from a disadvantage, certainly, in the "Titanic" by not being able to get as near to the waterline as we did in the "Nimrod."

If I gather rightly, your view is that if you are near the waterline, it is an advantage in seeing icebergs? - Yes.

And that is an advantage which a small boat like yours, which most of us have read about, has. You had that advantage in that boat? - We had that advantage over other vessels to a certain extent.

Your outside rate was six knots? - Yes.

You slowed down in ice to four knots? - Yes.

You say you slowed down. I suppose you experienced in going to the South Pole a very great deal of ice? - Yes, a great deal. We first got into the vanguard of the ice before we got to the heavy pack, and then we got into the region of icebergs, where we had to turn and twist. Sometimes we would have 8 hours' run, but ice suddenly comes up in front of you, and then you slow down at once.

The pace you speak of, four knots, was when you were in among the ice, turning and twisting, as you have described it? - Yes, when we were in the ice region. I would not like to compare in any way the North Atlantic, with its comparatively few bergs, with the South, but if I were going 20 knots, I would want to get down to the steerage way just the same as when I am going six knots I want to get down to four knots. 25085. But you do not compare the state of things which you found, as you were approaching the South Pole, where you had to turn and twist among the icebergs and masses of ice, with what prevails in the North Atlantic? - No, I do not compare it. The point I look at is, when you get a very fast speed, you must slow down, even as we in narrow waters had to slow down in our little ship.

Slow down to four knots? - We did.

What do you suggest a liner should slow down to? - I am not qualified to give an opinion, but I should suggest a liner should slow down sufficiently to give her steering way, which is, of course, more than the full speed of my own smaller ship.

What do you estimate would give a vessel like the "Titanic" steering way? - I am not qualified to say. I do not know enough of the turning movement of ships over 10,000 tons; I should say 10 knots.

(*The Commissioner.*) That would be half-speed, practically? - Yes, my Lord.

(*Sir Robert Finlay - To the Witness.*) Is your suggestion that all liners in the Atlantic should slow down to 10 knots as soon as they know that they may come across an iceberg? - As soon as they know they are in an absolute ice locality, which they can tell now because of the wireless. 25091. My expression was, "As soon as they know they may come across an iceberg"? - No, I do not say that.

What do you mean by an absolute ice locality? - The locality where it is reported and where it is generally known that more than one iceberg will be met - where you are likely to meet masses of ice floating about.

Assume one or two icebergs are reported: Do you say that if the vessel may pass near one of these icebergs she ought to reduce her speed to 10 knots? - No, I do not. I do not say just for one iceberg or two icebergs or ten icebergs if they are nowhere near one another, but if there is a general indication of ice in the locality within a certain area which is fairly well known, a vessel ought to be slowed accordingly at nighttime.

At nighttime? - Yes, only at nighttime, unless it is thick in the day. 25095. Can you give me an idea of the extent of the indication of ice that you say should lead to the reduction to 10 knots. You would not reduce for one or two or ten icebergs? - No. I would reduce if I heard that ice was generally reported, specifically from more than one-quarter. I am taking very modern methods, that is that ice is reported by wireless.

If it is reported, you mean you have something, I will not say equalling, but approaching the collection of icebergs through which you had to thread your way? - Oh no; the ice is generally known in the Atlantic.

## Page 722

But one or two or ten would not be sufficient. I wish only to understand exactly what you mean by the absolute ice region, which you think should lead to slowing down to ten knots an hour? - I should say that if ice was reported in any quantity, bergs and floes, when the vessel is anywhere near that latitude and longitude and had a late report of say even the day before, at nighttime she should slow till she was past that latitude and longitude in which icebergs and floe ice were seen.

Do you think that the practice in the North Atlantic has been all wrong for the last 20 or 30 years? - I do not say that. I say a certain state of things has evolved in the last few years by public desire and competition.

(*The Commissioner.*) You say what? - I say the state of full speed has evolved in the last few years with the great public desire for speed.

To get to their journey's end? - Yes.

(*The Attorney-General.*) By competition? - Yes.

(*Sir Robert Finlay.*) You have been following this case I take it? - I have to a certain extent.

And you know we have had evidence as to the practice existing among gentlemen who have been in the trade for 25 years? - Yes; I think the gentlemen that have been in the trade for 25 years have been acting under the instructions of their owners. 25104. Have you any ground for saying that? - No more than a general feeling that I have had, and the feeling I have had that when the owner is on board you *go*.

And supposing the owner is not on board? - I do not want to make surmises and I do not want to lay down any particular Rules, but there is a general feeling amongst people at sea that you have to make your passage. If you do not make your passage it is not so good for you. That is only my own personal point of view. I do not know whether I

should not refuse to answer this particular question.

*The Commissioner:* I think not; you are giving us very useful evidence.

(*Sir Robert Finlay.*) You have been in the North Atlantic trade to some extent yourself? - I have only been as a passenger. Well, once in 1891 I was across the Atlantic in March. Were you in command of a vessel? - No, I was only 17 years old then. 25108. But the other times you speak of in the North Atlantic you have been merely as a passenger? - Yes, that is all.

But apart from this voyage when you were 17 of ice in the Atlantic, you have had no experience? - I have had no experience, no, of actual ice in the North Atlantic. I happen to be aware of the conditions, though.

Now with regard to the coldness, the connection of cold with the presence of icebergs.

You know, of course, of the Labrador current? - Yes.

Is the cold very often due to the Labrador current? - I would not say that so much, but I would say the breaking up of the ice was due to the Labrador current. I mean it comes down with the Labrador current, but the other current goes up to the North. It is sometimes very clearly defined, but then again these currents sometimes come far out of their usual route.

You would not say, I suppose, that a fall in temperature was anything like a certain indication of the presence of ice? - No, I would not at all.

Not at all? - Excepting under very definite conditions, such as a dead calm and a sudden fall in the temperature, because if you are in colder water, and as I said before you have not an equal temperature of the air, then you have a haze. If both the air temperature and the water temperature are the same the effect is that the weather is clear. *The Commissioner:* My recollection is that the fall of temperature began on the Saturday.

*The Attorney-General:* Yes, it did; it became more acute on the Sunday afternoon.

*The Commissioner:* It gradually fell and fell rapidly, but began Saturday.

*The Attorney-General:* Yes. We know very little of the wind on the Saturday. *Sir*

*Robert Finlay:* I think we have information on the morning of the Sunday that there was wind.

*The Commissioner:* There was wind of a kind up to three o'clock in the afternoon of the Sunday, and then it fell and became a dead calm.

*Sir Robert Finlay:* Yes. The point is the cold had begun before the wind dropped.

*The Commissioner:* Oh, it began on the Saturday.

(*Sir Robert Finlay - To the Witness.*) I think you said that the importance you would attach to a fall of temperature in this connection was if there was a dead calm? - Yes. If the sea and the air are about the same temperature I would consider ice; but all those methods such as dipping up water in buckets to get the temperature are no good.

### **Re-examined by the ATTORNEY-GENERAL.**

We have been speaking hitherto about icebergs; but supposing you had a wireless telegram to the effect that there were icebergs and a large quantity of field ice in

the region which the ship had to cross, would that in any way accentuate the risk which you say would be run? - The field ice?

Yes? - I think field ice for a ship of the class of any ocean liner is almost as bad as an iceberg, because going at a speed like that, the kinetic energy is so enormous and field ice is very often 20 feet deep; it is like running on a rock almost.

*Mr. Cotter:* May I ask one question?

*The Commissioner:* Yes.

*(Mr. Cotter.)* Have you any faith in searchlights for picking up ice at nighttime? - No, I have no faith. If it happened to catch an iceberg I think you would see it all right but outside the actual range in length and width of the arc of light, the officer may be blinded. It is like going down the Suez Canal.

*(The Attorney-General.)* I did not ask a question about searchlights, my Lord, because I did not know whether Sir Ernest had any experience of them. *(To the Witness.)* Perhaps I may ask you, have you had any experience of searchlights for the purposes of detecting ice? - Not for detecting ice, no.

Have you formed any opinion at all? - Yes, I have just stated it.

*The Attorney-General:* I did not catch it, I beg your pardon.

*(The Commissioner.)* It agrees with the other evidence. *(To the Witness.)* I should like you to answer this. If you can see the berg at a sufficient distance to clear it, is there then any object in reducing speed? - My Lord, if there is one certain iceberg and one berg alone or two or three bergs, there is no object in reducing speed, but if you are in an area where there is floe ice and bergs which might perhaps be met at any moment, where if you put the helm hard a-port you might run into another one, then there is need. 25121. We have no evidence that the "Titanic" saw what you call floe ice, pack ice, or anything of that kind. There were telegrams warning the ship of the existence of such ice. But taking icebergs if you can see them at sufficient distance to avoid them, is there any object in slowing down? - I do not consider there is any need to slow down if you can see every iceberg at a sufficient distance to avoid it, but I doubt if you could when you come into such a region.

Now I am going to ask you about that. We have been told that on this night the conditions were very peculiar, that the sea was as flat as a table top and that there was no sort of swell, and therefore nothing that would make a ridge round the waterline of the iceberg on which the eye would fall. We have been told that this iceberg was black, and it has been said that in those

## **Page 723**

circumstances it is very difficult to detect the existence of a berg in time to avoid it. Is that so? - I agree with that, my Lord. I think it would have been a very difficult thing with a ship going at that speed to have done so.

Do you think the speed makes any difference in picking up a thing? - I do not know about picking up, but slower speed gives you a longer time from the time you see it at the same distance.

Of course it does. I did not understand your observation. Now, you know these conditions as they have been described - whether accurately or not I do not know - but they have been described to us. How far off do you think the men in the crow's-nest, if they had been attending to their business and not talking to each other, ought to have seen this berg? - I would not like to put a definite figure on it, but I should think the men in the crow's-nest saw that berg about as soon as you would ordinarily expect a man to see it. 25125. That means they saw it just as the ship was striking the berg? - Had not some three minutes elapsed from the time it was reported?

*The Commissioner:* I think not.

*The Attorney-General:* It is rather difficult to say. We know what was done; and we have to estimate the time.

*(The Commissioner.)* She was right on the berg before any time elapsed? - I should think, my Lord, that in the case of that particular berg it would be a very difficult thing to pick it up at all. A man might have said to his companion, "Do you think you see anything?" but arising out of that I should like to say that all officers, as far as I know, and Captains of ships in modern times, are only too ready to hear reported from the crow's-nest or wherever it is, any report of any sort even though the light reported is not there.

I am not quite following you I am afraid. Do you want to convey this to me, that that berg would be within 100 feet of the stem of the ship before it would be seen? - No, I should think a berg of that type would be seen somewhere about perhaps three-quarters of a mile away, not more.

Well, three-quarters of a mile - would it be seen less than three-quarters of a mile? - It might be; I do not know.

I am putting 100 feet to you? - I think it ought to be seen long before 100 feet. 25130.

What would you say would be the shortest distance that this berg would be seen by the men in the crow's-nest on a clear night? - The shortest distance from the ship? 25131.

Yes, on a perfectly clear night, and under these conditions of a flat sea and possibly black ice? - I would not like to express an opinion, because I have never actually seen a berg as close to a ship. I have never seen any ice quite exactly like that which was described. I have seen it in the winter time in the ice, but then we were always absolutely stationary. My difficulty is this, and I am afraid you cannot help me, but I cannot understand how the men in the crow's-nest and the men on the bridge - there were two, I think; one, at all events, on the bridge - failed to see this iceberg until it was practically in contact with the ship? - I think that iceberg was such a very little thing. It was such a small thing and the conditions were so bad, that a man on watch, even two hours on watch, might have his eyes strained, and the officer on watch might have his eyes strained, and might just miss that particular berg. In running round the horizon his eyes might hop over this particular thing.

But there were three pairs of eyes; there was a man on the bridge and two men in the crow's-nest? - I think that is a possibility.

Is it a probability? - I think it is a probability. I think they might not see such a thing.

Then do you really mean to say that on a fine night with a flat sea the probable thing is that every ship will come in contact with an iceberg that happens to be on its course? - No, my Lord, I think it is an abnormal case entirely.

I am putting an abnormal case - an extraordinarily flat sea and black ice; do you think if there happens to be an iceberg in the course of that ship she must run up against it although there are three men on the watch? - The next time somebody may see it a little earlier; it is possible to see it a little earlier but I do not like to express an opinion. *The Commissioner:* You said the probability was the ship would run up against the iceberg. *The Attorney-General:* Your Lordship will remember she is going 700 yards a minute and it would not take long.

*(The Commissioner.)* I know that. *(To the Witness.)* Then you know nothing about the turning circle of this ship? - I do not.

So that you cannot tell how she could avoid it. Well, now I want to know this - do these bergs extend sometimes under the water any considerable distance from the part that is visible? - It depends; if the berg is capsized it may extend perhaps 200 yards or more, depending on the size of the berg. Some bergs that are five miles long, which are rarely seen in the Atlantic, may extend 200 or 300 yards, what we call a spur, but not more than that.

So that the bottom of a ship might strike an iceberg before it reached what you may call the locality of the part that is uppermost? - Yes, before it actually struck the part above water.

But you think in an extreme case only 200 yards? - Yes, an extreme case. 25141. Did you say 200 yards? - I have seen spurs 200 yards away, but I think a couple of hundred feet would be about the average for a spur. A lot depends upon the sort of ice - what sort of mountain it came off, and how it was formed, and what its specific gravity is, whether it is worn down in the current by the temperature of the water.

But the bottom of the berg may extend under the water any distance, from 200 feet to 600 feet? - Yes.

Away from the visible berg itself? - Away from the visible vertical side of the berg.

So that the bottom of the ship might strike a berg any distance from 200 to 600 feet away from the visible berg? - Yes, that is my opinion, my Lord. There are no doubt other people who have also got perhaps slightly different opinions on it, but in the main, generalising, it is so.

I rather gather from what you have said to me - I am not sure that I ought to ask you this question, but I am going to ask it all the same - that you think it quite possible that the men were keeping as good a look-out as they could? - Yes, that is what I do think.

That is what you want to convey? - Yes, but I did say earlier and I still say I think it is an advantage to have only one man in the crow's-nest.

It has occurred to me; one knows what men are, when they are standing together they begin to talk sometimes? - I know I used to in my early days.

Then there is another question I am not sure I ought to ask you. Supposing it had been the invariable practice to navigate ships of this kind, following the usual track to America, at full speed, notwithstanding ice warnings, in your opinion would a Captain who had been brought up in that trade be justified in following the practice. Now, do not answer that question if you do not like, and I will not ask it, Sir Robert, if you do not want me to ask it. If you have not formed any opinion about it I will not press you to give me an answer? - We sailors all form opinions,

my Lord, like other people, but it opens such a very wide question of relationship between owners and captains, that I am not competent to answer it. I think it would be a natural thing for a captain who has been brought up in a line doing the same thing, to continue doing it. But in view of the fact that there is wireless now, I think any accident could be avoided.

Well, yes, that is quite true. If you are right in saying that the better thing would be to reduce the speed to half-speed, about 10 or 11 knots, and if you are right in saying that this

**Page 724**

berg might be approached practically without any warning to the look-out, it seems to me you would have an accident all the same, 11 knots or 22 knots; you would have to reduce it to your 4 knots? - Well, it would be better to do that.

Oh, yes, I quite agree. Now I want to ask you this question. Suppose that it took this ship 37 seconds to turn her two points, and that in that time she would travel 1,300 feet - supposing those to be the facts, and the helm was put hard a starboard as soon as the berg was sighted, the berg must then have been sighted more than 400 yards off? - Yes.

That would be so of course? - Yes.

*(The Witness withdrew.)*

*The Attorney-General:* There is a very short Witness I should like to take. It is not relevant to any issue which is before you except in answer to one question but it is very desirable he should state what he has to say in order to allay a considerable amount of feeling with regard to three persons whose bodies were found and it was said they had died from starvation. I only want that point cleared up.

*The Commissioner:* Is that something we have seen in the newspapers?

*The Attorney-General:* There has been a good deal said about it. I should like to call a Witness on this matter.

**Dr. RIVERSDALE SAMPSON FRENCH, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

On the 13th of May of this year were you surgeon on the steamship "Oceanic"? - Yes.

And on that date was she on her voyage from England to the United States? - Yes.

And somewhere in the course of that day was a boat sighted and did the "Oceanic" go to it, and did you go off in one of the "Oceanic" boats to that boat? - Yes on the second visit to the boat.

Very well. I do not want it in great detail. Did it prove to be an Englehardt boat? - Yes.

25155a. Did you identify it as being one of the "Titanic's" boats? - Yes.

25155b. What was in that boat? - Three bodies, a fur rug, a ring, and a lady's comb.

25156. They were dead bodies? - Yes.

I think you examined them? - Yes.

And you finally read the Burial Service and committed them to the deep? - Yes. 25159.

Were you as a medical man able to inform yourself whether they had died from exposure or from hunger, or both? - Do you mean in the light of what I know now or of what I knew then?

In the light of what you know now? - By the light of what I know now, I know those bodies had died of exposure.

*(The Commissioner.)* What were they, men or women? - Three men. One evidently was a passenger, and two probably members of the crew. The passenger's body was in evening clothes, and we found his name.

*(Mr. Butler Aspinall.)* There was a suggestion in consequence of something which appeared in the daily Press that you had said they had died of hunger. That is incorrect? - That is incorrect.

### **Examined by Sir ROBERT FINLAY.**

I daresay you have seen the paragraphs that have appeared? - Yes.

Stating you had come to the conclusion on examining them that they had died of starvation? - Yes, that is incorrect.

It is all pure invention? - I would not say pure invention, because before we knew the circumstances of the abandonment of this boat there was that idea in my mind that they possibly had done so. Having the evidence of five people in the boat and only finding three I had it in my mind that there might have been privation.

*(The Commissioner.)* There is a statement in the newspapers that there was a cork on this boat which had apparently been partly eaten. Did you see the cork? - No, it was not in the condition you think. There was powdered cork all over a good deal of the bottom of the boat attached to some of their clothing but this powdered cork had been collected - I am speaking of things which I am not absolutely cognisant of because the cork had been removed - but the cork must have been on the part which was covered by the lifebelts before they were taken off. The lifebelts were on the bodies. They were taken off before I saw the bodies.

*(Sir Robert Finlay.)* My Lord has referred to powdered cork. It was said you had found these poor people had eaten cork? - No, I never found that. There was a report but I never expressed that.

*(The Witness withdrew.)*

*Mr. Laing:* Your Lordship asked Mr. Wilding yesterday to get some correspondence from Belfast, and he has done so. It is here.

*The Commissioner:* Very well, you can hand it to Mr. Scanlan.

*Mr. Laing:* I think it was Mr. Edwards.

*Mr. Scanlan:* I think it was Mr. Edwards who asked for it.

*The Commissioner:* It was your desire to have this correspondence, Mr. Edwards?

*Mr. Edwards:* I should like to look through it.

*The Commissioner:* Very well; I think you might trust it to the custody of Mr. Edwards, and he can take it home and read it.

*(The correspondence was handed to the learned Counsel.)*

***(Adjourned to tomorrow, at 10.30 o'clock.)***

# In the Wreck Commissioner's Court

SCOTTISH HALL,

BUCKINGHAM GATE,

*Wednesday, 19th June, 1912.*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.

*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### TWENTY-SEVENTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURNE (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P., (instructed by Mr. Smith, Solicitor) appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes, of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder, Roberts and Company) appeared as Counsel on behalf of the dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

MR. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.) MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## Page 726

*The Attorney-General:* My Lord, I have to be away a little later and as the evidence will conclude this morning, there are one or two matters to which I would wish to direct attention. First, I would ask your Lordship to adjourn from the conclusion of the evidence until Friday morning. On Friday morning we expect to have the Captain of the "Carpathia" here, and his evidence will then close all the evidence to be put before you. It might be that he would not be available till the afternoon. As his evidence cannot affect any of my friends - as it cannot affect the interests with which they are particularly concerned - I would suggest, and I think it meets with their approval, that they should proceed with their addresses to your Lordship on Friday, notwithstanding that he may not be available at once, so that we may not lose time; as soon as he does arrive I will call him. His evidence in the main affects the address which I should have to make to your Lordship principally, because I have to deal with all the questions, but it does not affect anybody else, at any rate, very materially.

Then your Lordship was good enough yesterday to refer to a suggestion which had been made to you about a contrivance for the application of compressed air to a breach of the ship's side; and your Lordship asked us whether we had considered it. We have not in fact gone into it. We have made some little Enquiry into it, only such Enquiry as could be made from yesterday morning. What I suggest to your Lordship, subject to its meeting with your approval, is that this is a matter which should be referred also to the Bulkheads Committee when they are dealing with questions affecting the sinkability of ships, and that we should draw their attention to the suggestion which your Lordship has made, and ask them to consider it amongst their experts with other questions which are before them. I think any other plan would involve our calling a good deal of evidence before your Lordship on a subject into which we have not even yet enquired, and it would mean also that if we once proceeded upon that we should have to enquire into further suggestions that have been made. I think that that would be contravening the ruling which your Lordship gave just before the adjournment at Whitsuntide. If your Lordship approves, that is the course we propose to take with regard to that.

*The Commissioner:* Yes.

*The Attorney-General:* If your Lordship pleases.

*Sir Robert Finlay:* I entirely assent. I have gone a little into this matter with Mr. Wilding, and the result of what I have had from him on the subject is that I think the course which the Attorney-General proposes would be the right one.

*Mr. Edwards:* There is one point, my Lord. When Mr. Wilding was being examined, and the question came up as to longitudinal bulkheads, the learned Attorney-General said that they were going to call somebody from the Admiralty. I am not certain whether in view of what your Lordship indicated as to bulkhead construction going to the Committee, that intention now is abandoned.

*The Attorney-General:* My Lord, I will tell my friend at once. There are two considerations which affected me in not calling evidence from the Admiralty. The one, and I think the paramount consideration, is that on the whole it is not considered advisable that the Admiralty should give evidence upon this subject in a public Court. It must be obvious that it is not advisable. And, moreover, if I may say so, your Lordship has the advantage of the assistance of those who do know what takes place, and it becomes therefore unnecessary to call that particular evidence, and in the public interest, I came to the conclusion that I could not press it.

*The Commissioner:* Then there is a further consideration.

*The Attorney-General:* Yes, your Lordship gave a ruling which decided us that in any event it would only be taking up time uselessly upon this point inasmuch as your Lordship is only going to make a general recommendation with regard to this matter, and not a specific one; and consequently I thought we ought not even to attempt to take up further time with discussions of that kind. It would involve my calling evidence as to other systems as well.

*The Commissioner:* Not only that, but I think the considerations which guide the Admiralty are probably quite different from those which guide the constructors of merchant vessels.

*The Attorney-General:* Quite, my Lord.

*Mr. Edwards:* May I say at once that that is an explanation entirely satisfactory. *The*

*Attorney-General:* Very well. Then there are one or two matters I should like to deal with. There is the table I referred to. The Table was handed in, and is as follows: -

**BOAT ACCOMMODATION ON GERMAN PASSENGER STEAMERS.**

STATEMENT, showing the provision of Boat Accommodation on certain large German Transatlantic Passenger Steamers, forwarded to the Board of Trade by the President of the See Berufagenossenschaft at Hamburg. The additions to the Table made at the Board of Trade for the purpose of showing the cubic capacity of the boats in cubic feet, and the percentage of persons allowed to be carried, who could be accommodated in the boats, are shown in italics (2.832 cubic metres = 100 cubic feet).

Name of Vessel.					Boats.
-----------------	--	--	--	--	--------

	Gross Tonnage	Minimum Number of Passengers allowed.	Crew Carried.	Total Persons On Board.	31st March, 1912.					29th May, 1912.

\* Norddeutscher Lloyd Vessel. - This number is in compliance with the maximum number of berths fitted in the above steamer, but does not accord with the passenger certificate.

† Hamburg Amerika Line Vessel. - According to passenger certificate.

‡ When leaving Hamburg, 16th May. Number of passengers and crew carried on board, 2,980 persons.

§ When leaving Hamburg, 2nd May. Number of passengers and crew carried on board, 2,995 persons.

## Page 727

*The Commissioner:* Mr. Edwards, Mr. Scanlan and the other gentlemen - what I call the other side - should have copies of this document.

*The Attorney-General:* Yes, my Lord, I want to call attention to this document which is agreed between us. It is the table of boat accommodation on German passenger steamers. I referred earlier to it. I told you we had agreed to it, and I will call your attention to specific figures in it. Your Lordship will see first of all it contains the names of six of the large German liners, with their gross tonnage, with the maximum number of passengers they are allowed to carry; then the crew they carry, giving the total number of persons they can carry on board each of these vessels.

Then, my Lord, there are two further columns. One shows the number of boats and the persons who could be accommodated in those boats for the period up to the 31st March, 1912, and gives also in the last column of that table in italics the percentage of persons who could be accommodated. The next column is for the same vessels on the 29th May, 1912, when according to the German requirements there have been very important additions made, so that we may see now what the position was on the 29th May, 1912, with regard to these same vessels, the number of boats and the percentage of boatage

accommodation for the persons on the vessels. The point of it, as you will see, is that, according to the requirements before the 31st March, 1912, the percentage is as low as 48 percent boatage accommodation for persons carried. That is in the "Berlin."

*The Commissioner:* And that is the smallest vessel.

*The Attorney-General:* And it is the smallest vessel, 17,324 tons, carrying 3,092 persons; 24 boats, with boatage accommodation for 1,489, giving a percentage of 48 percent. The increase after the "Titanic" disaster, on the 29th May, 1912, was from 24 to 39 boats, cubic capacity in feet from 13,885 to 20,295; persons accommodated 1,489 in March, to 2,278 in May, and the percentage, therefore, of persons accommodated in May of 1912 was 74 percent, as against 48 percent before the "Titanic" disaster. That is the best instance. I need not go through them all. I take that as a typical instance and as the best, because it had the lowest percentage of boatage accommodation before March, and there has been a large increase. Your Lordship will observe from that that even now, at the present date, after the "Titanic" disaster, the total number of persons accommodated, according to the German requirements, is 74 percent, only of those on board.

*The Commissioner:* No; 74 percent, of those that are permitted by law to be carried.

*The Attorney-General:* I think I will take it at that; yes. I think it is because of the asterisk there to it.

*The Commissioner:* I notice, Mr. Attorney, that the boat accommodation appears by these figures to be regulated as it is with us, according to tonnage.

*The Attorney-General:* Yes.

*The Commissioner:* And not according to numbers carried.

*The Attorney-General:* Yes, that would be in accordance with the requirements to which I called attention earlier.

*Sir Robert Finlay:* I do not know whether the Attorney-General can supply it, probably not, but with regard to this that was done in May, after the "Titanic" disaster, do the figures represent what was voluntarily done, as, for instance, in the case of this country in the "Olympic" - the increase in the number of boats; or does it represent what is done under any Government requirement; if so, I think it would be desirable to have the requirement.

*The Attorney-General:* I understand from the Board of Trade, Sir Robert, that, in fact, the increase was voluntary. There are no new requirements; but in consequence of the disaster, as was done in this country, all liners did certainly make very great efforts to supply greater boatage accommodation.

*Sir Robert Finlay:* There is one other observation, and only one, I wish to make about this; it does not show the number of boats under davits.

*The Attorney-General:* No, it does not do that.

*The Commissioner:* I was told that since the "Titanic" disaster there had been some alteration in the law in the United States by which every passenger ship was required to carry sufficient boat accommodation for everybody on board.

*The Attorney-General:* I thought it was a recommendation, my Lord, but not a law yet.

*The Commissioner:* I did not understand that, but certainly within the last few days I have seen in the newspapers that that recommendation had been approved by the authorities in New York, and might be regarded now as one of their Rules and Regulations corresponding with the Rules and Regulations of our Board of Trade.

*The*

*Attorney-General:* I did not know whether it had got to the effective stage, but in any event it had, I think, so far as to indicate what would be done.

*The Commissioner:* But, then, I do not know what that means, whether it is a Rule applying to ships flying the United States flag or whether it is a Rule which would preclude any foreign vessel entering a United States port unless it complied with those Rules.

*The Attorney-General:* There is the question of reciprocity.

*Mr. Scanlan:* I asked a question with regard to this.

*The Commissioner:* I think it was you who drew my attention to it.

*Mr. Scanlan:* I asked a question on the Rules of the Department of Commerce and Labour of America, and I would like your Lordship to look at this. These are Rules actually in force, I am given to understand. This was issued on the 27th April, 1912.

*The Commissioner:* That is what I was referring to; it is something later.

*Mr. Scanlan:* Yes, it is later - the 27th April.

*The Commissioner:* When was the date of the American Report? It was last month?

*The Attorney-General:* I should like to see that document which Mr. Scanlan has.

*The Commissioner:* What is that pamphlet you have in your hand, Mr. Scanlan? *Mr.*

*Scanlan:* It is the official American Regulations, my Lord. (*The same were handed to the Attorney-General.*)

*The Attorney-General:* I see this is "General Rules and Regulations prescribed by the Board of Supervising Inspectors as amended January, 1912, and as further amended by action of the Executive Committee of the Board of Supervising Inspectors, April 26th, 1912." They are the requirements as amended. *The Commissioner:* What date is that last?

*The Attorney-General:* April 26.

*The Commissioner:* That is the document Mr. Scanlan referred to. I understood from what I read in a newspaper - perhaps I ought not to refer to newspapers - that it had recently been made a law in the United States. I do not know how they make these things laws, whether they are laws by being regulations, or whether there has to be some legislation about them.

*The Attorney-General:* I should gather from this that the Executive Committee has the power of amending the Rules.

*The Commissioner:* I fancy so.

*The Attorney-General:* And from this it must be so.

*Mr. Scanlan:* It corresponds somewhat to the Board of Trade.

*The Attorney-General:* I think so.

*Mr. Scanlan:* It is the same as the Board of Trade here.

*The Commissioner:* That is to say, they can make Rules which have the effect of laws.

## **Page 728**

*Mr. Scanlan:* Yes, my Lord. Your Lordship asked for the date of the American Report, and it is the 28th of May of this year.

*The Commissioner:* I think there was something that took place after that date.

*Mr. Scanlan:* I am not in possession of any information as to that.

*The Commissioner:* Have you heard of any, Sir Robert?

*Sir Robert Finlay:* I take it that the regulation of the 27th of April would not apply to vessels flying the British flag.

*The Commissioner:* That is what I want to know.

*The Attorney-General:* I am not so sure about that.

*The Commissioner:* Are they regulations which apply merely to American ships. *Sir*

*Robert Finlay:* It would seem very remarkable if any Executive Committee had any authority to make regulations which would affect foreign vessels.

*The Commissioner:* What occurred to me was this: it might make a regulation that no ship which did not meet their requirements should enter their ports.

*Sir Robert Finlay:* No doubt it might, but my observation is that it is very remarkable if such a power as that were given to an Executive Committee.

*The Attorney-General:* We know how it is. Under a reciprocal agreement between the United States and this country, to which reference has been made, the United States is satisfied with the compliance of British vessels with the requirements of the Board of Trade, and we do the same with regard to the United States in this country. Those are reciprocal agreements.

*The Commissioner:* And those agreements, I should think could only be altered by a treaty.

*Sir Robert Finlay:* The reciprocal treaty is still in force.

*The Attorney-General:* This Executive Committee cannot alter the reciprocal agreement between the United States and this country.

*The Commissioner:* I think it is cleared up. I do not think we need discuss it any further.

*Mr. Scanlan:* I may say, with reference to the American Report, this matter is referred to at page 18: By statute the United States accepts reciprocally the inspection certificates of foreign countries having inspection laws approximating those of the United States. Unless there is early revision of inspection laws of foreign countries along the lines laid down hereinafter, the Committee deems it proper that such reciprocal arrangements be terminated, and that no vessel shall be licensed to carry passengers from ports of the United States until all regulations and requirements of the laws of the United States have been fully complied with.”

*Sir Robert Finlay:* That makes it clear that it is as your Lordship said; it is a recommendation for a modification.

*The Commissioner:* And now, Sir Robert, you have made an observation with regard to this Table put in this morning, that it does not distinguish between boats carried under davits and collapsible boats.

*Sir Robert Finlay:* It does not; and I take it it would be impossible, at all events at present, to get the information.

*The Attorney-General:* Yes.

*The Commissioner:* There is another matter to which I am very anxious your attention should be directed. I mentioned it some days ago. I should like to know what liners were traversing this region on or about the date of the 14th April, and I should like to know at what speeds they were traversing the region. I mentioned it some time ago, and my

reason is this: I shall have to consider at the proper time whether Captain Smith was guilty of negligence or merely guilty of an error of judgment, and I think my opinion on that matter will be greatly influenced by the conduct of others, other experienced navigators traversing the same district at the same time.

*The Attorney-General:* Of course, you must add something to that, my Lord, must you not, to make the comparison - and receiving ice reports of a similar character? *The*

*Commissioner:* Oh, of course. I assume - I do not know it - that liners traversing this region on or about that day would receive similar advices to those that were received by the "Titanic."

*The Attorney-General:* Yes, enquiries have been made. I was just going to refer to it when your Lordship mentioned it. I have the document in my hand which enabled us to make some answer to it, but I am afraid it is by no means complete. Several lines have not answered at all.

*The Commissioner:* I daresay they would not.

*The Attorney-General:* I think there is some objection, or, at any rate, I can quite conceive there is some objection, to giving their sailing instructions and stating what happened. But I have it from some. The lines from which I have answers I am going to call your Lordship's attention to now.

*The Commissioner:* Have you any German boats?

*The Attorney-General:* No; we wrote to them, but we have had no reply to both the Hamburg-Amerika and the Norddeutscher.

*The Commissioner:* I should like to have copies of the letters, because the absence of an answer to the letters would have a significance in my mind.

*The Attorney-General:* I will read your Lordship the letter that was sent round to all the various Liner Companies, including the German and one of the French. It is on the 6th June, 1912, from the Board of Trade: "With reference to the Enquiry now proceeding into the 'Titanic' disaster, I am directed by the Board of Trade to inform you that they have been requested by the Court to obtain information from the leading British (and German) shipping companies engaged in the North Atlantic passenger trade respecting (a) the westward-bound vessels which received on or about the 15th of April wireless or other messages similar to those received by the 'Titanic' regarding the presence of field ice or icebergs in their vicinity."

*The Commissioner:* Why not the 14th?

*The Attorney-General:* I do not know why they said the 15th, but obviously it would cover it, and the answers show it does. "(b) The speed at which they were travelling, and (c) the precautions, such as alteration of course, or diminution of speed, adopted by the Master of the ship in order to avoid danger."

*The Commissioner:* If these gentlemen have omitted, or do not desire to answer for some reason (I can understand it, I am not in any way blaming them), the information can be obtained in another way, not so satisfactorily, it is true, but it can be obtained in this way - by ascertaining when these vessels left their ports of departure and when they arrived.

*The Attorney-General:* We can do that, but I do not know whether your Lordship would think that would give you the information.

*The Commissioner:* Well, if I found that American liners travelling through that region at this particular time kept their time, arrived at the ordinary time, I should draw the conclusion that they had not slowed down, at all events, for any length of time.

*The Attorney-General:* Yes.

*Sir Robert Finlay:* Of course, it might involve a good deal of investigation into each particular case.

*The Commissioner:* Of course it would. It is very rough.

*Sir Robert Finlay:* Your Lordship will recollect that in the case of the "Titanic" they had intended not to keep up their speed, but to arrive in the evening.

*The Commissioner:* I know that; for the convenience of the passengers, I think it was.

*Sir Robert Finlay:* Yes.

*The Attorney-General:* In order to make it quite clear, I think when I said just now the German Lines have not answered, that is not quite accurate. They have answered, but they have not

## **Page 729**

supplied us with the information. They have said that they will furnish the information as soon as it can be obtained.

*The Commissioner:* Well, that is a very reasonable answer.

*The Attorney-General:* Yes, I have not got the answer.

*The Commissioner:* I daresay they have to wait until they can inspect the logs. *The*

*Attorney-General:* Quite so; and the Norddeutscher also say they have to get their information from the head office at Bremen. At any rate, we shall have it according to the promise made, and as soon as it is obtained it can be supplied to your Lordship.

*The Commissioner:* I am very glad they have taken up that position.

*The Attorney-General:* We only wrote to the Hamburg-Amerika Line and the Norddeutscher Line, and they replied at once, saying they would furnish the information as soon as it could be obtained.

*The Commissioner:* Have you, Mr. Scanlan, or Mr. Edwards, any information bearing upon this subject.

*Mr. Scanlan:* I have not, my Lord.

*Mr. Edwards:* I have not, my Lord.

*The Commissioner:* Because when you come to address me I should like you to direct your attention to this question as to the blame that is to be fixed upon the Captain. I am very anxious not to fix blame upon a man who cannot be here, unless it is very clearly proved, and I want, therefore, to get out everything that can be reasonably regarded as explaining his conduct.

*Mr. Scanlan:* Yes.

*The Attorney-General:* We have some information that will be laid before the Court from various lines - the Leyland, the Anchor, the Canadian Pacific and the Allan Line - information which we can give you, and also from the Cunard.

*Sir Robert Finlay:* I am afraid this will want a good deal of probing. I take only one case, the "Mauretania." We are told that on approaching ice regions she deviated to the

Southward - I am informed that she deviated to the Southward, because she got a wireless message as to alteration of the track.

*The Attorney-General:* I think that is highly probable.

*The Commissioner:* But when did she get that? *The*

*Attorney-General:* Only after the "Titanic" disaster. *The*

*Commissioner:* It must have been after it.

*The Attorney-General:* That is the explanation.

*The Commissioner:* That would be of no importance whatever to my mind, Sir Robert. If it has any significance it is rather in your favour than otherwise, but I do not think it has any real significance.

*Sir Robert Finlay:* It very much qualifies it.

*The Commissioner:* I regard you as representing the Captain.

*Sir Robert Finlay:* Yes, I do, my Lord.

*The Commissioner:* Very well. I regard you as representing the Captain, and if you object to this, what I call an irregularity, then I will not do it.

*Sir Robert Finlay:* I should ask before anything of the kind is admitted, we should have the opportunity of examining the letters upon which this Table is based, and seeing what these letters show on their face.

*The Attorney-General:* You have them.

*Sir Robert Finlay:* And we must also see the logbooks. I do not think this is satisfactory. As things at present stand I object to it. *The Attorney-General:* I do not mind what happens to it.

*The Commissioner:* If Sir Robert tells me he objects to it, it is not, in my opinion, evidence in the proper sense of the word, and if it is objected to I will not accept it. *Sir*

*Robert Finlay:* We will assist the Court in every way in our power, but we must see the logbooks and we must see the correspondence.

*The Attorney-General:* If that is to happen, if your Lordship thinks it is of importance that you should have them, we will take care it is put before you in regular form. I cannot do anything more. We have got it in accordance with the Court's desire. There is the evidence, or, at any rate, the information which we have got.

*The Commissioner:* I will explain to you the significance which I think it has. If a number of experienced men who traverse the ocean, as Captain Smith did, are found to have been doing precisely what he did, it would be a very difficult thing for me to say that he was guilty of negligence. An error of judgment is a different thing altogether.

*The Attorney-General:* I do not want to argue it now, but your Lordship has to take into account some other considerations. It may be, and sometimes is, the case - it is quite necessary to put this view - that lines that are running in competition run unnecessary risks.

*The Commissioner:* Yes.

*The Attorney-General:* And the question is whether in this case, although they have all done the same thing, it was still an unnecessary risk.

*The Commissioner:* Yes.

*The Attorney-General:* And a negligent act, in view of the freight they carried.

*The Commissioner:* You mean the lives they carried.

*The Attorney-General:* Certainly, the number of passengers.

*The Commissioner:* You can imagine every man in the trade has been negligent for the last 20 years, but I should be much more disposed to say that a man who has followed the practice that has existed so long is guilty of an error of judgment.

*The Attorney-General:* There are so many considerations to apply to this particular case.

*The Commissioner:* I am not arguing it. I am only mentioning to you the consideration that I think might be given to these facts and figures if they can be procured.

*The Attorney-General:* The only thing I want to know is, where we are. Am I or am I not to proceed with this Enquiry in order to deal with the request which your Lordship made? We have done it as far as we possibly can, and we are waiting for the further documents. If objection is to be taken to it, and your Lordship rules it out, then of course we will go no further. If on the other hand your Lordship thinks it of importance that you should have it then we must take steps, and we must call evidence properly before you and take care to subpoena the owners to produce the logbooks and get all the material before the Court.

*Sir Robert Finlay:* What I said was, I object to it at present. We will give every help in our power to the Court, but it is absolutely essential that before a statement of this kind goes in, we should see not only the letters which are written, on which the statement is based, but also the logbooks of the several vessels.

*The Commissioner:* I quite agree.

*Sir Robert Finlay:* Subject to that, we will cooperate in every way in our power. *The*

*Attorney-General:* That does not really meet the difficulty. If my friend wants to see the logbooks of the vessels we cannot get them except by subpoena. *The*

*Commissioner:* You talk about subpoenaing these gentlemen to produce the logbooks, but you must remember these are German ships.

*The Attorney-General:* There are only two German ships, and there are a number of other lines we have to deal with. Of course, I cannot get the German ships. I am not thinking of them for the moment, but so far as they are concerned they may give them. I do not know. We have asked for them, and they have said they will supply us with all information, but have not specifically dealt with the logbooks. On the other hand, there are companies which have answered and have given us the information, but do not answer with regard to logbooks. If we want to get those logbooks we have to bring

## **Page 730**

them before the Court, and we should have to subpoena the companies to produce them. That is the only way we can get them. If that is required it must be done, and we cannot treat the evidence as concluded; that is all.

*The Commissioner:* All I can say at present, Mr. Attorney, is this: proceed to get the evidence; try to get it together, but do not let the Enquiry be delayed for the want of it. I think we had better, on the whole, go on, although the evidence may not be gathered together in such a way as to satisfy Sir Robert. If it is not, I shall not accept it. But still I think it would be desirable to get the evidence if you can, so that you may show it to Sir Robert, and if he chooses he can allow it to go in. If he does not choose, he can object.

Perhaps you would not like that.

*The Attorney-General:* No, I object to that.

*The Commissioner:* Yes, I can see why, because it would mean giving him the opportunity of letting it in if it favours his case, and of excluding it if it does not.

*The Attorney-General:* Yes. Of course I represent no party, I am here merely for the purpose of putting the matter before the Court.

*The Commissioner:* Sir Robert does represent a party. You do not.

*The Attorney-General:* If the Court wants the information I can see how it can be got, but, at the same time, as I say, it will take a little time, and the one thing that would be impossible is for me to say that the evidence will be concluded today with reference to it. I must leave it there. I cannot do anything else.

*Sir Robert Finlay:* We will give every help in our power, and we will make these investigations as soon as we get the materials, and we will go as far as we can if there is any difficulty in getting the logbooks.

*The Attorney-General:* You have the letters; all the information that we have my friend has. He is probably not aware of the fact, but all the letters that are referred to from which that is collected, are in that bundle.

*Sir Robert Finlay:* I did not know they were all there; I see there are some. *The Attorney-General:* All that I have are there.

*The Commissioner:* There is really only one question: "Did you in consequence of ice reports slow down?" That is the only question.

*The Attorney-General:* And that makes it necessary that I should formally put in the *proces-verbaux* of all the various vessels which were in the vicinity during these material days. It has been prepared in consequence of a request which was made by your Lordship earlier, but owing to what your Lordship said yesterday as to the "Baltic" message and the "Caronia" message affecting it I do not think it necessary to go further.

*The Commissioner:* I did not intend to qualify in the least what I said yesterday. *The Attorney-General:* Therefore I do not proceed with it, but I do think we ought to have the *proces-verbaux* in, in case we have to refer - *The Commissioner:* To what was said in the messages.

*The Attorney-General:* Yes, to what ice reports were received by a particular vessel. It may or may not become necessary, but we had better have it.

*The Commissioner:* I should have thought not. Then I shall consider the evidence is not formally closed, but that it is closed subject to this question of the course adopted by other steamers in similar circumstances at the same time.

*The Attorney-General:* Yes.

*Sir Robert Finlay:* Yes.

*The Attorney-General:* There are five Captains whose proofs we have, which have been supplied by the White Star Line, and whose evidence they have asked us to put before the Court. They are here today, and we shall call them. It is similar evidence to that which you have already had of four Captains, but I will call it as my friend thinks it right. The only reference I want to make further is this. Your Lordship asked for an analysis of the emigrants from Queenstown. That is being prepared, but it will be agreed so that your Lordship can have it on Friday as an agreed list. It will save discussion about it. You

will not want it before that. The only other matter is with reference to the questions, which I would like to deal with at once.

*The Commissioner:* Are you going to suggest other questions?

*The Attorney-General:* There are two alterations that I want to make. One is in Question 21. This is a mere limitation. It is only because, as the question stands, it goes much further than the Enquiry should. Your Lordship will see in Question 21: "How many lost their lives?" There should be added: "Prior to the arrival of the 'Carpathia' in New York." It is a mere limitation of time. There is no importance in it.

*The Commissioner:* I will tell you at once I should not have attempted to answer it in any other way.

*The Attorney-General:* I knew your Lordship would not, but I thought it was better to limit it in form.

*The Commissioner:* Yes, quite right.

*The Attorney-General:* The other question is Question 24: "What was the cause of the loss of the 'Titanic', and of the loss of life which thereby ensued or occurred?" To that I propose to add this question: "What vessel had the opportunity of rendering assistance to the 'Titanic,' and, if any, how was it that assistance did not reach the 'Titanic' before the 'Carpathia' arrived?"

*The Commissioner:* Will that involve my dealing with the "Frankfurt."

*The Attorney-General:* Well, only a reference. It is quite simple, I think. The only one that gives any difficulty with regard to this - any examination - is the "Californian." As to the "Mount Temple," you have the evidence about that. That question will cover the "Californian."

*The Commissioner:* Yes.

*The Attorney-General:* Those are all the additions that I want to make.

*Sir Robert Finlay:* I understand, my Lord, that it has been arranged that my friends who appear for the various parties admitted by leave will address the Court first.

*The Commissioner:* The course that I understand is to be taken, and which I should approve, is that Mr. Scanlan should begin, and deal with this case. Then I shall ask Mr. Edwards, and I hope that Mr. Edwards will be able to obtain the consent of some of the gentlemen to his dealing with their arguments whatever they may be. Will you do that, Mr. Edwards?

*Mr. Edwards:* Yes, I can already say, my Lord, that Mr. Cotter agrees.

*The Commissioner:* I shall listen to Mr. Scanlan first, as he has been, as a Rule, the first Counsel to examine the Witnesses, and then I shall call upon you, Mr. Edwards, and I want as many of the gentlemen who appear on that side of the Court as can be induced to do it, to entrust the case, so far as they are concerned, to you, so that you may deal, not only with your own arguments, but with theirs. It is in order to save some of the speeches. And then after I have listened to you there is a gentleman over there whom I have not seen for quite a long time, Mr. Lewis, and he is not here now.

*Mr. Edwards:* I can already tell your Lordship that, acting upon a suggestion, Mr. Cotter has asked me to address your Lordship upon those points which otherwise he would have had to address you upon, and I believe I shall be able to make the same statement, from information which has been conveyed to me, with regard to Mr. Lewis.

As to the others, I will put myself into communication with them.

*The Commissioner:* Do as much as you can. I daresay Mr. Harbinson (I say this because I think it) would desire to address me himself. Then there is Mr. Dunlop, who appears for the "Californian," and I think I must listen to him, as I

## Page 731

do not think he can leave his case in anybody else's hands. And then after I have dealt with all those, then, Sir Robert, I shall ask you to address me, and finally the Attorney-General.

*The Attorney-General:* Yes, my Lord.

*Sir Robert Finlay:* Then my friend, Mr. Laing, my Lord - *The*

*Commissioner:* Mr. Botterell, do you want to speak?

*Mr. Botterell:* No, my Lord, I do not think I can usefully employ the time of the Court by any observations.

*The Commissioner:* That is the best speech I have heard for some time.

*Mr. Scanlan:* I understand Mr. Holmes said he would like to address your Lordship. He is not here at the moment.

*The Attorney-General:* Mr. Wilding has to be called on the turning circle, and also I propose to get from him something else -

*The Commissioner:* There are two things Mr. Wilding must formally do. I understand he has made a diagram to show the space in which the vessel could turn.

*The Attorney-General:* Yes.

*The Commissioner:* I want him to come into the box and prove that diagram. Then there is another diagram which he produced showing what the condition of the "Mauretania" would have been having had a similar accident to that which happened to the "Titanic."

*The Attorney-General:* Yes.

*The Commissioner:* I do not know that it will be of much value, but still he has prepared it, and I should like him to put it in.

*The Attorney-General:* The only thing which I think would be useful if he did - he has done it at my request on the model, and I want him also to put it on this sectional plan - is to indicate the spots at which, according to the evidence, there was water found. It is so much easier to see it than merely to describe it. *The Commissioner:* It will be very useful to me.

*The Attorney-General:* He has done it on the model, but I think it would be better on the sectional plan as well.

*Mr. Edwards:* There is one matter I am not quite clear upon. Your Lordship has had a discussion as to the question of possible negligence or error of judgment on the part of Captain Smith; I understand your Lordship said that we may conclude the Enquiry subject to that question. The point I want to ask your Lordship is this: Though your Lordship may keep open your judgment on that point, whether those who are addressing your Lordship are also to leave the matter over or whether we are to deal with it as far as we can on the basis of the evidence already before the Court.

*The Commissioner:* I will tell you, Mr. Edwards, how it occurs to me. You and Mr. Scanlan and others are no doubt concerned generally in the question of this calamity and how it happened and who is to blame; but you are more particularly concerned in the matters that you so closely examined the Witnesses about - boats, watertight bulkheads, and the construction of the ship. Those are matters that it appears to me you are more closely concerned with. At the same time I do not mean to say that you are not also concerned with the question of blame, if any, to be imputed to those who were navigating the ship; and therefore you will have to address yourselves, but I hope not at any great length, to that question. There is, of course, a very important distinction between what I call an error of judgment and negligence. You cannot have a better illustration of it than something that has happened in the evidence in this case. You remember, I daresay, that Mr. Wilding said that in his opinion if this vessel had gone stem on to the ice it would have been better for the lives of the people than if she had starboarded her helm and so torn a rent in her side for some distance aft. As at present advised, assuming Mr. Wilding's view to be correct (I am far from saying that his view is correct) and that what the man at the helm was told to do was wrong, I should be very loth to say that such a direction given to the man at the helm was negligence. It was a mistake, possibly, but a mistake and negligence are very different things. I give you that as a sort of illustration.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* I am told, Sir Robert, and you can tell me if it is right - I did not know it - that it is not the practice to find negligence against a dead man. Is that so? *Mr.*

*Butler Aspinall:* I have never known a case, and I have always known this, that the Court has shown the greatest reluctance to accede to any such suggestion. *The Commissioner:*

That is what I feel. I feel the greatest reluctance to finding negligence against a man who cannot be heard.

*Mr. Butler Aspinall:* That is the point, my Lord. He has no opportunity of giving any explanation. He is a man with a good record.

*The Commissioner:* But if there is a fixed practice, of course, I am relieved of the difficulty altogether.

*Mr. Butler Aspinall:* Mr. Laing will, I think, agree with me; I cannot say it has been laid down as a fixed practice, and I really do not know a case in which the Captain or the officer in command has been lost, but there have been a good many enquiries in my experience, and I have never known a case in which the Court has found a dead man guilty of negligence, and I think I am right in saying I do not know a case in which it has been invited to do so even by adverse interests. The parties and the Court have always been very tender to the good name and the honour of a dead man.

*The Commissioner:* You heard what Mr. Aspinall says, Mr. Edwards?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* And you heard it, Mr. Scanlan?

*Mr. Scanlan:* Yes, my Lord. There was a suggestion in the course of the Enquiry that the look-out men were to blame, and, of course, on that point, in exonerating them, I shall have to make some remarks generally on the question.

*The Commissioner:* Different considerations arise in connection with them, because both of them are alive and have been heard.

*Mr. Edwards:* At this point may I ask formally for the production of the certificate of approval issued by the Board of Trade for the "Titanic," that is the certificate of approval which shows the point at which the loadline disc had to be placed according to the Board of Trade.

*The Commissioner:* Has not that been put in?

*Mr. Edwards:* I am told that it has been handed to your Lordship, but it is not in the proceedings.

*The Commissioner:* Is it not on the Note?

*Mr. Edwards:* I am not able to trace it, my Lord.

*Mr. Butler Aspinall:* You shall have it.

*The Commissioner:* Take care that Mr. Edwards has it.

*Mr. Butler Aspinall:* Yes, he shall have it at once.

*Mr. Edwards:* We may take it it is in, because I shall want to use it.

*Mr. Butler Aspinall:* With regard to these sea captains, they are very short, and I propose to call them at once. They are very anxious to get away. And then, after that, I will put Mr. Wilding into the box.

**Page 732**

**JOHN PRITCHARD, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

Do you hold a Master's certificate? - Yes.

Is it an Extra Master's? - No, an ordinary Master's.

I believe your last command was the "Mauretania," was it not? - Yes. 25171. When did you leave her? - Two years last Christmas.

I believe for 18 years you have commanded Cunard steamships sailing between Liverpool and New York? - Yes.

Have you heard the evidence in this case with regard to the weather conditions which existed when the "Titanic" struck? - Yes. 25174. You know them? - Yes.

Now what practice did you follow with regard to maintaining your full speed or reducing your speed, assuming similar conditions, and assuming you had information that there was a probability of your meeting ice on your course? - As long as the weather is clear I always go full speed.

You always have done so? - Yes.

What was the speed of the "Mauretania"? - 26 knots.

**Examined by Mr. SCANLAN.**

Tell me this, Captain: Do you under any circumstances at night double the look-out? - In fog only.

If on a night when you experienced some difficulty in seeing, you found, although the night was clear, it was more difficult to see than at other times, would you have doubled the look-out? - Oh, yes.

Very well. If you doubled the look-out, where would you station the extra lookout men?  
- One on each bow.

One on each bow? - Yes.

Of course you had a crow's-nest? - Yes.

Had you two in the crow's-nest as a Rule? - Yes.

During the nighttime, when you expected to meet ice, would you then, in accordance with your practice, double the look-out? - Not if it was clear weather. 25185.

But if you experienced any difficulty at all? - If it was hazy, yes, I should double the look-out at once.

If there was any difficulty at all in seeing would you reduce your speed? - Well, if it was hazy, yes.

If it was a flat calm and you expected ice - you were warned of ice and knew you would meet ice in the course of the night - would you double the look-out? - No, as long as the weather is clear.

#### **Examined by Mr. CLEMENT EDWARDS.**

Have you, in your Sailing Directions, any instructions as to what you are to do in an ice-field? - No, I do not think we have, because I never got into an ice-field. We do not go North, you know; we go on the Southern tracks this time of year.

There are no instructions at all. You have, of course, been through ice? - No. 25190.  
(*The Commissioner.*) Have you never seen an iceberg? - I have seen them, my Lord, yes.

How far off? - Sometimes two or three miles, sometimes 10 miles.

Have you never passed close to an iceberg? - No, not nearer than two miles. 25193. (*Mr. Edwards.*) In your instructions as to going on the Southern course is there anything said there as to avoiding ice? - No.

No reference at all in your printed instructions as to ice? - No.

You have to use your own discretion? - Yes.

(*The Commissioner.*) You followed the same course, as I understand, on the "Mauretania" as the "Titanic" took? - Yes.

#### **Examined by Mr. COTTER.**

Is it not the custom in the Cunard Company for every man to have a boat station? - Yes.

A bulkhead door station? - Yes.

And fire station? - Yes.

*The Commissioner:* You cannot begin all this over again.

(*Mr. Cotter.*) I want to show the contrast, if you will allow me. (*To the Witness.*) Every man receives a boat badge in the Cunard Company? - Yes, quite right.

You have boat drill before you leave port on sailing day? - Yes.

Have you ever had any difficulty in getting any members of the crew to attend boat drill?  
- Not in my time.

*(The Commissioner.)* Have you heard of difficulties since your time? - I believe they have had, but not in my time; we had no difficulty, none whatever.

*(Mr. Cotter.)* Have you ever had any difficulty with firemen coming to boat drill? - No.

*(The Commissioner.)* Have you heard of difficulty since? - Yes, I have.

*(Mr. Cotter.)* You never heard of it in your firm? - No.

In the Cunard Company, how long would you call a reasonable time to get the boats out and the covers off and swung out? - Six minutes.

That is with a properly disciplined boat crew? - Yes.

Is it the custom to have bulkhead door drill every day? - Yes, at sea.

At 11 o'clock? - At 12 o'clock.

**Examined by Sir ROBERT FINLAY.**

For the last two years I think you have retired from the sea? - Yes.

For the 18 years before that you were in command of Cunard boats? - Yes.

And you have been at sea altogether 30 years? - More, 51 years at sea.

You have been at sea for 51 years, or had been before you retired? - Yes. 25215. *(The Commissioner.)* What age are you? - 67, my Lord.

*(Sir Robert Finlay.)* And you have had, I think, a Master's certificate for 37 years? - Yes.

You told us your practice as to speed when ice was reported or you were in an ice region; did you also hold your course? - Always, if it is clear weather.

You have kept your course in clear weather, and maintained full speed? - Yes. 25219.

And was that the universal practice in your experience? - Yes.

**Page 733**

My Lord, a point was raised, and some time was spent, about binoculars. If your Lordship thinks it worthwhile I will ask it.

*The Commissioner:* Unless Mr. Scanlan tells me I ought not to do it, I will now express my opinion about binoculars.

*Mr. Scanlan:* I will submit to judgment now, my Lord.

*The Commissioner:* Very well. Then the judgment is that binoculars are not desirable in the crew's-nest.

*(The Witness withdrew.)*

**HUGH YOUNG, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

You are a retired master mariner? - Yes.

And you hold an Extra Master's certificate? - Yes.

For 37 years did you command steamers in the Anchor Line? - Thirty-seven years.

In such position were you travelling backwards and forwards between Glasgow and New York? - For 35 years I was travelling across, all that time. 25224. Are you familiar with ice-fields and icebergs? - Quite.

Do you know the weather conditions which existed when the "Titanic" struck the iceberg? - I understand it was a dead calm.

It was a dead calm; it was a clear night? - Yes.

No sea? - No sea.

And no moon. Now assuming those to be the conditions, and assuming that you had had information that there was a probability that you might be travelling through a region of the sea at night where you might meet icebergs, would you or would you not reduce the speed of your vessel? - No, sir.

What was the fastest vessel you ever commanded? - The "City of Rome," 17 knots.

One other matter. With regard to look-out at night, when you have been informed that you may be passing icebergs, what provision did you make for your lookout under such circumstances? - The same as other times, as long as it was clear - two men in the crow's-nest.

You had two men in the crow's-nest? - Yes, I had two men in the crow's-nest. 25232.

And nobody on the stem head? - Not when it is perfectly clear.

#### **Examined by Sir ROBERT FINLAY.**

25233. Captain Young, if ice were reported, would you keep your course, as well as maintain your speed, in clear weather? - I should keep my course and maintain my speed.

25234. How many years were you in the New York trade, crossing the Atlantic? - About 37 years.

*The Commissioner:* Just direct your attention, Sir Robert, to field ice, as well as icebergs.

*(Sir Robert Finlay.)* If your Lordship pleases. *(To the Witness.)* Suppose you were told there was field ice, would your practice be the same, or different? - Just the same.

Has that been the universal practice in the trade as long as you have known it? - As far as I know, yes.

All ships have done so? - I think so.

Now, just one question with regard to the change of temperature. A good deal has been said about a change of temperature, it becoming colder, indicating you were approaching icebergs or ice. What do you say about that? - I do not think it is any indication. The temperature indicates a colder current and no more.

*The Commissioner:* It stands thus on the evidence at present, that it may be an indication and it may not be.

*(Sir Robert Finlay.)* What do you say about that, Captain Young? - I say the change in temperature tells you you are getting into a colder current. There may be ice and there may not be.

*The Commissioner:* And it may be due to ice and it may not be due to ice.

*(Sir Robert Finlay.)* What do you say to that?

*The Witness:* I say the same thing.

Have you been in the Montreal trade as well? - No.

[NOTE: The original inquiry transcripts included Questions 25242 to 25253 as part of Hugh Young's testimony. However, after careful consideration of the testimony it was determined that this data actually constitutes the opening testimony of William Stewart, who followed Mr. Young on the stand. Therefore, the decision was made to move the testimony into its proper place.]

*(The Witness withdrew.)*

**WILLIAM STEWART, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

Are you a retired Master Mariner? - I am.

Do you hold a master's certificate? - Yes.

Have you been in the North Atlantic trade for 38 years? - Yes.

I think you held command for some years in the Beaver Line? - All the time that it ran, 35 years.

Sailing between Liverpool and Canada? - Yes.

When was it the Beaver Line were taken over by the Canadian Pacific? - 1903. 25248.

And did you continue on then in the service of that Company? - Yes, for three years, till I retired.

What was the last vessel that you commanded? - The "Empress of Britain"; but I went in the late "Manitoba" for a voyage to let a Captain fit in that was going to join her.

I do not want it in great detail. I only want to direct your attention to one of the salient matters. Was the "Empress of Britain" the fastest ship you ever commanded? - Yes.

What was her speed? - 18 knots. 25252. Do you know the weather conditions which existed when the "Titanic" struck? - I have read about them in the newspapers.

See you have them accurate. It was a clear night, no moon, no swell, no sea, and stars? - Yes.

Given those conditions, and that you had command of a ship, and were given information that you might meet ice and that your course would take you through the place where you might meet ice, and meet it at night, would you reduce your speed? -

No, not as long as it was clear.

Not as long as it was clear? - No.

I am going upon the assumption that you might meet icebergs - you would not reduce your speed? - No.

If you had information that you might meet field ice, would you still maintain your speed? - Until I saw it, and then I should do what I thought proper.

With regard to the look-out, if you have information that you may meet ice, either field ice or icebergs at night, do you take any special precautions with regard to the look-out? - In clear weather we have the ordinary look-out.

Where is that ordinary look-out kept? - In the crow's-nest.

**Examined by Sir ROBERT FINLAY.**

Would you maintain your course as well as your speed if ice were reported? - Yes.

And has that been the invariable practice in the North Atlantic? - It was with me.

And, as far as you know, with others? - As far as I know with others.

Did the "Empress of Britain" carry many passengers? - Yes. 25264. First, second, and third? - Yes.

25265. What was her tonnage, about? - I could not tell you now, she was a large ship.

25266. She was a big boat? - Yes.

Of 18 knots? - Yes.

How many people did she carry, about? - Oh, I suppose about 2,000 altogether.

*(The Witness withdrew.)*

*The Commissioner:* Who are the other two Witnesses?

*Mr. Butler Aspinall:* They are both Allan Line Captains, and they both give the same evidence.

*The Commissioner:* May we take it they say the same?

*Mr. Butler Aspinall:* They do according to their proofs. *The*

*Commissioner:* Give me their names.

*Mr. Butler Aspinall:* John Alexander Fairfull, who has held an ordinary Master's certificate since 1873, and been in command of Allan liners for 21 years. The other man is Andrew Braes, who is a retired master mariner, and holds an Extra Master's certificate, and who has commanded steamers of the Allan Line for 17 years.

*The Commissioner:* Perhaps you had better put them formally into the box and swear them, and ask them if they agree with the previous evidence.

**JOHN ALEXANDER FAIRFULL, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

Are you a retired master mariner? - Yes.

For 21 years were you sailing in command of Allan Line steamships across the Atlantic?  
- Yes.

Have you heard the evidence of the last two gentlemen? - I have.

Is your practice in accordance with theirs? - All except that when we get to the ice track in an Allan steamer, besides having a look-out in the crow's-nest, we put a man on the stem head at night.

*(The Commissioner.)* I do not hear what you are saying.

*The Witness:* Besides having a look-out in the crow's-nest in crossing the ice track, I put a man on the stem head at night.

Whether it is clear or not? - Yes.

*The Commissioner:* Mr. Aspinall, is the next one going to say something different? *Mr. Butler Aspinall:* No, my Lord, as far as I know.

**Examined by Sir ROBERT FINLAY.**

Were you crossing the Atlantic on the 14th of April? - We were.

In what vessel? - In the "Tunisian."

Did you get a message about ice? - Yes. I am not very sure. I could not remember whether we got a report from any other ships, but after we got clear of the ice our report was made out and given to the operators, and he gave it to every ship with which he got into communication.

Do you remember a message from the "Canada," or sent by you to the "Canada"? - I know the communication with the "Canada," Sir Robert, but I could not tell you what the message was.

What time was it that you had communications with the "Canada"? It was some time in the morning if I remember rightly? - I would refer to what Captain Jones said in his evidence at page 664, if your Lordship will kindly look at it.

*The Commissioner:* Yes. He said, "On the 9th I had a message from the 'Tunisian,'" Then he produces it.

(*Sir Robert Finlay.*) Yes, my Lord. (*To the Witness.*) Were you bound West? - Bound East.

Did you send a wireless message to the "Canada"? - I believe so.

You do not recollect it? - No, I cannot recollect it. I believe we did.

*The Commissioner:* Then it comes to nothing.

*Sir Robert Finlay:* It comes to nothing.

*(The Witness withdrew.)*

**ANDREW BRAES, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

Are you a retired master mariner? - Yes.

You hold an Extra Master's certificate? - Yes.

Have you commanded steamers of the Allan Line for the last 17 years? - Yes.

Have you heard the evidence of the last four Witnesses? - Yes.

Is your practice when you may be meeting ice at night similar to their practice? - Just the same. I never slowed down so long as the weather was clear.

**Examined by Sir ROBERT FINLAY.**

And did you hold your course? - Yes, I kept my course.

You kept your course and your speed? - Yes.

In your experience is that the universal practice in the Atlantic? - I never knew any other practice.

*(The Witness withdrew.)*

**Page 735**

**EDWARD WILDING, Recalled.**

**Further examined by Mr. BUTLER ASPINALL.**

Have you prepared a diagram which shows the turning curves of the "Titanic"? - I have got the results of some of the turning circles - in the first place of two circles which were made off Belfast Lough, one of them with both engines at full speed ahead, and the rudder put hard-a-starboard and the ship's head turning to port; and the other one with the helm put hard-a-port, the ship turning to starboard and the starboard engine reversed to full speed astern. Both of those curves were at speeds of between 18 and 20 knots.

*(Handing same to the Commissioner.)* I have also got the results of circles made with the ship, steaming at different speeds, the engines being kept at the same speed going ahead and the helm put hard-a-starboard and the ship turning to port, the speeds being 11 knots, 19 ½ knots, and 21 ¾ knots, and I have plotted the three different circles in comparison. *(Handing same to the Commissioner.)*

Does that complete the information? - No, there is a little more information that I think the Court wishes to have. Since the accident, we have tried the "Olympic" to see how long it took her to turn two points, which was referred to in some of the early evidence. She was running at about 74 revolutions, that corresponds to about 21 ½ knots, and from the time the order was given to put the helm hard over till the vessel had turned two points was 37 seconds.

*(The Commissioner.)* How far would she travel in that time? - The distance run by log was given to me as two-tenths of a knot, but I think it would be slightly more than that - about 1,200 or 1,300 feet.

*(Mr. Butler Aspinall.)* Does that complete the information with regard to the turning circles or curves? - As regards the turning, but my Lord also wanted certain information with regard to stopping with engines reversed and the rudder not put over. 25295. Yes? - The trials that I have were made again off Belfast Lough. Both engines were running at about 60 revolutions, corresponding to a speed of about 18 knots. The helm was left amidships and both engines were reversed. The way was off the ship in about three minutes and 15 seconds from the order to reverse engines being given, and the distance run was just over 3,000 feet. I might mention in that connection that, so far as we on the bridge could see, the engines were not reversed as quickly as we had seen them, and the distance is probably a little on the large side; but that is what we actually observed, and it would be very difficult to put an estimated correction on it.

Does that complete the matter, the curves and the distance the ship would run before she would come to a stop? - That is right.

Then your attention was also directed to this, I believe, whether or not you had made any calculations with regard to the flooding of the "Mauretania" in view of her internal construction. Have you been able to arrive at any certain results with regard to it? - Yes. The calculations, of course, were approximate, because the data available were not complete in the sense in which they had been complete for the flooding calculations that I made for the "Titanic," but made them in conjunction with the Cunard Naval Architect, who gave evidence, and we agreed on the figures as being the best approximation we could make with the data available. We wrote out a brief memorandum giving the results and made a plan which we both initialed, and I propose to put this in.

*(The memorandum was handed in and is as follows): -*

"We have considered by approximate methods the flooding of the 'Mauretania' in the event of an accident similar to that met with by the 'Titanic.' We have assumed the watertight doors and hatches to be closed and similar deductions to those made in the calculations for the 'Titanic.' From the calculations made, taking the vessel as damaged from the stem to the afterend of the forward boiler room (corresponding nearly - but not quite - to the length from the stem to the afterend of the No. 5 boiler room in the 'Titanic') the vessel would remain afloat with a considerable list, say 15 deg. to 20 deg., which, no doubt, could be slowly reduced by carefully flooding some after spaces on the opposite side. With the data available we do not think we can satisfactorily discuss flooding corresponding to the damage extending into No. 4 boiler room in the 'Titanic.' - (Signed), Ed. W.; L. Peskett."

*The Witness:* There is one thing I should like to say with regard to the calculations which have been handed in, because I do not think it appears in the statement. Might I see the statement for a moment? *(The statement was handed to the Witness.)* I see it does not appear in the statement. The calculations show that the vessel would have a considerable list, and in order that the water should not rise above the top of the bulkhead, we had to assume the bunkers flooded on the other side. It would be quite a practicable operation by raising the watertight doors, but they would have to be opened so that the water could get through to the port bunkers.

*(The Commissioner.)* This report of yours has been made in conjunction with the naval architect of the Cunard Line? - In conjunction with the naval architect of the Cunard Line, and we both signed it. It was an agreed calculation. There is just one other matter in that calculation which does not appear, which perhaps should be mentioned, and that is that the flooding of the foremost boiler room in the "Mauretania" was due to the fact that at one place in the boiler room there is only a single skin, and not a double skin, and that materially increased the danger to that vessel.

*(Mr. Butler Aspinall.)* I believe the other matter to which you have applied your mind is marking the profile plan at various places where according to the evidence the water entered the ship. Is that right? - It has not been marked yet; I have undertaken to do it. It is marked on the model.

*Mr. Butler Aspinall:* In order to do that, I suppose what he would want are some steps and a paint brush, or something. I do not know whether your Lordship wants him to do it now?

*The Commissioner:* Oh, yes; we have plenty of time.

*Mr. Butler Aspinall - To the Witness:* Will you do it now?

*(The Commissioner.)* First of all, tell me where those points are marked upon the model?

- They are marked *here* on the model, my Lord. (*Indicating.*) The blue marks the hole. A piece of ice has been assumed to break off and fill the part of the space marked in red. The white paper round the blue indicates the extent of the probable denting, in the middle of which was the hole.

*(The Commissioner.)* The blue marks the hole? - Yes.

Through which the water would come? - Yes.

The red marks the hole plugged? - Yes, by the piece of ice.

And there are five altogether? - Yes, five altogether. I may say the after one corresponds to that damage which is not absolutely proved, but which was under discussion, in No. 4 boiler room.

Now you might go with some red paint and mark the plan? - I could do it now of course, or I could do it before Friday.

*(Mr. Butler Aspinall.)* Your Lordship has already indicated that you wanted him to do it now; the Witness did not hear that.

*The Witness:* I did not understand his Lordship wanted me to do it now.

*Sir Robert Finlay:* I am not sure we have red paint handy.

*The Commissioner:* I think we can make these marks upon our own plans from the model.

*Mr. Butler Aspinall:* If your Lordship pleases.

## **Page 736**

*The Commissioner:* Therefore I do not think it is necessary.

*Sir Robert Finlay:* It might be convenient, my Lord, if it were done on this small model which has been shown. It is very handy. Your lordship recollects it.

*The Commissioner:* Yes.

*Sir Robert Finlay:* It will be convenient if Mr. Wilding puts it upon that.

*The Commissioner:* Yes, then he need not trouble about the other plan.

*Mr. Edwards:* May I ask Mr. Wilding one or two questions, to clear up certain things?

*The Commissioner:* Yes.

### **Examined by Mr. CLEMENT EDWARDS.**

You were asked by the Surveyor of the Board of Trade to trunk the spiral staircase? -

Yes.

If you had carried out that request of the Board of Trade, what difference would that have made on the volume of water in the area of the spiral staircase, do you think? - I do not quite take your question; either I have not heard it all, or something. Is it in the correspondence?

You were requested by the Surveyor of the Board of Trade to trunk the spiral staircase? -

Yes, pardon me, the lower part is trunked already, you know.

Up to where is it trunked? - Up to G deck, I think; it is marked on the big plan there. They wanted you to trunk it up to the saloon deck, did they not? - I think that point was raised at one time.

Supposing that recommendation had been carried out, what difference, in your view, would it have made to the area filled with water in that particular compartment? - None whatever.

Why do you say that? - Because the No. 1 compartment was damaged independently, and No. 2 compartment had to be damaged in order to admit water to the bottom of the spiral stair. As to the water that was admitted to No. 1 compartment, the only difference that it would have made - it might have made this difference - is that the water would have taken a few minutes longer, three or four minutes perhaps, to get to the same level inside the trunked spiral stair than it did take. But that would only have made a difference of two or three inches to the trim of the vessel by the head, and so is quite immaterial.

If the spiral staircase had been trunked in the way that was suggested, would it have been possible for water to have come over that bulkhead? - Over which bulkhead?

The bulkhead abaft the spiral staircase? - Certainly.

The trunking would have made no difference? - No difference.

Why? - Because the trunk would only have been carried up the middle portion of the bulkhead. The sides of the bulkhead were just in the same position as before. 25318. It was not proposed to trunk it all the way along? - Not for the whole width of the ship, as I understand, but round the two spiral staircases. That takes about one-third of the width of the bulkhead and leaves about two-thirds over which the water could flow.

You were also asked this. Perhaps I had better read you the letter. In 1910 you were asked by Mr. Chantler: "I am to state that the following information, as supplied in a previous case by the builders of an unusually large steamer, which greatly facilitates the consideration of these cases, should be furnished, namely, curves of buoyancy, complete curves of load, of shearing force, and of bending movement as applicable to the ship when on the crest, and also in the trough of a wave of her own length, corresponding to the conditions of leaving port, and of arriving at the end of a voyage, with coals consumed." In reply to that letter you say: "With regard to curves of buoyancy and load, showing also curves of shearing force and bending movement mentioned in the second paragraph of your letter, following our usual practice, we have not made out this information in the form you desire to obtain, nor have we found it necessary to do so for previous large vessels, and, as you are no doubt aware, the calculation of it is a very laborious process, and would occupy at least three months. Accordingly, we trust you may be able to see your way not to press for this particular information." And, in fact, they did not press for it? - They did not. May I say that the object of that information would be to supplement the basis on which the strength of the vessel is estimated, and which, I think, Mr. Archer mentioned as being represented by the weight displacement multiplied by the length and divided by 30. The effect of those data asked for would enable them to go into the question as to whether the 30 was exactly the correct figure or not.

That might be a very important factor in determining the strength of a ship of this size? - Yes, to the extent to which it departs from 30. Our experience is that it does not usually depart much.

Anyhow, the view was taken then that the mere fact of much greater magnitude might in itself effect this problem? - Not at all.

I am not saying whether that is right or wrong, but evidently that was the view of the Marine Department of the Board of Trade at the time? - I do not think that view would be held in the least.

“I am to state that the following information as supplied in a previous case by the builders of an unusually large steamer, which greatly facilitates the consideration of these cases”? - Certainly.

Anyhow, the information was not supplied and they did not insist? - It was not made out. I ought to have asked you this question. First of all, the Board of Trade took the view that your collision bulkhead by stepping did not quite comply with their regulation? - Quite right.

And to meet their view somewhat, you undertook to carry up the first bulkhead abaft the collision bulkhead a little higher? - Quite right.

The bulkhead immediately abaft the spiral staircase? - Yes, abaft the upper part of the spiral staircase.

Did that bulkhead in the “Titanic” vary in strength from any of the other bulkheads? - It is on the same basis; that is, all the bulkheads in the “Titanic” were constructed on the same footing for scantlings.

Have you any idea what weight of water might cause that bulkhead to give way at any point? - It is not a question of the weight of water, but a question of the height of water. I tried to explain that before, if you remember.

What height of water in relation to the height of bulkhead would reach either the bending or the breaking strain in the bulkhead? - Any height at all will produce a certain amount of bending; the steel is flexible. But to produce a breaking strain, that is assuming the calculations that were made to be correct, it would take a head of water of about 150 feet to break the bulkhead.

Have you considered the amount of bending that would be caused by different heads of water: take the height of the bulkhead? - I think that one is about 52 or 53 feet - something like that anyway.

Assume the water was up to 45 feet, with the flexibility of the steel, have you any idea to what extent it would cause a bend? - I believe I have got out figures, but I have no recollection what they are.

There would be a certain point reached by the bend which might cause a displacement of the rivets? - That point would not be reached; it was nothing like enough to do that.

Nothing like? - Nothing like.

Have you calculated what extent of bend there must be to displace rivets? - Not for this particular case, but in most riveted structures it goes to something like 7/8ths of the ultimate breaking strength before the rivets give.

If a bend - I am only putting it "if" - if a bend sufficient to cause displacement of the rivets with the weight of the water had in fact taken place, that would indirectly lead to the collapse of the whole thing, would it not? - No.

Assume such a bend by a weight of water as to displace rivets, what was there abaft the bulkhead that would hold it in position? - You say "displace rivets." I am not quite clear what you mean. Do you mean to push them out, or do you mean to make them slightly loose in the hole?

I mean to make them slightly loose in the hole to begin with, and then to cause a movement of the plates or a movement of the stiffeners. I purposely used the term "displacement"? - Go on. I am not quite clear yet.

*Mr. Edwards:* I purposely used the word "displacement."

*The Commissioner:* Yes, but he wants to know what you mean by it.

*(Mr. Edwards - To the Witness.)* There may be degrees of displacement? - Certainly.

There might be the breaking of the head of the rivet? - Yes.

There might be simply a loosening of the rivet? - That would occur, of course, much earlier than the other.

And the moment there was a loosening begun, there might be an accelerated process of displacement? - No, I think not, not an accelerating process.

You think not? - I think not.

Anyhow, you cannot state what would be in your view such a weight of water as would cause a sufficient displacement of the rivets, as to cause the collapse of any part of the bulkhead? - Only the general statement that I made to you, that in riveted structures in general, it would take something like seven-eighths of the collapsing head. I pointed out to you that the collapsing head was something like 150 feet, and therefore a head of something like 130 feet would generally do it. That is only in general terms. 25345. That is where your tank is perfectly still and the water is quite passive? - Or only moderately disturbed.

If there were a swaying movement, that would make a very great difference to the power of the water and the pressure of the water on the bulkhead, would it not? - It would undoubtedly make some difference, and that is why the strength of the bulkhead is so much in excess of the height.

Do not you think after this experience that it might be very advisable, instead of relying upon mere calculations, to get bulkheads practically tested under actual water conditions? - I think I told you that results were known to me of bulkheads which had been tested, and they agreed with the calculation.

That is not quite an answer to my question? - If the test agrees with the calculation, I do not see any reason for testing each one.

But your calculation has been based upon water perfectly passive, but I am putting if there were movement. Do not you think it advisable that there should be actual practical tests of what I will call the resistibility of the bulkhead under actual water conditions, and even a movement of water condition? - How are you to get the movement conditions? It does not seem very practicable.

*The Commissioner:* You can shake water either violently or a little. Do you suggest there ought to be a series of experiments beginning with a slight movement, and then going on to a greater movement, and a greater movement still?

*Mr. Edwards:* I suggest that there should be such tests as will, as near as may be approximate to the actual conditions which these bulkheads are built to resist.

*The Commissioner:* Sometimes they are in a storm, you know.

*Mr. Edwards:* Yes.

*The Commissioner:* Are you to get a storm for the purpose of your test?

(*Mr. Edwards.*) I am afraid, if I suggested that, I might raise one here, and that I am anxious to avoid; but I have the point I want. (*To the Witness.*) Anyhow, your view is that the builders can be trusted in this matter.

*The Commissioner:* I think these are matters which probably the Bulkheads Committee will enquire into. I should think so.

*Mr. Edwards:* Yes, my Lord.

### **Examined by Mr. LAING.**

Mr. Edwards said at page 687 that “either Messrs. Harland and Wolff defied the Board of Trade, or there was extraordinary laxity on the part of the officials of the Marine Department of the Board of Trade, to allow in the construction of this ship a departure from those Rules which they have already laid down.” Is there any foundation at all for saying that you defied the Board of Trade? - I really know of none. 25352. Or that the ship was allowed to be built by the officials of the Marine Department in violation of their Rules? - We have to comply with all their Rules, and make some sacrifices to do so.

*(The Witness withdrew.)*

*Mr. Butler Aspinall:* That is all, my Lord. Subject to the evidence of the Master of the “Carpathia,” and possibly two or three formal documents which the Attorney-General may seem fit to put in on Friday, that is the evidence put before your Lordship by the Board of Trade.

*Sir Robert Finlay:* I do not know whether the Table supplied to us by the Board of Trade with reference to the number of other British vessels has been formally put in?

*The Commissioner:* I think we were to have a Note of the vessels over 10,000 tons which had been built since that Rule was extended from 9,000 to 10,000. *Sir Robert Finlay:* The object of this Table was, as I understand it, to show in a considerable number of British vessels the boat accommodation, as compared with the number of passengers carried or the number of passengers which might be carried; a Table was prepared by the Board of Trade.

*The Commissioner:* And I think one of the things we wanted to know was what number of vessels of 10,000 tons and upwards had been built for the passenger or emigrant service since the Rule was extended from 9,000 to 10,000 ton vessels. *Sir Robert Finlay:* The Table that I had in my mind was a Table not directed to that precise point, but

directed with reference to the number of other vessels, to show what the boating accommodation in fact was.

*Mr. Butler Aspinall:* Is not this it? (*Handing a printed document to the learned Counsel.*)

*Sir Robert Finlay:* Yes. I saw it in manuscript and it is now printed, and I did not recognise it. I will not stop to comment upon it at any length. I will take the “Lusitania” and the “Mauretania,” which appear upon it. The “Lusitania” could carry 2,889, that was her license, and she had boats for 978. The “Mauretania” was licensed to carry 2,972, and had boats for 976; and so on - there are other cases. *The Commissioner:* This is not the list I was thinking of.

*Mr. Butler Aspinall:* It has only just been handed to me, but I think this statement contains the information. (*Handing same to the Commissioner.*)

### **Page 738**

*The Commissioner:* Is this the list, Sir Ellis?

*Sir Ellis Cunliffe:* I think so, my Lord.

*The Commissioner:* Yes, it is the one.

*Sir Robert Finlay:* To avoid misconception, there is a Mr. Blackett in New York, who examined the boats on board after the “Carpathia.” He has made an affidavit. He is not here. I do not know that it is of any great importance, but I may ask on Friday morning to put in that.

*The Commissioner:* Very well; to what point is the affidavit to be directed? *Sir*

*Robert Finlay:* Merely as to the condition of the boats and the equipment of the boats; the state of the boats as regards water and biscuits, and so on. However, Mr. Aspinall asks that that should stand over till Friday morning.

*The Commissioner:* Was Mr. Blackett a passenger? *Sir*

*Robert Finlay:* No, he was a Surveyor.

*Mr. Butler Aspinall:* He was one of Lloyd’s Surveyors. *The*

*Commissioner:* At New York?

*Sir Robert Finlay:* At New York. We have had a letter from the Marine Superintendent of the Red Star Line at Antwerp, which bears a good deal upon the question your Lordship put as to the speed of vessels. It is, of course, a general statement, and I may ask leave to call the gentleman who made it. I could not put in a letter, of course, unless by consent, but I may ask on Friday morning if that gentleman can come over here. He will not take any time. His name is Captain Apfeld, Marine Superintendent.

*Mr. Butler Aspinall:* With regard to the Board of Trade Witnesses, I am instructed to ask your Lordship whether or not your Lordship wishes any of them to remain in attendance. They have been kept here at very great expense, and they are anxious to go to their business.

*The Commissioner:* I do not think that we shall want them again. There is nothing more that occurs to me at present to call for, and therefore I suppose we had better now adjourn till Friday morning. That will give the gentlemen who have to address me an opportunity of considering the subjects upon which they are going to address me.

*(Adjourned to Friday next, 10.30 o'clock.)*

## APPENDIX

The following document was supplied by the White Star Line at the request of Mr. Clement Edwards. -

### “DOMINION LINE.

“To the Commanders: -

“Precautions to be observed in approaching and navigating the St. Lawrence.

“The principal dangers in approaching the St. Lawrence being ice and fog, during the ice season, particularly between February and June, a sharp look-out at all time must be kept for ice. In hazy weather ice-blink can be seen at some distance if the officer on watch is quick enough to distinguish it, but in dense fog you should go slow across the ice track, taking temperatures of the water at regular and frequent intervals of not more than half an hour. Some large bergs when close to will give an echo from the steamer’s whistle, and thereby give you warning. Again, most bergs have a few small detached pieces floating around and near them. Should you see small ice, stop and reverse at once. In the event of your running into thick field or pack ice during fog on the edge of the Grand Banks, it will be best to stop, turn round, and come out the same way as you went in, then steer to the southward to pass around the southern end of it. Remember this kind of ice frequently contains many submerged bergs.

“In approaching the Straits of Belleisle from the Eastward the best plan would be to deviate from the Great Circle course so as to arrive in the latitude of Belleisle Lighthouse about 40 miles East of it, then steer to pass South of the Island. In fog keep sounding; you will be safe in not going into less than 60 fathoms. The Strait should not be entered in dense fog without locating the Island. Even in hazy weather the greatest precautions must be taken, the only safe guide being the lead. After entering the Strait in thick weather take a continuous range of soundings with course and distance between each cast, so as to verify your position by laying this down on the chart.

“In approaching the South entrance pass about 40 miles South-east of the Virgin Rocks. In thick weather commence sounding as soon as you pass the edge of the Grand Bank, taking a continuous range of soundings until you run off the St. Pierre Bank into deep water, then haul up for Cabot Strait to pass midway between Cape Ray and St. Paul’s Island, keeping the lead going so as to keep in the deep water, and proceed with the greatest caution.

“Between Cape Rosier and Father Point in thick weather, the soundings should be very frequent on account of the Hundred Fathom Bank being only two miles off shore in some places.

“Remember that in the St. Lawrence the land is frequently obscured by thick mist or snow, and clear off shore, thereby obscuring the land by day, and the lights by night.

“As it is supposed by many that there is in some parts of the St. Lawrence a certain amount of local attraction, too much reliance should not be placed on the compass. Solar and stellar observations to correct the compasses should be taken at every opportunity. If no observations have been obtained for some length of time, particularly after a change in the course, you must be extremely careful how you proceed, bearing in mind the fact that the tides and currents, both in the St. Lawrence and also in the North and South approaches thereto, vary very much in force and direction, and cannot be relied on at any time.

“July 27th, 1903.”

## In the Wreck Commissioners' Court.

SCOTTISH HALL,

BUCKINGHAM GATE,

*Friday, 21st June, 1912.*

### PROCEEDINGS

THE RIGHT HON. LORD MERSEY,

*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,

CAPTAIN A. W. CLARKE,

COMMANDER F. C. A. LYON, R.N.R.,

PROFESSOR J. H. BILES, LL.D., D.Sc., MR.

E. C. CHASTON, R.N.R.

*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### TWENTY-EIGHTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S. A. T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURNE (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P., (instructed by Mr. Smith, Solicitor) appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes, of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder, Roberts and Company) appeared as Counsel on behalf of the dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

MR. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## **Page 740**

*The Attorney-General:* My Lord, we have had the analysis made of the number of Irish emigrants so far as we are able to distinguish them taking those who shipped at Queenstown, third class, as Irish emigrants; they numbered 113. There were 57 males and 56 females. It is rather difficult to distinguish children, but it makes altogether 113, and there were 7 men saved and 33 women, making 40 altogether saved out of 113, of which a very large proportion is women. That is the substance of the analysis, and I think that answers the question which your Lordship asked. So that it leaves us of the 113, 7 men saved and 33 women; the others were lost.

*The Commissioner:* About 35 percent of the whole.

*The Attorney-General:* Yes.

**ARTHUR HENRY ROSTRON, Sworn.**

**Examined by the ATTORNEY-GENERAL.**

Are you Master of the "Carpathia"? - Yes.

You have been a great many years at sea, I think - how many? - 27.

Altogether? - Altogether.

You have filled every rank in the Merchant Service up to Master? - Yes.

The "Carpathia" is a vessel belonging to the Cunard Company? - Yes. 25358. How long have you been Master of the "Carpathia"? - Since the 18th January. 25359. Of this year? - Yes.

Before that had you been Master of another vessel of the same line? - Yes, the "Pannonia."

At what date did you sail on the "Carpathia" from New York - on what date before the "Titanic" disaster? - The 11<sup>th</sup> April.

On the 11<sup>th</sup> April you left New York and you were then bound for Liverpool, Genoa, Naples, Trieste and Fiume? - No, Gibraltar.

Can you tell me the number of passengers you carried approximately? - We had about 125 first, about 65 second, and 550 third.

How many boats did you carry? - Then we had 18 boats.

Lifeboats? - Lifeboats.

Were they all under davits? - No.

How many had you under davits? - 12 boats under davits.

Were the rest on houses, or how? - No, the rest were inboard; 12 boats were under davits and the other boats were inboard of those boats.

Can you tell me what the carrying capacity of those boats was in persons? - 68 and 72; about 68 was the average.

25369a. And how many passengers could the "Carpathia" carry; how many was she certified to carry, do you know? - About 1,050, I think it was at the time. I am not quite sure of those numbers because I have been absolutely unprepared for these questions. I cannot give you anything definite.

You have just returned? - Yes, I arrived here last night.

Is this your first arrival since the "Titanic" disaster in this country? - Yes. 25372. Will you allow me, Captain, at the earliest opportunity to express to you on behalf of His Majesty's Government how deeply grateful we are to you for your conduct and for the great number of lives which you were instrumental in saving? - Thank you very much.

I take this opportunity of stating it in Court, because it is the earliest moment at which His Majesty's Government has been able to get into communication with you. - Thank you very much.

*Sir Robert Finlay:* I desire to make the same acknowledgment on behalf of the White Star Company.

*The Commissioner:* My colleagues and I entirely agree with these observation of the Attorney-General.

*(The Attorney-General.)* Can you tell us the tonnage of the "Carpathia"? - 13,600.

That is the gross tonnage? - The gross tonnage.

I am not going into further detail as to that; your Lordship appreciates why. I thought you would like the facts.

*The Commissioner:* I should like to know the number of the crew.

(*The Attorney-General.*) Can you tell us the number of the crew? - Well, the number varies from about 300 to 335. It all depends upon the number of passengers we are carrying at the moment.

Do you know at all how many there were on this particular voyage, when you started this particular voyage on the 11<sup>th</sup> April? - 325, I think.

That, I think, will give all the particulars your Lordship wants at the moment in this matter. (*To the Witness.*) Now you started on the 11<sup>th</sup> April from New York, and you received wireless messages from the "Titanic"? - Yes.

Would you tell me, before you received any messages from the "Titanic," had you had any ice reports? - Wireless?

Yes? - None; we had received the ordinary reports on shore from the office, which came through from other ships.

Do you mean the Hydrographic Office at Washington? - No, from our Company's office in New York.

I hardly expect you to remember in detail the wireless messages that were received from the "Titanic," but we have got them? - The first message I received was merely a verbal message. As soon as the Marconi operator received the message he left the instrument room and ran up to me at once, so it was merely a verbal message. 25383. Will you just tell us as far as you can, was the first message that you got a distress signal? - Yes, a distress signal.

That was the first message you received? - An urgent distress message. The Marconi operator told me when he called me.

I am going to help you with regard to the time by reference to the evidence which you gave very soon after the disaster, in New York. I am reading the evidence given at the Commission in America: "At 12.35 a.m. on Monday I was informed of the urgent distress signal from the 'Titanic.'" 12.35 was ship's time? - Yes.

(*The Attorney-General.*) If your Lordship has the last *procès-verbal* which I gave you, the corrected one, you will find at the bottom of page 4 the first one. New York time. 10.35 p.m.; " 'Titanic' time approximate" we have got it, "12.25 a.m. C.Q.D. call received from 'Titanic' by 'Carpathia'" - I cannot say whether it was "C.Q.D." or "S.O.S."

It is the urgent distress message? - Yes.

They might have used the one or the other. I see. Just tell us how you received that? - I was just in bed, as a matter of fact, and the First Marconi Operator came to my cabin and came right up to me and woke me - well, I was not asleep, as a matter of fact - and told me he had just received an urgent distress signal from the "Titanic" that she required immediate assistance; that she had struck ice, and giving me her position. I immediately ordered the ship to be turned round.

That is the wireless which your Lordship sees. "Titanic" said, "Come at once, we have struck a berg; it's a C.Q.D. O.M., position 41.46 N., 50.14 W." The position in which the "Titanic" was when she struck the berg, according to that message, would make her approximately, not exactly to a mile, about 58 miles from you when you got the call? - Yes, the true course was N. 52 deg. W., 58 miles from me when I turned her round.

At what speed could you travel? - Ordinarily about 14. We worked up to about 17 ½ that

**Page 741**

night. That was about the highest speed we made that night.

You gave instructions at once, I understand? - I immediately sent down to the Chief Engineer and told him to get all the firemen out and do everything possible.

25392. And those orders were continued - that is to say, those instructions were carried out until the time you arrived at the position indicated by the message? - Yes.

When you got to the position indicated can you tell us first of all, did you pass any ice? - I was passing ice. May I put it in my own words?

Yes, do? - At 20 minutes to 3 I saw the green flare, which is the White Star Company's night signal, and naturally, knowing I must be at least 20 miles away, I thought it was the ship herself still. It was showing just for a few seconds and I passed the remark that she must still be afloat. Naturally before this I had got the wireless message that the engine room was filling, so I felt it was a case of all up.

That was the last message you ever got? - The last message I received was that the engine room was filling, probably not exactly in those words, but to that effect. 25396. You are quite right, we have the exact message. It has been read? - That was 20 minutes to 3.

*The Attorney-General:* If your Lordship will look at page 8, the message in the middle: "Last signals heard from 'Titanic' by 'Carpathia' - 'Engine room full up to boilers.'"

*The Commissioner:* I want to know, or perhaps the Captain will tell me: What do you read that as meaning - "full up to boilers"? I think we have had that message before?

*The Attorney-General:* Yes.

*The Commissioner:* But I do not know whether anyone can tell me exactly what the message means. What is "full up to boilers"?

*The Attorney-General:* Your Lordship will see, as throwing a little light on it, if you look at the preceding page, the last message but one on page 7: "1.35 a.m. 'Titanic' time; 'Baltic' hears 'Titanic' say, 'Engine room getting flooded.'" Then this message apparently is 10 minutes after.

*The Commissioner:* Yes, but what does "full up to boilers" mean?

*Sir Robert Finlay:* The suggestion was made that "engine room" there must have been used in a loose sense - it did not refer to the engine room proper, but to the boiler section.

*The Commissioner:* That may be, and I think that is right, but what does "full up to boilers" mean? Does it mean the water was above the boilers or under the boilers? *Sir*

*Robert Finlay:* Well, it reached the boilers.

*The Commissioner:* Reached a set of the boilers?

*Sir Robert Finlay:* I think so.

*The Attorney-General:* Including all the boiler sections?

*Sir Robert Finlay:* Yes.

*The Commissioner:* It is suggested to me, Mr. Attorney, that it means this, that the water had travelled along the ship, from forward, aft as far as the boilers.

*Sir Robert Finlay:* I think that is what it must mean.

*The Attorney-General:* As far as the boilers? But, according to the evidence, it was there long before this - in some of the boiler sections. Is there any evidence that before this time (which was 1.45) the water had reached as far aft as the last boiler?

*The Attorney-General:* No, not before that.

*The Commissioner:* It is suggested by one of my colleagues that the meaning of this expression is that water aft had got as far aft as the aftermost boiler.

*The Attorney-General:* In other words, that the water was in all the boiler sections?

*The Commissioner:* Yes.

*The Attorney-General:* Yes, of course it might mean that. There are no boilers in the engine room proper, and, therefore, it cannot mean those.

*(The Commissioner.)* No, that is so. *(To the Witness.)* How do you understand that message? You have got the message in your mind? - Well, I really understood that message to mean that there was water in the engine room probably as high as the boilers, on a level with the boilers.

There are no boilers in the engine room? - No, there are not boilers in the engine room, certainly.

*The Attorney-General:* We tried to elucidate this before, your Lordship will remember.

*Sir Robert Finlay:* I think your Lordship will find that Mr. Wilding said that the water would not get into the engine room until the ship took the final plunge.

*The Commissioner:* Is it not the fact that all the engineers went down?

*Sir Robert Finlay:* Yes.

*The Commissioner:* I cannot suppose that there was any depth of water in the engine room at that time. Not one engineer came up to the surface, as far as I know.

*The Attorney-General:* Oh, yes, they were seen on deck undoubtedly.

*The Commissioner:* When were they seen on deck?

*The Attorney-General:* Almost at the last.

*The Commissioner:* As I understood, they were working in the engine room as long as it was possible to work.

*The Attorney-General:* Yes, I should gather from the evidence that what happened was when the water began to rise they came up on deck, but not till then; they remained there as long as they possibly could.

*The Commissioner:* 1.45 is more than half an hour before the foundering.

*The Attorney-General:* Yes.

*Sir Robert Finlay:* It was only at the last moment that any of the engineers came up.

*The Commissioner:* And not one of them was saved, I think.

*Mr. Laing:* No, my Lord.

25399. *(The Attorney-General.)* I am sorry we interrupted you, Captain. We had got to this. Your last message had come from the "Titanic" at about a quarter to two: "Engine room full up to boilers," this message which we have read? - Yes. 25400. You were making all speed towards her? - Yes.

Will you go on and tell us? - At twenty minutes to three I saw a night signal, as I was saying, and it was just about half a point on the port bow, practically right ahead. At a quarter to three I saw what we knew was an iceberg by the light from a star - I saw a streak of light right on the iceberg. We saw it, I cannot say the distance

off, but some distance - not very far; and from then on till four o'clock we were altering our course very often to avoid the bergs. At four o'clock I considered I was practically up to the position, and I stopped, at about five minutes after four. In the meantime I had been firing rockets and the Company's signals every time we saw this green light again. At five minutes past four I saw the green light again, and I was going to pick the boat up on the port bow, but just as it showed the green light I saw an iceberg right ahead of me. It was very close, so I had to port my helm hard-a-starboard and put her head round quick and pick up the boat on the starboard side. At 10 minutes past four we got alongside.

Let me just understand that. You had got up by about four o'clock? - Four o'clock I considered I was in the position.

You got up to the first of the boats then? - At four o'clock I could not see anything, but I knew I must be somewhere in the vicinity.

Because of the signals? - Well, yes, I had seen the signals, but I knew I had run my distance then, so I stopped her; and a few minutes after I saw the boat's light again. That was the first time I knew really it was a boat and not the ship herself.

And you intended, as I follow you, to pick her up on the port bow? - Yes, on the port side; that was the lee-side; but just after I saw his light I saw an iceberg right ahead. Then, of course, I starboarded - I could not port - to get away from the berg; so I starboarded to make it more convenient

## **Page 742**

for the boat I was going to pick up, and I picked it up on the starboard side.

How close was the iceberg which you saw? - Well, when we had stopped, when daylight broke, it was something less than a quarter of a mile away.

I should like to follow that to understand it. Had you seen that iceberg before? - No, it was the first I saw of it. We were close up before we saw it.

Was day breaking at all? - No, it was perfectly dark at the time.

And you had men on the look-out? - Yes, we had doubled our look-outs.

Had you men in the crow's-nest? - Yes.

When you say you doubled the look-out, does that mean you had also men in the eyes of the vessel? - Yes. 25412. Right on the stem? - Yes.

Two? - Two, and one on the look-out, one in the crow's-nest and two in the eyes.

Is that your practice? - No, we have one in the crow's-nest and one forward. 25415.

Your practice is to have one in the crow's-nest and one forward? - At night. 25416. Do you take any particular precautions if you have received ice reports? - Always.

Is that what you do? - Yes. Immediately I started round, before I knew we should be up to the ice; in fact, as soon as I got this report, and I had put her on the course for the "Titanic's" position, I doubled the look-outs at once, and took all the precautions I possibly could.

Was that the first iceberg that you had seen? - Oh, dear, no.

I mean, on this particular night? - Oh, no; the first iceberg we saw was at a quarter to 3.

I wanted you to tell us about that. You saw one at a quarter to 3? - We saw about half a dozen - in fact, more than that. I was moving about to get between them up to 4 o'clock.

No ice-field? - No ice-field. We were not up to the ice-field then.

Only icebergs. Take the first one you saw about a quarter to 3; how far off was it when you first saw it - when it was reported to you? - I should think it was about a mile and a half to two miles away.

And with regard to the others, I think you say you saw about six up to 4 o'clock? - Yes, about six.

Did you see all those at about the same distance? - Yes, about the same distance - from one to two miles.

Then, I understand, when you came to the last one - you will correct this if I am wrong - as far as I gather from your evidence, you did not see that till it was somewhere about a quarter of a mile off? - That is so; at daybreak I saw it was between 25 and 30 feet high.

Will you explain to us a little more in detail why it was that you did not see this iceberg, the one which you found about 4 o'clock, earlier? - I cannot tell you; we were all on the look-out.

It was rather low? - It was low.

Twenty-five to 30 feet. I do not know whether you can tell us what the height of your fore-castle was from the waterline? - Yes; the fore-castle head would be just about 30

feet.

Your two men were on the look-out then in the eyes of the vessel? - Yes.

No report had been made to you? - No.

Who was it saw it first, do you know? - Yes, I saw it first.

Before the look-out men? - Yes, we saw all the icebergs first from the bridge.

*The Commissioner:* I do not understand that.

*(The Attorney-General.)* You were on the bridge with your officers, I presume?

- Yes, the whole time.

And each time, if I follow you, that an iceberg was seen, you picked it up first on your bridge? - Either one of my officers or myself, before the look-outs.

Did you pick it up by sight, or by naked eye, or with binoculars? - At first with the naked eye.

Do you find that you pick them up better with the naked eye than with binoculars? - It all depends. Sometimes yes, at other times not; it depends.

How was it neither of the look-out men saw it or reported it to you? Why did not they see it before you? - Well, of course, they had all had warning about keeping a look-out for growlers and icebergs, previous to going on the look-out, and on the look-out also. You must understand, unless you know what you are looking for, if you see some very dim indistinct shape of some kind, anyone could take that as nothing at all - merely some shadow upon the water, or something of that kind; but people with experience of ice know what to look for, and can at once

distinguish that it is a separate object on the water, and it must be only one thing, and that is ice.

So that what it really comes to is this, if I follow you correctly, that it requires a man with some knowledge of icebergs, some experience of picking them up before he can detect them at night? - Precisely.

That is to say, before he could detect them unless they were very close to him? - Yes.

Do you employ on the "Carpathia" special look-out men, or are they some of your seamen who are told off as look-out men? - No, the seamen take it in turns, the whole watch right through. There are no special look-out men.

So far as you know, had any of these men any experience in being amongst icebergs? - Not to my knowledge, but I should imagine some of them must have had, because several of them have been in the Cunard Company for years.

On this North Atlantic track? - Oh, yes.

And if they had been on this track for some years they must have seen icebergs?

- I think so, yes, they must have done.

Does it mean that on your bridge you and your officers were quicker in detecting them than any of the men on the look-out? - Well, about 75 percent of the objects that are seen at sea every day or night are picked up from the bridge first. Naturally the officer will take more interest in these things than a look-out man. I always trust to the bridge preferably to the men.

(*The Commissioner.*) That is the point I had in my mind. I do not see any advantage in putting men in the eyes of the ship if you can pick up things from the bridge before them?

- It does not necessarily say we shall pick them up quicker from the bridge, but naturally an officer is more on the *qui vive*; he is keener on his work than a man would be, and he knows what to look for. He is more intelligent than a sailor. 25446. (*The Attorney-General.*) And he has to act? - He has to act, certainly.

He relies upon his eyesight, assisted by the look-out? - Yes, that is the position; we are assisted by the look-outs.

If I followed correctly what you said, you rely in the main upon what is seen from the bridge by the officers? - Yes.

Of course, it may be that the officer is, for the moment, attending to something else; his attention may be distracted by something else which is happening, and in that case he would have to depend on the look-out? - Well, the only thing is, supposing an officer is looking on the port side and there is an object on the starboard side, and the seaman happens to be looking on the starboard side, naturally he might detect it first and he would report it.

(*The Commissioner.*) Were you on the bridge? - I was.

25450a. You cannot account to me for your seeing some of these bergs a couple of miles away, but not seeing this particular one till it was about a quarter of a mile away? - No.

You cannot account for it? - No.

It happened to yourself? - I cannot account for it at all.

It did happen to yourself? - Yes, it did happen.

(*The Attorney-General.*) That would seem to indicate a considerable risk in going through the ice region, does it not? - Yes.

(*The Commissioner.*) Is that a common experience, that when you are amongst icebergs you will detect one two or three miles away and another not till it is within a quarter of a mile? Is that within your experience? - No, I do not think it is common experience. I think it is rather uncommon, as a matter of fact. 25456.

(*The Attorney-General.*) Rather uncommon? - I think so.

I want to understand this a little more if we can. If I correctly followed you, you said you only saw this one at about a quarter of a mile distance from you by the streak of a star upon it? - No, the first one I saw was about one and a half to two miles away; that was the one we saw at about a quarter to three with the streak of the star. That was the first one we picked up; it was a large one.

That one we understand, but this last one that you saw about 4 o'clock when you were getting ready to pick up the boat on the port side, was there anything at all special about the colour of that iceberg? - No, but I suppose it must have been because of the shadow or something of that kind that we could not make it out before. I cannot account for it.

Does it sometimes happen? - Yes, very often.

It may be, the iceberg presents to you a luminous appearance? - Yes.

Or it may be, it presents to you a dark appearance? - Exactly.

That is what you would ordinarily expect when you are looking out for icebergs, is it? - Yes.

You cannot tell from which side you are going to see it? - No.

Or how it is going to present itself to you in appearance? - No.

So that if I follow what you have said, you would always have to be prepared for an iceberg which presented a dark appearance to those who were looking out for it? - Yes.

(*The Commissioner.*) I do not understand where the shadow comes from; there is nothing to create a shadow. There were no clouds in the sky? - No, my Lord, there were no clouds, but the shape of the iceberg itself might account for it. Now this iceberg was about 30 feet high and the sides were rather precipitous. If the side had been more of a slope, do not you think that slope would have given off some shadow?

If you have a greater surface and there is anything in the theory about "blink," you would have more blink if you had a greater surface, and so you might have a dark place if the iceberg itself had a crevice in it or a break. I can imagine that, but I do not know where the shadow comes from.

(*The Attorney-General.*) I do not profess to know sufficiently about it. It may depend upon the angle of refraction. I do not profess to be able to explain it better than that. (*To the Witness.*) At what speed were you going when you saw this iceberg about a quarter of a mile from you? - I should think we were making something about 15; the engines had been stopped for about three minutes - probably between 13 and 15 knots at the time.

But slowing all the time? - Oh, it was slowing all the time - yes.

You starboarded, you have told us? - Yes, I starboarded, and we picked up the boat on the starboard side.

Will you tell me, when you starboarded, how close did you get to the iceberg? - When daylight broke I consider the iceberg was then a little under a quarter of a mile away.

I am not quite sure that we have got it correctly yet. When you saw this iceberg I rather understood that it was then about a quarter of a mile away from you? - Between a quarter and half a mile.

Then you say, although your engines had stopped and had been stopped for something like three minutes, you were still making somewhere about 13 to 15 knots? - Yes.

Then I want to know how close it was - you had an iceberg within your range of vision then - you went to the iceberg when you starboarded? - *This* was the boat over *here*. (*Describing*.) I did not know the distance off. *Here* was the iceberg right ahead. I was coming along *there*; I saw the iceberg right ahead *here*, and I saw the light was on my port bow. Of course, I could not see the boat itself, but only the light when he showed the flare. I came along *here* and starboarded, and brought her *here*. Then I saw the light on my starboard side. I saw the light showing. It was getting close. I went full speed astern. I went a little bit past the boat before I could get the way off the ship, and I came back again, because they sang out from the boat that they had only one seaman, and could not handle her. I brought the ship back to the boat. When the boat was alongside of me daylight broke, and I found the berg was about a quarter of a mile off.

Had you been any closer to the berg than that? - No, that was the closest I had been.

That answers what I wanted to know. Bearing round like that in answering the helm, she was still about a quarter of a mile from you? - Yes.

You picked up that boat. Altogether how many boats did you pick up? - We got 13 lifeboats alongside, two emergency boats, two Berthon boats. There was one lifeboat which we saw was abandoned, and one of the Berthon boats, of course, was not launched from the ship, I understand. That made twenty altogether.

My impression is there is one collapsible still unaccounted for in that? - Oh, yes; I beg your pardon, one bottom up; one that was capsized. That was in the wreckage. That was the twenty.

You picked up and actually took on board the "Carpathia" 13 of the "Titanic's" lifeboats? - Precisely.

One of them you saw; the occupants of the boat were rescued and taken on your boat, but the boat was left in the water? - Yes, she was damaged.

You did not bother any more about her? - No.

That made the 14 lifeboats. Then there were the two emergency boats; were they taken on board the "Carpathia," or abandoned? - I cannot say which were the boats we took up. I took them as they came along, and after the whole thing was over we got as many boats as we could. I did not notice which they were.

There were two emergency boats, and besides that there were -? - The two Berthon boats.

The two collapsibles? - Yes; and there is one Berthon boat which we saw amongst the wreckage bottom up. It was reported to me that there was another Berthon boat still on board the ship.

That makes 19 out of the 20? - No, excuse me.

It makes the 20 if you reckon the one still left, but I am not reckoning that. It comes to the same thing. If you reckon that one in, of course it accounts for the lot.

*The Commissioner:* The one collapsible boat was not launched in the proper sense of the word; it got into the water, very likely?

*(The Attorney-General.)* Yes; Bride's evidence was with regard to that. That is quite right; that made the 20. *(To the Witness.)* I do not know if you have the figures available, but can you tell us how many persons were taken on board the "Carpathia" from these various boats? - It was reported to me that 705 was the number of survivors, and we took three dead bodies from one of the boats, and also, not counting the 705, there was another man, a passenger we took up from the boat, who died two or three hours after we got him on board.

That is not counted in the 705? - No.

There were 705 survivors? - Yes, we landed in New York 705.

And then there were four, three were dead and one died? - Yes, he died two or three hours after coming on board.

*The Attorney-General:* We make it 711 somehow; I do not know how.

*The Commissioner:* This is 709.

*The Attorney-General:* There is some discrepancy in this; I will try to clear it up. There are 705 of

## **Page 744**

which we have a list. There are six persons who were saved whose names did not appear in the list of the 705, but according to our knowledge now were actually saved by you, so that that would make 711 altogether were saved. That is not including either the three bodies found or the one which died shortly after. *The Commissioner:* I do not know that it matters.

*The Attorney-General:* I am trying to give you the figures so that your Lordship can answer one of the questions. That is the point of it. It involves going into some detail through the evidence in America, but the substance of it is this: the 705 who survived and were landed at New York are included in a list which we have got from the "Carpathia" from America, but besides that there are six persons who were saved on the "Carpathia" who are not included in that list.

*The Commissioner:* Who prepared the list?

*The Attorney-General:* We have the names from cables; they are among the first class passengers who were saved according to the cable information which we have. What I am dealing with is the evidence which was taken in America. We cannot do more than that.

*The Commissioner:* What is the importance of ascertaining the exact number? *The Attorney-General:* I do not think anything, except that as far as possible we want to give you the figures as accurately as we can.

*The Commissioner:* There is a question directed to it?

*(The Attorney-General.)* Yes. It is desirable to know, so far as we can know. I think the difficulty is that more apparently were saved than Captain Rostron had included in the particular list. I do not know that he made out the list, but it was made out.

*The Witness:* The Pursers made out the list.

*The Commissioner:* But it is very small.

*The Attorney-General:* Yes.

*The Commissioner:* At most, six.

*The Attorney-General:* Yes, it does show that six more were saved than that list would indicate. There were some first class passengers which would make altogether 711. That is the position. I do not think it is worthwhile spending time on it.

*The Commissioner:* Seven hundred and eleven living persons from the "Titanic" were landed in New York.

*(The Attorney-General.)* Yes, by the "Carpathia." *(To the Witness.)* Now, from the time that you began to take the passengers on board the "Carpathia" from the boats, was it daylight? - Daylight was breaking just as we were taking the passengers up from the first boat. By the time we got them on board there was sufficient daylight for us to see the boats in the immediate vicinity of the ship.

I want to ask you some questions about that. You saw the other boats when you were taking the persons out of the first boat? - No, it must have been a quarter of an hour after I got them all on board that I saw the other boats. It was not sufficiently light to see the other boats. They were within a range of four or five miles.

The passengers from the first boat you had got on board before you saw any more? - Yes, before we saw any more boats.

In the meanwhile was it becoming lighter? - Yes, it was getting lighter all the time.

Did you see them all very quickly one after the other? - Yes, daylight broke very quickly, and we picked them up here and there within a range of four or five miles, as I say.

I want you to give the Court your impression with regard to these boats, as to whether or not they were full, or whether they could have accommodated more persons, so far as you could see? - Several of the boats could have accommodated a good many more people, and two or three boats were rather crowded, I thought.

I need not pursue that in detail, because we have more exact evidence of it, but I thought it was right to ask you. That agrees, your Lordship sees, with evidence which we have got. *(To the Witness.)* Did you see any wreckage at all of the "Titanic"? - The only wreckage we saw there was very small stuff - a few deck chairs and pieces of cork from lifebelts, and a few lifebelts knocking about, and things of that description, all very small stuff indeed. There was very little indeed.

Any bodies in the water? - We only saw one body.

Would this be between four and six o'clock or something like that? - When we got up to the wreckage it would be about twenty minutes to eight, or a quarter to eight, or something like that.

But you had been close to the spot for some time, had you not? - Yes, but we had not seen this wreckage. We had been dodging about picking up the other boats. I had not any idea where the wreckage was. As soon as we had finished taking the passengers from the boats I cleared off to another boat to pick them up, and was dodging about all over the place to pick them up. It was only when we got to the last boat that we got close up to the wreckage. It was close up to the wreckage. It would be about a quarter to eight when we got there.

*(The Commissioner.)* I understand you to say those boats were spread over an area of five miles? - Four to five miles, yes.

*(The Attorney-General.)* In the morning, when it was full daylight, did you see many icebergs? - Yes, I sent a junior officer to the top of the wheelhouse, and told him to count the icebergs 150 to 200 feet high; I sampled out one or two and told him to count the icebergs of about that size. He counted 25 large ones, 150 to 200 feet high, and stopped counting the smaller ones; there were dozens and dozens all over the place; and about two or three miles from the position of the "Titanic's" wreckage we saw a huge ice-field extending as far as we could see, N.W. to S.E.

About two to three miles from the "Titanic's" wreckage? - Yes.

Had you seen anything at all of that ice-field before it became daylight? - Oh, no, nothing; it was quite daylight before we saw the ice-field.

You must have been close to it? - We were then about four or five miles from it when we first saw it.

In the full daylight? - In full daylight, yes. We saw the bergs in the ice-field, but we did not see the field itself. There were numerous bergs among the ice-field. 25506.

You had not seen those till daylight? - No, we had not seen those till daylight; they were too far away.

25507. As I understand, from what you tell us, you saw six bergs from a quarter to 3 to 4 o'clock? - Yes, we passed those to get up to the position.

The number of icebergs of which you have told us, you did not detect at all in the night? - Well, we passed a lot of them on our way to the position; we must have done, because they were astern of us; they were all round us.

That is what made me ask you the question; because it would seem to indicate you were in amongst the icebergs without knowing it? - Yes, we had not the faintest idea. 25510.

And, therefore, they were not easy to pick up by the eye? - No, they were very hard to pick up, as a matter of fact.

We know the one you have told my Lord in detail about was only a quarter of a mile off; were the others close to you? - Do you mean the others that we saw?

No; what I want to know is this: When it got daylight, as I understand you, there were a number of icebergs all round you? - Yes.

Of which really you had only seen, so far as you know, this one which you had starboarded to avoid, when you were going to pick the boat up? - Yes.

You had only detected that one in the night? - No, those that we saw on our way to the position were included in those we could see at daylight. We must have passed some of

those on our way, because they were right in the course which we had come. 25515. Did I understand there were six altogether that you saw? - Yes, that we knew of.

## Page 745

I am dealing with the number of icebergs you saw. From a quarter to 3 to 4 o'clock you picked up with the eye six icebergs? - Yes.

When it cleared up and got daylight, and you were more or less in the same place, you found yourself surrounded by icebergs? - Yes.

You have told us there were a great many, and some of them 150 to 200 feet high? - Yes. But the point I wanted to be quite clear about was that these icebergs must have been close to you without your seeing them? - They must have been, yes.

I wanted to know if you could tell us how far off the nearest one was, leaving out the one which was only a quarter of a mile from you, of which you have told us in detail? How far off was the nearest berg, so far as you can tell us, of 150 to 200 feet high when full daylight came and you could see plainly? - Somewhere about three or four miles.

That would be about the closest? - Yes, that would be about the nearest. 25522. That would seem to indicate that it must have been particularly difficult to pick them up by the eye that night? - Under certain circumstances, yes. Of course, it all depends what you are looking for. If you know what you are looking for, you pick them up better than a man who does not know what he is looking for.

Was there anything, so far as you know, peculiar in the atmospheric conditions that night? - No, I never saw a clearer night. It was a beautiful night.

So far as you could see, you ought to have been able to pick them up easily, or comparatively easily? - Comparatively easily, yes.

If you are looking out for them? - If you are looking out for them.

If you are not particularly directing your attention to picking up icebergs, you might not see them, although they are close to you? - That is so. May I give you one more instance?

Yes, do. - We starboarded for this iceberg, which we saw ahead. When daylight broke and we were picking up the passengers from the first boat, I was looking round and 200 yards on my port quarters I saw a lump of ice twenty feet long and ten feet high, which we had not seen at all.

I think there is only one other matter I want to ask you about. You have navigated for a good many years on this North Atlantic track? - Yes.

And you have often seen icebergs on this track? - Yes.

Have you seen them during this particular month, April, on this track? - I never remember seeing ice in April on the track.

Supposing you had had a wireless message giving you the position of icebergs, and an ice-field or ice-fields, which you would reach in the ordinary course of things within a few hours, what precautions would you take when approaching that region, if any? - A great deal would depend. Do you mean at nighttime?

Yes? - Well, it is very hard to say what I should do, but I think I should do my best to get out of it, to avoid that position. But if an iceberg is reported, it is no use altering

your course and trying to avoid it when you do not know where it is. From the time it was reported near the vessel it may have drifted four or five or ten miles, and you might as well keep on your proper course. But if it is an extensive ice-field, we know it covers some area, and of course with an ice-field, I think I should try to get out of it; otherwise I do not know.

You mean you would not go out of your course? - Yes, for an ice-field, but for an iceberg, no. I do not think I should. I should rely upon keeping a look-out, and the weather and things of that kind.

You would attempt to keep out of the way of ice-fields and alter your course, but for icebergs you would go on your course and depend upon picking them up with your eye, and then avoiding them when you have picked them up? - Yes.

I think you have already told me, but I should like to make quite sure of it, that you would take special precautions with regard to the look-out by putting men in the eyes of the vessel? - Yes.

When you had an ice report? - Yes.

As well as having a man in the crow's-nest? - Yes.

*(The Commissioner.)* Do you put two men in the crow's-nest, or one? - I only put one.

*(The Attorney-General.)* And two in the eyes? - Yes.

*The Commissioner:* In the "Titanic" they had two in the crow's-nest, and it occurred to me it would be almost better to have only one. I do not know whether that is right.

*The Attorney-General:* The same idea in your Lordship's mind would apply to the two men in the eyes.

*The Commissioner:* I am not sure.

*The Attorney-General:* They cannot talk so easily, I agree.

*The Commissioner:* In the crow's-nest they are rubbing shoulder to shoulder. 25540.

*(The Attorney-General.)* Yes, it is not quite so easy, I agree. *(To the Witness.)* I have one other matter I want to know. Supposing you had had a report of the character that I have indicated to you of icebergs and an ice-field in the regions which you are bound to cross, when you approach that region, would you take any precautions with regard to the safety of your vessel? - Well, a great deal would depend on the weather and the atmospheric conditions.

*(The Commissioner.)* Suppose it is perfectly clear? - If it is a perfectly clear night, and I was sure of my position and everything else, unless I knew there was a lot of ice about, I should feel perfectly justified in going full speed.

*(The Attorney-General.)* But if you thought there was a lot of ice about you would not do it, I gather? - No, I would not. For one or two bergs I should feel perfectly justified in going full speed.

*(The Commissioner.)* I suppose it is a matter for the judgment of the man in charge of the ship? - Absolutely.

*(The Attorney-General.)* Which again, I suppose, must depend upon the atmospheric conditions as to whether he can see clearly ahead? - Yes. We have to take a whole lot of things into consideration in a thing of that kind. It is not one or two; it is many.

*The Commissioner:* Do you want to ask him anything, Mr. Scanlan? *Mr. Scanlan:* No.

**Examined by Sir ROBERT FINLAY.**

You gave evidence in America? - Yes.

May I put one passage to you? You were asked this by Senator Smith. I am reading to you from the evidence in America. "Captain, is it customary to take orders from a director or a general officer of the Company aboard? - (A.) No, Sir. (Q.) From whom do you take orders? - (A.) From no one. (Q.) Aboard ship? - (A.) At sea, immediately I leave port until I arrive at port, the Captain is in absolute control and takes orders from no one. I have never known it in our company, or any other big company, when a director or a managing owner would issue orders on that ship. It matters not who comes on board that ship, they are either passengers or crew. There is no official status and no authority whatever with them." That is correct? - That is correct. 25547. Did you know Captain Smith? - Yes.

He was a very experienced officer, I think? - Yes, very.

Of very high standing? - Very high, indeed.

*Mr. Bucknill:* My friend, Mr. Dunlop, unfortunately, is unable to be here at the present moment, and he has asked me to apply to your Lordship for leave to read an affidavit, it is a very short one, which Captain Rostron made.

*The Commissioner:* Just postpone it for a minute.

*Mr. Bucknill:* Captain Rostron made it.

**Page 746**

*The Commissioner:* Oh, yes.

*(Mr. Bucknill.)* Perhaps I had better read it and ask him if it is correct. *(To the Witness.)*

On the 4th June did you make an affidavit in New York? - Yes.

Did you say then: "I approached the position of the "Titanic" 41.46 N. L., 50.14 W. L. on a course substantially N. 52 W. (true), reaching the first boat shortly after 4 a.m. It was daylight at about 4.20 a.m. At 5 o'clock it was light enough to see all round the horizon. We then saw two steamships to the northwards, perhaps seven or eight miles distant. Neither of them was the 'Californian.' One of them was a four-masted steamer with one funnel, and the other a two-masted steamer with one funnel. I never saw the

'Mount Temple' to identify her. The first time that I saw the 'Californian' was at about eight o'clock on the morning of 15th April. She was then about five to six miles distant, bearing W.S.W. true, and steaming towards the 'Carpathia.' The 'Carpathia' was then in substantially the position of the 'Titanic' at the time of the disaster as given to us by wireless. I consider the position of the 'Titanic,' as given to us by her officers, to be correct." You swore that? - Yes.

*(The Attorney-General.)* Does that state all the vessels that you saw? I think it stated two steamers? - No; I saw one more, but it was during the night previous to getting out

of the "Titanic's" position. We saw masthead lights quite distinctly of another steamer between us and the "Titanic." That was about quarter-past three.

The masthead lights? - Yes, of another steamer, and one of the officers swore he also saw one of the sidelights.

Which one? - The port sidelight.

Do you know of any identification of that steamer at all? - No; we saw nothing but the lights. I did not see the sidelights; I merely saw the masthead lights.

*Mr. Bucknill:* May we have the distance and bearing of these lights that he saw, as far as he can remember?

*(The Commissioner.)* You did not see the additional lights yourself, the sidelight? - I saw the masthead lights.

Did you see the lights your officer spoke of? - I saw the masthead lights myself, but not the sidelight.

What time was it? - About a quarter-past three.

And how was the light bearing? - About 2 points on the starboard bow.

On your starboard bow? - On my starboard bow; that would be about N. 30, W. true.

I should like to ask you one or two questions. When the boats came up, or when you got alongside the boats, were the people in the boats wearing lifebelts? - Everyone we saw in the boats was wearing a lifebelt.

Can you give me any idea what the thickness of these lifebelts is? - About 4 inches - 3 to 4 inches.

*The Attorney-General:* We can produce one, if your Lordship wishes.

*(The Commissioner.)* No, that is quite sufficient. I am asking for this reason. It is said by, at all events, one of the Witnesses that one reason why the lifeboats did not carry more than they in fact carried, was that all the people in the lifeboats were wearing lifebelts, and you cannot stow them so closely as you could stow people without lifebelts. I suppose there is some truth in it? - There is some truth in that.

You saw the passengers that you landed at New York, and must have conversed a good deal with them? - No.

Did you not? - No, I did not speak to half a dozen passengers the whole time.

Did you hear no explanation at all as to why these boats were not better filled? - No. The only explanation I got was when the boats first left the "Titanic" the people really would not be put in the boats; they did not want to go in, and I understand that some of the boats that left first had fewer people in. That is all I know about it.

That is what I wanted to know. You heard that explanation given yourself? - Yes.

I wish you would tell us again what you know about the collapsible boats. There were four collapsible boats on board the "Titanic"? - Yes.

How many came alongside your ship, or did you get alongside of? - Two. 25570. Did you see any collapsible boat adrift? - We saw one adrift bottom up amongst the wreckage of the "Titanic."

25571. Then you only know of three boats? - We only know of three collapsible boats.

25572. As to what became of the other boat you know nothing? - Nothing whatever, my Lord.

25573. What condition were those collapsible boats in that you did come alongside of?

- In perfect condition.

25574. There were people in them, I suppose? - Oh, yes, they were full. Both the collapsible boats we took alongside were full of people. *The Commissioner*: Thank you very much for your evidence.

*(The Witness withdrew.)*

**GERHARD CHRISTOFER APFELD, Sworn.**

**Examined by Mr. ROWLATT.**

Are you the Marine Superintendent of the Red Star Line? - I am.

Is that a Belgian line of steamships? - Yes.

You live in Belgium? - Yes.

They sail from Antwerp to New York, Philadelphia, Boston and Baltimore, do not they? - Yes.

They carry passengers and mails? - That is right.

Have you experience at sea? - Yes.

How many years? - I have been 39 years at sea, and five years Marine Superintendent.

How long have you been in the Red Star Line? - 32 years.

When you have been navigating in the region of ice, have you changed your course or speed? - Never. I slow her down in the case of fog or thick weather, otherwise not.

Is that the case, although ice has been actually reported to you? - I would not slow her down.

Have you examined the deck logbooks and the engine logbooks of the steamers of your line running the Atlantic passage during April last? - I have.

What steamers are those? - The "Finland," the "Manitou," the "Kroonland," the "Zeeland," and the "Vaterland," and the "Minomini."

Do those logbooks show whether those vessels passed ice? - Some of them.

Which of them? Can you remember? - The "Lapland" and the "Manitou"? - The "Lapland," the "Finland," and the "Manitou," and I believe the "Zeeland."

25589. They all passed ice? - Yes.

Where were they going to, to New York? - They were going to New York except the "Manitou" and the "Minomini," which were going to Boston.

Did they change their course or their speed? - Absolutely not. The "Manitou" slowed down after she entered the field ice. She went into

**Page 747**

field ice at full speed for about an hour and then the field ice became thick, heavy lumps amongst it, and her Captain slowed her down for about an hour. He reduced speed for fear of damaging the propeller.

What date was that? - I think it was the 14th or 15th.

The 14th, the very day of the "Titanic" going down. I thought it was the 12th? - Yes, the 12<sup>th</sup>.

You think it was the 12th? - Yes.

You have the logbook if necessary here, have you not? - Yes.

Can you tell us what boats these ships carried, the "Lapland," the "Vaterland," the "Zeeland," and so on? - Yes, the "Vaterland," the "Zeeland," have 14 lifeboats and two gigs under davits.

(*The Commissioner.*) Two emergency boats? - Yes. The "Lapland" has nine collapsible boats, the "Zeeland" has seven collapsible boats, the other three had eight collapsible boats.

(*Mr. Rowlatt.*) Here is the list. (*Handing same to Witness.*) I think you have added some since the wreck of the "Titanic"? - Yes, since then.

Look at the list. There is a list of ships and boats, and are those that are underlined in black the ones which have been added since the "Titanic" went down (*Handing same to Witness.*)? - Yes, all above the black line were there before.

All under the black line have been added? - Yes.

(*Mr. Rowlatt.*) I was wrong; it is not underlined; it was under the line. I do not know whether that shows it; I do not think it does, but for what percentage of the passengers and crew do you provide boats? - Before the disaster to the "Titanic" about 50 percent, roughly speaking.

Are there any regulations in Belgium as to the boats which must be carried on passenger steamers? - No, we go by the regulations of the American law and the Board of Trade.

(*The Commissioner.*) The British Board of Trade? - Yes.

(*Mr. Rowlatt.*) That is because you call here? - We call at Dover.

You get a passenger certificate from our Board of Trade? - We do.

That involves a certain survey? - Yes.

Do your steamers follow the tracks agreed in 1898? - We do, yes.

I think in your early days you went further North, did you not? - We reported in former years at Cape Race.

You went to Cape Race so as to signal? - Yes; we went North of the Virgin Rocks and reported at Cape Race.

### **Examined by Sir ROBERT FINLAY.**

Can you tell me anything with regard to temperature as an indication of being near icebergs? - Absolutely none. I have tried that so often. I have gone across the banks, where I had the temperature down to 28 or 31 bright clear weather, night and day, and absolutely no ice. At other times I have been close to ice.

*Sir Robert Finlay:* I do not know whether your Lordship caught the last answer.

*The Commissioner:* Will you repeat it?

(*Sir Robert Finlay - To the Witness.*) Will you repeat what you said? I understood it was to this effect. He began by saying that he had often been in a very low temperature, absolutely no ice, and then he was going on. (*To the Witness.*) Just

repeat what you said? - Sometimes we took the temperature, and on passing a mile and a half or two miles from a mile of icebergs, and found a temperature up to 55 and 56 degrees. One of our Captains during the April voyage marked in his logbook what temperature he had. 25612. Was that the "Finland"? - That was the "Finland," yes.

Is that the log? (*Handing same to Witness.*) - Yes, the Captain made an entry in the logbook.

*The Commissioner:* I think, Sir Robert, that the effect of the evidence so far is that a fall in the temperature cannot be relied upon as indicating the presence of ice. *Sir Robert*

*Finlay:* If your Lordship pleases. Then I need not trouble. There is an illustration there that they passed icebergs with certain temperatures.

*The Attorney-General:* I think the only comment I should make with regard to the evidence is this. Speaking for myself, having considered it, and more especially having regard for some observations of your Lordship during the course of the evidence, I think it would rest thus, that it does not necessarily follow that a fall of temperature would indicate the vicinity of ice. But there is this comment to be made - it is the only comment which I propose to make - that if you are approaching a region in which you expect to find ice, in consequence of reports which you may have received, a fall of temperature then may be an indication to you, but by itself not, I agree.

(*Sir Robert Finlay.*) Perhaps you will read that entry from the log of the "Finland"? - "At 2.50 p.m. to 4 p.m. passed nine large icebergs between latitude 41° 28' N. and 40° 58' N., and longitude 46° 7' W. and 46° 42' W." It says, "We were nine miles off the iceberg when we had a temperature on one occasion of 42 degrees"; when he came close to the iceberg, one mile, he had the same temperature of 42 degrees. The same night he passed several other bergs where he had 56 degrees, 12 miles off and again one mile off, the same temperature. Absolutely, you cannot tell by that.

You have told us the practice is not to reduce speed. Is that the practice of all your captains of the Red Star Line? - Yes, all of them.

And, as far as you know, in other lines too? - I believe every captain will give you the same answer; they will not slow down unless it becomes thick or hazy. *Mr. Harbinson:* My Lord, the Witness has told us of the practice; would your Lordship ask him what the speed of the vessels is?

23617. (*The Commissioner.*) Yes, quite right. (*To the Witness.*) What is the speed of your vessels? - 15 ½ to 16 knots, the New York boats.

**(*The Witness withdrew.*)**

*The Attorney-General:* May I just remind you of this. I only want to do it, so that my friends, particularly Sir Robert Finlay, may know. Sir Ernest Shackleton said this in dealing with the temperature point: "If there was no wind and the temperature fell abnormally for the time of year, I would consider I was approaching an area that might have ice in it." If there was no wind, that is the point. Then he explained it more in detail. It is page 720.

We are calling these Witnesses at the request of my friend, my Lord.

*The Commissioner:* I was under the impression that the evidence was finished. *The Attorney-General:* Yes, so were we.

**Page 748**

**ARTHUR ERNEST TRIDE, Sworn.**

**Examined by Mr. BUTLER ASPINALL.**

You hold a Master's certificate? - Yes.

And have you been in the Atlantic trade for the last eighteen years? - Yes.

And are you at present in command of the "Manitou"? - Yes.

She is one of the Red Star Line that was spoken of by the last Witness? - Yes.

You heard the last gentleman's evidence. Is your practice as to reducing speed the same as the practice of the various other Masters in that fleet? - Yes.

*(The Witness withdrew.)*

*Sir Robert Finlay:* I am glad to say that after the examination of the correspondence and the logs, the statement such as your Lordship asked for with regard to other vessels has been agreed upon. The statement that was produced the other day has been altered in some respects after examining the logs, and we are now agreed that it is accurate. It will save a good deal of trouble.

*The Attorney-General:* I will hand in a summary. I have not seen it yet. I see that the letters are summarised in a short table. *The Commissioner:* What letters are these?

*The Attorney-General:* These are the replies that were received to the Board of Trade circular letter of the 6th June, which is the letter I read to your Lordship on the last occasion, when we had some discussion as to what was the answer received from the two German lines, as to the course pursued by them, and sailing directions. At that time your Lordship will remember, you indicated that they could not be put in unless my friend Sir Robert allowed them to be put in; he had the right to object. He objected then only for the purpose of considering the documents which he had not then seen. He has now seen them, and we have agreed upon the summary, and we have agreed upon the documents which are now being handed up to the Court. *(The same were handed in.)*

*Sir Robert Finlay:* There is only one addition I want to make. Your Lordship will see that under the head of "White Star Line" in this statement in the margin is "Logs not sent." The logbooks are in Court, and at the service of the Court. I have them here, and I will hand them up now.

*The Commissioner:* Do not encumber my table with a number of things which it is not necessary for me to have.

*The Attorney-General:* I quite agree. My friend can refer to them without handing them up.

*The Commissioner:* I get them here, and then very often I do not know what they have been handed in for.

*Sir Robert Finlay:* I entirely sympathise with that point of view.

*The Attorney-General:* We may treat them as in, and my friend can refer to any part of them if he wishes.

*The Commissioner:* And you will understand I shall not refer to any part of them unless you draw my attention to them.

*Sir Robert Finlay:* I do not know that it will be necessary to refer to them. I only wish it to be understood the logbooks are here.

*Sir Robert Finlay:* May I indicate what this table is? I think one has been handed up to each of the Assessors as well as your Lordship; the first, "Particulars of vessels in neighbourhood of disaster," you have first there in the summary, the Leyland Line. There is the "Californian" - of course that is already dealt with in the Enquiry - "Instructions to Commanders of vessels: The Commanders must run no risk which might by any possibility result in accident to their ships." That is a summary. The letter is actually here in the documents, but your Lordship really has got enough of it when you have that summary, which is an agreed summary. Then there are the logbooks, showing what has happened with regard to them. Then if you take the Anchor Line, the next one, "No vessels in actual vicinity but 'Caledonia' was warned by wireless of field ice; course altered to southward to avoid it. Sighted ice 9th April." "Instructions to Commanders: Course to be altered on ice being seen or reported. In the event of fog, speed to be reduced. No book of Instructions and Regulations sent; log not sent," and so forth. *The Commissioner:* Where does the Anchor Line trade to?

*The Attorney-General:* I think it is Glasgow to New York - Glasgow to the United States, certainly. I am told that they also trade to the Canadian ports, and that we do not quite know what track she was on.

*The Commissioner:* I thought so. That would make a difference.

*The Attorney-General:* I see what is in your Lordship's mind, and it may be necessary to enquire into it. Of course, these are the general instructions which are given to the Commanders of both.

*The Commissioner:* I think the Instructions, so far as they refer to ice, would apply more particularly to the voyages to Canada.

*The Attorney-General:* I agree, my Lord, to the extent that you would more probably meet ice on that voyage.

*The Commissioner:* For instance, in the Leyland Line, which I do not believe goes to Canada at all, there are no such words. There are no specific references to ice.

*The Attorney-General:* No. The Allan Line, which is a Canadian Line, specifically does mention it.

*The Commissioner:* Yes, that is another Canadian Line.

*The Attorney-General:* Your Lordship will remember that the White Star Line also itself has special regulations with regard to entering ice on the Canadian Line.

*The Commissioner:* Yes. And then the Canadian Pacific, again.

*The Attorney-General:* They do not seem to make any special reference to ice.

*The Commissioner:* I think so. We had the Master of the "Mount Temple." I agree this summary of the letter does not mention it, but the Master of the "Mount Temple" told us he had express directions, either to slow down -

*Sir Robert Finlay:* I think your Lordship will find it in the letter appended.

*The Commissioner:* However, I think you can leave this with me, Mr. Attorney. *The Attorney-General:* Yes, certainly. I see it is a letter of 11<sup>th</sup> June: "I have no knowledge of what other Shipmasters do" - this is the manager of the Canadian Pacific Line writing - "but our Masters know that they must not enter even light field ice or touch ice of any kind." That bears out what the Master of the "Mount Temple" says. The summary does not indicate that, as your Lordship sees, but it is there. It is under date 11<sup>th</sup> June. Then I have here some letters which I have not seen before, but they are answers which have been made, I understand, to the White Star Line, which has also been making some inquiries with the same object. They had better be handed in. My friends wish them handed in. Will you follow this, Sir Robert, because it does not seem very desirable to encumber the Court with more documents than are necessary? I think the only addition to what we have already in evidence is the Hamburg-Amerika Line.

*Sir Robert Finlay:* Yes.

*The Commissioner:* I have here the Norddeutscher, which is a sufficient answer for my guidance, because I assume that the Hamburg-Amerika is the

## Page 749

same: "Steamers were going full speed as long as the weather kept clear."

*The Attorney-General:* Very well.

*The Commissioner:* That looked as though they followed the same practice as the British ships.

*The Attorney-General:* Now, my Lord, there is one matter I want to mention to avoid any possible misapprehension. With reference to my friend, Mr. Duke, who appeared for Sir Cosmo and Lady Duff-Gordon - I mention it because I happen to have seen him with reference to it - of course he is ready to come if there were any necessity, but I indicated to him what I have already told your Lordship with reference to them, that is to say that I was going to make no comment whatever upon their evidence, except in so far as it became necessary in regard to that particular boat, but not in any way reflecting upon them. I had already said that, and therefore he did not propose to attend unless any other of my friends was going to make an attack upon them. I told him I understood from what had happened that that was not going to take place, and that therefore he need not appear; but if there is any intention of making an attack upon them it ought to be stated, so that he may have notice of it, and be here whenever the attack is taking place. *The*

*Commissioner:* What is your view, Mr. Edwards and Mr. Scanlan?

*Mr. Edwards:* I was going rather to ask your Lordship's direction. I was responsible in the first place for getting out the evidence as to the payment of money. I quite recognise, whatever might be our view or whatever might be your Lordship's view, about the actual conduct of any single passenger, it is not material to the issues which you have to try, except in so far as it may have had a certain effect in seducing the mind of the man responsible for navigating the boat from any idea there may have been of going back to the rescue. Of course it is a very serious matter in the case of that boat, which was practically empty, and was capable of saving a great number of people. It may be essential to point out the possible effect of a certain line of conduct on the part of the

passengers; and subject to what your Lordship might say, I did propose commenting upon the evidence as given against and by Sir Cosmo Duff-Gordon and Lady Duff-Gordon, in so far as it is calculated, or may be calculated, to have affected the mind of those responsible for the conduct of that particular boat. Therefore, I think, those who are representing Sir Cosmo and Lady Duff-Gordon ought to be apprised of the fact, subject of course to what your Lordship may say, that there is an intention to call attention to the evidence relating to that part of the case.

*The Commissioner:* What do you say, Mr. Scanlan?

*Mr. Scanlan:* I have felt that I could with propriety in discharging what I conceive to be my duty to my clients, leave the question of the personal conduct of the Duff-Gordon's out of this case. I feel I am not debarred on that account from making a comment on the fact that this particular boat was not filled with a proper complement of persons. But I am going to attribute that, my Lord, to another cause. I am going to attribute the fact that the boat was not filled to another cause, to the want of discipline. I shall have some remarks to make upon that when I come to it, but not at all in reference to the personal conduct of the Duff-Gordon's.

*The Attorney-General:* I have never said that I am not going to comment upon the conduct of the man who was in charge of the boat, and responsible for it, and also to some extent to what happened in the boat. What I have said, and what I intend to adhere to, is that I am going to make no comment on the conduct of Sir Cosmo Duff-Gordon and Lady Duff-Gordon. As I understand, the personal incident was introduced at first by some underlying suggestion that Sir Cosmo and Lady Duff-Gordon had promised money to the men not to go back to the spot at which the "Titanic" had sunk, in order that they might run no risk. Of course, if there had been evidence of that, it would be a matter, I presume, which your Lordship would not for a moment have passed over. But looking at the evidence, of course it is quite clear upon the evidence that that did not take place. I have been through it very carefully. And short of that, whether or not, having regard to what I may call the highest duties which are imposed upon persons in such circumstances, they should have gone back or should have done their best to persuade the men in charge of the boat to go back, is not a matter which it seems to me your Lordship will have to deal with. It has almost always to be left to considerations which are really not considerations which would sway a Court of law. Men and women will always differ to all eternity between what should be done in circumstances such as those described, and therefore it is that I am making no comment, and intend making no criticism in any way upon what took place with regard to that. It seemed to me not to be a matter which your Lordship would deal with. But the boat, and the conduct of the man in charge of the boat, I think we must deal with. I indicated that some days ago when I first mentioned this.

*The Commissioner:* My own view of the matter is this: It is material to enquire why that particular boat did not contain a proper number of passengers, and to the extent to which the acts or conduct of Sir Cosmo Duff-Gordon can explain, or can be said to explain, why that boat did not contain a full or proper complement of passengers. I think it is quite right that what he said and what he did and what his wife said and did, should be enquired into. But beyond that I do not see that it is at all necessary to go. I do not propose myself to make any reflections, at present at all events, at all upon the conduct of either the gentleman or his wife, and I want to add that if I do not my silence is not to be

taken as any adverse reflection on him at all. I shall be silent simply because it has got nothing to do with what I have before me. *The Attorney-General*: As your Lordship pleases.

*The Commissioner*: I do not know whether I have made it plain. I think, Mr. Edwards and Mr. Scanlan, you are both entitled to make any comments that you think proper upon the acts and conduct of Sir Cosmo Duff-Gordon, so far as they may be said to explain why that boat did not succeed in saving more people. I think you are quite entitled to do that, and I do not think you would discharge your duty if you did not do it; but, at the same time, it occurs to me that you may be able to do it without any reflections upon his conduct as a man.

*The Attorney-General*: There is one other matter I want to mention.

*The Commissioner*: There is one I want to mention, and I will do it when you have finished.

*The Attorney-General*: After I left on Wednesday your Lordship had a little discussion with my friends, Mr. Butler Aspinall and Mr. Laing, who are, of course, best qualified to express their views as to the practice in these Enquiries. My Lord, I confess that I thought it was necessary, and I think it necessary now, to make some observations to your Lordship with regard to what took place on that occasion, so that at any rate it may be made clear what the argument is which will be put to the Court by me at the end of this Enquiry, and so that my learned friend, Sir Robert Finlay, who I understand is representing also Captain Smith - *Sir Robert Finlay*: Yes.

*The Attorney-General*: Will have the opportunity of dealing with what I am about to say. I am very anxious, as your Lordship will understand, not in any way to press anything against either Captain Smith or the other officers who, unfortunately, met their fate on this occasion - so far as it is possible for me, whilst, at the same time doing my duty in this Enquiry I should wish to avoid it. The practice of these Courts of Enquiry has been, speaking generally, and only generally, as your Lordship will see in a moment, not to enquire whether or not an officer who does not survive the loss of his ship has been negligent. The reason of it is not far to seek. In the ordinary course of these enquiries if an allegation is going to be made of negligence against an officer which would, if found by the Court, affect his certificate, the practice - and it is a practice which is regulated by the Rules - necessitates that notice must be given to him so that he may appear and defend himself. Of course, in the case of an officer who has not survived, it is impossible to

## **Page 750**

deal with his certificate; the Court does not do it; and no notice to his representatives is necessary because of that fact. It is not necessary to go into it more in detail. Your Lordship will remember that I indicated this in opening the case, and pointed out that we were not asking your Lordship to find anything with regard to the certificates of the officers, because those who were in charge had succumbed in this disaster. But, my Lord, having regard to the nature of this Enquiry, and to what I think I am justified in calling the somewhat extraordinary character of this Enquiry, and also of the disaster, I cannot find, according to what I have been able to ascertain about the practice, that there is

anything which would prevent your Lordship coming to a conclusion - assuming that you did, of course - I will not say, coming to a conclusion, but I will say considering and determining whether or not you think this vessel was navigated with proper and seamanlike care. With great respect, it does seem to me that it is not possible to deal with this Enquiry and to satisfactorily answer the questions that are put without, at least, coming to some conclusion with regard to that question.

*Sir Robert Finlay:* I quite agree.

*The Attorney-General:* I am glad my learned friend agrees. I wanted to make it quite plain that it must be so. The reason I am mentioning it is that your Lordship did indicate the view which is in accordance with the general practice, but there is a case to which I wanted to call attention only because it shows so plainly that that practice is not an invariable one.

*The Commissioner:* I do not think either Mr. Laing, or Mr. Aspinall suggested the contrary.

*Sir Robert Finlay:* I may say that I shall certainly ask for no indulgence on the ground of the unhappy death of these officers. I shall ask the opinion of the Court, and I shall ask the Court to say that there was no error of judgment on their part whatever.

*The Commissioner:* That means also no negligence.

*Sir Robert Finlay:* Certainly.

*The Commissioner:* It includes it - no negligence or error of judgment?

*Sir Robert Finlay:* Yes. I used the expression "error of judgment" because your Lordship put that as denoting something less than negligence - not even an error of judgment. On behalf of every one of those officers I want the fullest Enquiry into it, and I give the Attorney-General notice that I shall submit to the Court that they did what was right under the circumstances, and that no blame of any sort or kind is imputable to any of them.

*The Attorney-General:* As long as it is quite clear that the matter is to be dealt with by the Court, I am satisfied. I want my learned friend to be quite clear that it will be my duty to submit to the Court some considerations which, if they commend themselves to the Court and are accepted would not agree with the view which my learned friend must necessarily contend for. I wanted it to be made quite clear, as I have to speak at the end. All I have to do is to put considerations to the Court.

*The Commissioner:* Very well, you have given full notice now to the others. *Mr.*

*Clement Edwards:* There is one matter, my Lord, a little outside the precise scope of my particular duties here which I want to mention.

*Sir Robert Finlay:* Forgive me, there is one very small matter I have to mention. Something was said about the steerage-way of the "Titanic" when Sir Ernest Shackleton was in the box. He put it at 10 knots. I am told it would have steerage-way at 6 knots. Mr. Wilding is not here today, but he will be here on Monday and will state that.

*The Attorney-General:* I should accept that.

*Sir Robert Finlay:* Sir Ernest put it too high. My learned friend will not want evidence on that point.

*The Attorney-General:* No, I accept that statement.

*Sir Robert Finlay:* Mr. Wilding will be here on Monday if my learned friend desires him to make the statement.

*Mr. Clement Edwards:* My Lord, in this Enquiry, except in the case where certain reflections were passed by a Witness on the conduct of particular passengers, there have been no passengers called to give evidence. I know there is a perfectly satisfactory explanation why that is so, but I think in the public interest it might be well if the learned Attorney-General indicated why that course has been taken.

*The Attorney-General:* I am quite ready to do so. I thought I had already done so, but I will state it in two sentences. We found it useless to call passengers who could only state what has already been stated by the officers and crew who have been called. If I had found in any proof or document submitted to me that any passengers could prove anything which was in conflict with what had been said on any material point, of course, I should have called them. As your Lordship knows, at an early stage, and since, as intimated to my learned friend, Mr. Harbinson, who naturally had some statements before him, I would call any passenger whose proof or statement was put before me, if it added anything to the testimony which we already have. My own view, after consideration of a great many statements was that it was useless repetition, and that therefore it was unnecessary to put it before the Court.

*The Commissioner:* That will probably be satisfactory to Mr. Edward. There was one matter I was asked to bring to your notice. When the answers were being received to the C.Q.D. messages from the "Titanic," apparently Phillips had a great difficulty in hearing them because of the noise of the steam. The question I was asked to put to you was this: Is it not possible to arrange that messages received in the Marconi room as well as despatched can be received in a silent cabin - I believe it is called.

*The Attorney-General:* It would be the same room, would it not?

*The Commissioner:* I am told it is so on board the vessels in the Navy.

*The Attorney-General:* It would be in the same room. They are received and sent in the same room.

*The Commissioner:* As I understand, they are sent from what is called the silent cabin, and the question is, could not it be arranged that they should also be received in a similar cabin, or in the same cabin, so that the noise should not interfere with hearing the message.

*The Attorney-General:* My impression is that they are received and sent in the same room. I do not follow how they could be received in a different room from the one in which they are sent. I should think they are received and transmitted in the same room.

*The Commissioner:* If that is so, I do not understand why the noise of steam should prevent them hearing.

*The Attorney-General:* Mr. Turnbull is here. May we ask him the question? 25623.

*(The Commissioner.)* Yes. *(To Mr. Turnbull.)* Will you please answer the question. Have you heard what I was asking?

*Mr. Turnbull:* Yes.

25624. *(The Commissioner.)* What is the explanation?

*Mr. Turnbull:* I think, on these large Trans-Atlantic liners, almost everyone of them, without exception, has the cabin in the most silent place in the ship. That is one of the

specifications we always ask for. The cabin is placed amidships for two reasons - one because that is the most silent place, and another because it is the best place technically. In the case of the "Titanic" the instruments were divided into two rooms. The transmitting instruments, which cause a certain amount of noise, were placed inside a silent chamber, so that the noise of the signals as transmitted would not be heard outside or by passengers. We have to preserve the secrecy of telegrams as far as possible. In the receiving cabin, in all ordinary

**Page 751**

circumstances under which the "Titanic" is sailed, there would be practically no noise at all. It was only, I think, under the exceptional circumstances of the "Titanic" being at full steam and being suddenly stopped that there was an excessive blow-off at a pipe in the immediate neighbourhood of the station. I do not think that would ever have occurred in ordinary practice. I understand from Mr. Bride that this noise was brought to the notice of the Captain and he had it stopped immediately. I do not know how he did have it stopped. I suppose he arranged that.

*(The Commissioner.)* I do not see how he could have stopped that?

*Mr. Turnbull:* By some arrangement in the engine room, I suppose.

*(The Commissioner.)* He could not stop that blow-off.

*Mr. Turnbull:* It might be diverted to another exhaust pipe.

*(The Commissioner.)* It is pointed out to me that the answers to their messages were of the greatest importance, and yet they could not hear them because of the noise, and it is suggested to me that there should be some chamber in which to receive the messages, and from which the noise outside in the ship should be excluded?

*Mr. Turnbull:* We used to do that years ago when wireless was in its infancy and when it was necessary to reinforce the strength of the signals as much as possible; but at the present day the signals are so strong within the normal range of shipping stations, that it is not necessary to go to the expense.

*(The Commissioner.)* It would have been a very good thing on this occasion?

*Mr. Turnbull:* Yes, my Lord, it would.

*(The Commissioner.)* I daresay the signals are very strong, but it would have been a very desirable thing that the messages which were being received by the "Titanic" on this occasion should have been heard.

*Mr. Turnbull:* There are occasions when we find it is impossible to fulfill the conditions of silence to the extent that we desire. For instance, in the case of a winch being outside, or pumps of any description making a noise, then we do have the receiving room silenced as much as possible.

*(The Commissioner.)* Cannot you have a cabinet?

*Mr. Turnbull:* We do, my Lord.

*(The Commissioner.)* So constructed as to keep out the sounds of a winch? *Mr. Turnbull:* We have them constructed to diminish sound as much as possible. *The Attorney-General:* I am not going to ask Mr. Turnbull anything, but the two documents which have been referred to and handed in, the one, the corrected *procèsverbal*,

and the other, received and sent messages, are taken in. I need not formally put them to Mr. Turnbull?

*The Commissioner:* No. Are you going to begin your address, Mr. Edwards? *Mr.*

*Clement Edwards:* No, my Lord. I thought your Lordship would like to know how the matter stands in relation to what your Lordship intimated on Friday. The position is this: that in the case of my friend, Mr. Pringle, appearing for the shipwrights, in the case of Mr. Cotter, appearing for the National Union of Stewards, and Mr. Lewis, appearing for the British Seafarers' Union, they have acceded to your Lordship's suggestion, and I shall represent them in making my speech. *The Commissioner:* That is very convenient.

*Mr. Clement Edwards:* With regard to the officers represented by Mr. Holmes, they are quite anxious, I understand, that he should address you, and, with your Lordship's permission, he will do that before I address your Lordship, and also, with your Lordship's permission, Mr. Harbinson will address you before I address you.

*The Commissioner:* Very well.

*Mr. Clement Edwards:* Your Lordship recognises better than anyone that in this Enquiry there is a huge mass of evidence, and if the case were an ordinary one where there is a responsibility placed upon individual Counsel to draw your Lordship's attention to the effect of the evidence, it would involve, if I may say so in my own case, taking up quite a considerable time, but inasmuch as the learned Attorney-General must, in the discharge of his duty to all concerned, point quite in detail to the effect of the evidence on the respective points, I suggest that there will be no need for me, except, perhaps, in the case of the Board of Trade, to go at all into detail with regard to the evidence, but to point out broadly to your Lordship what I deem to be the effect of the evidence on the respective points. It is a difference between two hours and two days, and I thought your Lordship would much prefer the two hours.

*The Commissioner:* I am always delighted to hear you, and, though it may seem inconsistent, I prefer the two hours.

*The Attorney-General:* I hope the same observations will apply to me. It must not be assumed that I am going to take up days by referring in detail to the evidence, except where it is necessary.

*The Commissioner:* Who am I to hear first, you, Mr. Scanlan?

*Mr. Scanlan:* I understand so, my Lord.

*The Attorney-General:* There is one matter Sir Ellis calls attention to which, perhaps, for formality's sake we had better put right. Under the Rules to which I called attention in opening the case, when the examination of witnesses has been concluded, the Board of Trade shall state in open Court the question in reference to the casualty and the conduct of officers or other persons connected therewith upon which the opinion of the Court is desired. What I want to call attention to is this: That if there is any other question which any of my learned friends would desire submitted which is not included in the questions which I have submitted, as amended, at the end of the evidence, I shall be very glad to consider any such question and determine whether or not I would ask your Lordship to consider it. So far as I gathered during the course of the case, and from the questions, of which my learned friends have had copies, they do cover all the ground upon which we are engaged, and I am not asked to put any other questions to your Lordship than those already before you. I understand that is so.

*Mr. Scanlan:* My Lord, at the outset, as this is the first opportunity that I have of addressing you, I desire, on behalf of my clients and myself, to express our sympathy with the relatives of those who were lost in this dreadful catastrophe, the circumstances of which have been brought so vividly back to us by the admirable evidence of Captain Rostron today.

I should like also to say that we feel that the greatest scope and indulgence has been given to us in putting the views of our Union before your Lordship, and so far as the conduct of the case by the learned Attorney-General is concerned, I may be permitted to express my indebtedness to him for calling a certain number of witnesses whose names and the nature of whose evidence I had an opportunity of submitting to him.

My Lord, there are portions of this case with which I feel it is quite unnecessary for me to deal. In the whole twenty-six Questions, as they are set down by the learned Attorney-General, there may be found three leading divisions. There are three considerations of safety which apply to every ship that goes to sea. The first is the seaworthiness of the ship; the second is the skill in seamanship and in navigation; and the third is the provision for the saving of life, which may be taken as the last resort. As to the construction of the "Titanic," saving, of course, what I shall have to say to your Lordship as to her boat equipment and appliances for life-saving, I do not think it is necessary for me to deal with this aspect of the case, because I feel I am justified, subject to what has been brought out in the evidence and what may be submitted to your Lordship, to proceed on the assumption that this ship was in a perfectly seaworthy condition, and that what befell it was due not to the condition of the ship, but to the seamanship and skill, or want of seamanship and skill, and the want of proper directions as to her navigation.

## **Page 752**

My Lord, it is important to consider Question 24 and Questions 10 and 13. Question 24 is: "What was the cause of the loss of the 'Titanic,' and of the loss of life which thereby ensued or occurred?" Question 10 is: "If at the time referred to in the last preceding Question, or later, the 'Titanic' was warned of, or had reason to suppose it would encounter ice, at what time might she have reasonably expected to have encountered it? Was a good and proper look-out for ice kept on board? Were any, and, if so, what, directions given to vary the speed? If so, were they carried out?" And Question 13 is: "Was ice seen and reported by anybody on board the 'Titanic' before the casualty occurred? If so, what measures were taken by the officer on watch to avoid it; were they proper measures and were they promptly taken?" These, my Lord, are three very important questions which I think go to the root of the first general consideration to which I am addressing myself, and that is the consideration as to seamanship and navigation.

Of course, it is of the very utmost importance to consider at the outset what were the conditions on the night of the 14th of April, when this catastrophe occurred. Here I have to present to your Lordship a view of the disaster which will at once, I doubt not, lead me into controversy with some of my learned friends. I am to submit to your Lordship on the evidence that there was in fact a haze on the night of the 14th of April, and that this haze

prevented the look-out men and the officer on watch from seeing the iceberg in time to have the course of the ship altered, so as to avoid the collision. I would like to refer your Lordship to two remarks which your Lordship made in the course of the evidence on this matter. At page 410, on the question of haze, your Lordship said, while the Attorney-General was asking questions of Fleet, one of the look-out men: "Yes, I will tell you at once. My impression is this, that the man was trying to make an excuse for not seeing the iceberg, and he thought he could make it out by creating a thick haze." That referred to one of them. Then at page 413, whilst Fleet is under examination still, your Lordship said: "He was asked by the Attorney-General, and he told us that he could not" - that is, see the iceberg - "and as I myself have very grave doubts about there being a haze at all, I can understand his having a difficulty in saying how long before the collision it was that he saw it." On this part of the case let me direct attention to the watches of the look-out men. The first watch was of Hogg and Evans from 6 to 8. Then came the watch of Jewell and Symons from 8 to 10. Then the watch of Fleet and Lee from 10 to 12. So far as the first watch, from 6 to 8, is concerned, there is no question of a haze. The evidence as to haze was first of all brought out when the men on the second watch were giving evidence to your Lordship. In the second watch, of the two men Jewell and Symons, Jewell has been asked no question whatever as to a haze, but the Witness Symons was asked a question on this by my learned friend Mr. Laing. Then we came to the third watch, and this is, of course, the all important critical time - from 10 to 12 - and we have it on the evidence, both of Fleet, and Lee, that there was a haze. This is not the whole of the evidence on the question of haze, but it exhausts all the look-out men to whom any questions were put as to whether or not there was a haze. Perhaps your Lordship will take a reference to the particular parts of the evidence. The evidence of Symons will be found on page 268, and he states at Question 11983, in answer to Mr. Laing, that there was a haze. Mr. Laing asked: "While you were on the look-out, up to 10 o'clock, what sort of a night was it? - (A.) Pretty clear, Sir, a fine night, rather hazy; if anything a little hazy on the horizon, but nothing to speak of. (Q.) Would you describe it as a very clear night? - (A.) Yes. (Q.) With stars? - (A.) Yes." Then the evidence of Lee is at page 72. He is one of the men on the look-out when this collision occurred. At Question 2401 he is asked by the Attorney-General: "What sort of a night was it? - (A.) A clear, starry night overhead, but at the time of the accident there was a haze right ahead. (Q.) At the time of the accident a haze right ahead? - (A.) A haze right ahead - in fact, it was extending more or less round the horizon. There was no moon. (Q.) And no wind? - (A.) And no wind whatever, barring what the ship made herself." And he described the conditions: "(Q.) Quite a calm sea? - (A.) Quite a calm sea. (Q.) Was it cold? - (A.) Very, freezing." Then Question 2408: "Did you notice this haze which you said extended on the horizon when you first came on the look-out, or did it come later? - (A.) It was not so distinct then - not to be noticed. You did not really notice it then - not on going on watch, but we had all our work cut out to pierce through it just after we started. My mate happened to pass the remark to me. He said, 'Well, if we can see through that we will be lucky.' That was when we began to notice there was a haze on the water. There was nothing in sight." Then there is the evidence of Fleet, at page 410, Question 17248. He is being examined by Mr. Attorney, and is asked: "Could you clearly see the horizon? - (A.) The first part of the watch we could. (Q.) The first part of the watch you could? - (A.)

Yes. (Q.) After the first part of the watch what was the change, if any? - (A.) A sort of slight haze. (Q.) A slight haze? - (A.) Yes. (Q.) Was the haze on the waterline? - (A.) Yes. (Q.) It prevented you from seeing the horizon clearly? - (A.) It was nothing to talk about. (Q.) It was nothing much apparently? - (A.) No. (Q.) Was this haze ahead of you? - (A.) Yes. (Q.) Was it only ahead, did you notice? - (A.) Well, it was only about 2 points on each side.” He is asked further questions about it.

*The Commissioner:* There is Question 17270: “You did not say anything about it to the bridge? - (A.) No.”

*Mr. Scanlan:* He is asked a further Question, 17321, I think, by the Attorney-General, at page 411.

*Sir Robert Finlay:* Question 17273 I think is important.

*Mr. Scanlan:* Yes: “I understand you to say that whatever it was it made no difference to the look-out? - (A.) Yes, my Lord.” I will come to that again. On page 411, he is asked at Question 17321: “I think then Hogg and Evans relieved you. Now, will you tell me, supposing there had been a haze, would it be your duty to report it at all to the bridge? - (A.) I have never reported haze yet.” I think, my Lord, it is fair to observe at this point that there has not been a suggestion from any Captain, or any officer, that a look-out man has a duty to report haze. I made a suggestion to the first Witness who mentioned haze as to whether or not he had reported it, and I think he looked at the question as being somewhat childish; it seemed so obvious to him, as it did to everybody else, that the officers on the bridge had at least as good an opportunity of determining for themselves whether or not there was a haze as the look-out men. The evidence of the Witness, Alfred Shiers, I consider most important on this point.

*The Commissioner:* Did this Witness contradict the evidence of the first man? *The Attorney-General:* There is Question 17271, on page 410.

*Mr. Scanlan:* That question is: “I think it is necessary to direct your Lordship’s attention to Question 2408, at page 73 of Lee’s evidence. I have asked him his story in detail, but I think it is necessary to put it to him now. I will read it. (*To the Witness.*) Just listen to this, Fleet. This is a question put to your mate, and I will read you his answer, ‘Did you notice this haze which you said extended on the horizon when you first came on the look-out, or did it come later? - (A.) It was not so distinct then - not to be noticed. You did not really notice it then? - Not on going on watch, but we had all our work cut out to pierce through it just after we started. My mate’ - that is you - ‘happened to pass the remark to me. He said, “Well, if we can see through that we will be lucky.” That was when we began to notice there was a haze on the water. There was nothing in sight.” - (A.) Well, I never said that. (Q.) You never

## **Page 753**

said it? - (A.) No.” On the question of haze he is examined somewhat further when he is being examined by myself at page 413, Question 17392: “I think you said when you were being examined that you said to your mate Lee that there was a slight haze coming? - (A.) Yes.(Q.) I want to make this perfectly clear. Is it your evidence that there was a haze that night? - (A.) No, there was not. I said there was a slight haze. (Q.) Could you recall now

how long you had observed the haze before - (*The Commissioner.*) He told us once that he could not. (*Mr. Scanlan.*) He was asked, I think, how long after he came on the watch. (*The Commissioner.*) He was asked by the Attorney-General, and he told us that he could not; and as I myself have very grave doubts about there being a haze at all, I can understand his having a difficulty in saying how long before the collision it was that he saw it." Then your Lordship is referred to the evidence of other Witnesses. Then at Question 17395 I quoted some evidence: "Would you describe it as a very clear night? - (A.) Yes. (Q.) With stars? - (A.) Yes"; and asked: "Do you agree with this description of the night - 'fine night, rather hazy; if anything a little hazy on the horizon.' (*To the Witness.*) Not when I went on the look-out; it was not hazy."

*The Commissioner:* But it occurs in Question 17394: "Pretty clear, Sir, a fine night, rather hazy; if anything a little hazy on the horizon, but nothing to speak of."

*Mr. Scanlan:* Yes. Then the next Question is "(*Mr. Scanlan.*) 'Would you describe it as a very clear night? - (A.) Yes. (Q.) With stars? - (A.) Yes.' Do you agree with this description of the night - 'fine night, rather hazy; if anything a little hazy on the horizon?' (*The Witness.*) Not when I went on the look-out; it was not hazy. (Q.) But when the haze did come on was it like that? - (A.) A slight haze. (Q.) And did it extend right round the horizon? - (A.) No. (Q.) It did not extend all round? - (A.) No. (Q.) Was it right in front of you? - (A.) Right in front. (*The Commissioner.*) I understand you to say two points on each bow. - (A.) Two points on each bow; that is in front." Then he is asked a question about binoculars, which I need not trouble your Lordship with. Then will your Lordship look at the evidence of Alfred Shiers, at page 111, he was a fireman on the "Titanic," and is being cross-examined by Mr. Aspinall. He was not on watch at the time the collision occurred, and the effect of his evidence - I do not wish to read it all - is that he left his quarters and came up on deck almost immediately after the collision occurred, and he is one of the two or three people who have given evidence who have been able to say that they saw the actual berg after the collision occurred. The evidence he gives as to the haze is at Question 4700, on page 113. He describes how he went on to the fore-well deck and looked aft on the starboard side, and he describes the berg, and he is asked, at Question 4699: "Could you get a good view of it from where you were standing? - (A.) No, only dim." Then Question 4700: "Was there a haze at the time; was the air clear, or was there a haze? - (A.) It was hazy. When I saw that berg it was hazy. The berg was in a haze." It might appear that he was being led at that time - that was part of my examination - but I think if your Lordship reads his evidence in the second column on page 111, it will be seen that what he said in his first examination by Mr. Aspinall is quite consistent with this: "How soon after you felt the striking of the iceberg did you see it away on your quarter? - (A.) About four or five minutes. (Q.) Tell me what you did, that will give me an idea. Did you get up at once? - (A.) Yes, I was reading in my bunk at the time. (Q.) You got up at once? - (A.) I went up on the fore-castle. (Q.) Did you run up? - (A.) I walked up; our fore-castle is only outside the companion ladder. (Q.) Did you see the berg then? - (A.) No, not then. (Q.) What did you do before you saw it? - (A.) Looked towards the window underneath the fore-castle head to see if there was anything there. (Q.) That took a short time, I suppose? - (A.) It is only just a walk round from our room. (Q.) What did you do next? - (A.) Came out on the deck; on the starboard side of the deck. (Q.) Was it then you saw the berg? - (A.) I saw the ice then, and then the berg when I looked over

the side. (Q.) And then the berg was away on the starboard quarter? - (A.) Yes. (Q.) About how far off? - (A.) I could not say; it was very dim then; I could just see it. (Q.) It was a dark night? - (A.) Yes, a starry night. (Q.) Starry, but dark. When you saw the berg could you judge whether your ship was stopped or going ahead? - (A.) When I looked over the side there was a slight way on her; she was moving, but not much." It is of some importance in this connection to remember that according to all the evidence, the "Titanic" must have proceeded a very, very short distance after the collision with the iceberg.

This, my Lord, is all the positive evidence as to the existence of a haze that night; but I think the evidence is corroborated by Mr. Lightoller, and I would direct attention to his evidence at page 305. At Question 13571 he is asked, "Was there any breeze on this night? - (A.) When I left the deck at 10 o'clock there was a slight breeze. Oh, pardon me, no. I take that back. No, it was calm, perfectly calm." Then Question 13575 on the same page: "Do you agree from that experience that this was an occasion when it was an absolutely flat sea? - (A.) Absolutely flat. (*The Commissioner.*) Not in fact, but to all appearance? - (A.) In fact, my Lord," is his answer. Then at page 306, Question 13606 he mentions about a drop in the temperature. Then Question 13607: "Well, it was now nine o'clock, and you had worked out in your head that you would probably get the 49 degrees meridian by half-past nine? - (A.) Just let me correct that. It must have been a few minutes before nine, because I remember the Commander came on the bridge at five minutes to nine, and I told him then that I had already sent word round, so it was perhaps ten minutes or a quarter to nine, as a matter of minutes. (Q.) Then that is a drop of 10 degrees in less than two hours? - (A.) Slightly less." Then his conversation with the Captain is given, and he is asked at Question 13612: "Is that all that took place? - (A.) No, my Lord. We had a conversation with regard to the weather. (Q.) But had you no conversation with regard to ice? - (A.) Well, I was coming to that, my Lord." I think I had better read on further: "(*The Solicitor-General.*) Had not you better tell us as accurately as you can what passed between him and you when he came on the bridge at five minutes to nine? - (A.) I will. (Q.) If you please? - (A.) At five minutes to nine, when the Commander came on the bridge (I will give it to you as near as I remember) he remarked that it was cold, and as far as I remember, I said, 'Yes, it is very cold, Sir. In fact,' I said, 'it is only 1 degree above freezing. I have sent word down to the carpenter and rung up the engine room, and told them that it is freezing or will be during the night.' We then commenced to speak about the weather. He said, 'There is not much wind.' I said, 'No, it is a flat calm, as a matter of fact.' He repeated it; he said, 'A flat calm.' I said, 'Yes, quite flat; there is no wind.' I said something about it was rather a pity the breeze had not kept up whilst we were going through the ice region. Of course, my reason was obvious; he knew I meant the water ripples breaking on the base of the berg. (Q.) You said it was a pity there was not a breeze? - (A.) Yes, I said, 'It is a pity there is not a breeze,' and we went on to discuss the weather. He was then getting his eyesight, you know, and he said, 'Yes, it seems quite clear,' and I said, 'Yes, it is perfectly clear.' It was a beautiful night; there was not a cloud in the sky. The sea was apparently smooth, and there was no wind, but at that time you could see the stars rising and setting with absolute distinctness." *The Commissioner*: "Rising and setting with absolute distinctness."

*Mr. Scanlan:* Yes, with absolute distinctness. Then the next question is: "On the horizon? - (A.) On the horizon. We then discussed the indications

## **Page 754**

of ice. I remember saying, 'In any case there will be a certain amount of reflected light from the bergs.' He said, 'Oh, yes, there will be a certain amount of reflected light.' I said, or he said; blue was said between us - that even though the blue side of the berg was towards us, probably the outline, the white outline, would give us sufficient warning, that we should be able to see it at a good distance, and, as far as we could see, we should be able to see it. Of course, it was just with regard to that possibility of the blue side being towards us, and that if it did happen to be turned with the purely blue side towards us, there would still be the white outline." Then will your Lordship look at Question 13643, at page 307? He was asked if it came at all hazy what were they to do. I do not know whether it would be as well to direct your Lordship's attention to question 13635 - it is all on the same context, and if I only read those other questions it may not be quite clear.

*The Attorney-General:* They must be read at some time.

*Mr. Scanlan:* Yes, Question 13635 is: "The Captain left you about twenty or twentyfive past nine, you say. Did he say where he was going to, or where he had been, and so on? - (A.) Yes. The Captain said: 'If it becomes at all doubtful' - I think those are his words - 'If it becomes at all doubtful let me know at once; I will be just inside.' (*The Commissioner.*) If what becomes doubtful? - (A.) The general conditions, my Lord, I suppose he would mean - if I were at all doubtful about the distance I could see, principally. (Q.) You were relying at this time exclusively upon the look-out; you were not taking any measures to reduce the speed? - (A.) None, my Lord. (Q.) And therefore you were relying for safety entirely on the look-out? - (A.) Yes. (Q.) Now tell me again what this observation of the Captain meant, because I do not understand it? - (A.) With regard to the word 'doubtful'? (Q.) Yes; what did he mean? - (A.) It is rather difficult to define. It means to say if I had any doubt at all in my mind. (Q.) What about? - (A.) About the weather, about the distance I could see - principally those two conditions it would refer to. If there were the slightest degree of haze to arise, the slightest haze whatever, if that were to any degree noticeable, to immediately notify him. (*The Solicitor-General.*) I will take what you have just said. You said if the slightest degree of haze was to arise - that would be what was meant - you were to notify him? - (A.) Immediately; yes. (Q.) And then did you understand, and do you represent, that if the slightest degree of haze arose it would at once become dangerous? - (A.) Well, it would render it more difficult to see the ice, though not necessarily dangerous. If we were coming on a large berg there might be a haze, as there frequently is in that position, where warm and cold streams are intermixing. You will very frequently get a little low lying haze, smoke we call it, lying on the water perhaps a couple of feet." I wish to emphasise this as indicating the possibility that there might be a local haze in the vicinity of this iceberg which the ship struck produced on account of such conditions as a variance between the temperature of the berg and the temperature of the water, or between the temperature of the air and the temperature of the water. At all events it was a possibility contemplated by Mr. Lightoller, and doubtless also by Captain Smith.

*The Commissioner:* What point are you making?

*Mr. Scanlan:* I am making the point that this was a hazy night.

*The Commissioner:* This evidence does not show that it was a hazy night. This evidence shows that there is sometimes a slight haze round the bottom of a berg to the height of about two feet.

*Mr. Scanlan:* Yes. I think this evidence is important corroboration of the evidence of the four persons who state that there was a haze.

*The Commissioner:* I am asking what point you are making. Do you suggest that the haze was of such a character that it was necessary to alter the navigation of the ship on account of the haze.

*Mr. Scanlan:* I do, certainly.

*The Commissioner:* This evidence you are reading now would not bear that out at all.

*Mr. Scanlan:* I thought it was only fair I should read those questions. This branch of the case is, I think, the only one in which I find it desirable to refer your Lordship to particular parts of the evidence and the answers of Witnesses.

*The Commissioner:* What time was Mr. Lightoller speaking of?

*Mr. Scanlan:* He was speaking of the time between 8 and 10 - just up to 10 o'clock. The importance of what he says in this last answer of his about a haze arising locally, I think I should impress upon your Lordship, because he contemplated as a possibility that they might find themselves in a local haze - in a haze produced by an iceberg. At Question 13679, on page 308, he is asked: "Were the conditions of the weather such that a haze might arise locally in one particular part of the field in front of you? - (A.) Then I should have seen it. (Q.) You thought that might be so, and you were looking out? - (A.)

It could possibly have been so."

*Sir Robert Finlay:* Read the next question, 13681.

*Mr. Scanlan:* Question 13681 is: "Did that happen so during the rest of your watch? - (A.) No, it was perfectly clear" - that is up to 10 o'clock. The answer at question 13680 is showing his knowledge and appreciation of the fact that a haze might be expected to arise locally in the circumstances in which they were. At page 327 he is asked this, at Question 14335: "At all events, it was more difficult than under normal circumstances to see an iceberg. You observed that yourself from six to ten" - and his answer is "Yes." *The Commissioner:* That had nothing to do with haze.

*Mr. Scanlan:* That had nothing to do with haze.

*Mr. Scanlan:* No, my Lord, but it at all events had to do with the peculiar atmospheric conditions in which he and those responsible for the navigation of the ship found themselves between 10 and 12 o'clock, and even between 8 and 10 o'clock, and I think it right to call your Lordship's attention to it.

*The Commissioner:* I do not know whether you have overlooked it, but there is Mr. Lightoller's evidence on page 322.

*Mr. Scanlan:* I have that.

*The Commissioner:* Then you will have to go back if you are coming to it. You are not taking it in its order.

*Mr. Scanlan:* It deals with the weather conditions.

*The Commissioner:* No, it deals with this question of haze. *Mr.*

*Scanlan:* Yes, my Lord.

*The Commissioner:* He says this: "No reference to what the weather had been after 10 o'clock. - (A.) No. The weather was perfectly clear when I came on deck after the accident, and the slightest degree of haze on the surface of the water would have been very noticeable, or, rather, I might put it the other way: It is proved that there was no haze by some of the boats noticing from the waterline this vessel's lights. I think that has been mentioned, and if there had been the slightest degree of haze they would not have seen them."

*Mr. Scanlan:* Yes, my Lord, and then it goes on: "As far as you saw, did you see any change in the weather conditions at all while you were working, helping to get these boats out? - (A.) Absolutely none. (Q.) Right up to the time the ship went down is it your view that the conditions were the same as they were between 6 and 10? - (A.) Precisely. (Q.) Can you suggest at all how it can have come about that this iceberg should not have been seen at a greater distance? - (A.) It is very difficult indeed to come to any conclusion. Of course, we know now the extraordinary combination of circumstances that existed at that time, which you would not meet again once in 100 years; that they should all have existed just on that particular night shows, of course, that everything was against us. (*The Commissioner.*) When you make a general statement of that kind I want you to particularise. What were the circumstances? - (A.) I was going to give them, my Lord. In the first place there was no moon.

## **Page 755**

(Q.) That is frequently the case? - (A.) Very. I daresay it had been the last quarter or the first quarter. Then there was no wind - not the slightest breath of air. And most particular of all, in my estimation is the fact, a most extraordinary circumstance, that there was not any swell. Had there been the slightest degree of swell I have no doubt that berg would have been seen in plenty of time to clear it. (Q.) Wait a minute: No moon, no wind, no swell? - The moon we knew of, the wind we knew of, but the absence of swell we did not know of. You naturally conclude that you do not meet with a sea like it was, like a tabletop or a floor, a most extraordinary circumstance, and I guarantee that 99 men out of 100 could never call to mind actual proof of there having been such an absolutely smooth sea." I think in one passage of the evidence which I have read he did say that it was flat and known to be flat at the time.

*The Commissioner:* What was flat?

*Mr. Scanlan:* That the sea was flat.

*The Commissioner:* Yes, he said that frequently.

*Mr. Scanlan:* Yes, and that there was no breeze, and this is the first time the suggestion is made by him that he did not know until afterwards that there was no swell.

*The Attorney-General:* No, I think he said that from the first.

*The Commissioner:* His whole case was that there was no swell, no wind, and no moon, and those three circumstances put together, he said, accounted for the iceberg not being seen, although the weather was quite clear.

*The Attorney-General:* He did not know there was no swell until the accident had happened.

*Mr. Scanlan:* Afterwards.

*The Commissioner:* Yes, he found it out when he was launching the boats that there was no swell, because the water did not lift the boat.

*The Attorney-General:* Yes, it could not get free from the tackle.

*Mr. Scanlan:* There is this statement from him, which summarises the whole of his evidence; and is, I think, consistent with what he has said in these various passages. I have already referred to it at page 327, Question 14335: "At all events it was more difficult than under normal circumstances to see an iceberg. You observed that yourself from six to ten?" And he answered, "Yes."

I want to refer generally now to the evidence given by the survivors and by members of the crew. We know now that they were in the midst of icebergs round about where the ship sank and where they were rowing until they were picked up by the "Carpathia"; but no single Witness who has been called has told us that any of the survivors noticed those icebergs while they were in the small boats, while, of course, they all saw them in the morning. There is the evidence of the Officer Boxhall, at page 358.

*The Commissioner:* Are you suggesting that when the people got into the boats they did not see the iceberg because they were in a haze? You cannot forget the fact that they saw the light miles away.

*Mr. Scanlan:* I can conceive a great difference between seeing a light and seeing an iceberg.

*The Commissioner:* Yes, of course.

*Mr. Scanlan:* There is this important distinction, according to Mr. Lightoller's evidence, that an iceberg may be surrounded with its own haze, due to the fact that it is an iceberg, and that it takes it out of comparison at once with the visibility of the lights on a ship or of other lights which those people might have seen. Then, on page 358, in the evidence of Boxhall -

*The Commissioner:* Are you going to be much longer on this point?

*Mr. Scanlan:* No, my Lord. I finish with this reference with all the evidence on this point that I have collected. At page 358, Question 15488, Boxhall is asked: "Did you see any ice when the day broke? - (A.) Yes, I saw quite a lot of ice at daybreak. (Q.) Large bergs, did you see? - (A.) The first ice I saw, I saw it probably about half a mile on the port bow of the 'Carpathia' just as I was approaching it, when I got about two ship's lengths away from her. Day was breaking then." I give that as a typical sample of the evidence we have had from survivors on this point. These are the only references to the weather conditions with which I am going to trouble your Lordship. But looking to the *procès-verbal* and the statements in the messages from the Captain, there is a reference on page 5 to the moderate, variable weather. Those are the messages sent from the "Titanic" to other ships - to the "Caronia" and the "Noordam."

*The Commissioner:* I do not see the particular telegram you are talking about. *Mr.*

*Scanlan:* It is a separate Paper that I have here, which is supplied to us all by the learned Attorney-General.

*The Commissioner:* From whom is the telegram, and to whom?

*Mr. Scanlan:* From Captain Smith, on Sunday the 14th. One of them is to the Captain of the "Caronia," and the other is to the "Noordam." The only reason that I read them is that he mentions on the Sunday variable weather.

*The Commissioner:* There has been variable weather. At 3 o'clock in the afternoon there was, I think, some wind, but I do not know what this has got to do with a haze at twenty minutes to 12 at night, when they were approaching the iceberg.

*Mr. Scanlan:* Except that the weather was variable. What I was going to suggest on the whole of this was that whether or not your Lordship agrees with the positive statements of the four Witnesses, who stated here that there was a haze or whether you take the conversation of Mr. Lightoller, this, at all events is established, that the atmospheric conditions that night were abnormal, and it was recognised on this watch up to 10 o'clock that it was more difficult to see icebergs on account of those peculiar conditions than it would be under normal circumstances.

*The Commissioner:* I do not think you are right there. The right way to put it is this - and this is what I think Mr. Lightoller meant - he did not then realise that it was difficult to see the ice, but he subsequently asked himself how it was he had not seen it, and then he said: "These are the circumstances which only happen once in a hundred years which prevented my seeing it."

*Mr. Scanlan:* I could take that explanation of it, my Lord, were it not that he does not say that himself. At page 327, in the question to which your Lordship has already referred, he is asked: "At all events, it was more difficult than under normal circumstances to see an iceberg. You observed that yourself from six to ten?" And he answered: "Yes." That, my Lord, coupled with the fact that he had various conversations with the Captain as to the difficulty of seeing bergs -

*The Commissioner:* Where is that? He had a conversation with the Captain as to the possibility of a change in the weather, and to the effect that the Captain was to be advised at once; but I do not remember any conversation he had with the Captain as to the difficulty of seeing icebergs.

*Mr. Scanlan:* I have given your Lordship the references.

*The Commissioner:* I think you have read it all to us.

*Mr. Scanlan:* I read the evidence he gave as to his conversation with the Captain, and I think this part of the evidence, and the statement which he makes that he recognised, between 6 and 10 o'clock, that it was more difficult to see icebergs than under normal circumstances, justifies me in making this observation, that on this occasion no extra precautions for safety were adopted, no extra look-out men were stationed, and there was no reduction of the speed. What I submit to your Lordship is that even in normal circumstances on a clear night where those abnormal conditions did not exist, but where warning was given of the presence of ice in a region through which the ship would pass, it would then have been the duty of those responsible for the navigation of the ship to have taken extraordinary and proper precautions to secure safety. *The Commissioner:* I thoroughly appreciate that point.

*Mr. Scanlan:* I am bound to say that in addition to the warning of ice, and the certainty of Mr. Lightoller and the Captain, and Mr. Ismay, that they were coming into ice, and that they would be in the ice regions that night, there was a duty on the owners which was not discharged, and in particular on Mr. Ismay. I am sorry to have to say it, but I feel it my duty to say that there was a duty on the Officers responsible for the navigation of the ship to have taken precautions to avoid the iceberg, and my submission is that those precautions were not taken, and that the failure to take those precautions in the peculiar circumstances, which I have referred your Lordship to, is negligence of a very serious character. I should be very sorry to asperse the character of Captain Smith, but while it is the case that Captain Smith has been drowned, it is also the case that hundreds of the passengers and hundreds of the crew are also drowned, and the whole of this dreadful tragedy is due, in the view I submit to your Lordship, not to any defect in the ship, but to the want of proper seamanship, to want of skill in her navigation, and to utter disregard of the warnings that had been given and of the duties incumbent on them under the peculiar weather conditions which prevailed that night.

*The Attorney-General:* There is just one point I will call attention to, so that your Lordship may have it in mind, because I do not want to get back to it. You said that in the conversation with the Captain there was no reference intended to a haze. That does not quite seem to accord with what happened.

*The Commissioner:* The difficulty of seeing icebergs.

*The Attorney-General:* But in reference to haze, I want to call attention - so that you may have it in mind, and I may not have to travel over these numbers of questions again - to page 307, Questions 13639 to 13641. I think they bear out what my learned friend, Mr. Scanlan, said about this conversation, because your Lordship asked him what he meant by saying: "If it becomes at all doubtful," and "What did the Captain mean?" Then he gives his explanation, and it is "About the weather; about the distance I could see - principally those two conditions it would refer to. If there were the slightest degree of haze to arise, the slightest haze whatever, if that were to any degree noticeable, to immediately notify him." That is what I think my learned friend, Mr. Scanlan, was thinking of.

*Mr. Scanlan:* Yes.

*Sir Robert Finlay:* But that does not bear it out.

*The Commissioner:* But I understood Mr. Scanlan to say that there was some conversation between the Captain and Mr. Lightoller as to the difficulty of seeing icebergs.

*The Attorney-General:* I think that is what he was referring to. He said he had read it, and your Lordship said: "I do not think that has anything to do with haze." I agree haze never was mentioned, but only when the question was put to Mr. Lightoller he seemed to think it included haze. That is the only point. *Sir Robert Finlay:* I do not think it bears that out.

*(After a short adjournment.)*

*Mr. Scanlan:* Just before the adjournment, my Lord, I was making a submission that the immediate cause of the disaster was the bad seamanship of those responsible for the

navigation of the "Titanic" at the time when she met with the disaster. I did not mean, however, and I wish to make myself clear on this point, to be understood as saying that the "Titanic" complied with all the requirements that she should have complied with, or that she was a perfect ship. I think it is only fair to some of my friends who are to follow me to make that clear to your Lordship. I say that the "Titanic" should have slackened speed, or, at all events, that she should have doubled her look-outs, and this involves both the officers who were responsible and, I submit, also the owners. It is important to bear in mind what the position of the owners is in this connection. They not only said in the evidence that their Commanders have no instructions to slacken speed, but in one part of the case, at page 441, Mr. Ismay, under examination by the Attorney-General, said they would be justified even in increasing speed.

*The Commissioner:* What question is that?

*Mr. Scanlan:* 18434, on page 440, and 18448, on page 441.

*The Commissioner:* You do not take exception to what he says in Question 18434, do you? It is a truism you know. If you can see far enough to avoid the ice you need not alter your speed.

*Mr. Scanlan:* This is how it is qualified in Question 18448: "So that on a perfectly fine, clear night, with the expectation that you are coming within the region of ice, your view is that the Captain would be justified in increasing his speed? - (A.) I do not see any reason why he should not, so long as he could see sufficiently far to clear the ice." *The Commissioner:* It is the same answer. Do you take exception to that?

*Mr. Scanlan:* I do, my Lord.

*The Commissioner:* Assuming he can see sufficiently far to clear it, why should he slacken speed?

*Mr. Scanlan:* Why should it be assumed, my Lord?

*The Commissioner:* No, but you must take his assumption.

*Mr. Scanlan:* I do, and I quarrel with the assumption.

*The Commissioner:* You may quarrel with the assumption, but assuming that you can see the ice far enough to clear it, I cannot understand why, if you take that assumption, he should trouble himself about the speed.

*Mr. Scanlan:* I daresay if you are to assume that you can see far enough ahead and that you can see an iceberg in time to avoid it, it may be so; but what I do say is that the assumption is not reasonable. In another part of his evidence, to which your Lordship will no doubt be referred, he said, in answer to the Attorney-General, that he knew there was always danger, or that there was danger, in the proximity of ice. I have not the exact reference just now.

At page 448, Question 18713, he is asked: "Do not you think, as ice was reported in your track, and as you expected to be in the presence of ice, that the look-out should have been doubled? - (A.) I do not. (Q.) Is it still your view that your captains and officers are discharging their duty in crossing the Atlantic, when ice is reported to them, in going ahead at full speed, and taking no extra precautions? - (A.) So long as they can see the object far enough ahead to be able to avoid it."

There is no need to bring home to the owners of the "Titanic" that so far as their instructions to their officers are concerned there is no prohibition, no direction against going at full speed in such circumstances as those I have indicated, because not only have

they produced their regulations to establish that, but they have called numerous Captains of the various lines controlled by the Liverpool Company or the American Trust to give evidence, all to the same effect.

*The Commissioner:* Will you for my assistance tell me what they ought to say in their sailing directions?

*Mr. Scanlan:* I think they should give particular directions in regard to the approach of ice.

*The Commissioner:* What should they say?

*Mr. Scanlan:* I think it would not be unreasonable in the case of a ship, the speed of which is 21  $\frac{3}{4}$  to 22 knots, that if a Captain gets a message of ice in his track at night, he should reduce his speed; I think half that speed would be a very high limit of speed in those circumstances.

*The Commissioner:* Then do you say that there should be in the sailing directions an order that if

## **Page 757**

they are advised there is ice in their track - I do not know how far it may be off - they must not go at more than a certain speed? At what speed?

*Mr. Scanlan:* I should say when they are approaching ice they should reduce their speed.

*The Commissioner:* How much?

*Mr. Scanlan:* I think they should reduce their speed to such an extent that it would be possible for them to escape the iceberg.

*The Commissioner:* Do you think it requires a direction of that kind?

*Mr. Scanlan:* It is difficult for a layman in nautical matters to say what would be a reasonable speed when approaching ice.

*The Commissioner:* Must not that be left to the Captain?

*Mr. Scanlan:* I do not know that it should be left to the Captain, my Lord. I think, at all events, the circumstances of this terrible accident point to the necessity of some direction being given, or some recommendation being made as to the reduction of speed in the proximity of ice.

Here you have the owner of the ship saying that he would not double the look-outs where ice was expected; he is quite definite on that.

*The Commissioner:* The Cunard Company do not give those directions, do they?

*Mr. Scanlan:* I do not think it has been shown that they do, my Lord.

*The Commissioner:* I think it has been shown that they do not know, and I do not know that German liners give that direction. They say what, of course, they must say, that every man in command of a ship must do all that reason and experience dictate to him to preserve his ship, and to preserve the lives of his passengers.

*Mr. Scanlan:* That is not saying much to him, my Lord; in fact, it is leaving everything to his discretion.

*The Commissioner:* How those sailing directions can govern the discretion of the Captain in each particular case that may arise, I am at a loss to understand. Are the sailing directions to tell him when he is to port his helm?

*Mr. Scanlan:* I do not make such an extreme proposition as that, my Lord; I think he has to qualify and pass an examination, and in his Apprenticeship he gets all the knowledge that is necessary to teach him that. But if there is, and undoubtedly there is, a somewhat general practice which I am forced to regard as a very dangerous practice, of not slackening speed at night when ice is reported on the track, surely it is time that something was done to put a stop to that practice. If it could be done by giving directions that speed is to be diminished or that the speed should not exceed a certain limit, say 10 knots an hour, that would be a positive direction which, if it had been in force on this occasion would probably have averted the collision. I think the importance of a direction on that point is sufficiently evidenced by what we have heard at this Enquiry, and that I am justified in making a submission to your Lordship on that point.

*The Commissioner:* That is very proper, but are you now trying to fix the liability for this calamity upon the owners, as distinguished from the Captain? I do not know quite what you are driving at.

*Mr. Scanlan:* So far as legal liability is concerned, I take it we are not concerned with it here.

*The Commissioner:* Oh, no.

*Mr. Scanlan:* And what your Lordship is attempting to do is to get a satisfactory answer to Question 24: "What was the cause of this disaster and of the loss of life?"

*The Commissioner:* What was the effective cause of the disaster.

*Mr. Scanlan:* The effective cause, and other matters, that had some relation to the accident, whether as the direct cause or the effective cause. With those directions or with the want of directions with regard to this point and with the presence of the managing owner on board, who knew there was ice ahead, and who had had something to do with the direction of the voyage in the instructions which he gave at Queenstown to the Chief Engineer, he clearly makes himself a responsible party, in the sense in which this Question 24 is put, as well as the Captain, and those who are charged by the duty of their office with the navigation of the ship.

At page 439, Question 18392, Mr. Ismay, describing his interview at Queenstown, says, "The reason why we discussed it at Queenstown was this, that Mr. Bell came into my room; I wanted to know how much coal we had on board the ship, because the ship left after the coal strike was on, and he told me. I then spoke to him about the ship, and I said it is not possible for the ship to arrive in New York on Tuesday. Therefore there is no object in pushing her. We will arrive there at five o'clock on Wednesday morning, and it will be good landing for the passengers in New York, and we shall also be able to economise our coal. We did not want to burn any more coal than we needed." And elsewhere in the evidence, to which I have no doubt your Lordship will be referred, it is clear that Mr. Ismay had the telegram, and it is not clear to my mind from his evidence how, unless he had discussed the navigation of the ship and the meaning of the Marconigram with the Captain or some of the other officers, he reasoned with himself and came to the conclusion that they would be that night in the proximity of ice shortly after turning the corner.

I do not wish to go further into this matter, because I have no doubt it will form the subject of a part of the address of Mr. Attorney, as a number of his questions have borne on that part of the case. But I must find fault with the attitude of Mr. Ismay in regard to

the look-out. It is true that a number of companies are in the same position, so far as regulations are concerned, about going into an ice track as the White Star Company.

*The Commissioner:* No, not so far as regulations are concerned, but so far as the absence of regulations is concerned.

*Mr. Scanlan:* Yes, that is a much better way of putting it. But it is not the case, my Lord, that they are all as reckless as the White Star people in reference to look-outs. Mr. Ismay says in this part of his evidence that he would not double the look-out; he does not think the look-out should have been doubled.

*The Commissioner:* To tell you the truth, I do not pay much attention to what Mr. Bruce Ismay said upon a matter of that kind. He is not a sailor.

*Mr. Scanlan:* He is not a sailor, my Lord, but he is the representative of the owners, and the principal owner of the "Titanic" - one of the principal members of the Company or syndicate which owned the "Titanic"; and in the circumstances in which he is connected with this voyage of the "Titanic" I think the observation is quite fair to him. A number of people who have given their evidence speak of doubling the look-out as being a proper thing. I do not think there could have been better evidence with regard to that than the evidence we had today from Captain Rostron. It was his practice. And I think in other points, as to the degree of care and the precautions which should be taken, his evidence strongly supports the contention which I have made all along that in the presence of ice, in proximity to ice, and especially where ice is reported, the look-out should be doubled, and in particular look-out men, or at least one look-out man, should be stationed in the bows.

*The Commissioner:* Do you apply this observation to this case? Do you think if there had been a dozen men there they would have seen the iceberg any sooner?

*Mr. Scanlan:* I think they would have had a chance of seeing it sooner; they might have seen it sooner; but if there was not a certainty that they would have seen it sooner, then the other obvious precaution should have been taken - of slackening the speed of the ship.

*The Commissioner:* Have you thought about a combination of causes in this connection?

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* That is to say, a bad look-out plus excessive speed. *Mr.*

*Scanlan:* I have not thought of a bad look-out, my Lord.

## **Page 758**

*The Commissioner:* No, you will not contemplate the possibility of your men not having looked properly, but have you thought about the combination of bad look-out, or, if you like, a bad disposal of the look-out - that you do not object to.

*Mr. Scanlan:* No, I must not quarrel with that.

*The Commissioner:* That does not hurt your clients - a bad disposal of the look-out, together with excessive speed.

*Mr. Scanlan:* Of course, I am bound not to complain of the combination, because I have already complained of both of those things taken separately and individually.

*The Commissioner:* What I mean is this: Can you logically attribute the accident to the two together, or must you confine yourself to one?

*Mr. Scanlan:* I do not think so, my Lord. I do not think it is necessary to confine myself to one. In the evidence of Captain Rostron, he said in some circumstances (and he is a very clear-sighted man, I have no doubt, and a man with excellent eyes and great practice), a look-out man might see an object ahead sooner than the man on the bridge. I think, therefore, that that is a wise precaution.

*The Commissioner:* He does, but he says in 75 percent of the cases the men on the bridge see an object before the look-out man.

*Mr. Scanlan:* Yes, my Lord. As your Lordship has suggested one view about the lookout, perhaps I should be permitted to say this: Captain Rostron saw one berg probably about the distance ahead that Fleet and Lee [Original spelled Leigh.] saw the berg which caused the collision; therefore, it would be unreasonable to hold that the look-out men who were posted in the crow's-nest could have seen this berg sooner than they did, whether your Lordship takes the view that there was a haze, or refuses to adopt that view. Another thing which confirms this is the fact that only the two look-out men saw the berg, and on this occasion the officer on the bridge, who was Mr. Murdoch, did not see the berg. There is nothing to show that Mr. Murdoch was not a careful officer; there is nothing to show that his mind was in any way distracted from his duty at the time the collision occurred, and when you couple those two considerations together, that these men did see it, and this other man who was in an equally good position did not see it, the iceberg in all probability was seen by those men as far ahead as they could have seen it in the peculiar circumstances of the night, and of the position in which they were placed. You have the evidence of Captain Jones as to stationing a look-out on the bows. He is a man who believes in going ahead. His evidence is at page 665.

*The Commissioner:* Who was Jones?

*Mr. Scanlan:* He was one of the Captains called.

*The Attorney-General:* Captain of one of the Dominion Line boats.

*The Commissioner:* The Dominion Line goes to Canada, does it not?

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* I say it in your favour: if it is a wise precaution to do what this Captain says he has been in the habit of doing for the last 27 years, I do not see why it should not be done anywhere else where there is ice reported.

*Mr. Scanlan:* Yes, my Lord. Another Captain, Captain Cannons, at page 667, says at Question 23771: "If any condition of the weather prevented you from seeing clearly, you would double the look-out? - (A.) Decidedly." *The Commissioner:* That is not to the point.

*Mr. Scanlan:* At Question 23778 he is asked about doubling the look-outs. *The Commissioner:* Yes, that is to the point.

*Mr. Scanlan:* "Is it considered that the position of the stem head is a good commanding position from which to see low-lying ice? - (A.) Yes, it is a position of advantage." Of course, there is the most important and, to my mind, convincing evidence of Sir Ernest Shackleton on this point. His evidence is at page 720. He is asked by the Attorney-General at Question 25041, "That would rather suggest that your view would be that you could detect bergs of that kind better at the stem than you could at the crow's-nest? - (A.) Better, the nearer you are to the waterline. When we navigated in thick or hazy weather

there was always one man on the look-out and one man as near the deck-line as possible. (Q.) That is thick or hazy weather? - (A.) Yes, that is thick or hazy weather, or even clear just the same. (Q.) What I want you to tell my Lord is, Do you think it is of advantage in clear weather to have a man stationed right ahead at the stem as well as in the crow's nest? - (A.) Undoubtedly, if you are in the danger zone; in the ice zone. (Q.) And supposing you were passing through a zone where you had ice reported to you would you take precautions as to the look-out? Supposing you only had men in the crow's nest, would you take any other precaution? - (A.) I would take the ordinary precaution of slowing down, whether I was in a ship equipped for ice, or any other, compatible with keeping steerage way for the size of the ship." Then he says he would slow down. *The Commissioner:* What did you say the speed of the "Titanic" would have to be to keep steering way on?

*The Attorney-General:* Six knots; that is admitted.

*Mr. Scanlan:* Then there is an important piece of evidence at page 734, from Captain Fairfull. He is asked at Question 25272 - other captains had been examined and he is asked if he agrees with them - "Is your practice in accordance with theirs? - (A.) All except that when we get to the ice track in an Allan steamer, besides having a look-out in the crow's nest, we put a man on the stem head at night. (*The Commissioner.*) I do not hear what you are saying. (*The Witness.*) Besides having a look-out in the crow's nest in crossing the ice track, I put a man on the stem head at night. (Q.) Whether it is clear or not? - (A.) Yes." Another witness is asked if he agrees with him, but I am afraid he agrees with too many.

*The Commissioner:* What do you mean?

*Mr. Scanlan:* There is another Witness, Braes, on the next page, and he is asked at Question 25286, "Have you heard the evidence of the last four Witnesses? - (A.) Yes. (Q.) Is your practice when you may be meeting ice at night similar to their practice? - (A.) Just the same." I do not take any advantage of that question, because the practice of the four referred to differs very considerably, and I do not think I can take him as concurring with Captain Fairfull.

*Sir Robert Finlay:* The next sentence says, "I never slowed down, so long as the weather was clear."

*The Commissioner:* There is a great mass of evidence to the effect that in clear weather speed is not reduced although they know that they are in an ice region.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* They trust they will be able to avoid the ice. And that seems to have been the practice of a great number of skilled and experienced captains?

*Mr. Scanlan:* Yes.

*The Commissioner:* That may have been all right according to their experience, and now to their experience has been added a very important circumstance, namely the loss of the "Titanic."

*Mr. Scanlan:* Yes, my Lord. Then I may say that almost universally, with the single exception of Captain Rostron, there is no suggestion, that I am aware of, of diminishing speed. There may be some other. But at all events it cannot be said that it is a universal practice not to double the look-out, or not to station men on the stem head.

*The Commissioner:* That is certainly true.

*Mr. Scanlan:* I think I may say that a large number of Captains speaking for themselves and speaking for their own line, as the Captain of that Allan Line steamer does, when they are in these circumstances of danger do at all events make this provision for safety, that they double the look-out. While the White Star people followed what may have been the practice, and a very dangerous practice, and took an unnecessary risk in navigation,

**Page 759**

at all events, they failed to do this; they failed to adopt the precaution which I pointed out to your Lordship is in a large number of cases adopted, and I submit should have been adopted by them, and by all responsible for the navigation of a ship in similar circumstances of danger. It seems to me manifest that a Captain who has such knowledge and drives a ship at a speed of 21 ½ to 22 knots into a region of ice, must know he is taking a risk. There seems to me to be no suggestion of justification of this practice, but inveterate custom.

*The Commissioner:* Will you look at the evidence of Captain Moore, who is the Captain of the "Mount Temple"? *Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* He goes to Canada. He answers a general question put to him by Mr. Harbinson at page 209, "Would you consider it safe in the neighbourhood of an icefield" - that is an ice-field - "provided your boat had the power to go ahead at 21 knots an hour? - (A.) It would be most unwise to go that speed at nighttime." He is speaking apparently with reference to an ice-field.

*Sir Robert Finlay:* Yes, the expression there is "ice-field," and at Question 9406, on the next page, it is put specifically as to field ice. "(Q.) You meet constantly field ice on your way to Montreal, do you not? - (A.) Yes, but we go round it. (Q.) And when you say it is not wise to go 21 ½ knots - I think your expression was in the neighbourhood of ice - did you mean field ice? - (A.) Field ice." At page 209 the expression is "ice-field" and on page 210 it is "field ice."

*Mr. Scanlan:* At page 208, my Lord, he gives some important evidence from Question 9261 downwards, about instructions he has from his company.

*The Commissioner:* Oh, yes; you need not read that; I remember that quite well. He has specific instructions.

*Mr. Scanlan:* Yes, my Lord, and then he doubles his look-out even on a clear night. You will find that on the same page. I will not further labour that point.

I was saying, my Lord, that the only justification for this practice of going ahead at full speed is inveterate custom, long-standing usage of mariners -

*The Commissioner:* Oh, no, not quite that, I think; it is not the justification; at least, I do not think they ought to put it in that way if they do. What they say is, "Hitherto experience has shown us that we may in safety in clear weather keep our speed." That is what they say, and I am not aware of any evidence to the contrary, but of course that is not conclusive of the question.

*Mr. Scanlan:* That is the point I was coming to, my Lord. They may say this is a custom of very long standing and an almost universal custom. They may also say that there has been long immunity from serious accident in following this custom, dangerous as it may appear, that there has not been any serious accident.

*The Commissioner:* As far as I know I have heard of none, you know.

*Mr. Scanlan:* What I am to submit on that is that even in those circumstances and with those two elements of justification brought forward, such a course of conduct, going ahead at full speed at night by a track or lane which leads you into a region where you know you will meet ice, is an unjustifiable custom, and that no amount of usage and no immunity from serious consequences in the past would justify it. When is a custom of that kind to stop? Is it to stop after one accident, or is it a custom which may be persevered in until a series of great disasters takes place? Because, my Lord, from the evidence of Mr. Ismay and Mr. Sanderson, those responsible for the conduct of the White Star Line, there have been no positive directions given, even since the disaster to the "Titanic," which would, so to speak, bind their Captains to adopt -

*The Commissioner:* You are on a wrong line now. What they have done since has got nothing to do with it.

*Mr. Scanlan:* Quite, my Lord.

*The Commissioner:* It was what they omitted to do before.

*Mr. Scanlan:* What they did before is sufficiently serious, and I have said all about it I need say. But I think the recommendations of your Lordship might have some effect in stopping this practice in the future. It is in that view and in that hope -

*The Commissioner:* Have you ever considered who the people are who are really responsible for it, if it is a wrong custom or practice? Is it not the passengers?

*Mr. Scanlan:* The demand of the public?

*The Commissioner:* The demand of the public.

*Mr. Scanlan:* And the taste for high speed?

*The Commissioner:* Yes.

*Mr. Scanlan:* That leads to a disregard of precautions of safety which one would think that ordinary common sense, apart from seamanship, would dictate. But does that relieve the owners of vessels and those in charge of vessels of their responsibility?

*The Commissioner:* You can answer that question with a "No," because the fact, assuming that it is a foolish act, that the public ask the captain of a ship to do a foolish act is no justification for his doing it.

*Mr. Scanlan:* No, my Lord; and then running at full speed and the making of records, or the keeping one's place as a shipowner in the competition amongst shipowners to do a voyage quickly, would not either be a justification for the avoidance of what would seem to be fair and reasonable precautions.

I have something further to say in reference to the responsibility in the sense of this Question 4, of the owners of the "Titanic." I say nothing at all about Mr. Bruce Ismay as an individual. I may say, if I may respectfully say so, that I was very much impressed by the evidence of a number of Witnesses as to the amount of care he took and the amount of help that he gave to a number of women and children, in getting them into the boats when he was on the deck of the ship before he left it. But, insofar as he is a shipowner, and, insofar as he took any part in this voyage, I think all his actions are fair subjects for criticism and comment in this Enquiry.

What I wish to direct your Lordship's attention to now, is the question of lifeboat accommodation. This involves amongst the questions submitted, No. 3: "In the actual

design and construction of the 'Titanic,' what special provisions were made for the safety of the vessel and the lives of those on board in the event of collisions and other casualties." Then Question No. 5 is: "What was the number of the boats of any kind on board the 'Titanic'? Were the arrangements for manning and launching the boats on board the 'Titanic' in cases of emergency proper and sufficient? Had a boat drill been held on board, and, if so, when? What was the carrying capacity of the respective boats?" Then Question 25 is, "When the 'Titanic' left Queenstown on or about 11<sup>th</sup> April last, was she properly constructed and adequately equipped as a passenger steamer and emigrant ship for the Atlantic service?"

This brings me to examine, which I shall do very briefly, the provision of lifeboats. We know the number of passengers she could have carried was over 3,500. She had on the occasion 892 of her crew and 1,316 passengers - a total on board of 2,208. Her lifeboat accommodation was for 1,178 persons.

*The Attorney-General:* That covers all boat accommodation; they are not all lifeboats.

*The Commissioner:* 1178 boat accommodation?

*Mr. Scanlan:* Yes.

*The Commissioner:* Give me the number she was entitled to carry.

*The Attorney-General:* 3547.

*The Commissioner:* That is with the crew?

*Mr. Scanlan:* Yes; she had, in point of fact, 2208.

*The Commissioner:* Is that 2208 an admitted figure? There was some question about two.

*The Attorney-General:* Yes, about 2206 or 2208.

*The Commissioner:* Am I to take it at 2208?

## **Page 760**

*The Attorney-General:* We have analysed it for the purpose of getting at the exact figure. We have got it from the documents I referred to this morning, and the exact figure is 2201. I do not think you have had that before.

*The Commissioner:* No, I have not.

*The Attorney-General:* We have assumed always that it was 2206 or 2208, and which it was was not quite clear; but I think you had better take it as 2201, because we have taken that with considerable care.

*The Commissioner:* What do you say, Sir Robert?

*Sir Robert Finlay:* If it has been calculated, I am quite contented to take it as that; I am not certain that it is more exact than the other. But the difference is not very great. I am told by Mr. Furniss that he has agreed that with the Board of Trade.

*The Commissioner:* Very well. Take it, Mr. Scanlan, at 2201; it makes no difference to your argument.

*Mr. Scanlan:* No, I have made a note of that figure. Then we have the total number saved of passengers and crew, 703.

*The Attorney-General:* No, 711 is the figure. That has been got this morning.

*Mr. Scanlan:* That is so.

*The Attorney-General:* Take that as the right figure.

*Mr. Scanlan:* Yes, the figure we have got today, 711. Now I am to ask this question, my Lord: Was this provision of lifeboats sufficient? It was evidently insufficient.

*The Commissioner:* Insufficient in what sense?

*Mr. Scanlan:* Insufficient for all on board; insufficient for the accommodation in the event of an accident for all those carried on this particular voyage; and, still more insufficient for the people who could have been carried, the full complement of the passengers and the crew of the vessel. The Board of Trade have power to make regulations with regard to the provision of life-saving appliances on ships, but I think the owners of ships have a duty incumbent on them apart from the regulations and requirements of the Board of Trade under this section to make provision for the safe carrying of their passengers. That is a general proposition in this particular case. I am to submit to your Lordship that the owners of the "Titanic" had brought specially home to them the insufficiency of the lifeboat accommodation which they had proposed to install on the "Titanic" and on the "Olympic." I refer to the evidence of Mr. Carlisle and also the evidence on this point of Mr. Ismay and Mr. Sanderson. Without going into the evidence and reading it, the evidence of Mr. Carlisle is that he submitted his plans, which would have provided for full accommodation on the "Titanic" to the directors of the White Star Line at two separate meetings, and that when those plans were submitted the directors of the White Star Line, Mr. Bruce Ismay and Mr. Sanderson were put to their election as to whether they should have the somewhat scanty provision of lifeboats recognised by the Board of Trade, or whether they would have adequate lifeboat accommodation for all they were entitled to carry, and in particular for the number of passengers who were carried on this fatal voyage. Both Mr. Ismay and Mr. Sanderson admit in their evidence that plans were submitted, but they have no recollection of the particular plans which would have shown accommodation for the number of passengers that could have been provided for, if the evidence of Mr. Carlisle is to be accepted by your Lordship as to what he submitted to them.

I may leave the matter, except for this further remark: the evidence of Mr. Wilding, at page 534, Questions 20758 and 20766, is to the effect that it would have been practicable, in the case of the "Titanic," to have provided adequate lifeboat accommodation. I do submit that this evidence brings home to the owners of the White Star Line a responsibility in connection with the disaster, by reason of their not having on the "Titanic" sufficient lifeboats to accommodate all on board. I could give the special references, but I think it is probably better not to trouble your Lordship with them. *The Commissioner:* In this connection I daresay you have taken into account in some way or another the fact that no more than two-thirds of the lifeboat accommodation provided was utilised.

*Mr. Scanlan:* Yes, my Lord, I was going to refer to that, and the fact that while you had lifeboat accommodation for this number, so few were saved.

*The Commissioner:* That, of course, is another topic.

*Mr. Scanlan:* It is another topic, my Lord. I do not think I can say any more on this topic. Then one of the Questions asked is as to binoculars and searchlights. I already understand your Lordship's view about binoculars.

*The Commissioner:* You invited me, you know, to express an opinion. That is disposed of. You need not go any further with that.

*Mr. Scanlan:* Not entirely, I may say, my Lord, to my satisfaction.

*The Commissioner:* Oh, I think so.

*Mr. Scanlan:* I feel a certain regret -

*The Commissioner:* I am sure you are quite satisfied.

*Mr. Scanlan:* I feel a certain regret at the loss of the binoculars; I could have let the searchlight go much more readily.

Now with regard to the launching of those boats - and this will bring me at once to the question which your Lordship has suggested - I think Questions 5, 16, 17, and 19, are those in this case which are directed to that point. We have the numbers saved, and we have this strange fact that while accommodation was provided for 1178 only 711 were saved. Then looking through the list prepared by the Attorney-General, you find the greatest disparity in going over the boats, number by number, in respect of the passenger accommodation actually provided and utilised. You find boat No. 1 with 12 people; you find No. 11 boat had 74 people.

*The Commissioner:* What you do find is that the evidence says so.

*Mr. Scanlan:* Yes.

*The Commissioner:* It is quite evident that the evidence is not right, because if you have taken the trouble, as no doubt you have, to add up the numbers that are deposed to as having been in the boats, you will find that there were put into the boats and saved a great many more than ever were saved.

*Mr. Scanlan:* There certainly is a good deal of exaggeration, but some things have come out clearly enough, and that is, for instance, with regard to No. 1 boat, that it only had five passengers and seven of the crew, and in regard to some other boats that they were properly filled.

*The Commissioner:* Is it your contention that if there had been more lifeboats on board this vessel more lives would have been saved, although the lifeboats that were there were not used more than to the extent of two-thirds of their capacity? *Mr. Scanlan:* I do say, my Lord, that if there had been discipline - *The Commissioner:* Yes, that may be.

*Mr. Scanlan:* And if there had been a training of the officers and crews in the manning and handling and navigation of the lifeboats, it would have been possible to have launched and lowered lifeboats sufficient to have rescued every one on that ship. We are all glad to think that there was nothing in the nature of a panic on the "Titanic," but I think it would be blinding one's eyes to the real facts of the case if one were to accept the view that discipline, in any proper sense of the term, was observed after the accident in the filling and sending off of these boats.

*The Commissioner:* Now I think what you must say - you will probably agree with me - is that the facts speak for themselves, and that the evidence of the Witnesses who nearly all say that there was no panic and plenty of discipline cannot be accepted in face of the facts.

*Mr. Scanlan:* That is my contention, my Lord. Of course, you might have panic in one sense if there had been a rush of the passengers past the officers to get into the boats; and the witnesses from the crew, and from amongst the officers, are quite justified probably in saying that there was

no panic whatever in that sense, and that discipline was maintained in that way, and that the officers were respected by the members of the crew and by the passengers. But in the sense of the officers and the members of the crew realising the duty thrown upon them and the work they had to do in the circumstances of the disaster, I think I am justified in saying in that broad sense that there was a lamentable want of knowledge and want of discipline amongst the officers.

*The Commissioner:* I want to follow you, and I want to have it clear. All the boats, except possibly one collapsible boat, were launched?

*Mr. Scanlan:* Yes.

*The Commissioner:* Let us leave out the one collapsible boat. And they were launched well before the ship foundered?

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* So that, discipline or no discipline, the boats were got into the water?

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* All of them, except the one collapsible?

*Mr. Scanlan:* Yes.

*The Commissioner:* The only fault, therefore, which was of any consequence, if it was a fault, was that they did not get the people into the boats?

*Mr. Scanlan:* That is it, my Lord.

*The Commissioner:* They managed, discipline or no discipline, to get all the boats into the water.

*Mr. Scanlan:* Yes.

*The Commissioner:* I leave out the one collapsible boat. What they did not do, for some reason, was to get the people into the boats.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* Now, have you thought about that?

*Mr. Scanlan:* I have, my Lord. I have given a good deal of consideration to the suggestion that people would not go into the boats, and I daresay that at the beginning that was true; but I do think if, when the terrible seriousness of what had happened was recognised by those in charge of the ship, they had told the people plainly that the ship was doomed, and was sinking, and would sink in a very short time, I think there would have been no indisposition to get into the boats.

There is a reference in Mr. Ismay's evidence, which I accept, to the fact that up to the time he left the "Titanic" he was not told by the Chief Engineer or the Captain or anybody else, that the ship would certainly sink. He was told that the condition of the ship was dangerous, and I think he was told, in one part of his evidence, that the engineers hoped that by working the pumps they would be able to keep the "Titanic" afloat.

*The Commissioner:* Have you looked at the Marconigram which says "sinking"? I will tell you which it is. It may be taken as showing that they, at all events, realised the condition then.

*Mr. Scanlan:* Yes, my Lord.

*The Attorney-General:* It is at the top of page 7, I think your Lordship means - "Titanic" to "Olympic."

*The Commissioner:* Yes. "We are in collision with berg. Sinking. Head down." Now that is 1.10 a.m. ship's time. Now I think probably that message was sent from the Marconi room upon information given by the Captain to the Marconi operator.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* So that it was realised apparently at that time.

*Mr. Scanlan:* Yes.

*The Commissioner:* That is an hour and ten minutes before the vessel went down. *Mr.*

*Scanlan:* Yes, but there is no evidence, so far as I know, to the effect that when the seriousness of the catastrophe was realised, the passengers were apprised of the seriousness of their position.

*The Commissioner:* Just think about that; let us see. They began, I think, to uncover the boats very soon after twelve o'clock, did they not? *Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* That is within about a short half hour of the striking? *Mr.*

*Scanlan:* Yes, from 11.40.

*The Commissioner:* Large numbers of people were then coming on deck.

*Mr. Scanlan:* Yes.

*The Commissioner:* Does not that show this, that there was the very clearest notification of danger? People do not uncover lifeboats, you know, and begin to lower them, until there is danger.

*Mr. Scanlan:* I thought I should indicate this to your Lordship as one explanation that has appeared to me. I think they would not have had any difficulty in getting the passengers; I do not think that any passengers would have held back, who knew that this was a last chance - if they were told, upon a boat going away, "If you do not go into it you will go down with the ship in half an hour." That would be a crude way of doing it. *The*

*Commissioner:* I doubt whether they knew when they first began to uncover the boats that the ship would go down. They knew at ten minutes past one when the Marconigram was sent off.

*Mr. Scanlan:* At all events, I do not think that can be put forward as an explanation why the boats were not filled to their full capacity. Two explanations suggest themselves to me. There was an idea in the mind of the Captain and in the mind of Mr. Lightoller as appears from the evidence of Mr. Lightoller at page 316, Questions 13953 and 13958. Shall I read those, my Lord, or just refer to them?

*The Commissioner:* Just wait a minute. There is a telegram sent from the ship at 12.26. It is on the top of page 5, the second telegram, and it leaves the "Titanic" at 12.26 a.m. "Require immediate assistance. We have collision with iceberg. Sinking. Can hear nothing for noise of steam." That makes the notification of the sinking three-quarters of an hour before.

*Mr. Scanlan:* Yes, my Lord. What that shows is that the responsible people, the officers, knew that this message presumably was sent by the Captain's orders.

*The Commissioner:* I want you to tell me your view. Do you think the officers ought to have announced in some sort of way to the passengers that the ship was sinking?

*Mr. Scanlan:* Well, I do, my Lord. I think the stewards -

*The Commissioner:* I cannot imagine myself any more likely way to defeat the object that they had in view.

*Mr. Scanlan:* I do admit that the situation then was a difficult one, and a delicate one, but at all events the stewards should have been instructed by the officers to make it quite clear to any passengers who were holding back that if they did hold back they did so at their peril, and to let them know as quietly as might be the serious condition in which affairs were then. They might have even been forced into the boats, the women. In one department a large number of the women were not saved, and it would probably be the duty of the stewards, if discipline were rigorously carried out, to have put those people into the boats.

*The Commissioner:* To have done what?

*Mr. Scanlan:* To have put those people into the boats. I say the women, my Lord, who were held back by fear, should have been forcibly put into the boats.

*The Commissioner:* I cannot imagine anything more alarming than for stewards to be dragging women by force; it would be a most terrifying thing.

*Mr. Scanlan:* It is very alarming, my Lord, but it is not quite so terrible as being left behind on a ship that is doomed.

*The Commissioner:* But, as you said just now, and you were quite right, it was a very difficult and delicate duty to perform.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* You must not frighten the people too much, because if you do, you may have panic.

*Mr. Scanlan:* I agree, my Lord.

*The Commissioner:* And yet, you must get them into the boats.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* You have to reconcile those two things.

## **Page 762**

*Mr. Scanlan:* Yes, my Lord. I think probably something more might have been done. It is difficult, it is impossible, for me to say how much more might have been done; but this has occurred to me now as one explanation, and which I have put before your Lordship. There is another matter. We had it in the evidence of a number of Witnesses that certain of the officers did not know the carrying capacity of the boats, and that certain of the officers entertained doubts as to the strength of the falls. It is true that the boats were new. I believe the boats were sound; I believe the falls were sound, but I think reading together the evidence of a number of Witnesses, Hogg, Boxhall, Symons, Hendrickson and Crawford, this is apparent.

*The Commissioner:* I agree with you that there is evidence of that kind. That, you know, does not account for some of the boats going away with only a dozen people in them.

*Mr. Scanlan:* No, my Lord, it does not. Then there is the evidence of Mr. Lightoller at page 316 with reference to this. It is where he lowered the boat with 40 people in it; it is Question 13953.

*The Commissioner:* There is 13971, "You put as many into No. 4 boat as you thought safe? - (A.) Yes. (Q.) That was about 40. We know some of the boats carried considerably more than 40. - (A.) 65." I think I am examining. I apparently took a large slice of examination here: "Would the man in the boat to whom you had said, 'That boat is full; lower her,' know that she was capable of taking more when she became waterborne? - (A.) Yes, my Lord. (Q.) They would know? - (A.) They would know." Do you see those questions, Mr. Scanlan? How do you account for some of these boats going away with only twelve people in them?

*Mr. Scanlan:* I am going to comment upon that, my Lord.

*The Commissioner:* It cannot have been want of discipline.

*Mr. Scanlan:* I was going to say this: I have put before your Lordship this consideration that the officers did not know the carrying capacity of the boats or the strength of the falls.

*The Commissioner:* That would not account for only 12.

*Mr. Scanlan:* Very well. There is another consideration which I think is relevant to this branch of the Enquiry, and that is that there was a suggestion that when the boats were lowered they should be brought along when they became waterborne -

*The Commissioner:* Below a gangway door?

*Mr. Scanlan:* Below a gangway, and the passengers might be let down from the gangways. I understand there were two gangway doors, on each side of the ship, on the starboard and on the port.

*The Commissioner:* Yes.

*Mr. Scanlan:* Your Lordship will find this in the evidence of Mr. Lightoller on page 316 at Question 13957. "(*The Commissioner.*) You had ordered the gangway to be lowered, as I understand? - (A.) What gangway, my Lord? (Q.) The gangway in the forward part of the ship? - (A.) I had ordered the doors to be opened. (Q.) Well, that is what I mean."

*The Commissioner:* If I said the forward part of the ship, I made a mistake. I think it was in the afterpart of the ship.

*Mr. Scanlan:* Yes, my Lord, but they had those doors in point of fact both forward and aft. There were two sets of gangway doors. I think that is clear from the evidence. "You had ordered the gangway doors to be opened? - (A.) Yes. (Q.) And the gangway to be lowered from that point? - (A.) If there were sufficient time. We had a companion ladder." Then at Question 13961, "I do not see what is the use of the door if you do not lower the gangway? - (A.) We should probably lower the rope ladder; that was our idea. (Q.) That is the same thing as a gangway. You would provide some sort of communication between the opening of the door and the boat in the water below? - (A.) Exactly. (Q.) Whether it was a gangway or a rope ladder, it does not matter. You had ordered this door to be opened? - (A.) Yes. (Q.) There was no use having that open unless there was some sort of gangway? - (A.) No."

There is a good deal of further evidence as to that, my Lord. We have from Mr. Wilding, speaking of the construction of the ship, that in her construction special attention was directed to the possibility, if the lifeboats had to be used, of having the passengers lowered through those gangway doors. I will refer your Lordship to page 522 of Mr. Wilding's evidence. Almost at the top of the page your Lordship sees: "(*The*

*Commissioner.*) The suggestion, I understand, was that those side doors might have been utilised for the purpose of getting passengers into the boats? (*Mr. Rowlatt.*) Had they all gangways? - (A.) They can be used without gangways.”

*The Commissioner:* I do not understand that. The doors were high up above the waterline. You could not step out into the boats, you know.

*Mr. Scanlan:* No, you could not possibly, my Lord.

*The Commissioner:* They would want either a companion ladder, or rope ladder, or something of the kind.

*Mr. Scanlan:* Yes. Just at the foot of that page it is explained lucidly by Mr. Wilding the provision which they did make. At Question 20476, your Lordship says “Directions by the Captain that these side doors should be opened, and, as I understood, it was suggested in the examination of the witness by, I think, Mr. Scanlan (possibly by Mr. Edwards, I do not know), that if they had been open, people who were either on that deck or could have been brought to that deck, could then have been put into the half-filled boats, and so more lives would have been saved. Now what have you to say to that? - (A.) The door that would most likely be used was *this*” - he pointed to the model. He means aft.

*The Commissioner:* He pointed about to where the police officer is standing now. *Mr. Scanlan:* Further aft than that, my Lord, “that door, at which there is an accommodation ladder; that is, a portable sloping ladder is provided just inside the ship opposite this door, which can be slipped on either side, and the order would probably be intended to apply to that door. (*The Commissioner.*) There is a corresponding door on the other side of the ship? - (A.) There is a door on each side, with a broad passage leading through from one door to the other. If this accommodation ladder was put in position from one of these doors it would be very easy for anyone, even ladies and children, to go down the accommodation ladder to get into the boats in smooth water, which we understand prevailed. There would be no difficulty once the accommodation ladder was rigged, which would be a matter of perhaps half an hour, to use it in that way. (Q.) But we have no evidence at all, as far as I know, that anybody from the ship got into a boat from that doorway? - (A.) I have heard none, my Lord.”

*The Commissioner:* I do not think we even know whether the door was opened. Orders were given to open it.

*Mr. Scanlan:* Orders were given, and I think there is some evidence of the door being opened.

*Sir Robert Finlay:* I do not think so.

*Mr. Scanlan:* I had asked some questions previously on that. There is evidence of Mr. Boxhall at page 337 as to that method of getting the people away from the ship. *The Commissioner:* This is not a method contemplated of getting people into boats at all, is it?

*Mr. Scanlan:* I think it is, my Lord, yes.

*The Commissioner:* To lower the boats into the water and then fill them by means of a rope ladder or something of that sort?

*Mr. Scanlan:* Or this companion ladder. It is an adjustable ladder which was specially provided for the purpose, Mr. Lightoller says that was his intention.

*The Commissioner:* It is the way you get on board the ship.

*Mr. Scanlan:* Yes, my Lord. When I was visiting with my learned friends the

“Olympic” at Southampton, this was pointed out to me as a

**Page 763**

recognised way for using the boats and getting people into them. Boxhall says at Question 15472 on page 358, “Was any suggestion made of going back? - (A.) There was a suggestion made. I spoke about going back to the sailorman that was in the boat - that was whilst I was pulling round the stern - about going back to the ship, and then I decided that it was very unwise to have attempted it. So we pulled away, and then we did not pull back at all. (*The Commissioner.*) What did you intend to go back to the ship for? - (A.) I intended to go back to try and obey orders that I heard given through the megaphone. (Q.) Was that to stand by the gangway door, or what? - (A.) I do not know whether it was to stand by the gangway door; I do not remember any gangway doors being open.” *The Commissioner:* That is not to the point.

*Mr. Scanlan:* It is dealing with that point, my Lord. Your Lordship remembers the Witness, I think it is Crawford, who said that as he understood his orders from the Captain, they were to take the load of people he had off to that ship, pointing to a light, and then to come back for more. What appears to me, my Lord, is that there was a confused idea in the minds of the Captain and officers that those doors might be used. Of course, the ship was new and the crew were new to the ship, and even this method of filling the boats with passengers does not seem to have been understood.

*The Commissioner:* It was not adopted.

*Mr. Scanlan:* It was not adopted, but I think it was meant to be adopted, because you have from Mr. Lightoller’s evidence that he gave directions to have the door opened, and he told your Lordship the reason.

*The Commissioner:* I can imagine that many of the women would have preferred going down steps to get into a boat rather than being swung out.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* Than being swung out 90 feet above the water and dropped down by means of the falls.

*Mr. Scanlan:* I think it can be conceded that it would have been, in the circumstances of that night, a calm night, a most desirable way to have adopted. The only point I am trying to make now on this is that it is evident that the officers did not know properly that this was a means, and that there was no decision come to, and communicated from one to another for the adoption of those means; because had it been adopted, I think quite a number of people who were left behind might have been got in, especially in the earlier stages.

In my examination of Mr. Lightoller, at page 323, I asked this question at Question 14228: “Had you understood between you and the Captain that this was one way of filling the lifeboats in the event of the lifeboats being required? - (A.) I had not discussed the matter with the Captain. (Q.) How was it that it occurred to you and to the Captain at the same time? - (A.) I do not know that it occurred at the same time. (Q.) But it did occur to both of you? - (A.) It came to both our minds, and naturally anyone familiar with the ship, any seaman, anyone attached to the ship, would know at once that was the best means of putting the people into the boats - by the gangway doors.” I think it of

importance to indicate this as one explanation for the lifeboats not being filled. *The Commissioner:* It does not account for one or more boats going away with only 12 people.

*Mr. Scanlan:* No, it does not. I do not think there would have been any danger in lowering a boat with more than 10 or more than 12, or more than 20. The only boat that had 12 in it was this No. 1 boat.

*The Commissioner:* Yes, and I am reminded that she was told to stand by the steamer.

*Mr. Scanlan:* Yes, my Lord. They say that there were no other people there at the time, but she was to stand by.

*The Commissioner:* How many people were there in the boat that Sir Cosmo Duff Gordon went away in?

*Mr. Scanlan:* Twelve.

*The Commissioner:* That is the one.

*Mr. Scanlan:* That is the same boat; 12 people - five passengers, and seven of the crew. I was pointing out this on the question of discipline. In the first place, it was not properly known and understood that this was a means of filling the boats, and there were no concerted means adopted between the officers and the crew to carry out this method of loading. There was an ignorance on the part of the officers as to the carrying capacity of the boats and the strength of the falls. Then, my Lord, we have this evidence from one of the officers, Harold Godfrey Lowe, on page 346, "What was the boat to which you belonged? - (A.) I do not know."

*The Commissioner:* Yes, he did not know, but whose fault was it that he did not know?

*Mr. Scanlan:* I think that the fault is a somewhat wide one. There is a general want of discipline. Of course, there is a great want of drilling.

*The Commissioner:* That is another matter.

*Mr. Scanlan:* Yes. You certainly had it that this man did not know his boat. I offer it as an explanation. If there had been discipline, if there had been a proper system of boat drills, and if through the years of their service with this Company and with other Companies more importance had been attached to boat drills, then I think the men would have been more useful in this emergency. On the question of the importance of having boat drills, I refer your Lordship to Captain Clarke at page 678, Question 24109, "Was it your duty to see whether all the lifeboats on the "Titanic" were equipped in accordance with the provisions of the Rules and Regulations made by the Board of Trade under the Merchant Shipping Acts? - (A.) That had already been done at Belfast. (Q.) It did not fall to your duty? - (A.) No, it did not fall to me. (Q.) Have you any idea as to what would be an efficient method of drilling crews to man lifeboats in case of accident? - (A.) Yes; I think that all hands that form the crew should be exercised in handling the ship's boats, both firemen and stewards. (Q.) I take it that up to the time of the 'Titanic' disaster that had not been the practice? - (A.) Not in the White Star Line." That is sufficient to indicate to your Lordship this view, and if you take the evidence of the Principal Professional Officer, as he is called, at the Board of Trade, Captain Young, he says at page 640, Question 23188, "I have witnessed in the course of my duties as an emigration officer methods of putting out boats which were a disgrace to the service; and during the time that I was carrying out my emigration duties I did the best I could to remedy that defect. I was imbued with the knowledge that since that period when I was an emigration officer,

things have not materially improved in the merchant service with regard to the training of deckhands. I may as well say at once that it is not the fault of those deckhands themselves; it is simply due to circumstances, the lack of opportunity, the lack of time in the hustle of the passenger service of the present day, which precludes those men from getting the training that they ought to have.” *Mr. Laing*: Then the next question.

*The Commissioner*: Yes, the next Question.

*Mr. Scanlan*: “Do you mean the ships do not remain in port enough? - (A.) That is the reason, my Lord. There are not sufficient facilities for the exercise of the deckhands in the boats; there are in some ports but not in others.” That sufficiently indicates it. I am anxious not to detain your Lordship by reading much of the evidence, but perhaps that and his answers to me, if I generally direct your Lordship to them, on the next page 641, will establish sufficiently the point I am now trying to make. He gives me his opinion that it is very desirable to have boat drills, and to have expensive boat drills, so as to practise a large number of the crew, and with a view, if possible, to give an opportunity of boat practice, not to 10 or 12 deckhands, selected at the port, as they were in the case of the “Titanic,” but to all the different men of the different branches of the crew who would be called upon in the event

#### **Page 764**

of an emergency to go to the boats to help man them and rescue the passengers. *The Commissioner*: One has to think about these big vessels. Stewards are expected to serve at these boats, are not they?

*Mr. Scanlan*: Yes.

*The Commissioner*: And firemen?

*Mr. Scanlan*: Yes.

*The Commissioner*: And the deckhands?

*Mr. Scanlan*: Yes, my Lord.

*The Commissioner*: No others, I think, are there?

*Mr. Scanlan*: Well, my friend, Mr. Roche, suggested that it would be well for the engineers whom he represents - the engineers -

*The Commissioner*: I do not know. That would amount to some hundreds.

*Mr. Scanlan*: Yes.

*The Commissioner*: I think there were 300 stewards on board this vessel?

*Mr. Scanlan*: Yes, my Lord, at least.

*The Commissioner*: I do not know when you are going to get a drill which would include all these people.

*Mr. Scanlan*: In various ways, my Lord. I tried to suggest to the Board of Trade that there should be some method of testing the efficiency of seamen and the efficiency of men in the different grades, and that a certificate of efficiency might be obtained. Your Lordship pointed out to me the undesirability of having anything like Civil Service examination tests, through which the sailors and the firemen and others would have to go.

*The Commissioner*: I am afraid you would have very few sailors if you did that. *Mr. Scanlan*: I do not think it would be too much that a man who is qualified as an efficient

seaman should be expected to have a knowledge of the handling and the management of boats. This, I think, also would be reasonable in the case of firemen and in the case of stewards. In the questions put to Sir Walter Howell, Sir Alfred Chalmers, Captain Young, and Mr. Clarke I brought out those various points. I think it is unnecessary for me to labour it further.

Now a suggestion has been made - I do not think I shall have to make any further observations upon this branch of the case - that no passenger had a right to dissuade members of the crew from doing their duty - that is, if their boats were not properly filled - from going back to rescue drowning people out of the water, or from going back to stand by at these gangway doors if they had been opened. But in a general way this is the submission I should like to make to your Lordship: If there had been discipline, if there had been in practice a system of training of the men by extensive boat drills and by boat musters, and a standard and test of efficiency in force, then you would have discipline amongst the members of the crew; and through paying some attention to the lifeboats, and some attention to the handling of the boats, the men would know that they had duties imposed upon them, and they would have recognised more than they did a sense of their responsibility.

I could not say anything in justification of the conduct of the Witness Symons, who refused to go back with this boat No. 1, which had only five passengers in it, when he heard the cries of the drowning. But I think the few examples, and they were few, in the case of the "Titanic," of failure to recognise his duty by any member of the crew, would not have occurred if there had been discipline amongst them, and if they had had the training which Captain Young and Captain Clarke think is desirable.

I think I may pass from this branch of the case, my Lord, and I will come to the remaining and the last point that I am to discuss, and that is the Enquiry suggested by Question 26 as to the way in which the Board of Trade have carried out the duties entrusted to them under the Merchant Shipping Act. This Enquiry is very important, and I think its importance is greater in the light of the recommendations that may be made as to the future, than in condemning members of the Board of Trade or the Board of Trade as a whole, so far as the past is concerned.

I feel it is the duty imposed, I think, to some extent by your Lordship on me and on my friend, Mr. Edwards, to be accusers of the Board of Trade, and that the Board of Trade Court, if not accusation, at all events, a searching examination into their methods, in this Enquiry; and this is the feature of the Enquiry which distinguishes this from any ordinary Enquiry held under the Section of the Merchant Shipping Act under which your Lordship is now acting.

In the first place, the Board of Trade, and not its Advisory Committee, and not any outside body, is charged with the duty of making Rules and Regulations with reference to life-saving appliances and securing the safety of persons who travel at sea.

*The Commissioner:* Well, you say that, but surely you do not suggest that the Board of Trade ought not to take skilled advice on the subject?

*Mr. Scanlan:* No, my Lord; I wanted to guard myself against getting into such a position. But your Lordship warned me that if I enquired into the composition of the Board of Trade, I was in some danger of stumbling on an old joke. That may be, but still the composition of the Board of Trade is a matter which should be above joking, and, I think

if your Lordship looks to the failure of the Board of Trade in making efficient regulations under this Section 427, it suggests that there is great need for reform at the Board of Trade. What are the life-saving appliances at the present time? They are according to the Rules which came into force in 1890. We have had the history of those Rules as to life-saving appliances in very great detail, but I think it very easy to analyse this history and to pick out the salient points. In 1890 there was provision for ships of 9,000 tons and upwards, and here is the fact which stares one in the face in reviewing the conduct of the Board of Trade since 1890, that the only additional provision for lifeboats and life-saving appliances made since 1890 is the amendment made in 1894. Now see the importance of it.

*The Commissioner:* That is about 10,000 ton ships?

*Mr. Scanlan:* Yes. What is that difference? In 1890 the maximum provision for lifeboat accommodation was 5,250 cubic feet; that was, of course, with the three-fourths addition.

But that need not disturb the very slight calculation which I am going to make here. Under the new provision, the provision in 1894, they provided for 250 additional cubic feet. Now, what does that mean? It means accommodation for 25 people, or accommodation, if you take the three-fourths additional for, I think, 41.

*The Commissioner:* Where do you get the three-fourths additional?

*Mr. Scanlan:* The addition of 250, three-fourths.

*The Commissioner:* Yes, but what is the Rule or provision with regard to three-fourths' addition?

*Mr. Scanlan:* The Rule is contained on page 6 under D. With the three-fourths additional, the Board of Trade provided in the biggest ship for only forty-three people. It comes to this, therefore, that since 1890 although the tonnage of ships has gone up from 9,000 to over 46,000 gross tonnage -

*The Commissioner:* Have you taken the trouble to look at the list of boats exceeding 10,000 tons built since 1894?

*Mr. Scanlan:* I have gone into that question, my Lord, to some extent.

*The Commissioner:* If you look, you will probably be astonished to see how few they are.

*Mr. Scanlan:* I see about 1894 you had the "Lucania."

*The Commissioner:* Oh, you can find some, and you can find them, I think, going up to 26,000 tons, but I do not think you get them above that.

*Mr. Scanlan:* In 1901 there were additions, 20,000 tons, and the "Baltic" in 1904. Then you had the "Lusitania" and the "Mauretania," getting up to 30,000 tons, and during the last couple of years you have had ships like the "Olympic."

*The Commissioner:* I think for a considerable time after the Rules of 1894 were promulgated by the

## **Page 765**

Board of Trade, there were not any large number of vessels above 10,000 tons.

*Mr. Scanlan:* They had at all events in 1894 the "Lucania," which was built then, that is practically 13,000 tons - 12,952. There has been no addition from 1890 down to the present day.

*The Commissioner:* Except the one.

*Mr. Scanlan:* Except this one, which is only a provision for 43 people, that is, the biggest ship now has only to provide by the Board of Trade Rules for 43 more people than the biggest ship, which was a comparatively small ship, was required to provide in 1894.

*The Commissioner:* Of course it does not follow from that fact that any great mischief has arisen. It is perfectly obvious that if there had been an alteration by the Board of Trade, it would not have provided for anything like the number of lives carried in these big steamers.

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* We know that for good reasons or bad reasons, up to the present time it has not been the practice to carry lifeboats to accommodate everybody on board.

*Mr. Scanlan:* No, my Lord.

*The Commissioner:* Neither in the British Mercantile Marine nor in the German nor any other. We know that, and therefore if the Board of Trade had extended its Rules, as I daresay they ought to have done, they nevertheless would not have extended them to such an extent as you suggest now they ought to be extended.

*Mr. Scanlan:* Quite, my Lord.

*The Commissioner:* And I do not suppose they would have been blamed for not doing it.

*Mr. Scanlan:* If I may put my point shortly, it is this: That there is surely a failure to recognise growing needs in this body charged with making those regulations in failing to cope with the advance in ships' construction and in resting content in 1911 and 1912 with provisions that might have been thought suitable in 1890.

*The Commissioner:* You are so fair, that I scarcely like to say what I am going to say now.

*Mr. Scanlan:* Do, my Lord.

*The Commissioner:* I do not think you have put it quite fairly, and for this reason. The Board of Trade knew full well as we know, as you know and all of us know, that whatever the Board of Trade Rules were, the shipowners did provide what they considered at all events an ample supply of lifeboats accommodation.

*Mr. Scanlan:* And that is one of my quarrels with the Board of Trade, my Lord. *The Commissioner:* Let me see your quarrel? The Board of Trade know that the thing is being done properly, and then you blame them for not making a Rule.

*Mr. Scanlan:* No, my Lord. The Board of Trade know that so meagre and insufficient are their own Rules that shipowners voluntarily make provision in excess of those Rules, and this very fact should have convinced them that their Rules needed revision. That is the point.

*The Commissioner:* But they do not need revision if there is no occasion for a Rule. *Mr. Scanlan:* If one could conceive that shipowners did spontaneously make adequate provision, then the thing would have been all right in spite of the Board of Trade, but it is not the fact that shipowners made adequate provision. What I maintain is that shipowners made inadequate provision, and further that, though their provision was inadequate, it

was not so inadequate as the provision required by the Board of Trade, and consequently in so far as keeping a look-out and keeping abreast of the times is concerned, the Board of Trade is much more culpable than the shipowners.

*The Commissioner:* To tell you the truth, Mr. Scanlan, I do not believe any shipowner ever looked at these Rules. I do not believe they ever looked at them. They simply said, "Here is a ship, how many lifeboats ought she to have?" and as they knew perfectly well that the number they were going to supply would far exceed anything that the Board of Trade ever contemplated, they went on.

*Mr. Scanlan:* I think they knew that the Board of Trade were not likely to contemplate anything in the way of an increase, and as your Lordship said, when one witness was in the box, they were hoping that the Board of Trade would do nothing, and certainly they were not disappointed in that hope. I wish to treat this seriously, my Lord. With regard to the lifeboats altogether between the Board of Trade and the shipowners, lifeboats are quite a neglected department in ships, and the reason I suspect is this, that there is no money in lifeboats. Every other department of a ship has seen improvements.

*The Commissioner:* I do not agree with you there.

*Mr. Scanlan:* Very well, my Lord.

*The Commissioner:* And I will tell you why. There is nothing so detrimental to the business of a shipowner, a passenger carrying shipowner, as a loss. It does his business an enormous amount of harm, and he incurs the greatest money loss of all. I am talking of the money loss. And therefore you must not say they neglect these provisions out of parsimony. They do not.

*Mr. Scanlan:* I may say a shipowner does not get an increase in his freight or in his passage money in proportion to the adequacy of the lifeboat provision.

*The Commissioner:* I do not agree with you there either. Everything that adds to the expense of saving the ship increases the cost of the passenger's ticket.

*Mr. Scanlan:* It is the case, although there is a certain excess of provision over the requirements of the Board of Trade, that relatively to the total number of passengers carried, there is a most marked disparity between the provision made and the provision that would be necessary if a catastrophe occurred.

*The Commissioner:* Yes, that is quite true, but you will not overlook the fact that shipowners have been struggling for a very long time past to make a ship its own lifeboat.

*Mr. Scanlan:* Yes, my Lord, I was coming to that.

*The Commissioner:* Their great object is, and their great object ought to be, to make a ship so safe that lifeboats are not necessary?

*Mr. Scanlan:* Yes, my Lord.

*The Commissioner:* That ought to be the great object.

*Mr. Scanlan:* I think my friend Sir Robert Finlay recalled a poet who sang of the "oarless sea" - I remember coming on that passage in reading the evidence yesterday - and that undoubtedly must have been the dream of shipowners. Well, it is a dream, my Lord. Unless you are dealing with "painted ships upon a painted ocean," I think it is necessary to consider the two things.

Besides if the owners have been making their ships less sinkable, increasing their flotability, why could they not at the same time contemporaneously have gone on

increasing the excellence of their ships by providing better lifeboat accommodation and life-saving apparatus? And that they have not done, and that the Board of Trade have not done. I want to bring this thing home to the Board of Trade, my Lord. We are told by Sir Walter Howell that after 1894 the only time that the conscience of the Board of Trade was pricked was in 1904, and your Lordship asked him - I think this is quite fair to him: I am getting through this part of the case as quickly as I can - what did he do then, and this is what he did: He consulted his Professional Adviser, that was Sir Alfred Chalmers, and then we had to wait till Sir Alfred Chalmers came to find out why nothing was done, and we certainly got an explanation from him. I think he is the personification of the Board of Trade in a more direct sense than any of the other Witnesses. You know what he said, my Lord?

*The Commissioner:* Well, you tell me.

*Mr. Scanlan:* He was asked, "Why did not you increase the scale of lifeboat accommodation?" and he says, "I did not think it was necessary in 1894."

*The Commissioner:* Do you mean 1894 or 1904?

## **Page 766**

*Mr. Scanlan:* 1904; and then he is taken a step further, and he is reminded that since then the "Titanic" has gone down, and he is asked even now in the light of this calamity, would he increase the lifeboat accommodation?

*The Commissioner:* I think you asked him that question.

*Mr. Scanlan:* Well, some of us did.

*The Commissioner:* And you asked him in an irritating way.

*Mr. Scanlan:* Some people who are less irritating than I was - and I am sure if I have been unwittingly irritating, Sir Alfred Chalmers and other gentlemen from the Board of Trade will overlook it. But it is not through irritation that a man who occupied the responsible position of head of the Board of Trade would say that his deliberate conviction, even after the "Titanic" was lost, is that the boat scale of 1894 is still to be regarded as sufficient.

*The Commissioner:* You must not dwell too much upon the "Titanic," because do not forget that she only utilised two-thirds of her boat accommodation.

*Mr. Scanlan:* I have given you the best explanation I can.

*The Commissioner:* Yes, and it is not quite an explanation that I understand so far. I do not want you to go back on it.

*Mr. Scanlan:* Your Lordship will at all events be spared that. Still, after the "Titanic" disaster great preparations are being made at the present time, and naturally what has affected other countries must affect even more intimately this country, to which the "Titanic" belonged. I do not say that it is any reflection that it is only now that great exertions are being made. But if this was the disposition of the principal man in the Board of Trade, I think it becomes easy to understand how it is that we have not had drastic alterations in the provision for life-saving appliances.

I must say that the successor to Sir Alfred Chalmers, Captain Young, appears to me, if I may respectfully say so -

*The Commissioner:* My recollection is that he did not agree with all that Sir Alfred Chalmers did.

*Mr. Scanlan:* No, my Lord; it occurred to me that his views were not so conservative, and that he was inclined to advance.

*The Commissioner:* And, therefore, you are entitled to be a little more hopeful now. *Mr. Scanlan:* Yes, because he is a bit more liberal. But if your Lordship reads the references of the Board of Trade to their principal Surveyors, when they were asking for information, you will find this conservative instinct shown. At page 18 and page 22 of this paper which your Lordship has seen, which was given to us at the last sitting, you will see them.

*The Commissioner:* What is it called?

*Mr. Scanlan:* It is "Memorandum on the Statutory Requirements as to Life-Saving Appliances." It has a history, my Lord. At page 18 the Board of Trade are writing a confidential letter to their principal officers in London, Liverpool, and Glasgow for advice and guidance as to life-saving appliances, and here I find them saying: "It is not intended that the boat capacity on vessels included in the extension should *necessarily* increase in a regular proportion according to the increase in tonnage." *The*

*Commissioner:* You will observe that the word "necessarily" is in italics. *Mr. Scanlan:* Yes, my Lord, I do not think the Board of Trade should be blamed less or more on that account.

*The Commissioner:* No, but it gives a meaning to the sentence.

*Mr. Scanlan:* At page 22, in the reference to the Advisory Committee they say, "It appears to the Board that the number of boats and the boat capacity need not necessarily increase in a regular proportion according to the increase in tonnage, and that due regard should be paid to what is reasonable and practicable in passenger steamers exceeding 10,000 tons." They evidently did not expect any alarming increase in the boatage provisions.

*The Commissioner:* You do not want an alarming increase, do you?

*Mr. Scanlan:* No, I want a considerable increase. *The*

*Commissioner:* Yes, but not alarming.

*Mr. Scanlan:* No, that I agree, my Lord. Now I want to call your Lordship's attention to this important fact. The Board of Trade asked advice, and they got it, but they did not act upon it. The Board of Trade asked the advice of their principal officers and each officer has given a scale. The first is Captain Young. I will only give one figure from each scale. Captain Young, at page 14, for a vessel of 45,000 to 50,000 tons would have provided for 19,075 cubic feet of lifeboats. That is accommodation for 1,907 persons - probably more, because the divisor of ten is applicable to some boats and the divisor of eight to others, but at least 1,907 persons. Then Mr. Park, on page 16, would have provided for 16,625, that is for 1,662 persons. Then there is Mr. Harris, on page 17, who would have provided for 16,975 cubic feet - 1,697 persons.

Then, my Lord - and this is very significant - you have the advice from the Principal Ship Surveyor at the Board of Trade, the man who is at their elbow, and from whom they could have got advice at any moment. *The Commissioner:* That is Mr. Archer.

*Mr. Scanlan:* Yes, who gave his evidence here and what he recommended is a provision of 24,937 cubic feet. Your Lordship will see that if they had taken the advice of Mr. Archer, their Principal Ship Surveyor - they got all those reports early in 1911, I think in February - they would have provided in the case of the "Titanic" for 2,493 persons. But take any of the Surveyors; if they had taken any of this advice asked for, they would have had a very considerable increase in lifeboat accommodation. Take their present requirements according to their own scale of 5,500 and add on the three quarters and you get 9,500 - provision for 950 people. Almost the lowest figure from any of their advisers would have been close on double that.

Then, my Lord, they had the Advisory Committee. I cannot venture to offer any compliments to the Advisory Committee, although they included two of my own clients. This great matter occupied their attention for two forenoons. They made a recommendation which you will see on page 24, and if the Advisory Committee's recommendation had been adopted, you would have had 8,300 cubic feet, to which of course the three quarters would have been added. This would have given you 14,525 cubic feet, and that is accommodation for more than 1,452 people. And they had this in July, 1911. Contrast even that figure, the provision for 1,452 people, with their requirements of 950 -

*The Commissioner:* Do not keep telling me about that; I know it so well.

*Mr. Scanlan:* It is altogether a painful subject.

*The Commissioner:* No, but it is not very relevant in my opinion.

*Mr. Scanlan:* I am sorry if your Lordship thinks so. Here is my submission on those points, my Lord. If either the advice of the Advisory Committee or the advice of their own officers had been taken and acted upon, the "Titanic" would not have been allowed to proceed on her voyage with accommodation for just over 1,100 people, but she would have had considerably more. Therefore, Sir Norman Hill was right to this extent when he stated that if the provisions of the Advisory Committee

## **Page 767**

had been carried out, there would have been at least fifty percent of addition to the lifesaving appliances. I do not see any justification for this.

One justification was offered to your Lordship, and it was this: "Oh, in the interval after getting this report, we were considering the question of boats." This is the suggestion made by Captain Young. You will remember at the close of his evidence he made a little speech or explanation in which he took the whole blame for the Department on himself. But in one part of his evidence the only explanation he gave was "I was considering the question of boats - that there should be some different proportion between the depth and the breadth of lifeboats."

Your Lordship asked him: Had he any fault to find with the lifeboats provided by Harland and Wolff, and did those come into question at all? And he answered, "No, those did not come into question."

Then why should those be a means of delaying the provision of life-saving appliances, seeing that the Board of Trade were clearing at Belfast and at Southampton one of the

biggest passenger ships ever launched, and ever cleared by the Board of Trade? I am afraid, my Lord, that this requires more justification than has been suggested on behalf of the Board of Trade in the course of this Enquiry.

Well now, in a general way we are told, "Oh, when we considered this matter we always thought of suitability, we always thought of watertight compartments and watertight bulkheads." I will say very little about that, but I must make this observation. We have it in evidence, and it is the fact, that the only statutory provision with reference to bulkheads is that contained in Rule 12 on page 16 of these Rules under the Life-Saving Appliances Act. To my mind a very material distinction exists between this statutory provision and Instructions to the Surveyors in reference to bulkheads, which, of course, is not statutory, and which is constantly being departed from, and which was departed from repeatedly in the case of the "Titanic." Nothing is laid down hard-and-fast, and if the builders of a ship can satisfy the Superintending Officer that although what they are doing is not just exactly what the Instructions recommend, still it is as good, it is allowed to pass. But this is the one and only statutory provision with regard to watertight bulkheads. And what do we find in the case of the "Titanic" so far as this one statutory provision is concerned? We find that it was not complied with in the case of the "Titanic." And if your Lordship will look at the Report and recommendation of the Principal Ship Surveyor, Mr. Archer, you will see he refers to this at page 17. *The Commissioner:* In how many ships is it complied with?

*Mr. Scanlan:* The number is given here in Sir Walter Howell's evidence. I think he said 150, or some big number, had applied, and the number which had complied with the requirements and had qualified for exemption was considerably smaller.

*The Commissioner:* About four a year, I think.

*Mr. Scanlan:* Five a year, it used to be, and now it comes down to four a year. *The*

*Commissioner:* Sixty-nine, I am told.

*Mr. Scanlan:* That is the figure I had in mind, my Lord. Here is what Mr. Archer says about this Rule in his Report at page 17 of that paper to which I referred, your Lordship: "Owing, no doubt, to the very small reduction of life-saving appliances at present sanctioned by this Rule, none of the large vessels recently constructed have complied with the recommendations of the Bulkhead Committee, although they are thought to be most reasonable in the case of vessels which have boat capacity for only a proportion of the persons carried." He is the Principal Ship Surveyor.

The Board of Trade have two standards of watertight bulkheads; one is a fixed standard, and the other is not. One is a higher standard, that is the one referred to in Rule 12, the other is a lower standard.

*The Commissioner:* Where is that standard to be found?

*Mr. Scanlan:* It is No. 16, on page 8 of the "Regulations and Suggestions as to the Survey." Your Lordship has been frequently referred to this provision. It is the provision which deals with the four watertight compartments. There is no justification for having two standards of sufficiency of watertight bulkheads. To comply with the lower standard will give you a certificate of clearance, and will allow you to carry passengers and emigrants. But then there is a higher standard, and if you comply with it, it will allow you to take your ship away with a smaller number of lifeboats.

*The Commissioner:* That is a question of policy.

*Mr. Scanlan:* That is true.

*The Commissioner:* Whether it is good policy or not I do not propose to say, but the policy is this: Make your ship a safer ship, more likely to float than it would otherwise be, and then we will not require you to provide such great lifeboat accommodation. It is apparently to encourage them to make their ships unsinkable.

*Mr. Scanlan:* What kind of inducement is this to shipowners and shipbuilders to make the ships unsinkable? They get a certificate of clearance if they conform to the lower standard, which is no standard at all, but if they conform to the higher standard then what happens? Instead of carrying 9,500 cubic feet of lifeboat accommodation, they can carry 7,000 odd. I do not see, my Lord, that it is reasonable or justifiable to set up those two standards. There should be a standard of safety and stability and seaworthiness, and it should be the higher standard, and the higher standard should be insisted upon before a ship is cleared and passed by the Surveyors and the authorities of the Board of Trade. That, in a word, is the submission I want to make on this point.

But there is something I should add. This Rule 12, the only statutory Rule, has been regarded for a long time as an obsolete Rule. This suggestion is put by the learned Attorney-General to Sir Walter Howell: "Is it an obsolete Rule?" and he admits it is an obsolete Rule. If the justification for not ordering sufficient lifeboats is "We looked after the safety of ships and their passengers in another way; we made good Rules as to watertight bulkheads," then I am forced to make this answer: It cannot be said that the Board of Trade have made such provision. They have been content with this one statutory provision made in 1890, because, I take it, from the evidence, that it was in operation before Sir Edward Harland's Committee made its Report. And it is now obsolete; it has been obsolete for many years. How does that justify the conduct of the Board of Trade in failing to provide lifeboats for all? They have not renewed that provision; they have not revised it or reviewed it; they have allowed the standard for the sufficiency of bulkheads to become obsolete, and, side by side with that, they have also failed to make adequate provision for life-saving appliances.

Your Lordship has had your attention directed to what was done in foreign countries. Take the United States. I had an opportunity of referring your Lordship to the present provisions in the United States. I think they are reasonable, and I am going to ask your Lordship to recommend them as the result of this Enquiry to the Board of Trade, that is, to provide lifeboats, or life-saving apparatus, for all persons carried on board those ships, passengers and crew.

*The Commissioner:* I suppose we are not to do that if we are satisfied that by doing it a greater danger will be created than will be averted.

*Mr. Scanlan:* I sincerely hope your Lordship will not find it necessary to take that view.

*The Commissioner:* I can contemplate what Sir Norman Hill told us, that you may get the ship into such a condition of congestion with lifeboats as to make it more dangerous than if there were no lifeboats at all.

*Mr. Scanlan:* I am very indisposed to take the view of Sir Norman Hill, who, for all that he has said about being an expert, is merely a lawyer.

*The Commissioner:* What do you say? Merely a lawyer?

*Mr. Scanlan:* Insofar as the requisite knowledge to guide your Lordship in these matters is concerned, I ask your Lordship not to be, shall I say, led by lawyers in advising you as to what is practicable and safe to carry in the way of lifeboat accommodation. I would much rather impress upon your Lordship the view of Mr. Wilding, or the view of Mr. Sanderson, or the views of any of the other real experts we have had, especially the views of Mr. Carlisle, than the view given by Sir Norman Hill. What does Sir Norman Hill know in comparison with Mr. Wilding about the way in which the boat deck space on a ship like the "Titanic" could be utilised? Mr. Wilding said, "There is nothing in the engineering sense impracticable in putting on the boat deck of a ship like the 'Titanic' sufficient lifeboats for all carried - even for 3,500." I got the same statement from Mr. Archer, of the Board of Trade, and you have had a chorus of real experts whose testimony is all to that effect, and in the face of such evidence as that I should hope your Lordship would not weaken the stringency of the provisions to be recommended on account of what may be said by this distinguished solicitor, who is also an expert when he goes to the Board of Trade.

I was directing your Lordship's attention to the provisions of other countries, and this is the last thing I have to say. Before the disaster took place, your Lordship will see on page 38 of this Memorandum the statutory requirements of America. For a ship of the size of the "Titanic" you will see that they provide 24,345 cubic feet. That is in the last column. That is what the United States had provided before; and you see how logical is the arrangement in that Table. There is a graduated increase in proportion to tonnage, and, of course, if tonnage is to be recognised as the basis for providing lifeboats, then the number of lifeboats and their extent would go on progressively with the tonnage, and that is what they have been doing in the United States.

Then the German requirements show 42,656 cubic feet.

*The Commissioner:* I have forgotten the exact tonnage of the "Titanic": was it more than 46,500 or less?

*Mr. Scanlan:* It was 46,328.

*The Commissioner:* It is under 46,500, so we must take from 45,000 to 46,500.

*Mr. Scanlan:* Yes.

*The Commissioner:* 45,942 to 49,476 tons, the quantity to be provided is 21,328 cubic feet; is not that right?

*Mr. Scanlan:* I think that is part of it. You also have another 21,328. I think that refers to boats of another description, and then you get the sum of the two, namely, 42,636.

*The Commissioner:* The total number of passengers and crew provided for would be 4,265; is that right?

*Mr. Scanlan:* Yes.

*The Commissioner:* Then in Germany there is an exemption for efficient bulkheads.

*Mr. Scanlan:* Yes.

*The Commissioner:* They seem to recognise the same principle that the Board of Trade recognise by Rule 12.

*Mr. Scanlan:* I do not know that we are in a position with the evidence given here to say exactly what they do.

*The Commissioner:* No, not exactly.

*Mr. Scanlan:* What is important on this is this consideration; the shipping of this country is greater than that of those other countries and so far as lifeboat accommodation is concerned, we have been lamentably behind, and therefore I say, even on a comparison with other countries, the Board of Trade stands condemned for negligence in exercising its duty under the Merchant Shipping Acts.

And now additional provisions are being made, and will be made, and I submit that what should be asked and insisted on is adequate lifeboat accommodation, whether in boats or rafts, and life-saving apparatus for every person carried. I say it is possible to do it, and from the evidence of the Board of Trade, we may take it that shipowners have themselves since the loss of the "Titanic," recognised this, because they have offered to the Board of Trade to provide their ships with lifeboats for all on board.

*The Commissioner:* Have you contemplated this, that if the number taken away from the "Titanic" in the lifeboats is to be taken, if the amount of the lifeboat capacity utilised, is to be taken, as what can be utilised in circumstances such as happened on board the "Titanic," you would require a very much larger lifeboat accommodation than would accommodate the number of persons on board. Do you follow what I mean? *Mr.*

*Scanlan:* I follow it, my Lord. I do not see that it can be any justification for the disparity between the boat capacity which the "Titanic" had and the number of people actually saved. I am afraid that is to be attributed to lack of discipline.

*The Commissioner:* If it is not to be attributed to lack of discipline, if in the hurry of two or three hours you cannot fill your lifeboats, if you cannot do that, then I do not know what you are to do. If they did their best to fill the boats, then the "Titanic" had more boat accommodation than she needed.

*Mr. Scanlan:* I fail to see how she can be said to have had more boat accommodation than she needed; she was sinking, and she needed boats for everybody.

*The Commissioner:* You do not follow what I mean. If they did all that could be done to get the people into lifeboats - of course, you say they did not, and I understand that argument very well - but if they did then the truth is she had more accommodation than she needed.

*Mr. Scanlan:* I am afraid that the failure to load those boats to their full capacity must be attributed to the ignorance of the officers and crew, and the want of discipline. *The*

*Commissioner:* I have heard you on that point, and there is a good deal to be said for it.

*Mr. Scanlan:* And if there follows from this Enquiry not only a provision for lifeboats for all on such a ship as this, but for sufficient crew to man them, and sufficient boat drills with a test of efficiency, I am sure that such a thing could not be repeated; I mean that you could not have the amount of ignorance and indiscipline which characterised this catastrophe. That is my submission to your Lordship on this point. I am told that this is the proper time to mention the question of costs.

*The Commissioner:* That is always a very important question, but you need not do more than mention it now. I shall deal with the question of costs when the whole thing finishes, and then I shall deal with all the question of costs together.

*Mr. Scanlan:* Very well, my Lord.

*The Commissioner:* I thank you very much for the help you have given me; it has been valuable.

*(Adjourned to Monday next at 11 o'clock.)*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### TWENTY-NINTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## **Page 770**

*Mr. Roche:* My Lord, my friend Mr. Edwards does not desire to address your Lordship at this moment, and with your Lordship's permission I will now make the few remarks which I desire to make.

*The Commissioner:* If you please.

*Mr. Roche:* I represent the Marine Engineers' Association, an association consisting of a large number of certificated engineers. A large number of their members unfortunately were drowned in this casualty. Your Lordship knows also that all the engineers in this case were drowned, and there is a question your Lordship will see which at any rate raises this matter, namely, the latter part of Question 21. The first part relates to the passengers; the latter part says: "What was the number of the crew, discriminating their ratings and sex, that were saved? What is the proportion which each of these numbers bears to the corresponding total number on board immediately before the casualty? What reason is there for the disproportion, if any?"

With regard to the engineers, unfortunately the answer of fact is simply that 100 percent were drowned. I shall have a word or two, and that is the main point on which I wish to address your Lordship, as to whether any answer is possible or any recommendation is possible in connection with the last sentence: "What reason is there for the disproportion, if any?" But before I deal with that, which is the main point I wish to deal with, it is fairly obvious that in this state of circumstances, joined with the fact, which has, unfortunately, become almost common knowledge, that the disproportion of the loss of engineers in these cases is not uncommon - indeed, is rather the Rule than the exception - it is obvious, I say, that although all persons that go down to the sea in ships are interested in the safety of ships, probably the engineers, having regard to this state of facts are as much, if not more, interested than anyone else. That, my Lord, shall be my excuse for saying a very few words on one or two other parts of the case to which those who instruct me - who, of course, are versed in these matters - have given their best consideration and as to which they have certain conclusions or ideas which they desire to submit to your Lordship.

The first matter I shall deal with is the question of speed. I took the opportunity when Mr. Sanderson was in the box to ask him a few questions, and drew a very clear distinction between what was negligent at the time and what will be proper after this event. I know that is a distinction which is very present to your Lordship's mind. It is perfectly true to say that what is being done now either in regard to boats, or speed, or

track, or anything else, is no evidence at all that what was done before was negligent, but it may be evidence of considerable weight as to what is possible now, and as to what is proper now.

With regard to this question of speed, the most obvious truism is that, if possible, you want to keep your ships out of collision. In the circumstances which prevailed in this case, although there is a great body of evidence with regard to the usual practice of navigators which might, and may, render it very difficult for your Lordship - even if it is desirable - to say that anyone was negligent, yet I desire to submit that in such circumstances a reduction of speed from that which was employed upon this occasion is desirable.

I thought the question of the turning circle was material, and your Lordship has had that put before you. I have not seen the plans, but they are here, and I understand from Mr. Wilding the effect is this - that he has got the turning circle at what is roughly 22 knots; he has a turning circle at what is, broadly speaking, 11 knots - that is half the speed - more than half the speed of this vessel - and he tells me, and I have no doubt it is accurate, that whereas in 37 seconds you turn two points at the higher speed, in 74 seconds at the lower speed you will not turn very much more than the two points; that is to say, the turning circle is about the same at the two speeds, but that at the slower speed it takes double as long as at the other. Therefore, you do not by decreasing your speed affect very much your power of averting that which it is your object to avert by your action. I accept that and start with that.

But the proposition I desire to put before your Lordship is this, that nevertheless the reduction of speed is important, nay, essential for two reasons: in the first place, what you have to rely on under those circumstances is mainly the reversing of your engines, and at the slower speed you give your reversed engines a chance; at the higher speed in the distance at which this object was seen and at which such objects may be seen in future, your reversed engines have little or no chance at all. In the first place, therefore, you give double the opportunity to your reversed engines. For example, supposing your Lordship found this object was seen at rather over a quarter of a mile; that happens to coincide with the distance in which this ship could alter two points at the speed she was going, that is, a distance of about 1,200 or 1,300 feet, Mr. Wilding said. Now, in that distance, 1,200 feet, or a quarter of a mile to travel, it is obvious that at the full speed the reversed engines, by the time the matter is communicated to the bridge, will not have any very great effect; but, still, in this case, in spite of that fact, whether by the reversing of the engines or by the pulling up consequent on the collision, this vessel was pulled up within some not very great distance of the berg, because it was seen and described to your Lordship after the event as being within sight and observation. That shows, I submit to your Lordship, that if the speed is half and the time, therefore, is doubled, although the distance at which the object is seen *ex hypothesi* will not be greater - it will be a quarter of a mile or whatever the distance is - the time which it takes to cover that distance, instead of being 37 seconds, is 74 seconds, or a minute and a quarter. In that time the reversed engines (your Lordship will be advised about this) will have a very much greater opportunity of doing their work and bringing the ship up.

*The Commissioner:* Would the reversing of the engines when the vessel was going at 11 knots enable them to steer it as quickly as if they were going at the greater speed? *Mr.*

*Roche:* I have not had an opportunity of considering this minutely, but I understand that the result is the same under all conditions, only it takes double the time. Your Lordship will be advised about that. But I suppose if you reverse one engine and keep the other ahead the conditions would be the same as if the speed were greater; it would be proportionately the same, only it would take double as long. We have no evidence to the contrary, and I do not know that the reduction of the speed would cause any difference in the steering of the ship or would cause the reversing to have any other influence at the slower speed than it would have at the higher speed. I do not know of any such evidence, and I do not know of any reason why it should be so.

*The Commissioner:* I suppose the vessel would answer her helm quicker if she was going at the higher speed.

*Mr. Roche:* That is the proposition which I started upon - she would answer much quicker: she would take double the time at the lower speed according to the relative speeds I am taking, and, therefore, she would alter just as much in the 74 seconds at the slower speed as she would in the 37 seconds at the higher speed. It might be a little bit more; your Lordship will be advised about that, but I am assuming against my argument that her helm would not alter her bearing and position - her heading - any more in the 74 seconds with the slower speed than it would in the 37 seconds with the higher speed. I say the conditions as regards the alteration with regard to the object would be identical, but the advantage of giving the opportunity to her reversed engines would be exactly double.

*The Commissioner:* Would the result be any more than this, that the impact would not be nearly so great?

## **Page 771**

*Mr. Roche:* I was coming to that. In the first place you should have no impact at all; and the second point I was coming to is that the impact would in any case be very much less. As your Lordship knows, it is a mechanical proposition: the force of the impact expressed in terms of mechanical energy is the product of the speed multiplied by the weight. Supposing this vessel, at 22 knots, which we are assuming is the higher speed, and the 11 knots at the half speed, ran without any alteration against this berg, at the 22 knots force the impact would be exactly double the force of the impact at the 11 knots; in one case it would be 50,000 tons, or whatever it was, multiplied by the 22, and in the other case the 50,000 tons multiplied by the 11.

But it goes further than that, because it is so much easier to check the way when you have 11 knots to start from than it is when you have 22 knots as the initial speed. That is why I called attention to the reversing of the engines at first. Instead of a reduction, say, from 22 knots to 15, which might be effected by the reversing at the higher speed, you might very well have, and I submit you would have (it is a matter your Lordship will be advised about) a reduction from 11 knots to only two or three knots if you have the lower speed at which you start the reversing of your engines. What the result of that would have been in this case is almost incalculable and it is difficult to say. But if, as we believe and are told, the fatality of these wounds was that they extended so far aft, then if the initial velocity had been less owing to the reversing of the engines and the natural checking

which comes from the actual shock itself, the great probability is that the aftermost wounds of the ship would never have been inflicted at all, because the ship would never have arrived in contact with the iceberg at that point. That, I think, illustrates and brings home the point I want to make as to the very great importance in the light of events as we now know them, of some precautions being taken to very much reduce the speed when the circumstances are at all similar with regard to the vicinity of ice to the circumstances which prevailed in this case.

I only wanted to say one word about the lookout. I ventured to suggest to Mr. Lightoller - and I see Sir Ernest Shackleton adopted the same view, in his evidence to your Lordship - that doubling look-outs was not very advantageous; that it might only result in dividing the responsibility, and the more men you have looking out at any one time the less may any one man look-out. I also ventured to suggest to Mr. Lightoller - and Sir Ernest Shackleton rather seems to take the same view - that where you get men looking out for this sort of object you may find a very great eye strain. Of course, looking for lights which present themselves to the vision automatically is a very different operation from peering into the gloom to pick up some unlighted object, and if an alteration is to be made in the matter of lookouts, those who instruct me desire to submit to your Lordship the consideration whether more frequent relief under these circumstances of lookouts is not an object which is more desirable. That is all I desire to say about the matter before the collision.

I desire, then, to say a word or two about the question of boats. If your vessel is in collision the next important thing, it is admitted on all hands, must be to keep her afloat if you can. That matter has been referred to a Committee, and one cannot but express the hope that the resources of engineering and shipbuilding science are not exhausted, and that they can come to some conclusions which will enable these very large vessels to be kept afloat for a longer time than the "Titanic" was kept afloat, even if they do not keep them afloat altogether. That is, of course, without saying one word as to the efficiency of the structure of the "Titanic," in the light of engineering and shipbuilding science as it was known at the time she was built. We do not desire to say one word and could not say one word against the perfection of her building and equipment at the time when she was built.

But the question of boats, I submit, stands on rather a different footing. If you cannot keep your vessel afloat you must have efficient boats, and one cannot overlook the fact that even if the vessel can be kept afloat there may be circumstances, such as fire, which may arise on board the ship which will render the use of boats not only expedient, but absolutely necessary. With regard to that we do desire to submit to your Lordship that an equipment of boats of this proportion that prevailed on the "Titanic" to the number actually carried is not sufficient. Whether it was proper in the past I desire to say very little. It is obvious that the shipowners, from what Mr. Sanderson said - it occurred in Mr. Sanderson's evidence and in Mr. Ismay's evidence in New York in a passage that was read, and in Captain Bartlett's, the superintendent, evidence - did rely very much on the Board of Trade, plus the fact that they exceeded the Board of Trade Regulations. They all answered to that effect. We only desire to submit with regard to that that if you have a low official standard you will automatically tend to lower the actual standard, and that it is better that the Board of Trade should have no standard at all than so low a standard.

*The Commissioner:* Did Mr. Ismay or Mr. Sanderson say that they relied upon the Board of Trade scale?

*Mr. Roche:* Yes, my Lord.

*The Commissioner:* In point of fact, they did not.

*Mr. Roche:* Not that they limited themselves to it, but Mr. Sanderson said this at page 482. That page also contains Mr. Ismay's answer in New York to the question which was put to him. When I say they relied on it, I do not mean that they limited themselves to it, but they took it as their starting-point.

*The Commissioner:* I wish to see what they said.

*Mr. Roche:* It begins at Question 19377. My friend Mr. Scanlan is examining Mr. Sanderson. He said: "I would like to direct your attention to the evidence given on this point by Mr. Ismay in the American Enquiry. It is right I should say that this was not put to Mr. Ismay here in the witness-box, but it is from the Official Report of the evidence. If your Lordship thinks it right, I will suggest to you the question I propose to put. (*The Attorney-General.*) What are you reading from? (*Mr. Scanlan.*) I am reading from the Report of Tuesday, the 30th April. (*The Commissioner.*) What is the question? (*Mr. Scanlan.*) Mr. Ismay is asked here, 'How does it happen that the "Titanic" had but 20 lifeboats?' (*Sir Robert Finlay.*) What page are you referring to? (*Mr. Scanlan.*) Page 925. "How does it happen that the "Titanic" had but 20 lifeboats, including lifeboats, emergency boats, and collapsible boats? (*Mr. Ismay.*) That was a matter for the builders, Sir, and I presume that they were fulfilling all the requirements of the Board of Trade." (*The Commissioner.*) That is quite right. (*Mr. Scanlan.*) That is what I put to you, Mr. Sanderson? - (A.) I think I have answered very much on the same lines. (Q.) That it was left, in the first instance, to them? - (A.) Yes; that it was left, in the first instance, to them. They would submit a profile plan of the ship showing the boating arrangement to us, and they would undoubtedly say that it complied with the Board of Trade requirements, and as the result of this conversation which I am giving, referring to the additional boats with which she was supplied were put on, but as to what we said or what Lord Pirrie said on that particular occasion, I cannot say." Captain Bartlett, the marine superintendent, said substantially the same thing. *The Commissioner:* Let me see that.

*Mr. Roche:* It is at page 563, an answer to Question 21622. Apparently the Witness had been asked matters which were not in his proof, and there was a little discussion about his proof. His proof was handed up to your Lordship. Your Lordship will see about 12 lines down, this

## **Page 772**

is the passage which occurs in his proof. Your Lordship says: "I will read it: 'With regard to the number of boats on the "Titanic" we are guided to a large extent by the Board of Trade requirements, but, in fact, provide a larger boat capacity than the Rules call for.'" That is my reason for saying that the Board of Trade scale is the foundation. The good shipowner may exceed it and may take pride in doing so, but the probability is he will not largely exceed it, and, therefore, if you have a low Board of Trade scale it will have a very depressing effect on the amount and extent to which boats will be provided. I could

not help being struck by a matter which has been very much in your Lordship's mind in the course of this Enquiry: What is the good of having a larger number of boats, assuming they are possible, if they cannot be got away? With regard to the possibility of putting them on board, of course, the evidence of what the German Lines have done and what the "Olympic" has done with regard to the possibility of providing the boats is very potent and forcible evidence, and I cannot improve upon it by talking about it. But I could not help observing that what was very much in your Lordship's mind was, what is the good of having more boats if you cannot get them away from the ship, if time does not allow and circumstances do not allow your getting away more than were got away on this occasion or even as many as on this occasion.

I want to submit a consideration to your Lordship with regard to that, which may sound a paradox, but, nevertheless, I think it is true, and that is this, that it was the very deficiency of boats, the very disparity between the number and the number of people that had to go into them that caused the delay in this case, and that is bound to cause a delay. That the delay was not a delay in mechanically lowering the boats in most instances is clear - there were one or two instances in which falls caught, and so forth - but in the majority of cases the boats seem to have gone perfectly smoothly into the water, and your Lordship will be advised as to how much time is necessary to take off the covers of the boats and to actually lower them into the water. I think your Lordship will find that it is comparatively short. The delay that took place was a natural delay, because of the difficulty of selecting your passengers and getting them into the boats in a selected condition - a difficulty which is naturally obvious when you are trying to get wives away from husbands.

*The Commissioner:* If there had been a sufficient number of boats to accommodate all the passengers, do you suggest that the order would not have been given: "Women and children first"?

*Mr. Roche:* My Lord, not to the same extent. There might have been [an] attempt at selection, but probably not for this reason. At the time when they started putting the people into the boats, at any rate; they did not think, apparently, that the disaster was very imminent. They did not put anyone in for half an hour. Mr. Lightoller says he did not get the order to clear away the boats for some half an hour afterwards. I think in that state of mind and in that condition of things they would have let people go in a natural order; at any rate, they would have let families go together. As to unaccompanied women, there might have been a desire to put them into the boats first, but after that, at all events, the more normal process would have been going forward of the families going together, the women being attended and assisted by their friends, those whom they knew, and there would not have been the great difficulty of the stewards having to go down two or three times. Your Lordship had evidence particularly of the third class stewards having to go down two or three times, with the boats waiting, trying to urge people into the boats, and, on the other hand, keeping back other people who were anxious to go. You got all the conditions which were unfavourable to a speedy filling of the boats and none of the conditions which are favourable to a speedy filling of the boats.

I should be sorry if it were thought that anything I was saying was intended to reflect on the propriety of the order which was given in this case of "Women and children first." One is glad to think it was given and that it was adopted and followed, and even glad to think, out of respect for human nature, that it probably led to many of these boats going

away half filled, because men would not go into them when they knew that the standing order was "Women and children first." That is a reason, I submit, which accounts not merely for the delay in sending away the boats, but for the boats being only partly filled.

*The Commissioner:* I have difficulty in accepting that. I cannot understand why a boat should be sent away half full.

*Mr. Roche:* If a boat had been waiting for some time, and they desired to get another boat out, it is of course, easy to lower it down and trust to it being filled from elsewhere. That the people who actually lowered away thought that boat was going to leave the ship's side empty one very much doubts, but they thought it had been waiting there long enough and that some had better get into it from ladders down below.

*The Commissioner:* I can understand that. I can understand the boats being filled only half full or a third full if there was an idea that the boat might be filled later on. That I can well understand.

*Mr. Roche:* There is ample evidence to substantiate this proposition.

*The Commissioner:* There is some evidence.

*Mr. Roche:* That at all times there were men about the decks there does not seem to be any doubt, and that the boats were not filled because the women and children were not available.

*The Commissioner:* I think that is true; that seems to be a fact.

*Mr. Roche:* It would have been an excuse for the boats having left the ship half filled, but I say the reason they were not filled at the ship's rail was because the women and children were not ready; and it does account for the boats not being filled then and the disproportion of boats to the number of people accounts for the slowness with which they were lowered.

With regard to the mechanical lowering of the boats your Lordship will not forget that in many cases there is evidence that the boat was lowered very quickly. One starboard boat was away, Mr. Boxhall said, almost before he expected it, while he was on the bridge letting off rockets. Other falls and davits lowered their own wooden boats and one, if not two, collapsibles, I think your Lordship will find. I think your Lordship will be advised and will be of opinion, having read the evidence, that mechanically a considerably larger number of boats could have been got out of this ship at the time in question had they been available, but that that delay was a personal and a human delay.

*The Commissioner:* What time did the last boat leave the vessel?

*Mr. Roche:* The last boat left the vessel about half an hour before the ship sank. *The*

*Commissioner:* The steamer was still in such a position as to have enabled them to lower more boats if more boats had been there?

*Mr. Roche:* Except the collapsibles.

*The Commissioner:* There was one collapsible boat, I know, but I am thinking rather of the boats under davits. The ship was still in a condition to have launched or lowered from the davits boats if they had been there to launch?

*Mr. Roche:* Particularly is that the case, my Lord, on the starboard side. The evidence with regard to that is this: Two men, Scott and Dillon, come from the afterpart of the ship, from the engine room, comparatively late in the proceedings, half or three-quarters of an hour before the ship sank. All the boats were gone from the starboard side; all the

wooden boats were lowered from the port side, but one of the men - I think it was Scott - got into a boat down the falls.

**Page 773**

*The Commissioner:* According to the recommendations which had been made to the Board of Trade before this accident happened, it was contemplated that a much larger, or, at any rate, a larger supply of boats would be right.

*Mr. Roche:* Yes, my Lord, it was, and I might, without unduly criticising the Board of Trade, say this - and it is the only thing I desire to say about it - that Captain Young represented the reasons on behalf of the Board of Trade for their non-acceptance of the recommendations, of the Advisory Committee, for example.

*The Commissioner:* What was his reason?

*Mr. Roche:* His reason was broadly this: He was the gentleman who, rightly or wrongly - I am not for a moment saying it was wrongly - thought there was some defect now-adays in the construction of a large number of the boats - that they were made deep in order to get the requisite capacity instead of being broad and long, and that the depth was a fictitious capacity and did not assist at all. But he said this, apparently: "I have no complaint with the boats of a ship of the 'Titanic' class." He apparently had in mind quite a different kind of ship and quite a different kind of shipowner. He said: "Because I could not get my way with regard to this capacity and could not get my requirements in that matter within the recommendations of the Advisory Committee, which had rejected my recommendations on this other head or had not passed them at the moment, we would not have them at all; until they took the whole we would not have a half." But as the halves were not complements of one another, and related to entirely different matters, it is difficult to see the logical justification for that position. That is all I desire to say with regard to the boats.

My Lord, the last thing I desire to say is with regard to the question of the loss of the engineers. They were all lost, and it is one of the misfortunes of this case, the loss of life is so tremendous that it is idle to complain of any particular loss of life. But, of course, it is one of the misfortunes of the case, not only that such highly competent and skilled engineers were lost, but it is a misfortune to the Court that none of them are here to tell us, as they could, no doubt, a good deal of the operation of the pumps, bulkheads, and other matters which have not and cannot be finally cleared up. What I want to say about them is really again with a view to the future. There is, as your Lordship knows, this disproportion in this case of loss among the engineering staff. It is a disproportion which has prevailed before, and is too commonly found. It is one of the noblest traditions of the engineering profession on board ship that in case of accident the Rule is, "All hands below." Those who instruct me have no desire to weaken the force or effect of that tradition. But the finer the tradition is, the more closely it is observed, the more need is there that the interests of those who carry on the tradition should be safeguarded from the deck, and that they should be given an opportunity, when things are hopeless, of coming on deck and taking their chance with others, of the boat accommodation which one hopes in future will be available. In this case, unfortunately, if they had come, although they might have had some of the empty places in the boats, they would have been excluding

others, and therefore it is more with a view to the future than the past that I am addressing these observations to your Lordship.

Now the fact of this case is this: practically speaking, there is no evidence of any engineers being on deck at all after the calamity. There is the evidence of Scott, who speaks, first of all, in answer to the learned Attorney-General about seeing all the engineers on deck when he came on deck, but that was after all the boats were gone. Scott was saved by going into the water and being picked up. That was after all the boats had gone, but it appeared, in answer to myself, that all he was speaking about was some eight engineers - he did not know their names except one - who came from his section, which is the turbine.

*The Commissioner:* What page is Scott's evidence?

*Mr. Roche:* Pages 124 and 125. In answer to the Attorney-General, at Question 5685, he said when he came and was looking over at the boats, one or two were alongside, but they were all lowered: "All the engineers and firemen and all that." At page 125, Question 5711, I asked him: "How many of them did you see? - (A.) I should say there were about eight of them." Whether he meant eight engineers and firemen or not, I do not know.

*The Commissioner:* He is speaking of engineers, I think, and not of firemen: "(Q.) Which of the engineers did you see? Can you tell me their names? - (A.) Mr.

Farquharson. I do not know the names of the others. (Q.) How many of them did you see? - (A.) I should say there were about eight of them."

*Mr. Roche:* It is a small matter, and those came on deck after the boats were gone. There may have been a general order, I know not, in this case for the engineers to come on deck, but, of course, there were no boats for them, and, obviously, if it were given, it was too late.

*The Commissioner:* They had nothing to trust to but their own swimming and the lifebelts.

*Mr. Roche:* That is so. I think the truth is this. Mr. Sanderson, one of the Managing Directors, at page 486, Question 19475, said to me: "I think the engineers on the 'Titanic' were fully alive to the danger in which they stood, and that if they did not come on deck it was due to a magnificent conception of their duty." That is a tribute to the engineers which is as just as it is generous, and there is evidence, as Mr. Sanderson pointed out, of their having sent up the firemen in time from the forward part of the ship and having remained there themselves.

All I want and desire is this, that in future cases where there may be, we hope, a sufficiency of boats, there shall be a Rule, not written to this effect. If your Lordship's answer to this question in your Report, which will be widely and universally read, your Lordship would call attention to the paramount necessity of the obligation on those in charge of the deck of seeing in time, before it is too late, before all the boats are gone, that those in charge of the engine room shall have their chance and opportunity of coming on deck, then that is all we desire. The engineers are asking not that they should have an opportunity of neglecting their duty or of weakening the force or the effect of this tradition, but there does come a time when all has been done that can be done, when they should have an opportunity of a fair and equal chance of life. And they are asking your Lordship, if only by a sentence in this Report and in answer to this question, to call

attention to the paramount duty and necessity of those in charge of the deck paying heed in that matter to the interests of the engineers.

*The Commissioner:* I am very much obliged to you, Mr. Roche. You have taken a very short time and said a very great deal that is useful.

*Mr. Holmes:* My Lord, in addressing you on behalf of the Imperial Merchant Service Guild and the officers of the "Titanic" and the relatives of the deceased officers, with the exception of the Master, I hope that I shall be able by my brevity to maintain the character for considerateness that you were good enough to give me last week. So far as the general character of the officers is concerned, I think your Lordship and the Court will be satisfied that it is of the very highest nature. They were men in whom their employers, through long experience, had placed every confidence; they were men, as Captain Bartlett described them, the pick of the service; with the exception of two of them, they all held extra masters' certificates, which is the highest rank to which they can attain in their profession, and I shall ask you, on the evidence as a whole, to come to the conclusion that they behaved themselves in an emergency of a terrible nature, an emergency whose nature they must have realised far more than the other people on board, in a manner

#### **Page 774**

worthy of the best traditions of the British Mercantile Marine and of the pluck and resourcefulness of British seamen.

The Attorney-General, in his opening said, and the questions bear it out, that there is no question, at all events, so far as the surviving officers are concerned, which would call upon your Lordship to deal with any certificates in this case; but there have been some suggestions made - not serious ones, but which I think are capable of perfectly good explanation, to the detriment of the officers.

Now the first one is in connection with the lowering of the boats, which we have already heard something about this morning. It is quite true that a large number of the boats were lowered without their full complement of passengers, and there are, I think, three explanations, any one of which alone is sufficient to justify the course that was adopted; but all three taken together are an ample justification. The first one was that given by Mr. Lightoller, that he thought there was a danger of the boats buckling. According to the evidence of the constructors and builders that turns out to have been a mistaken apprehension on his part, but I do submit that it was a perfectly natural mistake for anyone to make. You have boats 30 feet long suspended by falls from the extreme ends, with a heavy weight of 60 to 65 people, and the certainty is that none of those officers had ever before had to lower a boat full of people, and I do not suppose there are a dozen officers in the merchant service who have ever had practical experience of lowering a boat from a ship's side full of people. There is, further, ample evidence that a large number of people refused to go into the boats. And not only is there the case of wives who refused to leave their husbands, but, at all events, one-third class steward who informed us that he had conducted large numbers on to the deck said that, as he came up with the parties, there were large numbers returning, some of them, I think he said, even going back to their bunks.

*The Commissioner:* Just give me that reference.

*Mr. Holmes:* It is at page 209, Question 9924. It starts with a repetition of the previous question: “(Q.) Pass the women and children up to the boat deck? - (A.) Yes, those that were willing to go to the boat deck were shown the way. Some were not willing to go to the boat deck, and stayed behind. Some of them went to the boat deck, and found it rather cold, and saw the boats being lowered away, and thought themselves more secure on the ship, and consequently returned to their cabin.” *The Commissioner:* That, I expect, refers to women.

*Mr. Holmes:* “(Q.) You say they thought themselves more secure on the ship. Did you hear any of them say so. - (A.) Yes, I heard two or three say they preferred to remain on the ship than be tossed about on the water like a cockleshell.”

*The Commissioner:* Very well.

*Mr. Holmes:* To counteract that it has been suggested that the passengers should all have been informed that within a very short time the ship was going to the bottom. I suggest to your Lordship that is a consideration which is almost ridiculous. There would inevitably have been a panic of the most terrible nature. The probability is that not one of those boats would have been lowered into the water at all and there would have been people falling overboard or the boats might have been capsized before ever they reached the water. As it is, we have had Mr. Lowe’s evidence that he had to fire his revolver on one occasion to keep the people back from the boat, and one other man did say that there were people hanging on to the falls, which made it desirable to get the boats out in a hurry.

The third justification for the lowering of the boats without their full complement was the anxiety to get them waterborne and to fill up afterwards from the gangway doors. That has been referred to by Mr. Scanlan in his address, and I will just refer again to one question in Mr. Lightoller’s evidence, Question 14230, at page 323. Mr. Scanlan asked him: “But it did occur to both of you? - (A.) It came to both our minds, and naturally anyone familiar with the ship, any seaman, anyone attached to the ship, would know at once that was the best means of putting the people into the boat - by the gangway doors.” Again, on page 332, at Question 14491, he said, in answer to your Lordship: “(*The Commissioner.*) There are two or three other matters about the boats I should like to ask a question on. (*To the Witness.*) I want to know whether you knew that those boats were not intended to be lowered full of people. Did you know that? - (A.) We have no instructions to that effect, my Lord, but I knew that it was not practicable to lower them full of people. (Q.) Had you any reason to suppose that they were weaker than they should have been? - (A.) No. I have not had much experience with these Englehardt collapsible boats. (Q.) I am not talking about collapsible boats merely, but the lifeboats? - (A.) I should not think they were capable of being lowered full of people. They may be. I have never seen them full of people, but if they are only supposed to carry 65 people, afloat, it hardly seems feasible that they would carry 65 people when suspended at each end. It does not seem seamanlike to fill a boat chock full of people when it is only suspended at each end. It is to guard principally against accidents in lowering. That must be taken into consideration a very great deal - the fact that you have to lower a boat from a great height and get her safely into the water. It is of more importance to get the boat into the water than it is to actually fill her at the boat deck, because it is no use filling her

if you are going to lose those people before you get her down; it is far better to save a few and safely. (*Mr. Scanlan.*) Do you think you could have filled the boat still more in the water? - (A.) Undoubtedly.(Q.) If your organisation had been complete ? - (A.) I do not see the organisation would have prevented the ship sinking. (Q.) I know it would not? - (A.) It was that that prevented us putting the people in.” Then there is a remark by your Lordship. “What occurs to me about that, Mr. Scanlan, is this, that the order was, and I suppose quite a proper order, that women and children were to go first. Now it appears to me that you might have great difficulty indeed in putting the women and children down a rope ladder hanging from these gangway doors. That might be a very difficult thing to do.”

*The Commissioner:* In point of fact, not a single person was put into the boats from the gangway doors.

*Mr. Holmes:* I am coming to that, my Lord, in a moment. The plan adopted was that all the women in sight on every occasion were got into the boats, and then the boats were lowered away. That is borne out to a great extent by the boat list. If you look at the numbers of passengers in the boats which were not full, they were practically all women. In a few cases there are two or three, or, I think, as many as half a dozen male passengers, in those boats which were not full. The intention was to get the men in through the gangway doors. Orders were given to that effect, and the men who received the orders presumably went away to carry them out, but they never came back to report. And in point of fact, there was no time for the officers to go from the boat deck to the gangway doors to complete the work which they intended the boats to do. Mr. Lightoller himself had not finished the getting away of the collapsible boats before he was absolutely washed into the water himself, and ran a very near risk of drowning.

Boat No. 1, which had only 12 people in it, perhaps calls for a little more particular comment, and the explanation of that, I think, is found in Mr. Lowe’s evidence at page 368, Question 15896.

*The Commissioner:* That has been explained, you know. That boat was directed to stand by the ship.

*Mr. Holmes:* Yes, my Lord.

## **Page 775**

*The Commissioner:* Apparently it was not contemplated that it would go away with only 12 people in it.

*Mr. Holmes:* No, my Lord. Perhaps I may refer your Lordship to two sentences: “I do not know how many there were. I took everybody that was there: that is all I know.” Then at Question 15900: “(Q.) You did not, for instance, send over to the port side to find if there were any women or children? - (A.) No, because I wanted to get the boats away. I did not have any time to waste. (Q.) And you did not send down to any of the lower decks? - (A.) There was nobody on the next deck. I stopped the boat there and asked them to look. (Q.) Or on any of the lower decks? - (A.) I do not know about that. I stopped the lowering of the boat at A deck, and told the men to have a look there, and they saw nobody.” And then he gave the order to stand by the ship. That is all I have to

submit to your Lordship on the question of the boats not being properly filled with their proper complement.

Further, I cannot call it a charge, but a suggestion was made that the officers ought to have known the capacity of these boats as far as the number of persons they would carry. Mr. Scanlan raised that point on Friday in his address, but it does not seem to me to be a very serious one. A boat may by a computation on a scale be said to be sufficient for a certain number of people, but it does not necessarily follow that it will hold that number of persons, and in any case it is impossible at a time of crisis of this kind for one officer at a boat 30 feet long being lowered in as great a hurry as possible to count every person that gets into that boat. Even when the boats were in the water, the officers have told us that they had difficulty in finding out exactly the number of their passengers; they counted heads as long as they could, but they were so crowded together in some cases that it was impossible to get any accurate number.

*The Commissioner:* And in truth they were thinking about other matters.

*Mr. Holmes:* And they were thinking about other matters. On that I think I might refer to Rule No. 3 of these Life-Saving Appliances Rules which provides for the capacity of these boats. It arrives at the holding capacity by dividing the cubic capacity by 10 in the case of boats of the A section and by 8 in the case of B section. You have heard the evidence of Captain Young and of Captain Clarke as to the tests which have been made with boats for finding out whether that divisor 10 or 8 was the proper one. I should like to remind your Lordship of a report that was received by Captain Young from the people to whom he entrusted this work of making experiments. He said at page 644: "The first report was received from the London Principal Officer on August 25th, and related to two boats that had been tested - (A.) A section A boat, calculated accommodation for 66 passengers. This boat, when fully loaded, was overcrowded and top-heavy, and could not have gone outside the dock gate. It would have been well loaded with 10 men less." That is one of the first experiments, my Lord. "(b) A section D boat of similar dimensions, to carry 82 persons. The test showed that even if such a number could have been put into the boat it would have been unsafe."

*The Commissioner:* Who is it making that report?

*Mr. Holmes:* Captain Clarke.

*The Commissioner:* It is not Captain Clarke who signs the letter.

*Mr. Holmes:* I think Captain Young was reading from a document when he gave his evidence.

*The Commissioner:* I want to know whose letter it was he was reading from. Is not it Captain Young's own letter?

*The Attorney-General:* I have not the passage here, but my impression is this was what was referred to as the memorandum of the report of Captain Young, which was made before the letter of the 3rd of April appointing the reference.

*Mr. Holmes:* I am obliged.

*The Commissioner:* And Captain Young is the gentleman who thinks the form of the lifeboats is not at present satisfactory?

*The Attorney-General:* Yes, I said "appointing the reference," but I did not mean that I was speaking of the letter of 1912, not of the letter of 1911 - directed on the 4th April and written on the 16th April.

*The Commissioner:* Am I not right in saying that it is Captain Young who thought the form of the lifeboats was a matter that ought to be enquired into?

*The Attorney-General:* Certainly, my Lord.

*The Commissioner:* And he is practically saying the same thing in his letter. *Mr.*

*Holmes:* This is the result of practical tests which he has made for the Board of Trade.

*The Commissioner:* Yes, he says, "I have had one of the boats tested. I find that it is very crowded with sixty" - or whatever the number is - "and that it is tender." *Mr.*

*Holmes:* Then we had Captain Clarke, who gave evidence himself, and on page 640 he referred to this matter in answer to questions which I put to him, and also in answer to your Lordship. Your Lordship will recollect he was a little reluctant to say that the present Board of Trade Regulations and the present system was not quite as it should be, but when your Lordship pressed him he said this. Your Lordship asked: "Do you think the method employed at present is right?" and he said, "No."

*The Commissioner:* Who was it said they were right notwithstanding this experience?

*Mr. Holmes:* Sir Alfred Chalmers suggested that everything was correct. *The*

*Commissioner:* He has retired, I think?

*Mr. Holmes:* Yes, my Lord. Then at Question 24147 Captain Clarke is asked: "Is it your idea that the divisor should be 12? - (A.) Instead of 10, yes. (Q.) And that, you say, is the idea which the Board of Trade are considering adopting? - (A.) Yes, I based that on this, that the Board have given very much attention to the question of these lifeboats long before the 'Titanic' disaster, and I formed that opinion. (Q.) That is why I ask you. - (A.) The Board have gone into this question very fully - long before the 'Titanic' disaster. (Q.) And worked out upon that computation, the boats would be considered fit to hold less people than now? - (A.) Undoubtedly, and probably that will be made law." Perhaps if your Lordship can see your way to add a recommendation it would make that "probably" into a certainty.

I think the only other suggestion which has been made against the officers is that they did not know their own boats. I must admit that they did not, because they have said so in their evidence, but it is absolutely immaterial.

*The Commissioner:* It is a small matter.

*Mr. Holmes:* Yes, my Lord; and I submit that it is absolutely immaterial, because it is impossible for an officer to remain at his own boat. You can conceive a state of circumstances in which the six boats to which the six officers were allotted would be the six boats first ready to be got into the water, and then the rest of the passengers would be left to their own resources. All these matters are matters in which the officers had to exercise a discretion, I submit, and I ask your Lordship to say in your finding that they exercised their discretion wisely.

I know that in the case of deceased officers your Lordship will err very much on the side of leniency, but it is much more important, if I may say so, to the surviving officers that their characters, which have hitherto been without any blemish whatever, should not be tarnished with any suggestion that they did anything in the course of this disaster which reflects upon their character as officers of the British mercantile marine. So much for the general conduct of the officers in this disaster.

There are one or two other matters relating more to the deceased officers which will undoubtedly have to be dealt with by the White Star Line insofar as they affect the question of

**Page 776**

suggested negligence, and I do not propose to say a word to your Lordship about that, because it is better to leave it to be dealt with by the proper parties.

I next want to direct your Lordship's attention to Question 4: "Was the 'Titanic' sufficiently and efficiently officered and manned? Were the watches of the officers and crew usual and proper?" I am afraid that the watches of the officers were usual, but I am going to suggest to your Lordship that they were not proper. You will remember what the system was: The Chief Officer, the First Officer and Second Officer - those first three officers - were on the three-watch system; that is to say, four hours on watch and eight hours off duty; the other five officers were on the two-watch system - four hours on and four hours off continuously. That does not mean that they got four hours' sleep. It is four hours from the time that they are first entitled to leave the bridge to the time at which they have to be back ready to take up their duties on watch; and it is not fair either to the officers or to the travelling public that they should be expected to perform the duties they have to perform with such short stretches of sleep. It was admitted in examination, I think by Captain Bartlett, that those officers might be called upon at any time to make abstruse calculations, they may have to take bearings and do other things which require the very clearest mind possible, at the bidding of the officer in charge of the watch. I do, therefore, suggest that your Lordship should answer this question as far as regards the propriety of the watches of the junior officers, in the negative. Captain Bartlett, of course, is the Marine Superintendent of the White Star Line, and perhaps he has reached such a height in his profession that he has forgotten the days when he was a junior officer.

*The Commissioner:* Any way, he survived them.

*Mr. Holmes:* He survived them. But he refused to admit even that they would be better equipped in any way for their duties if they had longer stretches of sleep. I do not make this request to your Lordship, as your Lordship has rather suggested when other similar suggestions have been made throughout the Enquiry, in order that a few more members of the Imperial Merchant Service Guild may obtain berths on ships. If I may say so, the Imperial Merchant Service Guild have no difficulty in obtaining berths for all their members whenever they want them.

While on this point, there is a point connected with it under the twenty-sixth question dealing with the Merchant Shipping Act, 1894, Section 92, and that is the standard which is laid down by the present law for the number of officers and engineers required for our ships. It is a most important point, because it is obviously - and Sir Walter Howell admitted it at once - an improper thing that a ship like the "Titanic" should be allowed to go to sea with a complement of two officers in addition to the Captain. That is all that is required by this Section. Of course, it is not the complement that is provided by responsible shipowners; but there is a minimum laid down by that Section, and if there is to be any scale at all, I submit that it must be a proper one.

*The Commissioner:* What is the Section?

*Mr. Holmes:* Section 92, Sub-section (1)(c). Sir Walter Howell admitted that at once, and with the same breath he said he would hesitate to say that it was wise to legislate, because he objects to lay down a minimum, finding that the minimum is generally adopted as the maximum. He seemed to forget that the minimum is already laid down by the Section, and what I am suggesting is that the minimum should be increased or that there shall be a number of minima, a scale, if I may say so, in a similar way to the scale for boat accommodation, rising with the tonnage and size of the ship. It is certainly of no use having any regulation upon the point at all unless the regulation is complete. I next want to deal quite shortly with the question of survey of the ships. The Board of Trade is in the habit of appointing an Engineer Surveyor to be an engineer and ship Surveyor; that is to say, he does the whole of the surveying of a ship both from the point of view of the engines, the hull and the equipments. In the case of the "Titanic" it was Mr. Carruthers who did that. I have not a word of complaint to make against Mr. Carruthers as an engineer. The complaint I am making is that the Board of Trade system is to put the wrong man to do the work, or to put a man to do work for which he is not really by his training qualified. The appointment is made by the Assistant Secretary, Sir Walter Howell, and he said that he relies, before making the appointment, on the fact that the applicant has satisfied the Principal Ship Surveyor, Mr. Archer, of his capabilities. Mr. Archer, when asked, admitted that he puts them through no test whatever as nautical men. They have an examination as engineers. They have six months' training, for a probationary period, he said, as shipwrights, which would seem to me to be very insufficient. All he could tell us was that they accompanied a senior officer in his work.

*The Attorney-General:* I am sorry to intervene, but I am very anxious to know what it is we have to deal with. I have found a little difficulty in following my friend's argument on the last two points and its bearing on the Enquiry before you. Of course, if it was a general Enquiry into the administration by the Board of Trade under the Merchant Shipping Acts. I agree it would be relevant, and, as to what amending Statutes would be necessary, it would be relevant, but, so far as I have understood the evidence, it is not suggested that by reason of either of the two points, upon which my friend is now relying, there was any loss of life or that there was any increased risk to the vessel, and if your Lordship would bear in mind Question 26, it is limited to the Merchant Shipping Acts and the administration of the Acts and the Rules, so far as the consideration thereof is material to this casualty. The difficulty I find in dealing with it is that I thought that was the view your Lordship took at an earlier stage. My friend's last two points are opening up very much wider considerations, which would necessitate, or at least certainly would have led to, some further evidence to explain what was done. I thought what we were doing here was merely enquiring into the administration of the Acts so far as they related to this casualty. I am anxious to know. I do not want to stop anything which your Lordship thinks ought properly to be enquired into or dealt with by you, but I am anxious to know how far we are to go with this, and whether we are to enquire, or whether your Lordship proposes to deal in answer to that question, with all the matters that are raised relative to the administration by the Board of Trade of these Acts.

*Mr. Holmes:* My Lord, I do not suggest for one moment that there was any loss of life through any failure in the survey by the Board of Trade Surveyors.

*The Attorney-General:* That is the difficulty, you see.

*Mr. Holmes:* In making the remarks, I was exercising what I considered to be my right of commenting upon the evidence which has been clearly brought out in cross-examination, and in answer to questions put by me - questions which were allowed by your Lordship, and in connection with which in one or two cases, I think, your Lordship even assisted me by putting further questions.

*The Commissioner:* I am afraid you must not rely too much on my having allowed the questions to be put.

*The Attorney-General:* I am not suggesting that the questions would not be quite useful, but not on this Enquiry.

*The Commissioner:* Mr. Holmes, you suggest that two officers in addition to the Captain are not enough.

*Mr. Holmes:* Yes.

*The Commissioner:* How does that matter arise under Question 26? *The*

*Attorney-General:* That is what I do not follow.

## **Page 777**

*Mr. Holmes:* I did not understand that this was the question the learned Attorney-General was objecting to; I thought it was on the question of the survey.

*The Attorney-General:* Both.

*The Commissioner:* He said this and the last one or two. How does that come within the object of our Enquiry?

*Mr. Holmes:* I am afraid I cannot say it is particularly connected with the "Titanic" except so far as these Survey Reports have been put in, which contain, my Lord - *The*

*Commissioner:* I know; it may be an important thing to consider these points, but I do not think it is for us to consider them or to make recommendations about them. *Mr.*

*Holmes:* May I refer, my Lord, to both the Report of the Survey of an Emigrant Ship and the Declaration for the Passengers' Certificate which were made by Mr. Carruthers. In each of these cases there is a Table. It contains a list of masters and officers, and the only names that appear upon that are the master, the first mate, the second mate, the first engineer and the second engineer, and then it contains a statement that the certificates of the masters, mates, and engineers are such as are required. *The Commissioner:* You are not directing yourself to the objection the Attorney-General put nor to what I was asking you. Question 26 empowers us to make any recommendations or suggestions that we may think fit, having regard to the circumstances of the casualty, with a view to promoting the safety of vessels and persons at sea. Now, I do not think, you know, that the appointment of Mr. Carruthers has got anything to do with the circumstances of the casualty and I doubt very much whether the fact that there are only two officers, in addition to the Captain, has anything to do with the circumstances of the casualty. It may be a very desirable thing to enquire into, but I can imagine thousands of questions which it might be desirable to enquire into. *Mr. Holmes:* I rather understood that this Enquiry was not to be limited merely to the nature of an inquest on a few persons who are dead,

which can do no one any good whatever, but to try to do something to prevent accidents of a similar nature in the future, and I can conceive very few questions -

*The Commissioner:* You know these two questions, Mr. Holmes, that you have been dealing with for the last few minutes appear to me not to have any reference to the casualty at all, but to be material to your Society.

*Mr. Holmes:* Not to my Society, my Lord, alone by a long way - it is the whole mercantile marine.

*Mr. Roche:* At the same time it is fair to tell your Lordship that my Society takes an entirely different view to my learned friends, not unnaturally.

*The Commissioner:* I am quite sure you do, and I can imagine other people taking that view also. I do not think, Mr. Holmes, we ought to enter into these matters. *Mr. Holmes:* Very well, my Lord. Then a point upon which Mr. Roche has touched slightly this morning, and which I think your Lordship will have to take into consideration very carefully, if there is not to be a recommendation for boats for all, is the question of fire on board ship, and the regulations which are at present in existence upon that point.

*The Commissioner:* I have had very little evidence about fire. I do not know what your suggestions amount to or why we should do anything. There was that fire, for instance, that Mr. Edwards took so much interest in.

*Mr. Holmes:* Nothing to do with that, my Lord, but if you are not to recommend that there shall be sufficient boat accommodation on every ship for all persons, then the regulations for fire appliances should be more stringent, more carefully carried out and surveyed.

*The Commissioner:* I really have heard no evidence as to fire appliances. I know nothing about them.

*Mr. Holmes:* With all respect, my Lord, I asked Mr. Archer all about the provisions.

*The Commissioner:* Do you think you have brought the subject of fire appliances on board these big ships to our notice with such particularity that we are able to deal with it? As far as I am concerned, I am not.

*Mr. Holmes:* I took him through all the provisions of the Merchant Shipping Act and the Instructions to the Surveyors. It may have escaped your Lordship's memory.

*The Commissioner:* Do you, Mr. Attorney, expect us to deal with the fire appliances? *The Attorney-General:* No, my Lord, not with fire appliances, but I understood my friend's questions to be directed to this, that the circumstance of the possibility of a fire would be taken into your Lordship's consideration as one of the elements in determining the boat accommodation that should be provided.

*The Commissioner:* That I can understand.

*Mr. Holmes:* That is my point.

*The Commissioner:* I rather understood we were really invited to enquire into the sufficiency of the appliances for a steamship fire.

*The Attorney-General:* We could not do that; we have not the evidence. *Mr. Holmes:* No, but I do suggest that you should recommend that there should be further and more stringent provision made for the supply of fire extinguishing appliances to ships unless they have -

*The Commissioner:* I cannot do that; I have not heard sufficient evidence.

*The Attorney-General:* No.

*The Commissioner:* Nor until this morning have I realised that we were expected to deal with the supply of appliances for extinguishing fires.

*Sir Robert Finlay:* I think, my Lord, there has been no suggestion that everything that was wanted was not there on board the "Titanic."

*Mr. Holmes:* I am not suggesting for one moment that there was anything wrong with the fire appliances on the "Titanic."

*The Commissioner:* Then, if you are not, you are travelling outside matters which have anything to do with this casualty. I think you must leave the fire appliances.

*Mr. Holmes:* Then, my Lord, the last point which I wish to mention - I think this is one your Lordship will allow me to proceed upon quite shortly - is the provision in these lifesaving appliances Rules that only four of the boats supplied to a ship should be properly equipped with the various equipments. No one was able to explain it properly, except that Mr. Archer said he thought it was probably in the minds of the persons who framed the Rule that the boats would all keep together and that, therefore, if four of them were fully equipped that would be sufficient. I submit to your Lordship that is quite insufficient, and that your Lordship should recommend that not only four but the whole, at all events, of the lifeboats - I would not say necessarily all of the collapsible boats - supplied to the ship should be properly equipped with all necessary appliances.

*The Commissioner:* I do not know where you could put them in the collapsible boats.

*Mr. Holmes:* That is why I do not suggest the Rule should be extended to any collapsible boat.

Those are all the points I want to bring to your Lordship's notice except, in conclusion, to say that I have been asked by the representatives of the deceased officers to thank your Lordship and His Majesty's Government and the representatives of the White Star Line for the expression of sympathy with which they opened this case.

*The Commissioner:* I am very glad to hear you say that, Mr. Holmes.

*Mr. Holmes:* And, finally, I wish to associate myself with Mr. Scanlan's application for costs in this case, and to remind your Lordship that, at the time when my application for leave to appear was granted, you did state that you thought the Imperial Merchant Service Guild ought to be represented.

## **Page 778**

*The Attorney-General:* I take it your Lordship will deal with all matters of costs afterwards.

*The Commissioner:* I shall deal with all questions of costs afterwards.

*Mr. Harbinson:* If it please your Lordship, at the suggestion of my friend Mr. Edwards, who will probably propose to deal with the various topics that the other speakers overlook, when he comes afterwards, I venture now to address a few observations to your Lordship.

*The Commissioner:* I take exception to that observation. I do not think any of them have overlooked anything.

*Mr. Harbinson:* Well, for the observations I overlook.

*The Commissioner:* No, no, no, you will certainly overlook nothing. *Mr. Harbinson:* And the subjects we fail to deal with; but I hope, my Lord, in addressing your Lordship, I shall not rival the exploits of an advocate who recently addressed a Court for three weeks, and at the end of that period applied for an adjournment in order that he might resuscitate his failing energies, and that he might the better continue his oratorical efforts when the Court met again.

*The Attorney-General:* May we know where this was?

*Mr. Harbinson:* I think it was in Italy.

*The Commissioner:* In Viterbo, or some place like that.

*Mr. Harbinson:* I think it was, my Lord; I remember reading it quite recently. While I am endeavouring to curtail myself as much as possible, and I probably will be consulting the wishes of all in that regard, at the same time there are a few statements that I should like to make to your Lordship.

The first proposition, my Lord, that I desire to submit is that this calamitous accident, this disaster, was not the outcome of an inevitable accident. By "inevitable accident," my Lord, I mean an accident which could not possibly have been prevented by the exercise of ordinary care, caution or skill, and my suggestion to your Lordship will be (and of course I shall endeavour in what I say to make, as far as I can avoid it, no reflections upon anyone) that if proper and seamanlike care had been exercised this very deplorable disaster could have been avoided.

Now, my Lord, on this question of "inevitable accident," would your Lordship allow me to refer you to "Bevan, on Negligence," page 879?

*The Commissioner:* I do not think you need do that; it is a most respectable work, but I do not want it. Put it away, Mr. Harbinson.

*Mr. Harbinson:* I have it here, my Lord, if your Lordship desires to refer to it, but, of course, I accept the suggestion that your Lordship makes. My point is this, that after the warnings were received by the Captain of the "Titanic," no special precautions were taken to cope with the contingency of ice in his track. Now it will not be necessary for me to refer to any authority to establish the proposition that negligence is of the same quality while steaming on the Atlantic Ocean or driving on the Thames Embankment, if life is lost as the result of excessive speed or negligent conduct, my point being, my Lord, that it is the same practically whether at sea or on land. There is no difference in the quality of the act. Could it be seriously suggested, my Lord, that if, to give you an illustration, the driver of a motor-car were warned when driving along the road that some obstruction was on the road, for instance, that a flock of cattle were on the road, if he were warned of this, could it be seriously argued that he fulfilled his duty by taking, say, the other side of the road from the side upon which he was told the cattle were encamped and going on at full speed in the hope that he might be able to detect this obstruction before he came up with it?

*The Commissioner:* Do let us get back to the "Titanic."

*Mr. Harbinson:* Why I want to give this illustration is this: It is said that the Captain of the "Titanic" did slightly alter his course, and I think, my Lord, he went slightly further Southward than had been the custom of navigation in that track. But there is no - *The*

*Commissioner:* Do you make any point of that, Sir Robert Finlay - that there was a slight alteration of the course?

*Sir Robert Finlay:* Well, my Lord, I say this: The Captain made that alteration. Of course, he is not here to state the precise reason which led him to make it. I say it was a proper alteration to make, and we are not, of course, in a position fully to judge of all the motives which actuated him in making it.

*The Commissioner:* You do not follow me. Are you going to say that it was a precaution taken by the Captain in consequence of the telegrams which he had received about ice?

*Sir Robert Finlay:* In all probability, my Lord, I think it was. *The*

*Commissioner:* Very well. Now, Mr. Harbinson.

*Mr. Harbinson:* I thank your Lordship. If I may I would like, with your Lordship's permission, to adhere to the illustration I gave; it is merely to illustrate -

*The Commissioner:* Are you coming back to the Embankment now?

*Mr. Harbinson:* No, my Lord, but I wish to compare the illustration I give of the cattle browsing, or encamped on the road, with the ice. The Captain must have known that ice -

*The Commissioner:* I do not follow this.

*Mr. Harbinson:* I wish to make it quite clear. When the Captain of the "Titanic" was informed that there was ice in the track he must have known that ice was an object that would drift with the current and might, therefore, move slightly down, even so as to be on the track that he had altered to, that is to say, that it would not remain stationary. That is an element or feature that I think should have entered into his calculation. That would have been an act of ordinary prudent calculation in a captain who had been many years at sea. In the same way, if the driver of a motor-car were told that there was an obstruction, say, any living obstruction, on the road, he would not be adequately discharging his duty in taking the other side of the road from that upon which he was told the obstruction was located because he should calculate that the obstruction might naturally change from one side of the road to the other. And therefore, my contention, with great respect, my Lord, is this: that the only method by which such a contingency could be adequately coped with was by reducing speed. In this case speed as your Lordship knows, was not reduced. The Captain relied, or his officers relied on their natural powers of perceiving obstacles at a distance. But, my Lord, what is the result? The disaster to the "Titanic" shows that they failed to do that. They failed, and as the result of that failure, my Lord, the world has been shocked by the calamitous nature of the event. Therefore, my contention is this - I respectfully press it on your Lordship - that when the warnings about ice were conveyed to the Captain and to the officers of the "Titanic," knowing the nature of ice, knowing, my Lord, as it is in evidence that that the sea did gradually subside to a flat calm, and that, therefore, as the result of the atmospheric conditions it would be more difficult to detect ice because, my Lord, not only would they be unable to hear the wash of the water against the berg, but also they would probably be unable to detect the white foam that would be caused by the water breaking against the berg - those facts should have been present to their minds and as a result of that, as a special result of the peculiar atmospheric conditions which prevailed, special precautions should have been taken. The most marked precaution that should have been taken was the reduction of speed. My learned friends have suggested, some of them, that an additional man should have been placed at the bow and I think that suggestion is substantiated by the evidence of Sir

Ernest Shackleton, who unquestionably adheres to the view that the nearer a look-out man can come to the waterline the more

**Page 779**

effective are his services likely to be. Nothing like that was done. No special precautions were taken. So far as we know, the Captain communicated with nobody beyond giving the Marconigram to Mr. Bruce Ismay and afterwards getting it and giving it to the officers for the chart room.

Now, my Lord, what was the object of the Captain in taking the Marconigram with reference to the "Baltic" to Mr. Bruce Ismay? I ventured, as your Lordship may see, in the cross-examination of Mr. Ismay, to suggest to him that it was on the part of the Captain an attempt to invite from Mr. Ismay an expression of opinion as regards the speed the vessel was maintaining. Your Lordship may remember that it came out in Mr. Ismay's evidence that prior to the "Titanic" leaving Queenstown he had a discussion with Mr. Bell, the Chief Engineer, on this question of speed, that that discussion with Mr. Bell took place without the Captain's knowledge, the Captain was not present, and that at that discussion with Mr. Bell it was arranged that the speed of the vessel was to be gradually increased, and, my Lord, the expression was used, "We were to run her at her full speed on the following Monday," the day after the Sunday upon which this great disaster occurred. "We were to run her at her full speed on the following Monday"! The vessel gradually forging her way across the Atlantic did increase her speed. Mr. Ismay stated that at no time during the passage did he attempt to interfere with the Captain, that he had no conversation with the Captain, that he was never on the bridge with the Captain and never in the Captain's room. Now those being the relations which prevailed between Mr. Ismay and the Captain. I again put it to your Lordship, was it not a very extraordinary circumstance that on this particular Sunday afternoon, when the Captain received this Marconigram about ice, he should go and search out for Mr. Ismay and hand him the message. I take it, my Lord, and I ask your Lordship to agree with me, that this was a very special precaution on the part of the Captain. Mr. Ismay says there was no discussion between them; I am loth, of course - it would be very regrettable if I were obliged to say, as I fear I am obliged to say - that that seems, at any rate to my mind, somewhat improbable, because I can hardly believe that it is consistent with the conduct of the Captain, after seeking him out and taking this Marconigram to him, that this Marconigram should merely be handed to Mr. Ismay, casually taken by him, glanced at, and put in his pocket, and that no conversation at all should take place with regard to its contents as between him and the Captain. My suggestion to your Lordship is that Captain Smith of the "Titanic" did feel, after the warnings about ice, that the situation was becoming dangerous, that the owner, the Managing Director, the Chairman of the International Mercantile Marine, the chief, the directing spirit of the Oceanic Navigation Company was on board, and I say, even considering the relations that do prevail in these ships between owners and Captain, it was impossible that Mr. Ismay, on board this new ship making her trial trip, should not imperceptibly exercise some influence on the Captain. My contention to your Lordship is that his very presence on that boat, the "Titanic," had an effect on the navigation of the ship, even although he never said a

single word; that under the circumstances, as Mr. Ismay was there for the purpose, as he said, of seeing how the vessel ran for the purpose of discovering defects, that as Mr. Andrews was there representing the builders, Messrs. Harland and Wolff, as this was the trial trip of the largest vessel in the world, going from England, from these kingdoms to America - they were all on the alert, and that undoubtedly the presence of Mr. Ismay exercised considerable influence on the navigation. That is my contention.

Now, my Lord, that being the condition, I suggest that the speed at which the "Titanic" was going was excessive, and that if, after the warning had been given, special precautions had been taken and a diminution of speed had been ordered, in all probability the vessel would never have gone to the bottom. Now, whether it is navigating on the Atlantic Ocean or travelling in London on any highway, what is the rate that should guide those who are in command either of vessels or vehicles? It is this I respectfully submit to your Lordship's better judgment: that the speed should be such that they should have either the ship or the motor-car, or whatever it is, under such control as to avoid an object after being seen. And, as the result proves, my Lord, the "Titanic" was unable to avoid this object after it was notified from the crow's-nest, because, I believe I am right in saying that that was the place where the notification came from first, I do not think there is any evidence, so far as I can remember, that it was seen on the bridge until the notification was received from the crow's-nest.

*The Commissioner:* There is some evidence: I do not know that there is very much, but there is some evidence. Lightoller, I think, says that, in his opinion, the helm had been starboarded before the message came from the crow's-nest. *Mr. Harbinson:* Yes, my Lord.

*The Commissioner:* And he says that leads him to think that they saw the iceberg from the bridge before the crow's-nest announced it, however, that is the whole of it. *Mr. Harbinson:* Your Lordship is quite correct; Mr. Lightoller did say that, but except that isolated expression of opinion, with which there did not seem to be any very general agreement, I think there was no other. Of course, as your Lordship sees, assuming that they did see it from the bridge at the same time that it was notified from the crow's-nest, any interval of time that could have taken place must necessarily have been very short, considering how soon the collision occurred after the ice was notified.

Now if this vessel, the "Titanic," had been going at a reduced speed the argument I wish to reinforce is the argument which has been addressed to your Lordship on that particular point by my friend, Mr. Roche, this morning, and that is that, assuming that she had been reduced to half her speed and that she had been only able to turn two points in the distance she had traversed from the place where the object was seen, at the same time she would have been able to have the more effectually reversed her engines, brought the fact of the reversal into play, and thereby in that regard the impact would not have been so great as it was. Now a number of Captains were called to say what the practice is with regard to navigating the Atlantic, and Mr. Pritchard, the ex-Captain of the "Mauretania," which he says steams 26 knots an hour (that was the only one of the captains whose vessel did exceed the speed of the "Titanic") said his practice was to do exactly what was done in the case of the "Titanic." With regard to the others, there was Captain Young, of the "City of Rome," who said that his was a 17-knot vessel; Captain Stewart, of the "Empress of Britain," 18 knots; Captain Ranson, of the "Baltic," 16; and, as your

Lordship will remember, there was Captain Apfeld, of the Red Star Line, who said, if I recollect aright, that his vessel's speed was something like 18 knots an hour. Now all these vessels, with the single exception of the "Mauretania" - and this is a consideration I would like to impress on your Lordship - are considerably slower than the "Titanic." Therefore, they do not incur the same risk by navigating in that way (that would be my submission) for that reason, that they are the better able, even assuming that their helm answers slower and that they can only turn the same number of points in the distance that intervenes between the place the object is seen and the object, to bring their ship to a standstill.

Now, that is the situation. Why, on this particular occasion, was there not a conference of the officers called after ice had been notified? If that is not the usual practice on these ships for the captain to discuss with the officers, why were not some special instructions given considering that a very special message with regard to icebergs and

### **Page 780**

field ice had been received? I would like to make one suggestion to your Lordship, and it is this, that the matter, in all its gravity, did not seem to come home to the officers, and I wish to illustrate Mr. Lightoller as the officer to whom I refer, and that therefore it probably did not come home with sufficient force to Captain Smith. Now Mr. Lightoller told me - I think he also told your Lordship - that he had made a calculation as to the time he expected the "Titanic" would be in the vicinity of ice, and it will be within your Lordship's recollection that he said half-past 9 was the time he expected the ship to reach the ice. Mr. Moody, the Sixth Officer, had also made a calculation with reference to the time this vessel should reach ice, and the time he indicated was 11 o'clock, a difference of an hour and a-half in the calculations of these two officers. My Lord, that seems a pretty considerable margin. To my mind, at any rate, it would seem a difference in calculation which would call for some further Enquiry in view of the repeated warnings the "Titanic" had received. But yet, as illustrating my point, that the gravity of the situation, after the warnings that had been given to them had not been realised with sufficient force, Mr. Lightoller allowed Mr. Murdoch to come on at 10 o'clock when Mr. Murdoch relieved Mr. Lightoller, and he never mentioned the question of the difference of their calculations. I wish to make no reflection on Mr. Lightoller's capacity or his general conduct, but at the same time I think it my duty to mention this matter to your Lordship that to my mind that was a matter which should unquestionably have been brought to Mr. Murdoch's attention. That difference in calculation as to the time when they might expect to reach ice was of vital importance, considering the speed at which the "Titanic" was travelling, and yet not one single word about that was said to Murdoch when he relieved Lightoller at 10 o'clock. My Lord, is that consistent with careful seamanship? Is it consistent with careful seamanship that when two officers make a calculation with regard to the time a vessel speeding at, roughly, 22 knots an hour, will be in the vicinity of ice, and there is an hour and half difference, and not one single word of it is mentioned to the senior officer when he comes on watch? I quote that as an illustration of the sort - I hope I am not using too strong a word if I say - of slackness that prevailed amongst the officers in regard to the warnings that they had received, and also

in regard to this question of ice, considering the speed at which the vessel was then going. My Lord, those being my contentions, I desire to make the submission to your Lordship that the disaster to the "Titanic" was not the result of inevitable accident, and if it was not the result of inevitable accident, blame must attach to some one. My Lord, blame is at the root of negligence, blame must attach to someone, and my suggestion is that the vessel was not navigated with an adequate amount of care consistent with the warnings that had been received, and that blame undoubtedly attaches to those who were in charge of the navigation of the vessel. I would respectfully, as I say again, press on your Lordship that your Lordship should find that she was not navigated with proper care, that there was a breach of the duty to take care, which Lord Herschell has defined as constituting negligence, and that the breach of the duty to take care in this instance was to take adequate care to protect and preserve the lives of those who were on board; that that breach of the duty to take care amounts to negligence, and my respectful submission to your Lordship is that there was negligence in the navigation of the "Titanic."

Now, my Lord, that question of negligence touches on the Questions, submitted by the learned Attorney-General to the Court, 9, 10, 12, 13, and 14. These Questions 9, 10, 12, 13, and 14 relate to ice and speed, and they bear directly upon the question of negligence. Now, my Lord, having dealt with that aspect of the question, I wish more briefly to refer to portions of Questions 21 and 24 - the latter portion only of Question 21. "What is the proportion which each of these numbers" (that is, the numbers of the different classes) "bears to the corresponding total on board immediately before the casualty? What reason is there for the disproportion, if any?" and Question 24, "What was the cause of the loss of the 'Titanic' and of the loss of life which thereby ensued or occurred? Was the construction of the vessel and its arrangements such as to make it difficult for any class of passenger or any portion of the crew to take full advantage of the existing provisions for safety?"

Now, there has been a huge volume of evidence given, and I do not desire to range over it at large. A brilliant writer, my Lord, has invented, or constructed, a somewhat unorthodox paradox, that the best way to meet a temptation is to yield to it. Like many paradoxes, my Lord, I fear that is only half a truth, and I am much too orthodox in morals to practice it on this occasion, and, therefore, I shall confine myself to the questions that more immediately concern me. Now might I refer your Lordship to the Certificate for Clearance? I am here specially representing, as your Lordship knows, all the third class passengers. I represent, I am glad to say, not only my own countrymen but also the English third class passengers, and thereby, I hope, symbolise in some way that community of interests and sentiment which we all hope in the near future will be established between the two countries. There were 710 third class passengers carried, and out of that number, my Lord, 176 were saved. Now, there were 113 (Your Lordship asked for this, and perhaps I may be allowed to repeat it) Irish passengers taken on at Queenstown, and of that number 57 were males and 56 females. Out of the 57 males, my Lord, 7 were saved, 12 percent; and out of the 56 females 33 were saved, making 59 percent. Now, might I refer your Lordship to the Table in the evidence, which you will get at page 479, and just compare that with the percentages as given in the Table. Of the first class passengers the percentage saved (I need not trouble with the numbers) was men 34 percent, women 97 percent, and children 100 percent. Of the second class, men 8

percent, women 84 percent, and children 100 percent. Of the third class, men 12 percent., women 55 percent., and children 30 percent. The disproportion, as your Lordship sees, is very considerable. Now, my Lord, of the Irish, a constituent element of the third class, of men there were 12 percent. saved, exactly the same as the percentage of the whole of the third class passengers; women, 59 percent, and there is no figure furnished to me as regards the children.

*The Attorney-General:* They are all under the males and females.

*Mr. Harbinson:* I thank you, Mr. Attorney-General; I did not know. Through a question I put to Sir Walter Howell, when he was in the witness chair, asking the number with reference to third class emigrants, I merely quote this to show your Lordship the importance of the class - I have no reason to believe your Lordship would dispute it, but I thought it proper to put the question, and with great courtesy Sir Walter Howell has furnished me with the returns for the last ten years. I do not propose to read that because it would take too long, but may I mention that I have added up the numbers and I find that the number of third class Irish passengers who have gone to North America for the last ten years from 1902 to 1911 is 294,359, and that the number of British passengers who have gone to North America during the same period is 1,369,260. Those figures show, my Lord, that the proportion of Irish passengers who have crossed the North Atlantic to North America in that 10 years bears to the proportion of the total number of third class passengers who have gone from Great Britain the relation of between one-fourth and one-fifth. Between one-fourth and one-fifth of the whole number who have crossed to North America in that time, steerage passengers, have come from Ireland. If your Lordship cares to see this table you can have it afterwards for the purpose of verification.

## **Page 781**

*The Commissioner:* I am listening to it.

*Mr. Harbinson:* I quote that, my Lord, to reinforce two facts; first, the number of Irish passengers who have travelled, and in whom, as your Lordship knows, I am specially interested, and also the number of British passengers who have crossed by steamers plying on the North Atlantic for the last ten years. It amounts to over a million and a half, and must furnish a considerable portion of the revenue of the various shipping companies. Therefore, as I respectfully suggest to your Lordship, this is to a large extent an inarticulate class, not people who are very well educated, not people who belong to that rank of life where they can look after themselves, nor people who are accustomed to travel; in Ireland certainly, and to a large extent in England, I think, people who come from rural divisions, and who probably have seen a ship for the first time. These are people not accustomed to the ways of travelling, and, therefore, my respectful submission to your Lordship is that these are people who in times of danger and emergency require special attention and special protection. They would be unaccustomed, my Lord, to the many passages, the many ways of communication which would lead from the third class quarters on the "Titanic" to the boat deck. They would never have been on the boat deck, because what is the evidence? The evidence of Captain Clarke, on page 679, is that when he made the inspection at Southampton before the "Titanic" sailed the emergency doors

were locked and the barriers were fastened. He made that inspection, as he says, at 8 o'clock in the morning of the day upon which the "Titanic" sailed.

Then there was Hart, the Steward, whose evidence your Lordship will find at page 214. I wish to deal, if I may say so, with this matter with absolute fairness, concealing nothing, and giving the evidence that bears on the matter regardless of whether it bears out the view which I shall put before your Lordship or not. At page 214 Hart told the Court that provision was made for having the third class passengers directed to the boat deck. At Question 10213 he was asked - I asked him, as a matter of fact: "(Q.) You have told us that you saw a number of stewards placed at various portions to direct the third class passengers how they were to go? - (A.) Yes. (Q.) About how many stewards were so placed? - (A.) I passed about five or six on the starboard side. (Q.) Who else besides you, then, were bringing the people from their berths - rousing them and bringing them up to the boat deck? How many others? - (A.) almost eight. A portion of the third class stewards were room stewards, of whom I am the only survivor. (Q.) I understood that there were only eight third class stewards in the aft portion altogether? - (A.) To look after them. (Q.) Who were stationed at various places to direct the third class passengers the way they were to go? - (A.) Not of that eight. (Q.) There were five? - (A.) Five others. (Q.) What class stewards were they? - (A.) I could not tell you. Stewards were placed all round the ship. (Q.) Do you know who placed them there? - (A.) I cannot tell you. (Q.) Do you know the stewards by sight who were placed to direct the third class passengers? - (A.) No. (Q.) But you say they were not third class stewards? - (A.) They were not third class stewards. (Q.) Did you see the emergency door open? - (A.) I saw it open. The swing door to the second class, you mean? (Q.) Yes? - (A.) Yes. (Q.) Do you know at what time it was opened? - (A.) Yes, I can tell you. It was open at half-past 12. (Q.) Would it be right?" (and, my Lord, this question I was obliged to put because of a number of statements that had been made in the papers. I put this question, although, of course, I was not a position to adduce any evidence to substantiate it, but, if I may say so, my position sometimes in some of the questions I put resembles that of a navigator trying to steer between Scylla and Charybdis; I did not want to put some of the questions, but there were some questions I was obliged to put and I put this question in that way) "if anyone said that a number of sailors were keeping back the third class passengers from reaching the boat deck? - (A.) Would it be right to do so? (Q.) Would it be right if any one said so? - (A.) I do not say that it would be right. (Q.) I asked you would it be right if anyone said so? - (A.) I would not like to say it would be right. (*The Commissioner.*) Would it be true? - (A.) I should not think so." Then I say: "It is not what you think. Did you see any sailors keeping back the third class passengers from reaching the boat deck? (*The Commissioner.*) Did you see anyone keeping the third class passengers back so as to prevent them getting to the boat deck?" and he says, "No, my Lord."

Now, my Lord, I wish to say distinctly that no evidence has been given in the course of this case that would substantiate a charge that any attempt was made to keep back the third class passengers. There is not an atom or a tittle of evidence upon which any such allegation could be based, and I do not for one moment say the third class passengers were deliberately kept back or were kept back at all in the sense that any effort was made to prevent them reaching the boat deck. I desire further, my Lord, to say that there is no evidence that when they did reach the boat deck there was any discrimination practised

either by the officers or the sailors in putting them into the boats. It would be wrong of me to say so, because there is no evidence which would bear me out in saying so, and I think it only fair that in speaking on behalf of the third class passengers I should make that observation to your Lordship. But, my Lord, how do we account for the disproportion in the saved as between the third class and the other classes? My Lord, I regret to say I cannot accept the statements made by Hart as being in all respects absolutely accurate. If I may put it colloquially, my Lord, my suggestion would be that the picture has been somewhat touched up, because in the evidence given by several witnesses, and in answer to questions which I put to quite a number who came into the witness-box, there was not one of them who could say that they had heard any instructions given to stewards to go and take their places and direct these third class passengers to the boat deck. Hart says they were there, that the emergency door was opened, but he is the only third class steward called, and we have only got his uncorroborated evidence to rely upon. Now, my Lord, is this account which he gives consistent in all respects with the number of third class passengers who have been drowned. I questioned him further to this effect: Question 10255, "According to you, all the women and children, from the aft part of the boat who were taken up and who wanted to escape could have done so?" and he says, "I do not doubt that for a moment." True it is that in another portion of his evidence he said that some of them who did go to the boat deck returned again, but in Question 10200 he said: "It was only a small number who refused to leave," that is to say, who refused to leave their cabins. He says, "It was only a small number who refused to leave."

Now, my submission to your Lordship is this, that if there had been a proper organisation of the stewards in the third class quarters, if a proper warning had been given to the third class passengers, if they had been told that the position of the "Titanic" was dangerous and that the ship was doomed, my submission to your Lordship is that if they had been told that, and, further, told that the "Carpathia" was coming to their rescue, a circumstance they could have been informed of, then I say it is highly improbable that any of them would have refused, even in small numbers, to have left the sinking ship. Now, my Lord, the question has been raised - I raised it, and my friend Mr. Holmes said it was rather ridiculous, but, of course, that is a matter of opinion - of a general alarm. True it is, my Lord, that if a general alarm were sounded it is possible it might give rise to panic - I admit that at once - but, my Lord, on the other hand, there is also the view to be considered that it is only fair that people who are on a ship that is doomed should in some way be apprised of the

## **Page 782**

serious condition of the circumstances in which they are placed, and it is therefore a matter I would respectfully suggest to your Lordship for consideration and for the consideration of your Lordship's skilled advisers, as to whether or not it would be desirable in case of danger, fire, or wreck, that some kind of general alarm should be sounded. That is a matter I would leave to your Lordship and to your Lordship's skilled advisers, but I merely suggest that it is a matter which is worthy of serious consideration. I do think on this occasion, as appears from the evidence of Boxhall and Bride that the

passengers on the "Titanic" could have been informed by the officers that the "Carpathia" was coming to their assistance. There is no doubt that that was known to those on board of the "Titanic," because if your Lordship refers to the evidence of the Fourth Officer, Boxhall, on page 361, Question 15610, I asked him, (Q.) "Did you hear the Captain say anything to anybody about the ship being doomed?" and he says, "The Captain did remark something to me in the earlier part of the evening after the order had been given to clear the boats. I encountered him when reporting something to him and he was enquiring about the men going on with the work, and I said, 'Yes, they are carrying on all right.' I said, 'Is it really serious?' He said, 'Mr. Andrews tells me he gives her from an hour to an hour and a half to live.' That must have been some little time afterwards. Evidently Mr. Andrews had been down." Therefore, my Lord, the Captain a very short time after the collision, at any rate some time after the collision, knew that the "Titanic" was not going to survive.

Now, my Lord, in reference to the knowledge of the "Carpathia," it will be found from Bride, whose evidence on that subject appears at page 393, Question 16795. I asked him, "Do you remember how long it was after the collision when you learned that the 'Carpathia' was coming to your assistance? - (A.) The 'Carpathia' was the second boat to answer our call. (Q.) Can you remember how long it was after the collision? - (A.) No, I could not tell you; it was within a very short space of time after we sent out our first distress signal."

*The Commissioner:* When was that?

*Mr. Harbinson:* That would be, my Lord, about half an hour after the collision, as far as my recollection serves me, and he says it was shortly after they sent out their first distress signal.

*The Attorney-General:* I think 12.25 was the first C.Q.D message.

*Mr. Harbinson:* That would be three-quarters of an hour. I asked him, at Question 16797, "And you took the message that the 'Carpathia' was coming, to the Captain?" And his answer was "Yes."

My Lord, I think with that knowledge in the possession of the Captain, if there had been conveyed to the passengers the seriousness of their situation and the fact that assistance was near at hand, at any rate was on its way, the lifeboats would have been properly filled and a greater number saved. I think such information ought to have been given, and especially to these third class passengers, who, as your Lordship knows, were in a different position, both as regards environment and as regards previous experience of the sea, from the cabin passengers.

*The Attorney-General:* May we get that time right? 12.15 is the message to the "Mount Temple," receive from the "Titanic," and 12.25 is the message from the "Titanic" to the "Carpathia," which the "Carpathia" received.

*Sir Robert Finlay:* My Lord, I would submit that the four following questions and answers ought to have been read. I think my friend stopped at Question 16797 on page 393?

*Mr. Harbinson:* Yes.

*Sir Robert Finlay:* Question 16798 and the following questions are these: - "(Q.) Now do you know if the Captain communicated the substance of your message to any of the

officers or to the crew? - (A.) I passed the word myself as I went to find the Captain. (Q.) To whom did you pass it? - (A.) To anybody I happened to come close to. (Q.) Did you pass it to any of the officers? - (A.) Not to my knowledge. (Q.) But you gave it out that the 'Carpathia' was coming to your assistance? - (A.) Yes."

*Mr. Harbinson:* Yes, that is quite right, Sir Robert. My submission is that the Captain had the knowledge, and that the knowledge should have been communicated. That is my respectful submission. Now, my Lord, there is a question which has been dealt with, and I do not wish to take up any time dealing with it in detail, and that is regarding the despatch of these lifeboats not adequately filled. The fact remains. But might I refer just to one piece of evidence in connection with that, and that is to the evidence of Fifth Officer Lowe at page 368, Question 15906? "(Q.) Is it not the function of lifeboats on a steamer, as far as possible, to take away the full complement of passengers? - (A.) Yes, but I was going on the idea that the gangway doors were going to be opened and to take people from there. (Q.) And that was why you lowered the boats from the boat deck when they were not altogether full? - (A.) Certainly; we were not going to load a boat with its floating capacity from the davits. (Q.) What grounds or evidence had you for the opinion you formed that there was going to be additional people put in the lifeboats from the gangways? - (A.) I really forget now. I must have overheard it. (Q.) Do you remember whom you overheard saying it? - (A.) I do not. (Q.) Did you hear any instructions given for those gangways to be opened?" and he said, "Had I any instructions?" and then I repeat, "Did you hear any instructions given?" and his answer is, "No, but as I say, I overheard a conversation somewhere referring to the gangway doors being opened, and that the boatswain and a crowd of men had gone down there."

*The Attorney-General:* Had been sent there.

*Mr. Harbinson:* (Q.) With reference to these boats that were lowered on your side, at which you assisted, did you, after they had been lowered, have any means of communicating with those on board in order to have them filled up through the gangways?" and his answer is "Yes; I told them to haul off from the ship's side, but to remain within hail. That is what I told each of them, with the exception of the boat that Mr. Pitman went in." Then I go on, "What I want to get at is this."

Now, my Lord, it is clear there was some confusion with regard to these gangway doors. Whether it was the intention that the boats should be partially filled on the boat deck and afterwards completely filled when they were lowered to the gangway doors is a matter, I think, that is a point of speculation, but that there was some discussion about the opening of the gangway doors, as Lowe says, I think there can be no reasonable doubt, and that that might account for the boats being to some extent lowered inadequately filled from the boat deck. But what I want to suggest is this, that the fact that those boats were lowered unfilled, or improperly filled, that the fact that there was some discussion or some thought that they might subsequently take on additional passengers from the gangway doors, which was never done, shows there was confusion and a lack of proper system and administration amongst the officers and those in control of the boat at this time when it was being filled. True it is, and I think it fair to say, that this was a new ship, and that the officers had only been on it for a very short time, a few days at the most. True it is also that the sailors and firemen who principally manned the boats were also new to it, but still I think under a proper system of organisation and administration

sufficient time had elapsed from the time they joined the "Titanic" to have accustomed them to their duties if an emergency arose. But, my Lord, it is clear that the possibility of danger arising had not occurred to their minds, and nothing was done, and the result was a certain amount of confusion - not chaos, I do not go so far as to say that - but there was a certain amount of confusion and misunderstanding, with the result that only roughly 700 people were saved in the lifeboats

**Page 783**

when there was lifeboat capacity and accommodation for between 1,100 and 1,200. It would have been quite possible for these boats, when they lowered to have concentrated on boats that were improperly filled or inadequately filled, to have transferred their passengers and come back and taken on additional passengers. That could easily have been done - concentration in some boats while others came back and got further passengers. There was time to do that, but, my Lord, it was not done, and that, I respectfully suggest to your Lordship, is an omission which undoubtedly resulted in the loss of a few hundred lives that possibly might have been saved if the boats had been filled to their full carrying capacity. As regards the manning of the boats, I wish to say nothing beyond this; that it is a curious coincidence and bears out the contention I have been respectfully submitting to your Lordship that in No. 1 boat, about which I am to offer no criticism beyond saying this, there was a crew of seven to man it and only five passengers, but in No. 12 boat there were over 40 passengers and only a crew of two. I respectfully commend that to your Lordship's consideration, and I think, if I may say so, it justifies me in saying that on this occasion in connection with the manning the administration was not all that it might have been.

As regards other subjects which I touched on in the course of this Enquiry, it will be for your Lordship and your Lordship's skilled advisers, to consider the whole question of the launching of lifeboats from davits 70 feet high. I did make the suggestion that some consideration might be given to the question of whether or not the boats might be lowered from the stern or from a slip further down the side of the boat, and, if I might make a suggestion to your Lordship in the presence of the Attorney-General, it would be this, that in this committee that is considering the question of bulkheads, the relation of boats to bulkheads, it might be not undesirable that within the scope of its discussions it might include the question also of the proper launching of boats and the proper positions and the importance, at any rate, of the safe manner in which boats could be launched. With regard to a suggestion that I made, my Lord, it will also be a matter for your Lordship to consider, and that is as far as possible this question of the continuous service of crews on board these liners that ply across the Atlantic. I do not think it requires argument that if men who are accustomed to work on a boat, familiar with the vessel, with its various passages and ramifications, are employed continuously on that vessel, they will be more serviceable, better accustomed to their positions and better fitted to discharge their duties in times of danger and emergency; and if any system could be devised - I do not suggest a system of compulsion, but if it could be accomplished by inducement, by the offer of benefits - I do not wish to say that additional burdens should be thrown on the shipping companies - but if arrangements could be devised by

employing them as shore gangs whereby these crews could be employed more continuously on Atlantic-going vessels, it might tend to safer navigation and to more dispatch in the matter of life-saving in case of danger.

Now, my Lord, here is one other question that I should like to touch upon, and that is the question of the Board of Trade.

*The Commissioner:* The Board of Trade? Do you propose to deal with that? *Mr.*

*Harbinson:* I do not propose to deal with the Board of Trade with regard to bulkheads at all; I leave that absolutely to my learned friend who will follow; in fact, my Lord, I think it is probably better for me practically not to touch on the Board of Trade beyond saying this, that the learned Attorney-General has a big task, I think before him when he comes to vindicate the Board of Trade because, if I may say so, I think to seek to defend the Board of Trade is like defending the indefensible. Its position is serious. It wakes up in 1894, and it makes Rules with reference to vessels up to 10,000 tons, and then, my Lord, it goes to sleep and it does nothing. There is nothing done, no steps taken to extend the scale, although vessels are built between 1894 and 1910 which leap up in tonnage from 10,000 to between 40,000 and 50,000 tons. Nothing is done, my Lord, in that time to deal with the extension of the boat scale; nothing is done to frame regulations with regard to speed -

*The Commissioner:* You are trenching on Mr. Edwards' speech. *Mr.*

*Harbinson:* I should be very loth to do that.

*Mr. Clement Edwards:* Shortening my task, my Lord.

*Mr. Harbinson:* I do not wish to trench on the ground which Mr. Edwards is going to cover, but I think, my Lord, he is to cover it so fully that anything I say will not detract in the slightest from the multifariousness of the topics which he proposes to deal with. May I only say this? I did take a point with reference to the dent in the "Olympic." I think that matter is rather serious. It was described by Mr. Wilding as a dent, but the information I had was that it was something more serious, although I accept his description, of course. I say that, of course, pointed and should have pointed to the necessity of a double skin, but my learned friend, Mr. Edwards, will deal with that, and probably he will also bear in mind when he is dealing with it that this slight damage to the "Olympic" did occur, and that an argument can be based upon it. Now, with reference to that, I think I have said all I wish to say. I wish to say that the Board of Trade has got many eyes and many ears, but it does not seem to have any brains.

*Mr. Clement Edwards:* I do not know what there is for me to say after that, my Lord.

*The Commissioner:* I think your speech is being quite spoilt.

*Mr. Harbinson:* And although it gets information from all sides it does not seem to be able to digest it, to assimilate it, or to apply it; and if, as the result of this awful tragedy the Board of Trade could be modernised, and made, as it were, the reflex of the living, throbbing and palpitating life of this country, then I should think, at all events, appalling, world-wide as this calamity has been, my Lord, it will have borne some fruit.

*(After a short adjournment.)*

*The Commissioner:* Mr. Laing, you appear, I believe, for Messrs. Harland and Wolff.

*Mr. Laing:* Yes, my Lord.

*The Commissioner:* I want to tell you that we should like to hear you upon the question of the bulkhead between No. 5 and No. 4 boiler rooms.

*Mr. Laing:* If your Lordship pleases.

*The Commissioner:* It is suggested that if that bulkhead had been carried up to C deck, even if the water got into No. 4 boiler room, over the top of the bulkhead between 4 and 5, the ship would have been afloat much longer. Supposing you were to have a bulkhead going up to C deck, then the vessel would have been much longer afloat, unless it be true that No. 4 boiler room was holed to such an extent that the water came in in quantities which the pumps could not cope with. Do I make myself clear?

*Mr. Laing:* Yes, my Lord, I think I understand what your Lordship means.

*The Commissioner:* It is suggested, you know, that if the bulkhead between 4 and 5 had been carried up to C deck, and it be true to say that No. 4 boiler room was not holed to such an extent that the pumps could not cope with the water which came in, then the boat would have floated for a considerably longer time.

*Mr. Laing:* I follow that, and I will look up the evidence with regard to that. *The Commissioner:* Now, Mr. Edwards.

## **Page 784**

*Mr. Clement Edwards:* May it please your Lordship: What I am going to say in the main will be said not only on behalf of my own clients, but, accepting your Lordship's suggestion, also on behalf of the Seafarers' Union, represented by Mr. Lewis; the Stewards' Union, represented by Mr. Cotter; and the Shipwrights' Society, represented by Mr. Pringle. I am instructed to say on behalf of these and also on behalf of my clients that we join with those who have expressed their appreciation of the sympathy which His Majesty's Government has tendered to the sufferers in this terrible catastrophe, and also the sympathy which has been extended by the owners of the "Titanic"; and also - particularly those of us who are appearing here - desire to express to your Lordship (whatever ultimately may be your Lordship's views does not for this purpose matter) our very highest appreciation of the very great and profound patience which you have manifested in a very difficult Enquiry, very laborious, and presenting many trying circumstances.

Now, I should like in the next place to remove any possible alarm that might have been conveyed to your Lordship's mind by the perfectly unauthorised programme of my intentions tendered to your Lordship by my friend Mr. Harbinson. I have no sort of intention to travel over a single inch of the ground which I think can possibly be avoided, and your Lordship has by certain intimations already enabled me very much to cut short anything that I should have had to say; that is to say, a good deal of my cross-examination was directed to the construction and efficacy of bulkheads of different kinds, transverse and longitudinal, and also to the question of the advantages or otherwise of watertight decks, and also to what I may call the interrelation between boat accommodation and the sinkability of the ship as affected by the question of bulkheads.

Your Lordship on all these three points has already indicated a certain line which is this, that in the opinion of your Lordship the Committee which has already been set up should devote attention to these problems, so that so far as each one of those questions is

concerned as affecting the future I do not propose to trespass in the least degree upon your Lordship's time by discussing them. Of course, I have to touch on each one of them in relation to the actual accident to the "Titanic," and also in relation to what I may call the relative responsibility of owners, builders and Board of Trade in regard to each one, and that of course will constitute the main part of the remarks which I have to address to your Lordship.

There are certain other matters; for instance, there is the question of boat accommodation and manning and equipment, and I may say at once that except for certain particular remarks which I may desire especially to address to your Lordship on behalf of my friends Mr. Lewis and Mr. Cotter, I at once freely and fully adopt the suggestions made to your Lordship by Mr. Scanlan, and I shall, therefore, not attempt anything like a detailed discussion of those.

Then, of course, there are a number of questions which, of necessity, the learned Attorney-General must go into quite fully, and, if I may say so, with respect, the evidence is almost so unanimous upon the point that I do not think there is likely to be much disparity of view and submission between what I might call the view put by the learned Attorney-General and the view which I should desire to submit to your Lordship; and upon this question again I do not propose taking up any time. So that what I have to say narrows down, if I may say so, to the question of construction in relation to the avoidance or the mitigation of the calamity, and to certain particular incidents upon which I feel that a certain amount of responsibility rests upon my shoulders owing to a particular line that I took in cross-examination.

Now, the first point upon which I desire to address some observations to your Lordship is the question as to the immediate cause of the calamity and whether the look-out was deficient or not. I think the evidence points inevitably to the conclusion that there was some negligence in the matter of navigation; that is to say, under the special circumstances which have been given in evidence here there was an excessive speed. In connection with that a very important question will arise as to the responsibility of persons other than the late lamented Captain. We have had put in the sailing directions and regulations of the International Marine Company, which governs not only the navigation of the White Star but also governs the navigation of the Dominion Line and also the Atlantic Transport Line. Now those regulations are important in relation to what precisely happened to the "Titanic" in so far as this is concerned, that while there are no specific regulations as to what a Captain is to do so far as ice is concerned other than in what one may call the Canadian ice regions, those regulations do lay down quite conclusively that if a certain conditions of things exist, and because a certain condition of things is likely to exist, there is to be the exercise of the greatest possible care and caution and particular care and caution in slowing down and avoidance in those regions.

Now, if there had been in the case of the navigation of the "Titanic" no warning, if there had been no indication then, if I may say so, I think that the evidence which has been called by the learned Attorney-General, the evidence of captains, and other evidence called by him at the request of those appearing for the White Star Company, would be of very great importance - *very* great importance; but when you have a condition of things indicated by the "Baltic" Marconigram, which is descriptive by its wording, of precisely that state of things against which the captains are warned by this very company in

navigating in the Canadian ice-field, I suggest that there is this responsibility placed upon those navigating the ship that, having had shown to them that there is present a condition of things equivalent to that for which regulations exist elsewhere; they must manifest precisely the same degree of care and caution and avoidance. That, I submit, is so? Now, in connection with this arises a very grave personal question as to how far any independence of mind and judgment of Captain Smith, of course, the responsible person, may have been affected by the presence and attitude of the managing director of the company on board his ship. On that aspect of the question I want to state two or three preliminary points. We have had it in evidence from Mr. Ismay that he did discuss with Mr. Bell, the Chief Engineer, at Queenstown, the question of the speed; we have it further in his evidence that the Captain, so far as Mr. Ismay was aware, knew nothing at all about that interview. We have that at Queenstown, and at Queenstown there is a decision arrived at between Mr. Ismay, on his own evidence, and the Chief Engineer, that is to say taking his own rendering, that on the Monday and Tuesday, all being well according to the matter of weather, they are so to put up the revolutions as to attain to the maximum of 78. Now Mr. Ismay has this knowledge at Queenstown when the ship leaves; Mr. Ismay has this knowledge right away through on to the Sunday. Now Mr. Ismay was asked an exceedingly important and valuable question on page 454, by Mr. Holmes. It is Question 18873.

*The Attorney-General:* There are two questions before that.

*Mr. Edwards:* Perhaps there are two or three earlier questions which I should read?

*The Attorney-General:* Yes, I think so.

*Mr. Edwards:* He was examined by Mr. Holmes, and at the bottom of page 453, Question 18869, he is asked: "(Q.) You have told us at the conversation between you and the Chief Engineer the Captain was not present? - (A.) He was not. (Q.) And that you had no conversation with him during the voyage about speed? - (A.) Absolutely none. (Q.) Then will you tell us how it was he was to become aware of your decision to increase the speed on the Tuesday? - (A.) I think the Engineer would probably have spoken to him. (Q.) Did you make any arrangement with the Engineer about that? - (A.) I did not. (Q.) Then, as far as you know, the Captain

## **Page 785**

was not aware that you were going to make this increase in speed? - (A.) No." I suggest that shows that Mr. Ismay was taking upon himself a very tremendous responsibility. He has denied any conversation having taken place as between himself and the Captain, so that the extent, if any, to which his attitude may have affected the mind of the Captain we do not know; but certain it is that for the purpose of the future in this connection it is in the highest degree important that no person in the position of what I may call commercial supremacy should be allowed under any circumstances to discuss except through the responsible head of the ship, the Captain, any question of speed or navigation at all.

*Sir Robert Finlay:* I think in this connection the last answers given by Mr. Ismay to me at page 460 should be read. They begin at Question 19000: "(Q.) Now I think there is only one other matter I want you to tell me about. You were asked about a conversation with

Mr. Bell that took place at Queenstown? - (A.) Yes. (Q.) And it was suggested, if I followed the questions, that you had given some orders to Mr. Bell as to the speed? - (A.) No, I had given no orders. (Q.) Will you just repeat exactly what took place between you and Mr. Bell? - (A.) Mr. Bell came into my room, and I spoke to him with regard to the coal which he had on board the ship. I also said that there was no chance of the ship arriving in New York on the Tuesday; that we had very much better make up our minds to arrive there on the Wednesday morning and be off the lightship at 5 o'clock, and if the weather was fine and right in every respect on the Monday or Tuesday we then could take a run out of the ship. (Q.) Was that all? - (A.) That is all. (Q.) Did you ever contemplate that being done without communication with the Captain? (A.) Certainly not." *The*

*Commissioner:* I suppose that the speed on the Monday could not have been increased or the number of revolutions increased without the Captain knowing of it. *Mr. Edwards:* Oh, yes, my Lord; I do not suggest that the revolutions could have been increased without the officer in charge of the bridge at a given time knowing it, but it is quite clear that you could increase the speed without the knowledge of the Captain, at all events for a period.

*The Commissioner:* Of course I know that; but what I mean is there could be no real increase of the speed without the Captain becoming speedily aware of it. I do not know that what I am saying depreciates at all from the point of your observation, with which I am certainly disposed to agree, that there ought to be absolutely no interference, direct or indirect, by what I call a stranger to the navigation, as Mr. Ismay undoubtedly from my point of view was. He was a stranger to the navigation of the ship, or ought to have been.

*Mr. Edwards:* If that is your Lordship's view there is no need for me to pursue that aspect of the question further. That is quite sufficient for my purpose.

In that connection, however, there is another matter that arises, and that is this. A Marconigram - as things have turned out the most vital Marconigram - comes to the "Titanic" from the "Baltic." Mr. Ismay, in reply to questions by myself, admitted that he was sufficiently familiar with the Rules of navigation and sufficiently familiar with the practice with regard to Marconigrams to say this: that whenever a Marconigram came to a ship affecting the navigation, the right course to adopt was to have it posted in the chart room.

*The Commissioner:* Give me the reference to that. I have no doubt it is so, but I should like to have the reference.

*Mr. Edwards:* It is on page 452, Question 18828: "(Q.) Now I will come to the question of the 'Baltic' telegram. Did you, before that particular Sunday, know what was the practice with regard to Marconigrams received by the officers on the ship relating to the navigation of the ship? Did you know what it was the practice to do with those Marconigrams as soon as they had been received? - (A.) I believe the practice was to put them up in the chart room for the officers. (Q.) Did you know that on Sunday, April the 14th? - (A.) Yes. (Q.) Was not the Marconigram from the 'Baltic' essentially a message affecting navigation? - (A.) Yes. (Q.) Then will you say why, under those circumstances, with that knowledge, you put that Marconigram into your pocket? - (A.) Because it was given to me, as I believe now just before lunchtime, and I went down and had it in my pocket." So that it is perfectly clear that when that Marconigram was handed to Mr. Ismay he was in full possession of the knowledge that a Marconigram of that character had to be posted up in the chart room. Now why was the Marconigram given to him at

all? He admits there was no other Marconigram shown to him on this journey on the "Titanic." I suggest that in view of his own evidence there is only one conclusion, and that is that the Captain was anxious that whatever was done should be done upon the responsibility of Mr. Ismay. Well, my Lord -

*The Commissioner:* I mean by shaking my head that he could not accomplish such a thing.

*Mr. Edwards:* That may be.

*The Commissioner:* The Captain could not shift his responsibility.

*Mr. Edwards:* That may be, my Lord. I at once recognise that whatever pressure may have been put upon him by his owner, he had got charge of that vessel and could not in any way get rid of his legal liability before he got into port.

*The Commissioner:* Nor his responsibility.

*Mr. Edwards:* Nor am I suggesting it was an effective thing, but I am leading up to something else. What I am suggesting is this. I may put it in a way which will be a little less objectionable perhaps to the precision with which necessarily your Lordship is looking at the matter, and it is this, that the fact of the Captain handing this Marconigram almost as soon as it came to the Managing Director of the Company, showed conclusively the very special and peculiar position which Mr. Ismay occupied upon that ship, and that he was not treated by the Captain in any way as an ordinary or casual passenger. That is further shown by the very fact that as soon as Mr. Ismay came out of his room after the impact the first thing he did, on his own evidence, was to go straight to the bridge. Of course, your Lordship is sufficiently familiar with the Rules of these liners to know that that is not a place to which on a great liner a passenger is admitted. But what I am coming back to is this: I asked Mr. Ismay why he put that Marconigram in his pocket, and there are two or three questions to which I want to call your Lordship's attention. I asked Mr. Ismay at Question 18832, on page 452, "and you suggest that you put it in your pocket simply in a fit of absentmindedness? - (A.) Yes, entirely. (Q.) And had it occurred to you when you were talking to Mrs. Ryerson that you had absentmindedly put this message into your pocket? - (A.) It had not. (Q.) It had not occurred to you? - (A.) No. (Q.) And you still retained it in your pocket until it was asked for by Captain Smith late in the evening? - (A.) Ten minutes past seven, I think it was, he asked me for it. (Q.) That is to say, it had been in your possession for something like five hours. - (A.) Yes, I should think so. (Q.) And you seriously say it was put into your pocket in a fit of absentmindedness and retained for five hours? - (A.) Yes."

Now, my Lord, when your Lordship remembers on the evidence how rare a thing it is for ice to be seen down on this main track and even then only in the form of icebergs, a colossal ship like the "Titanic" going out on her first voyage to be suddenly warned that right in her track there are not only icebergs, but field ice, great masses of field ice, to suggest that the Marconigram of the "Baltic" was so unimportant that Mr. Ismay could really and truthfully put that Marconigram in his pocket and retain it in his pocket for a period of five hours in mere absentmindedness, is to suggest that your Lordship must be exceedingly credulous. I suggest that it was nothing of the sort, but that Mr. Ismay was

anxious that there should be a record - I am not suggesting by that anything improper - but that he was hoping for a record first passage for this great ship. One knows what the stress of competition is and how valuable from the point of view of commercial success, as we know from what is said in the papers an advertisement of that kind is; and I again suggest not that he could do it lawfully or legally, but that at all events in order that the onus - the responsibility - should be with Mr. Ismay and not with the Captain, was the purpose for which the Captain handed that message to him. If the matter had no importance for all those hours, it could have had no very special importance that evening; but yet we know that at 7 o'clock, on Mr. Ismay's own showing, it was the Captain, and the Captain himself, who asked for the return of that Marconigram, and it was not volunteered by Mr. Ismay to the Captain.

That brings me to the question upon which that distinction, if there be a distinction drawn, has to be drawn between what may be called negligence which is culpable and that degree of negligence which amounts to an error of judgment. It is a painful thing to have to do, but one must not forget the character of the catastrophe, even when one considers the memories of individuals, and I submit -

*The Commissioner:* That observation was made by Mr. Scanlan, and for my own part I protest against dividing the question in this case with reference to the terrible nature of the calamity. The magnitude of the disaster has really in truth no bearing upon the question of negligence, and I am sure you will agree with me in that.

*Mr. Edwards:* Quite, my Lord; I mean it has been rather put that there should be a very special and tender regard, and quite rightly, for the memory of a dead man, who possibly might have been in fault; but, on the other side, there are considerations which I am suggesting. Those considerations, if I may say so, wipe each other out, and, therefore, what your Lordship has to consider is quite rigidly and quite formally the question of whether there was in the light of all the circumstances negligent navigation, and to come to your decision entirely regardless of personal feeling on one side or the other.

Now, what I was going to say with regard to this is this: The "Baltic" Marconigram does not merely say that there are icebergs, but it says that there are great masses of field ice. The Marconigram makes it perfectly clear that that ice is going to be met with in a few hours in the direct course of the "Titanic." It is further worked out that they are going to reach it, one officer says something after eleven, but by correction by another officer, something after nine o'clock.

*The Commissioner:* You are not quite right, I think, there. You are referring now, I think, to the statement that is supposed to have been made by Mr. Moody. *Mr.*

*Edwards:* Yes, my Lord.

*The Commissioner:* And the only evidence we have of that is Lightoller's evidence. *Mr.*

*Edwards:* Yes.

*The Commissioner:* And Lightoller's evidence upon that point is, in my opinion, not at all satisfactory. I have been examining it very carefully, and it seems to contain contradictions and statements which it is very difficult to reconcile with what we know to have been the facts. I am not disposed to place very much reliance, or to attach much importance, to the fact that Moody is stated to have calculated that they would get into the ice region at eleven. It is not right. If he was acting upon the "Caronia" Marconigram eleven o'clock would not be right; 9.30 would be right, as I understand.

*Mr. Edwards:* Yes.

*The Commissioner:* And Lightoller, when he gave his evidence about it, is not, in my opinion, very satisfactory.

*Mr. Edwards:* Whether there was a dual calculation, and whether there was one correct and the other incorrect, based on the "Caronia," or the "Baltic" is immaterial to the main point I was making, which is this, that there was contained in the "Baltic" message a sufficient warning as to the character of the ice that was to be met with.

*The Commissioner:* Do you mean the "Baltic" or the "Caronia"?

*Mr. Edwards:* I mean from the "Baltic," my Lord. By a correct calculation it was quite clear that that ice was to be met with in the track which the "Titanic" was pursuing, and that it was to be met with at a point and at a time which the officers could accurately calculate from the speed which she was then making from the point where they knew her to be. The other point is really a sort of backwash of very little importance to the main stream of the contention.

I do not want to labour this point because this must constitute one of the very main points upon which the learned Attorney-General will have to address your Lordship; but I do submit, in view of the particular character of the ice indicated that at least that caution ought to have been manifested in the navigation of that ship which this Company has imposed upon its commanders when they meet with ice of a similar character in a district where it is much more frequently met with; and that in practically ignoring that special warning, and by proceeding at an unabated pace, those responsible for the navigation of the ship, whether it be at that moment the Captain, or Mr. Murdoch, are guilty of reprehensible negligence.

Now I pass from that point to the next question to which I must address some few words, and that is the circumstances which transpired immediately after the impact. I think that your Lordship will have no difficulty in finding, on the evidence as given, that an iceberg was struck, that an iceberg did rip and jag the ship, either in a wholesale way, or, as was rather suggested by Mr. Wilding, in a detached and, if I may say so, a speckled kind of way. Three or four very important questions arise on this. If the main portion of the evidence which has been given is to be relied upon, then it is pretty clear that the "Titanic," when she went down, went down very gradually, and that the evidence which has been given about her going down head first and practically perpendicularly is not true. If she went down as was suggested, the more gradually she sloped it is perfectly clear the wider the area occupied by water; that is to say, if you had had a sufficient amount of water in the very fore-part of the ship to sink her, then she would have tilted up and gone down as some of the witnesses have described. So that it is pretty clear on the evidence that, as the sinking was gradual, there must have been water coming in a good way aft.

That will raise and has raised one or two very serious questions which your Lordship and your special technical advisers will have to decide, namely, as to whether there was any fault in the construction of the ship; whether there was any negligence in utilising the mechanical precautions in the ship for averting a disaster of this kind; whether the bulkheads did serve their purpose even as far as they were intended; whether this, therefore, was a much greater catastrophe than was anticipated in the putting in of those particular bulkheads; whether the speed with which she sank was in any way facilitated

by the refusal of the builders to adopt a certain suggestion and recommendation by the Marine Department of the Board of Trade; and whether the Marine Department of the Board of Trade were right in yielding to the objection of the builders in respect of those particular precautionary measures.

First of all, as the evidence stands, it is fairly clear, I think, that the brunt of the collision was on the starboard shoulder close to the spiral staircase. It is also perfectly clear that there was some mischief either in the immediate vicinity of the spiral staircase or in the vicinity of the firemen's passage. It is perfectly clear that in Boiler Section 6 there was a very great deal of mischief; it is also clear that there was some, but slight mischief, in the starboard bunker of Boiler Section 5. So far as the positive evidence goes that is practically all there is to indicate the extent of the

**Page 787**

mischief. But there is also certain circumstantial evidence, quite reliable, I think, that there was mischief in both No. 1 hold and in No. 2 hold. We have a statement reported to have been made by the carpenter as to the one hold, and you have the evidence, I think it was of Dillon, who saw the tarpaulin over the other hold bellying as if the water was rushing in and forcing the air against the top. We have also certain evidence, and I think perfectly reliable evidence, that for an hour and forty minutes after the accident had happened the watertight doors were opened; immediately after they had been closed they were opened and were left open for an hour and forty minutes from the engine room through to No. 1 Boiler Section through to No. 2 Boiler Section, through to No. 3 Boiler Section and through to No. 4 Boiler Section.

*The Commissioner:* I do not want to interrupt you unduly, but if you can give me the references to the evidence it will assist me. If you find it inconvenient do not stop. *Mr. Edwards:* It is the evidence of Dillon, my Lord, at page 101 - my examination of Dillon. I asked him, at Question 3913, "From the time that the ship struck until you came back from No. 4 Boiler Section, what time elapsed? - (A.) About an hour and forty minutes. (Q.) At that time some water was coming through in No. 4 Boiler Section? - (A.) Yes. (Q.) As you came back was there any water at all coming in at No. 3 or No. 2, or not? - (A.) No. (Q.) From the time that you left the engine room until you started back from No. 4 Boiler Section what time elapsed? - (A.) From the time I left the engine room till the time I came back from No. 4 Section what time elapsed? (Q.) Yes? - (A.) An hour and ten minutes. (Q.) Did you report to anybody in the engine room that you had seen water coming through in No. 4 Boiler Section? - (A.) No. (Q.) Did anyone report, to your knowledge? - (A.) No, all the engineers were working there. (*The Commissioner.*) Do you mean by that that they all knew it? - (A.) Yes. (*Mr. Edwards.*) Did you hear any orders given, before you left, to reclose the watertight doors? - (A.) No." So that there is that evidence as it stands that for an hour and forty minutes after the accident the watertight doors aft of Nos. 4 and 5 bulkhead were open.

Then you have the evidence of Barrett. I am sure your Lordship will recognise that I am getting warm again. You will find his evidence on page 57.

*The Commissioner:* What part of the evidence do you want to refer to?

*Mr. Edwards:* I think it was in the re-examination by the learned Attorney-General.

*The Attorney-General:* If you tell me what it is I can find it.

*Mr. Edwards:* I want the passage where he described how he escaped from No. 5 hold.

*The Commissioner:* It is not in your re-examination, Mr. Attorney, because that is quite short.

*Sir Robert Finlay:* Barrett was recalled at page 66.

*The Commissioner:* Is it Question 2038, Mr. Edwards?

*Mr. Edwards:* Would your Lordship mind reading it; I have not it at the moment.

*The Commissioner:* I will. He describes how Shepherd broke his leg, you remember.

*Mr. Edwards:* Yes, it was some time subsequent to that.

*The Commissioner:* “(Q.) 2032. He broke his leg? - (A.) Yes. (Q.) What did you do with him? - (A.) We lifted him up and carried him into the pump room, me and Mr. Harvey. (Q.) Is that the pump room in No. 5? - (A.) Yes. (Q.) At this time, in this No. 5, was it easy to see? - (A.) No, all the water which had been thrown on the furnaces when they were pulled out was making the stokehold thick with steam. (Q.) And then you attended to Mr. Shepherd as best you could. Did you stay there after that? - (A.) Just about a quarter of an hour after that. (Q.) And during that quarter of an hour did No. 5 keep free from water? - (A.) Yes. (Q.) Then tell us what happened at the end of a quarter of an hour? - (A.) A rush of water came through the pass - the forward end. (Q.) You say the forward end of the pass. What is the pass? - (A.) It is a space between the boilers where we walk through. (Q.) There are boilers on either side of it? - (A.) Yes. (Q.) From which direction did this water come? - (A.) From the forward end. (Q.) And this pass that you walk through, is that at the same level as the plates? - (A.) Yes. (Q.) The same level as where you were standing? - (A.) Yes. (Q.) Supposing that the bulkhead which is the fore end of No. 5 had given way, would water come through it and through this pass? - (A.) Yes. (Q.) Do you know yourself where it was the water came from, whether it had got through the bulkhead or not? - (A.) I did not stop to look.” I do not know whether that is what you wanted.

*Mr. Edwards:* That is part of the passage, my Lord; and a little further on your Lordship asked him at the top of page 60, in the second column: “It could not come over the top of the bulkhead, I suppose? (*The Solicitor-General.*) I was going to ask him. He could tell from his feet, of course, whether the ship had shown any tendency to tip, because that gives one some guide. (*To the Witness.*) Can you tell us up to this time, was the ship lying on an even keel? - (A.) No, she was sloping down by the head. (Q.) You felt that she was down by the head? - (A.) Yes. (Q.) Had you noticed that already? - (A.) Yes. (Q.) And had it been getting worse? - (A.) Yes.” Then Question 2056 is “and you say it got worse. Now can you give me any idea whether the water came from over the top of the bulkhead or through it? - (A.) I do not see how it could come over the top. (Q.) You do not think it did come over the top? - (A.) No. (Q.) Now, when it came through this pass between the boilers, did it come with a rush? - (A.) Yes. (*The Commissioner.*) I suppose he means by that as if something had given way. (*The Solicitor-General.*) Do you hear my Lord’s question? He is asking whether, when you said that, you got the impression that something had given way? - (A.) That was my idea. (*The Commissioner.*) Something that had been holding the water back gave way? - (A.) That is my idea, my Lord.”

*The Commissioner:* Then my attention is drawn to page 67, Question 2103: “Then you got this wall, nine feet or thereabouts. I want you to tell us, was the water coming through

all parts of that or through some part of it only? - (A.) Which wall do you mean? (Q.) The water is coming through the skin of the ship into the bunker? - (A.) Yes. (Q.) And the bunker is about nine feet along the side of the ship. Now, I want to know, was the water coming in at this level right across the bunker or only in part of it? - (A.) Water was coming in about two feet abaft the watertight bulkhead. (Q.) Do you mean that it was coming in from the watertight bulkhead and for two feet back? - (A.) No, only from the ship's side. The watertight bulkhead was not damaged. (Q.) Was it coming in at one point, or was it coming in for two feet? - (A.) I could not estimate exactly how large the hole was."

*Sir Robert Finlay:* I think this was discussed in the course of the evidence, and the conclusion reached, I thought, finally was that the water was coming in through the side of the ship, and what gave way was the side of the bunker, which was another thing altogether, and then there was the rush of water. I thought we had settled all that.

*The Attorney-General:* Mr. Edwards, I think, gave out that it was the bulkhead that gave way.

*Mr. Edwards:* The side of the bunker in that case would correspond with the bulkhead?

*Sir Robert Finlay:* No.

*The Attorney-General:* No, not there.

*The Commissioner:* I daresay you are right about this, Sir Robert, but unfortunately these things escape my memory a little. What is suggested to me, Mr. Edwards, is this, that the water got into number 5 boiler room at the bottom of the strong watertight bulkhead, separating 6 and 5 - I mean of course through the ship's side - but at the point where the watertight bulkhead separates 6 from 5. *Sir Robert Finlay:* A little abaft that point, my Lord.

*The Commissioner:* A little abaft, that is to say it had not come into number 6 but it came into number

## **Page 788**

5, but just abaft of the bulkhead separating 5 and 6.

*Mr. Edwards:* Does your Lordship mean that particular wound did not go into number 6 because your Lordship will remember that in number 6 it came with a great rush.

*The Commissioner:* I am talking about the particular wound in number 5.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* That particular wound was just abaft of the bulkhead separating 5 from 6, and it let water into a space which had a bulkhead a little further aft which was not watertight and in which there was a door which had been shut, and it is suggested that the water getting into that small space bounded by a strong watertight bulkhead on the forward side of it, and by a bulkhead which was not watertight and had a door on it on the after side of it - it is suggested that the water would break through the weakest side, that is to say, the bulkhead which was not watertight and which had a door in it. Does that agree with your view, Sir Robert? *Sir Robert Finlay:* Yes, my Lord.

*The Attorney-General:* Yes, my Lord, I understood that was what the evidence was. I thought we had agreed at a certain stage that that was the effect of it after a good deal of discussion.

*Mr. Edwards:* For present purposes it does not very much matter. I shall have to say something when I come to deal with the question of surveying; but it appears to be common ground that something gave way and caused the water to come with a rush, and alternatively that was the side of the bunker under the pressure of water which had come through the wound in number 5 about 2 feet abaft the 5 and 6 bulkhead, or the great pressure of the water in number 6 by pouring in there had caused the forward end of section 5 of the bulkhead to give way. Those are the alternatives, and so long as your Lordship and your advisers know that -

*Sir Robert Finlay:* There is no alternative at all. The evidence is quite clear. I submit that the water did not come through owing to the bulkhead giving way, but came through the side of the vessel.

*Mr. Edwards:* With very great respect I do not think that Sir Robert can point to a single passage which makes that clear. It may be an inference which he draws. Barrett, of course, simply says he did not stop to look; he got up out of it. There it is, my Lord, I have drawn attention to it. In either event, it will raise the question as to whether if it be the bulkhead, they should not have been stronger; if it be the side of the bunker, serving as a sort of inner skin, whether that should not be stronger. It is a matter which your Lordship will have to consider if I may say so with respect, with your assessors. Now the next question which comes is again a matter which may have to be considered both collectively and also alternatively, and that is the question as to whether, what I may call the later water mischief - I am coming to the engine room - was due in the first place, or entirely, to water coming over the bulkheads, especially 5 and 6 bulkheads; and whether, in the second place, when the water came over in that way, it did mischief and irreparable mischief in the engine room and sections 1, 2 and 3 before the automatic float for the watertight door had operated; or whether again (there is no definite evidence) the bulkhead between sections 4 and 5 gave way. The further question is whether, though the automatic float may have operated all right, the water came over the bulkhead and came across the working alleyway, and down. Very strong views were taken as to the efficacy of this automatic float which your Lordship had an opportunity of seeing upon the "Olympic." If your Lordship will take your mind back you will remember the watertight doorways between -

*The Commissioner:* If the automatic door remained open, that is to say if it did not work so as to close, the ship would have remained afloat longer, would it not?

*Mr. Edwards:* That, of course, my Lord, is my suggestion, but I do not want to have it put, if I may say so, quite upon me to assert that positively. I did not really wish to carry it further than this, with an eye on the future. After very careful consideration, the point is how far the automatic float, which is supposed to operate the closing of the door, on the theory that water may gradually rise from the bottom of the ship, how far that particular operation may be retarded by a great rush of water on a level above the float through a straight passage through the watertight doors on a level with the engine room. That was rather the point. Your Lordship may perhaps remember I directed certain questions of my examination of Mr. Wilding to show that whilst water coming up, on the principle of the

working of the ball-tap, underneath this hollow float might raise it, a huge rush of water across the top might retard it. That is while the level below the engine room floor might get full up to a sufficient level to operate the watertight door, you might have insufficient water in each one of the subsequent sections. That was the point. Mr. Wilding to begin with strongly combated that view, but he finally agreed that there might be some effect. This of course is essentially a technical question, and a technical question of vital importance to the future question as to how far bulkheads should be solid bulkheads, and how far there should be watertight doors, and, if there should be watertight doors how far they may or may not be automatically operated. It is not a question which I feel at all competent to discuss in all its bearings, but it is a matter which I do suggest - it has been rather impressed upon me by my clients - is one of very great importance. It is sufficient for my purpose if it is one of the matters upon which your Lordship will carefully consult your technical advisers. In this connection this question arises. There has been really no definite evidence upon it, but I would ask your Lordship to have it in mind in any special recommendations that your Lordship may make to the Bulkhead Committee. The whole effective argument in the case of this "Titanic" that has been put forward for leaving those watertight doors open was to get through certain additional pumping pipes. A very important question I suggest arises here which your Lordship might consider if I may say so with respect with your technical advisers, that the whole of the pumping arrangements instead of working horizontally along the bottom of the ship might be worked over the tops of the bulkheads. It is a point which has been suggested and I do not want to pursue it any further.

Now comes the question: Supposing the bulkheads had been taken higher, supposing there had been a watertight deck at least up to which the other bulkhead went; supposing that the firemen's passage and the spiral staircase had been trunked, supposing all these things had been done, would there have been a substantial delay in the sinking of the "Titanic." Secondly, if all these things had been done would it have been probable that the "Titanic" would not have sunk at all even assuming all the mischiefs that were done. These questions are not asked idly or speculatively. Every one of these questions I have put is raised as part and parcel of the negotiations - I would rather use that term - between the Marine Department of the Board of Trade and Messrs. Harland and Wolff, and also arise in the instructions to the Surveyors and that report of the Bulkhead Committee, by which they say that Surveyors are guided in their decision. I have asked those questions. There is a certain amount of evidence upon them. Mr. Archer gave definite evidence, and I think perhaps it would be convenient if, having asked the questions, I just left the answers until I come to deal with the evidence of these particular officers. I think it will save a good deal of time, if I may say so. Mr. Archer, your Lordship will remember, took a strong view with regard to the question. It raises also the whole question of the policy and conduct of the Marine Department in regard to the construction of the "Titanic." I will leave it and return to it in connection with the Board of Trade.

## **Page 789**

Then, my Lord, another point arises. Immediately after the accident what communications were set up with other ships?

*The Commissioner:* What is the evidence as to what the effect would be if there had been in the "Titanic" a continuous watertight deck?

*Mr. Edwards:* The evidence, my Lord, is that of Mr. Archer.

*The Commissioner:* Will you refer me to it?

*Mr. Edwards:* It is on page 691, my Lord. This matter is so important that perhaps your Lordship would not mind turning to page 690. There was a good deal of discussion as to it. Why I was suggesting that the things should be taken together is this: Your Lordship will see on page 689 at Question 24373 I start discussing with Mr. Archer the question of the watertight deck as contained in the report of the Bulkheads Committee. Then I travel on the same matter right away through to page 691, Question 24424. "(Q.) Now, in the light of the 'Titanic' experience, do you think that a very great advantage might be obtained from the point of view of greater safety, in having a watertight deck? - (A.) Yes, I do. (Q.) Now, the relative sinkability of a ship which has had its side opened to the sea depends, does it not, upon the height to which water may be allowed to come in the so-called watertight compartment? That is to say, if you have two watertight compartments filled - that is, to the height of the waterline - still the 'Titanic' might have floated? - (A.) Yes. (Q.) Now supposing you had had a watertight deck below the waterline here, the chances are that three or four of the compartments might have been filled, and still she would have floated? - (A.) That is so."

*The Attorney-General:* The difficulty I feel in dealing with this point is, as your Lordship will remember, that this discussion arose as to whether you could properly have a watertight deck in these ships, and it was felt that it was a very difficult question. Your Lordship points out that you thought this was one of those questions which ought to be taken into consideration by the Advisory Committee dealing with bulkheads, and there it was left. Your Lordship indicated to my friend, Mr. Edwards, that that was what you supposed was all he wanted, and my friend, Mr. Edwards, says Yes. That is at page 692.

*Mr. Edwards:* I think we were a little at cross-purposes. What I was suggesting was, looking into the future, so far as the value of watertight decks is concerned, it was a matter that should be left open.

*The Attorney-General:* That is quite right.

*Mr. Edwards:* But specifically I say here at once that according to my view the Marine Department of the Board of Trade ought to have insisted upon a watertight deck, and inasmuch as they did not do so they were guilty of negligence.

*The Attorney-General:* That is a very extraordinary proposition for me to have to deal with after what took place. I thought that was the precise point which was left.

*The Commissioner:* I understood Mr. Edwards to say that he raised the question of the advantage of a watertight deck, and that was to be a subject of the reference to the Committee, but that with respect to the "Titanic" in particular he says that there ought to have been a watertight deck and that the absence of the watertight deck contributed towards the disaster.

*The Attorney-General:* How can you decide that unless you come to a conclusion whether or not it is an advantage to have a watertight deck. If your Lordship will look at the bottom of page 691 you will see what I mean. I agree my friend raised it and raised it very specifically, but I thought the point was left at this, that he had shown that it was an important matter and that it was one which ought to be considered by the Committee

because obviously there are many considerations to be taken into account before you come to the conclusion that there must be a watertight deck, and that there was negligence of anybody in not advising it or in not having it. That was the point we did not go into. Your Lordship took the point yourself.

*The Commissioner:* I think so. I am referring now, Mr. Edwards, to what I said, which appears on page 691. I am addressing the Attorney-General: "The gentlemen who advise me on this matter seem to think that the Committee which is to take into consideration these matters should among other things consider the desirability of having watertight decks either above or below the waterline." That comes immediately after you had been putting questions to Mr. Archer as to the advisability of having a watertight deck in the "Titanic."

*Mr. Edwards:* Well, my Lord, if your Lordship will kindly look you will find that after I had put my specific question to which Mr. Archer gave me an answer he went on then to speak of certain theoretical objections and I was taking him upon those theoretical objections and, of course, beginning to discuss the whole question, when your Lordship intervened and suggested that this was a matter of such importance that it ought to be dealt with by the Committee. But I say that I had no intention at all of leaving to a Bulkhead Committee, which is not entirely out of the wood over this question themselves, the question of whether there ought or ought not to have been in the "Titanic" a watertight deck.

*The Commissioner:* I do not see what the Bulkhead Committee have got to do with the matter. What do you mean by saying they are not out of the wood.

*Mr. Edwards:* They are the people that you have suggested should consider this question.

*The Commissioner:* They are.

*The Attorney-General:* They have been just appointed.

*The Commissioner:* They are, but I do not know they are in anyway pledged to any particular view.

*The Attorney-General:* They have only just been appointed for this purpose. *Mr.*

*Edwards:* I misunderstood. It was not a continuing Committee, but a new Committee I understand?

*The Attorney-General:* Yes.

*Mr. Edwards:* I misunderstood.

*The Commissioner:* Are you thinking of Sir Edward Harland's Committee. *Mr.*

*Edwards:* I was thinking of the Committee which did discuss this question of bulkheads last year. I mean Sir Norman Hill's Committee.

*The Attorney-General:* They had nothing to do with it; they only said it ought to be taken into account.

*Mr. Edwards:* I at once say that what I said is withdrawn; it does not touch this point. But what I was satisfied should be dealt with by that Committee was the theoretical question of the advantage or otherwise of the watertight deck in ships. I did not intend nor do I intend being satisfied with leaving to the Committee the question whether in the "Titanic" there ought or ought not to have been a watertight deck.

*The Attorney-General:* That is a position I really do not understand. I was going to read three or four questions which took place on it if your Lordship will look at what

happened. My friend is drawing a distinction now between whether or not it is advisable to have watertight decks, and then agrees that that is to be left to the Bulkhead Committee. That arose upon Mr. Archer pointing out some balancing considerations, and its being obvious from what was taking place that it is not such an easy thing to say. You must have a watertight deck. And that does not end it, there are so many other considerations to take into account. Then your Lordship said this was one of those matters which ought to be left to the Bulkhead Committee, because, obviously it would take months to enquire into properly. If you read on, three or four observations that are made here, I cannot understand how we are to deal with this now. We never asked another question about it; it was left. Let me read what took place.

*Mr. Edwards:* Do you mind reading the three questions before.

## **Page 790**

*The Attorney-General:* I agree; I will with pleasure, because I think it makes it so plain. Do you mean 24429.

*Mr. Edwards:* Take 24426.

*The Attorney-General:* We have read that. Then he is asked to explain why.

*Mr. Edwards:* Do you mind reading the end of 24426.

*The Attorney-General:* I thought we had read it. I will read it again.

*The Commissioner:* Forgive me, you stopped reading the answer, "That is so"; but this is Mr. Archer going on - "Might I be allowed to point out the great objection to taking a deck below the waterline. If the damage had occurred not below the deck, but above the deck, there would be a danger in many vessels that they would capsize." *The Attorney-General:* Yes, and then he says, "Would you explain why? - (A.) Because, if I may put it in a rough and ready way, you have admitted water above this deck, and you have a space in which there is no water, but a space filled with air, and there would be a big air bubble, which tends to turn the ship over. (Q.) There might be a possibility of getting a little top-heavy? - (A.) Yes, if you get a deck below the waterline. (Q.) But that could be easily relieved, could it not, by a valve arrangement to let the water through. If that were the particular danger, you might get some compensation by having an opening in the floor? - (A.) In the deck, do you mean? (Q.) Yes? - (A.) Then your deck would be no use. (Q.) I am suggesting that it might be used under all circumstances except the particular one of danger which you point out? - (A.) Yes, if you can avoid that danger of a ship capsizing, the watertight deck below the line is useful." Then I remember there was a little discussion between your Lordship and those skilled gentlemen who are assisting you, and then your Lordship said, "Mr. Attorney, the gentlemen who advise me on this matter seem to think that the Committee which is to take into consideration these matters, should among other things consider the desirability of having watertight decks either above or below the waterline. I do not know whether you or Sir Robert Finlay would suggest that that is not a desirable thing to be submitted. (*The Attorney-General.*) I think it would be quite right that it should be suggested for their consideration. It was occurring to me during my friend's examination, but I did not attempt to ask your Lordship's view about

it. It would be obviously impossible to decide upon this question without a mass of evidence which we have not called. (*The Commissioner.*) Oh, yes. (*The Attorney-General.*) But it occurred to me that might be the right course. (*The Commissioner.*) That is probably all you want at present, Mr. Edwards? (*Mr. Edwards.*) Yes. (*The Commissioner.*) I said long ago we cannot sit here - I should have to sit for months, or years, possibly - to decide a question of this kind; but the gentlemen who are with me are of opinion that the question of watertight decks either above or below the waterline is a matter that requires examination and consideration. That probably is all that you would ask, Mr. Edwards? (*Mr. Edwards.*) Yes. (*Sir Robert Finlay.*) I quite agree with what the Attorney-General has said. Of course there are a great many balancing considerations which need to be taken into account. (*The Commissioner.*) Yes. (*Sir Robert Finlay.*) That is without in the slightest degree prejudging the question, which is undoubtedly one which deserves consideration. What the result may be of course will appear later." Then my friend Mr. Edwards says: "That intimation is quite sufficient for my purpose. I shall not attempt to pursue it" There the matter stopped, and there has never been another question asked about it.

*Mr. Edwards:* Might I say, my Lord, that in precisely the same position stands the question of the height and strength of the bulkheads which I was pursuing when your Lordship intimated on a suggestion of mine that probably the Bulkhead Committee might take the matter into consideration; and in precisely the same position stands the question which I was also pursuing as to what I may call the interrelation between the boat accommodation and the sinkability of the ship. That again on my suggestion was conveyed by your Lordship to the Attorney-General as a matter to be considered by the Committee.

*The Attorney-General:* Yes, that is quite right.

*Mr. Edwards:* But because those matters in their theoretical aspect and with regard to the future are to be considered by the Committee, does that mean that your Lordship is not to express a view in this Enquiry as to the character of the bulkheads here? Does that mean that in your Lordship's view this Enquiry is not to determine the question as to whether there were or were not sufficient boats? I submit that the two things are totally different.

*The Attorney-General:* That is quite a different thing.

*The Commissioner:* Nobody suggested that. But let me ask you, did you put these questions with reference to watertight decks and their effect on a deck and its effect to Mr. Wilding?

*Mr. Edwards:* With regard to a watertight deck. Not then, but subsequently; because if your Lordship will remember it was not until Mr. Archer was in the box and while he was under examination that we got produced from the Board of Trade the correspondence which transpired. Mr. Wilding was asked by me as to certain correspondence, and he said he did not remember; and when Mr. Archer was in the box we got the correspondence, and as I shall show later on that was one of the reasons why I desired to deal with the whole question in relation to the conduct of the Marine Department of the Board of Trade. This very question of a watertight deck is raised in the correspondence between the builders and the Marine Department of the Board of Trade. There it is a question of a partial watertight deck.

*The Commissioner:* Do let us see where we are. Are you not wanting to suggest that this ship was an unseaworthy ship because she had not a watertight deck? Is not that what you want to suggest?

*Mr. Edwards:* Yes, my Lord, that is so.

*The Commissioner:* You seem to hesitate about it.

*Mr. Edwards:* Because I did not want to be drawn further afield than I think is necessary for the purpose. What I would rather put is this, that under normal conditions of navigation she might have stood things, but she was not seaworthy for the purpose of going straight through ice. I would rather put it in this way that the Marine Department of the Board of Trade did in the first place submit certain requirements to Messrs. Harland and Wolff for this and the sister ship the "Olympic," and what I am going to say is this that if the Marine Department of the Board of Trade had insisted on those requirements the probabilities are that the "Titanic" would be afloat today. I do not know whether your Lordship has seen the correspondence.

*The Commissioner:* No I have not seen it; I think you took it.

*Mr. Edwards:* Well, it has been printed, my Lord.

*The Commissioner:* You appropriated it.

*Mr. Edwards:* It has been printed and I thought your Lordship had been supplied with copies by the Board of Trade.

*The Commissioner:* Well, they had some mercy upon me. But I want to understand what your contention is. If your contention is not that this was an unseaworthy ship, then I do not know what your contention is.

*Mr. Edwards:* Very well, my Lord. This is Question 2 put to this Enquiry: "Before leaving Queenstown on or about 11<sup>th</sup> April last, did the 'Titanic' comply with the requirements of the Merchant Shipping Acts, 1894-1906, and the Rules and Regulations made thereunder with regard to the safety and otherwise of 'passenger steamers' the 'emigrant ships'?" The answer which I am going to ask your Lordship in your judgment to return to the question is "No."

*The Commissioner:* Well now, why?

*Mr. Edwards:* Because I shall be able to show your Lordship that the loadline was higher than was required by what has been called Table C; I

## **Page 791**

shall be able to show from the correspondence that the Marine Department of the Board of Trade permitted the bulkhead which their regulations require to come to a certain deck, to only come up to a deck, one below, and I shall be able, I think, to satisfy your Lordship that according to their own showing these ought to have been in this ship on the recommendations of the Harland Committee on bulkheads, which they take as their guide, a watertight deck running throughout. Those are the three propositions.

*The Commissioner:* The last is the one you are on at present.

*Mr. Edwards:* Yes.

*The Commissioner:* Now which is the Rule of the Board of Trade which requires a watertight deck?

*Mr. Edwards:* Your Lordship will remember that the Assistant-Secretary, Sir Walter Howell, and Captain Young and Mr. Archer all said that the standard by which they were guided in deciding whether there should be an efficient watertight system was the report of the Harland Committee.

*The Commissioner:* That is not a Rule or regulation of the Board of Trade. *Mr.*

*Edwards:* The officials themselves said that that report was, in the matter of bulkheads, as to scantlings and as to watertightness, the sole standard by which they were guided.

*The Commissioner:* Well, I do not know yet whether they did or did not say so, but I am upon Question 2, and that is the question you say I ought to answer in the negative upon the ground that the builders of the "Titanic" did not supply a watertight deck. Now the question being "before leaving Queenstown did the vessel comply with the requirements of the Merchant Shipping Acts and the Rules and Regulations made thereunder?" - I ask you to tell me what is the Rule or the regulation made under the Merchant Shipping Acts which the builders of the "Titanic" did not comply with? How can I say, "No," unless you are able to point out to me the specific Rule or regulation and say they did not do that?

*Mr. Edwards:* Very well, my Lord. Your Lordship will remember that I directed a great number of questions to ascertaining whether when the Surveyors were deciding upon the seaworthiness of a ship they had any standard or test by which to determine whether a ship was seaworthy or not. *The Commissioner:* I remember.

*Mr. Edwards:* And your Lordship will remember - I can give you the references - that Sir Walter Howell, the Assistant Secretary, Captain Young, the present Technical Adviser, and Mr. Archer, the special Shipwright Surveyor, all said that the standard by which they were guided was that as laid down by the Bulkhead Committee's report, and the other standard was Lloyd's requirement.

*The Commissioner:* But neither of those is a Rule or regulation of the Board of Trade.

*Mr. Edwards:* If that be so, then here is a perfectly amazing position, that the Marine Department of the Board of Trade, the sole body responsible for determining whether ships are seaworthy or not, have no Rule and no regulation, and they have been entirely wrong all these years in treating the report of the Bulkhead Committee as a Rule for ascertaining what the scantling should be, and ascertaining what should be done as to watertight bulkheads. That is the position.

*The Commissioner:* Do let us stick to the one thing - watertight decks. Now I want to see that I appreciate what you are saying. What you say as I understand is this, that they profess to be guided in their surveys of these vessels by Sir Edward Harland's recommendations when he was Chairman of the Bulkheads Committee, and that they have not done it in this case. Is not that what you mean?

*Mr. Edwards:* Yes, but it is something a little more than that; that they profess that this report has been adopted by them as the guide and standard. If they have not that as the guide and standard, then there is no guide and standard, and every Surveyor in every port does just as he likes in the matter of bulkheads.

*The Commissioner:* That is not quite the way to put it, I think. The better way to put it would be, "does what he thinks as a skilled man is right with reference to the particular ship that he is surveying," that is my amendment; but now will you turn if you please to the recommendations of the Harland Committee, and point out to me (I remember

something of them and the expression “watertight decks”), where in that report watertight decks are insisted upon.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* Just read it to me.

*Mr. Edwards:* Amongst other things which this Committee were asked by the minute of the 7th March, 1890, to consider was “as to the manner in which ships shall be subdivided, so that they may float in moderate weather with any two compartments in free connection with the sea; and what Rule there should be as to the proportion of freeboard of the watertight deck next above, to which such bulkheads are attached, as shall be sufficient to enable the ship so to float.” That is the request from the Board of Trade to which the Committee returned this answer: “Vessels may be considered able to float in moderate weather with any two adjoining compartments in free communication with the sea, if fitted with efficient transversed watertight bulkheads, so spaced that when two such compartments are laid open to the sea the uppermost watertight deck to which all the bulkheads extend and which we will call the bulkhead deck, is not brought nearer to the water surface than would be indicated by a line drawn round the side at a distance amidships of 3/100ths of the depth at side at that place below the bulkhead deck, and gradually approaching it towards the ends, where it may be 3/200ths of the same depth below it. This line we may call the margin-of-safety line.”

*The Commissioner:* Now what did Mr. Archer say with reference to that? I think he was examined on it.

*Mr. Laing:* It is page 690, my Lord, Question 24381.

*Mr. Edwards:* Will your Lordship turn to page 689, Question 24368, “Yes, my Lord, it sat pursuant to a Minute of March, 1890. (*To the Witness.*) (Q.) Had you anything to do with the drawing up of Circular 1401? - (A.) Yes. (Q.) Are you responsible for its draftsmanship? - (A.) For its draftsmanship, yes. (Q.) Apart from Messrs. Harland and Wolff, has any discussion arisen with any firm of shipbuilders and yourself as to the precise meaning of this Rule? - (A.) I cannot recollect that any discussion has arisen as to the meaning of it. (Q.) I will come to the discussion you had upon it with Messrs. Harland and Wolff in a moment or two; but take that circular in conjunction with Rule 16. What were those Rules based upon? Were they based upon the Report of the Bulkheads’ Committee of 1891? - (A.) No. (Q.) When you were asked to decide whether there is an efficient and watertight system of bulkheads in a ship to what do you refer? What is your standard? What is your test of efficiency? - (A.) I am not asked whether there is an efficient system. The question is not put to me. (Q.) By Rule 16 there is to be an efficient and watertight engine room and stokehold bulkhead, as well as a collision watertight bulkhead? - (A.) Yes. (Q.) What is your test of efficiency? Or, I will put it in this way; have you any standard by which to test the efficiency of a watertight bulkhead? - (A.) We have two standards; we have the standard laid down by the Committee of 1891, and the standard in Lloyd’s Rules. (Q.) You do then sometimes refer to the Report of 1891? - (A.) Yes. (Q.) Is it not the fact that in that Report of 1891, part of the test of an efficient watertight system was that there should be watertight decks? - (A.) In the Bulkheads Committee of 1891? (Q.) Yes? - (A.) If there is any requirement in the Report of the Bulkheads Committee that there ought to be watertight decks, it has escaped my memory; there may be such a thing. (*The Commissioner.*) Read it to us, Mr. Edwards. (*Mr.*

*Edwards.*) The Committee were asked by the Minute, My Lord, to report: ‘As to the manner’” - then I read it.

*The Commissioner:* Go to the end of your question -

## Page 792

“Do you know if in any of the ships it was insisted upon that they should have a watertight bulkhead deck? - (A.) Not watertight in the sense of resisting pressure from below.” That is from the sea. “Leave out the question of watertight in regard to pressure, but watertight in the sense of water not being able to percolate. (*The Commissioner.*) To flow over. (*Mr. Edwards.*) That is so, my Lord; yes, to flow over. (*The Witness.*) No, we do not.” And, therefore, whatever he said it is clear they did not adopt the Harland Committee’s Report so far as it relates to watertight decks. What is suggested to me is that the expression “watertight deck” contained in the submission to the Harland Committee is not a watertight deck in the sense in which you have a watertight deck in a man-of-war but watertight in this sense that it will resist seas that may break over it, on the top of it. It will be battened down, if it has hatches in it so that seas breaking upon the top of it will not go into the space below.

*The Attorney-General:* That is what Mr. Archer said in the questions that follow. *Mr. Edwards:* In reply to your Lordship Mr. Archer, in the following questions, gave that as his explanation of what he understood by a watertight deck.

*The Commissioner:* If he is right, and so far as I know that is the only evidence we have on the subject, they had no unwritten Rule or regulation that a vessel like the “Titanic” should be provided with a continuous watertight deck in the strict sense of the word “watertight,” and in fact Mr. Archer says that he had forgotten altogether that in the Harland Report the expression “watertight deck” was used at all. He says so. *Mr.*

*Edwards:* That is so, my Lord. But this is part of the case. Here you have got a report by which those officials profess to be bound, and if they have taken a certain view - I am not surprised after the evidence we have had, if I may say so, from one or two of them, that they think that Report does not mean what the man in the street would understand by it - up to this time, though that report was published more than 20 years ago, I can quite understand that you have not the condition of things in practice. *The Commissioner:* Having regard to what the gentlemen at the side of me tell me I cannot help thinking that the expression “watertight deck” used in the submission to the Harland Committee and used also in the Report of the Harland Committee does not mean a watertight deck such as you are talking of.

*Mr. Edwards:* May I ask your Lordship on that point to keep your mind open until I come to deal with the correspondence which passed between the Marine Department and Messrs. Harland and Wolff.

*The Commissioner:* Very well, certainly I will.

*Mr. Edwards:* Because they certainly did use the phrase there “watertight deck.” *The Commissioner:* At all events, Mr. Archer says that it only meant a deck which was capable of resisting water from above. That is what I understand him to say, and it has always been treated so.

*The Attorney-General:* There is one answer further than that, my Lord. On the same page you are reading there are several questions about it. He was asked "Are there any ships with watertight decks," because he had said it was not practicable, and he says "I do not know of any that are absolutely watertight." *The Commissioner:* A continuous watertight deck? *The Attorney-General:* No, only in certain parts.

*The Commissioner:* With the exception of the "Mauretania," and possibly of the sister ship the "Lusitania," are there any British merchant steamers that are built with watertight decks fore and aft?

*The Attorney-General:* Not certainly according to Mr. Archer's evidence. He says he did not know of any; and then the "Mauretania" and "Lusitania" were put to him. *The Commissioner:* What do you understand by a weather deck, Mr. Edwards? *Mr.*

*Edwards:* I understand by a weather deck precisely what you have given as a description of a watertight deck.

*The Commissioner:* You mean Mr. Archer's description? *Mr.*

*Edwards:* Yes.

*The Commissioner:* That is to say a deck that is to resist water from above? *Mr.*

*Edwards:* The wash of the sea, yes.

*The Commissioner:* Is there on any British steamer, except, perhaps, the "Mauretania" and the "Lusitania," any watertight deck other than that weather deck that you are talking of?

*Mr. Edwards:* I am not sure that there is. When we come to deal with the Rules your Lordship will see that in most cases that particular deck is the deck which the regulations stipulate shall be the deck up to which the bulkheads come.

*The Commissioner:* That is another matter. The bulkheads form what may be called the wall of the watertight compartment; the deck which you are speaking of forms the ceiling. What I am suggesting to you is this, that the ceiling is not watertight except in this sense, that it is intended to keep out water from above. I do not know, you know; I am rather asking you.

*Mr. Edwards:* I think there was evidence.

*The Commissioner:* If you are right in saying that this ship was not a seaworthy ship when she put to sea by reason of not having a watertight deck, why all the policies of insurance upon her are void.

*Sir Robert Finlay:* And upon all other ships, my Lord.

*The Commissioner:* And upon every other ship afloat. There is not a good policy of marine insurance on them, because the warranty of seaworthiness is absolute.

*Mr. Edwards:* Well, my Lord, of course I cannot help what may be the consequence.

*The Commissioner:* Oh, no, you do not mind the consequences, I daresay.

*Mr. Edwards:* That is a great testimony to my indiscretion, my Lord. But if the Marine Department of the Board of Trade have placed this interpretation upon it, it is not at all surprising that there should be the condition of things which your Lordship suggests. *The Commissioner:* You know, I may tell you that one of my colleagues has drafted the terms of submission to the present Bulkhead Committee, which I think covers the point that you are upon, but of course it has no special reference to the "Titanic"; it is a general question: "The desirability of adopting a deck or decks at a convenient distance or

distances from the waterline, made watertight throughout part or the whole of the vessel's length." That question it appears to me will cover the matter which you are upon for the future, but I agree with you it will have nothing to do with the particular question so far as it affects the past, and the "Titanic" of the past.

*Mr. Edwards:* I do not know whether your colleague when he says "watertight deck" there means a watertight deck or only a deck up to which the bulkheads go. But just this one point, my Lord. If your Lordship will look carefully at No. 1 paragraph of the Committee's Report, if the suggestion of Mr. Archer as to interpretation is correct then this report is reduced to this absurdity, that when you say watertight bulkhead you mean a watertight bulkhead which is watertight, but when you say "watertight deck" you mean a deck which is not watertight.

*The Commissioner:* Which is watertight, but only in a limited sense.

*Mr. Edwards:* Well, it is watertight on the top side, my Lord.

*The Commissioner:* That is true; and when it is a ceiling you know as a Rule you only want it watertight on the top side; you do not want it watertight underneath.

*Mr. Edwards:* If you are living in a flat you can imagine a condition of things where you are bothered by your neighbour above you pouring water through; he can annoy you by filling his room with water and letting it down.

### **Page 793**

*The Commissioner:* I do not know what the customs are of people who live in flats, but I do not think they fill their rooms with water as a rule.

*Mr. Edwards:* I can imagine watertight bulkheads being of great advantage then. *The*

*Commissioner:* I think, Mr. Edwards, on the whole, you must leave this question of the watertight deck where it is; that is to say you must abandon the question so far as it relates to the past and to the "Titanic," and you must be satisfied with it forming the subject of a recommendation to the Committee.

*Mr. Edwards:* That, if I may say so with respect, is subject to my dealing with what is raised in the correspondence.

*The Commissioner:* It is subject, as I said just now, to your showing anything when we come to the correspondence to lead me to take a different view. I shall keep my mind open upon it.

Now what would you like me to do. Would you like me to rise now or sit to hear you out.

*Mr. Edwards:* Frankly, I do not think I can finish now at a convenient time.

*The Commissioner:* Very well, then I think under those circumstances we will rise. *Sir*

*Robert Finlay:* I have heard from my friend Mr. Dunlop, who is going to address your Lordship with regard to the "Californian," that it would suit him better if I followed Mr. Edwards and that he should speak later. There can be no objection to that of course.

*The Commissioner:* None at all. Mr. Dunlop's case has nothing to do with you. *Sir*

*Robert Finlay:* No; so I propose, subject to your Lordship's approval, to address the Court tomorrow as soon as Mr. Edwards has finished.

*The Commissioner:* Very well. My colleague, Mr. Chaston cannot be here tomorrow, but it makes no difference I think.

*Sir Robert Finlay:* I think we have agreed there is no objection to be taken on that score.

*(Adjourned to tomorrow, at 10.30 o'clock.)*

## In the Wreck Commissioners' Court,

SCOTTISH HALL,

BUCKINGHAM GATE,

*Tuesday, 25th June, 1912*

### PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### THIRTIETH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

Page 796

*Mr. Edwards:* May it please your Lordship; yesterday I was speaking of the scheme of observations which I had intended to address to your Lordship, and although I have already, in consequence of your Lordship's intervention, dealt to some extent with the Board of Trade in regard to watertight decks, I have not dealt with the Board of Trade in regard to other matters. But there are two things which I think it will be well to get rid of entirely, and then to return to deal fully with the Board of Trade, as I had intended, as that will involve the questions of recommendations and the future.

One point I was coming to immediately yesterday, but which I do not propose to deal with very fully, is the matter of the "Californian." As the case has now presented itself I shall submit that there is really no substantial element of doubt that the lights which were unquestionably seen from the deck of the "Californian" were the lights of the "Titanic," and that the explanation of the Captain of the "Californian," Captain Lord, that he thought possibly they might have been private signals cannot be treated otherwise than the merest idle excuse. There is not a particle of justification in his evidence for his suggestion that they might possibly have been private signals. Your Lordship will perhaps bear in mind in this connection that a question was asked, I think by myself, of Mr. Sanderson, as to whether the International Mercantile Marine Company controlling the Leyland line did issue to the Leyland line a copy of these Sailing Instructions. In these Sailing Instructions on page 23, there are these particulars given as to distress signals: "The following signals numbered 1, 2 and 3 when used or displayed together or separately shall be deemed to be signals of distress at night (1) a gun fired at intervals of about a minute. (2) Flames on the ship as from a burning tar barrel, oil barrel, etc. (3) Rockets or shells of any colour or description fired one at a time at short intervals."

*The Commissioner:* I will tell you what I think the "Californian" will attempt to say that having regard to the bearings these lights cannot have been the lights of the "Titanic." I expect you are not prepared to deal with that.

*Mr. Edwards:* Yes, my Lord, I was, but it is perfectly clear that the learned Attorney General must deal pretty fully with the matter. But what I was coming to was

this, and it was rather from that point of view, that so far as the question may arise as to whether those were the signals of distress of the "Titanic" in fact, or whether they were the signals of distress of another ship, so far as the personal conduct of the responsible Captain of the "Californian" is concerned, his conduct, I shall submit, is equally reprehensible. *The Commissioner:* I think, you know, he is going to say, or it will be said on his behalf, rather, that these signals were not distress signals at all, necessarily; that they were ship's signals.

*Mr. Edwards:* That, of course, my Lord, is what he has already endeavoured to say in evidence; but I think, in face of the two main facts, the first that the Officer Groves, in reply to your Lordship, did say in specific terms that in the light of all the facts he had not the slightest doubt that the signals which were seen were the signals of the "Titanic."

*The Commissioner:* I do not want to stop you, but I think the onus of proof in this matter is upon the "Californian." I think for myself - I do not speak with absolute certainty for my colleagues - that it will be for the "Californian" to satisfy us that those were not the signals of the "Titanic"; whether they will succeed I cannot say, but I think you may leave it.

*Mr. Edwards:* Then I will not carry the matter further with regard to that. Then there is the question upon which I feel a certain degree of special personal responsibility, and that is the evidence as to the conduct of those in boat No. 1. Having examined on a certain line, I feel it is only due to the Court that I should in the fewest possible words indicate to the Court what in the four corners of that which is relevant I believe to be the effect of the evidence with regard to that boat. As your Lordship will remember, it is No. 1 boat, that in which the skipper was a man named Symons. There were seven of the crew, and there were five passengers, Sir Cosmo Duff-Gordon, Lady Duff-Gordon, Miss Francatelli and two others. Now the broad facts with regard to that particular boat are these, that she was not in any way undermanned, and that she had accommodation for some 28 more passengers than, in fact, she carried. The real responsibility, at all events the primary responsibility, so far as this Enquiry is concerned, will necessarily be that of the member of the crew who was in charge of that boat, and any conduct that there may have been, however reprehensible, however abhorrent we might think it, will not be relevant except in so far as it may have been done in order to affect, or may have affected, the mind and the judgment and the conduct of the man responsible for the conduct of the boat. As the evidence stands, the position is this: - Here was a boat a little away from the ship, not so far away but what the cries of those who were struggling in the water could be heard; that they were in fact heard; that Hendrickson said -

*The Commissioner:* Before you go to what happened in the boat, is not there some evidence that the boat was to stand by the ship?

*The Attorney-General:* Yes.

*The Commissioner:* That is to say evidence of what happened on board the "Titanic" before that boat cleared from the ship?

*Mr. Edwards:* That is so.

*The Commissioner:* Just remind me of that.

*Mr. Edwards:* Yes, my Lord.

*The Attorney-General:* It is Question 11488. It is the orders not to go far from the ship, but to stand by.

*The Commissioner:* That is what I meant.

*The Attorney-General:* It is page 257.

*The Commissioner:* How you carry the numbers of these questions in your head passes my comprehension.

*The Attorney-General:* I do not profess to carry the numbers in my head, my Lord. I happen to have it before me. I worked it out this morning. "My orders were to pull away from the ship not too far, and to stand by if I was called back."

*The Commissioner:* That is what I want.

*Mr. Edwards:* That is in Symons' evidence, my Lord.

*The Commissioner:* Now you can pass on from that and go on to what you were saying. The boat leaves the ship with instructions to stand by near the ship.

*Mr. Edwards:* That of itself imposes quite explicitly upon Symons, the skipper, the duty of standing by. The next point is that there is the fullest possible knowledge conveyed to those in the boat when the "Titanic" sinks, that there are a large number of people struggling in the water. The evidence then passes to what Hendrickson says, that he suggested that they should return, and not that Hendrickson said it, but that somebody suggested it is corroborated by two of the witnesses. Then the evidence passes to a statement that some one of the ladies, identified by one of the witnesses as Lady DuffGordon, appealed that they should not, as they might be swamped. So far as that particular matter for the moment is concerned, I do not propose passing any comment at all upon what might have been said under the circumstances of horror there by a woman. But we then pass from that point to this, that Sir Cosmo Duff-Gordon - he denies it - approved of his wife's opposition.

We then pass to the main fact that there was no attempt to go back. Whether what Sir Cosmo Duff-Gordon says is true or not, your Lordship will bear in mind that it did represent his mental attitude at that time. Whether he gave utterance to it in words that they should not go back or not, it did represent his mental attitude as given

## **Page 797**

in evidence in answer to a question that I myself put to him. What he says is this: He denies that he said anything of that sort, but he says he was so absorbed in his attentions to his wife that he could not think of anything. When I put it to him whether he could not think of going back to help these struggling people, he said, "No," that did not cross his mind; but within 20 minutes or half-an-hour of the "Titanic" going down, and while, therefore, as we have from independent evidence, the screams of the drowning could be heard, we have it on Sir Cosmo Duff-Gordon's own admission that he did say to the men that he would give them £5 a piece to replace their kit.

It is an unpleasant task, but what I am going to say, and to say quite fearlessly, is this: That a state of mind which, while within the hearing of the screams of the drowning, could think and express so material a matter as the giving of money to replace the kit, is a state of mind which must have contemplated the position in which those drowning people were; it is a state of mind which must have contemplated the fact that there were vacant places in the boat: it is a state of mind which must have contemplated the possibility of

rescuing some of those drowning, and it is a state of mind which must have contemplated the dangers admittedly incidental to the operation. I am not going to say that there was a blunt, crude bargain of bribery, that there was a deal done with these men, "If you will not go back I will give you £5." Nothing of the sort. But what I am going to suggest is that the right and true inference to draw from all these circumstances is this, that that money was offered at that time, under those circumstances, to give such a sense of ascendancy, of importance, of supremacy, to Sir Cosmo Duff-Gordon in the boat, with the view, to which I say, on the evidence, he gave expression, that they should not go back as would weigh more with the men than if he had simply given it as a naked piece of advice and recommendation apart from that.

*The Attorney-General:* The order of events is quite wrong there, surely, is it not?

*The Commissioner:* I followed it, and I did not want to interrupt, but I would like you, Mr. Edwards, if it is convenient for you, to indicate to me the question and answer which justifies each one of your statements. I should like to examine you, but that is irregular. I should like to ask you a few questions; first, tell me when this boat was launched into the water - the time, if there is any evidence about it.

*Mr. Edwards:* That I can give your Lordship, I think.

*The Commissioner:* I daresay I can find it out myself.

*Mr. Edwards:* Your Lordship will find it, I think, on the last page of the boat list analysis.

*The Commissioner:* That is the boat list analysis which has been handed up to me, is it?

*Mr. Edwards:* Yes.

*The Attorney-General:* I do not think it gives the time, which was your Lordship's question. It gives the order, but not the time. Your Lordship will not find it there.

*The Commissioner:* It is not here, I see at once.

*Mr. Edwards:* It is in Officer Lowe's evidence, my Lord.

*The Commissioner:* I want to know the time.

*The Attorney-General:* I can tell your Lordship and my friend, because we have looked into it.

*The Commissioner:* I am told it is in Lowe's evidence.

*The Attorney-General:* Yes; about 10 minutes to a quarter past one, as far as I can fix the time. I have looked into it, and that is about it. You cannot be precise.

*The Commissioner:* Can you give me any passage in the evidence which supports that statement?

*The Attorney-General:* Yes, I can. It will require a little looking into.

*The Commissioner:* I am told it is in Lowe's evidence.

*The Attorney-General:* Yes, I think Lowe gave it. It is very difficult to make out the times of the boats.

*Mr. Edwards:* I think you will find it on page 367. He gives the order in which those boats went off.

*The Attorney-General:* Yes, but he does not give the time; it is a little later that he gives the time.

*Mr. Edwards:* Question 15818.

*The Attorney-General:* That is the order; my Lord wants the time.

*The Commissioner:* At Question 15793 he is asked about the time he did something, and he said "I have not the remotest idea of the time right throughout."

*The Attorney-General:* My impression is he says nothing about the time. He gives the order of the boats 7, 5, 3 and 1; that is the order in which the boats were lowered, but there is nothing about time. You have really to work it out from the evidence of other persons as to what time those boats were lowered. That is the only way you can get at it, and it is a complicated business, and, of course, it must be unreliable.

*The Commissioner:* Yes, it is unreliable, anyway.

*The Attorney-General:* Yes.

*The Commissioner:* But now let us assume for the moment that it can be shown that this boat was lowered at 1.15.

*The Attorney-General:* It was about that.

*The Commissioner:* Let us assume that; I do not know that it can be established, but let us begin with 1.15 as the time that the boat was lowered. Now, the ship went down an hour afterwards, 2.20 or thereabouts, and therefore they were in the boat for an hour. Is there any evidence to show what they were doing during that hour?

*Mr. Edwards:* There is some evidence that they were pulling and then resting on their oars. That is Hendrickson's evidence.

*The Commissioner:* Were they obeying the directions which had been given when the boat was lowered, that they were to stand by the ship?

*Mr. Edwards:* That will depend, I think, entirely upon whether they were pulling away, and not coming back, or whether they were moving backwards and forwards.

*The Commissioner:* My notion is they were just moving on their oars, not going any distance away, but keeping about the ship, because at 2.20 they were near enough to the ship to hear the cries of the people in the water. They did hear them.

*The Attorney-General:* That is right, my Lord; that is Hendrickson's evidence, certainly. I think it is everybody's, really.

*The Commissioner:* My recollection is that they heard the cries of the people in the water, and, therefore, wherever they had been in the meantime, at the time the "Titanic" went down they were near the ship.

*Mr. Edwards:* Yes.

*The Commissioner:* That is right?

*Mr. Edwards:* Yes.

*The Commissioner:* Now, here are some questions to Symons, which you will find at page 267 at Question 11500: "And did you see the 'Titanic' go down? - (A.) Yes, I watched her. (Q.) Now, just tell us about that? - (A.) After I left the ship I gave the order to pull away. We were pulling very hard; we were pulling very steady; a moderate pull. After I gave that order we pulled away, I should say, about 200 yards, and I told them to lay on their oars, and just a little while after that, after I saw that the ship was doomed, I gave the order to pull a little further, and so escape the suction." Now, if that evidence is true, it is true that at the time the ship was going down they were close to it, so close to it that Symons feared the effect of the suction; and, therefore, it seems to point to this, that the boat did keep near to the ship. Well, now then, where do you get your 20 minutes after 2.20, when the ship went down?

*Mr. Edwards:* That is in the evidence of Sir Cosmo Duff-Gordon, my Lord.

*The Attorney-General:* Question 12586 is the promise of money, on page 263. *The Commissioner:* What I am upon is when the money was promised; I know it was promised.

*Mr. Edwards:* Yes, Question 12586. "(A.) There was a man sitting next to me, and of course in the dark I could see nothing of him. I never did see him, and I do not know yet who he was. I suppose it would be some time when they rested on their oars, 20 minutes or half-an-hour after the 'Titanic' had sunk, a man said to me: 'I suppose you have lost everything?' and so on. That is the time fixed; it is fixed by Sir Cosmo Duff-Gordon himself.

*The Commissioner:* That is sufficient; it is 20 minutes to half-an-hour.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* As far as that witness remembers the matter; so that you get it now about a quarter to three in the morning.

*Mr. Edwards:* Yes. The learned Attorney-General suggested that I was not giving the matter quite in its correct sequence.

*The Attorney-General:* Yes.

*Mr. Edwards:* On this matter I am supremely anxious to be scrupulously careful. *The Attorney-General:* I will tell my friend what I mean. I was saying it, my Lord, because Mr. Duke is not here, and in consequence of what your Lordship said the other day one has to be a little careful about these statements. If I follow my friend's argument, it was that this promise had been made and that this promise actuated the man Symons and the others in not going back; that the promise of money showed what was in the mind of Sir Cosmo Duff-Gordon; and although my friend did not say that it was a bribe, still he said it gave him an ascendancy - that was the expression used - a supremacy over the men. If that means anything, it means they did not go back when they heard the cries, because of the promise of money. My impression of the evidence, and I think it is borne out, is that they did not go back. That was the point I had in mind when I interrupted my friend. Before that they did not go back. That all happened before the promise of money at all. The promise of money was afterwards; that is, as I understand the order. That is the point between us. Of course, it is very important.

*Mr. Edwards:* You mean, from whatever cause, they might have gone back even before the lapse of the 20 minutes if there was any real intention on their part to go back.

*The Attorney-General:* Quite.

*Mr. Edwards:* So that with whatever object the promise may have been made, it could not, at all events, have operated as an inducement for them not to go back, at all events, in the first place?

*The Attorney-General:* That is what I mean.

*The Commissioner:* That certainly was the effect of Sir Cosmo's evidence. *Mr.*

*Edwards:* I still submit that the right inference to be drawn, as shown by the evidence of Officer Lowe, by the evidence of Joughin, the head baker, and by the evidence of others, is that at the time, the 20 minutes or half-an-hour that is referred to in Sir Cosmo's

evidence, a time at which it would have been perfectly useless to render service, the fact remains that there was no attempt on the part of this boat to go back. Whether the money had the actual effect of shaking the men's intention, or whether they had no intention, or, perhaps it is better to put it, whether Symons had no intention at any time of going back, or whether he was affected, is a matter which your Lordship will have to decide. I am not going to leave it there, because I am going to the evidence of Symons, which is essentially unsatisfactory. One cannot help recalling to your Lordship's mind the effect of the very severe examination by the learned Attorney-General, of Symons. He came into the box; he gave utterance to expressions about being master of the situation, his sole discretion, and so on, and then it turned out that each one of these phrases had been derived from somebody who saw him on behalf of the relatives of Sir Cosmo Duff-Gordon. I suggest that you can put aside entirely for that reason the evidence of Symons, and treat the whole question upon the basis of the evidence of the other people. Now, there it is: I submit, notwithstanding what has been suggested by the learned Attorney-General, that the right inference is this, that with a view of securing - I use the term advisedly - an ascendancy over the mind of Symons and the others, at this given moment this monetary offer was made.

I was interrupted when I was saying that if he was in such a state of mind as, surrounded by all those circumstances of horror and suffering, he could suggest some ministration to the later material wants of the sailors by offering them £5 a piece, he was in a state of mind where he must have been able to, and did, contemplate all the circumstances, especially the circumstance of possible danger that there might have been in the operation.

There is another side, and that is this: that if, with ladies in the boat, he himself thought there was grave danger in going back, why was there no attempt made to go to other boats which were in the vicinity, to get rid of the ladies, and then to utilise that boat and go back? So much for that part. Here is the fact upon which your Lordship will have to determine - that there were 28 vacant places in that boat, and no single person in that boat had a right, I submit, to save his life at the expense of those vacant places. I ought, perhaps, to put it that no one of them had the right, the moral right I mean, to save their own life merely by avoiding the possible risk that was involved in utilising those 28 vacant places. I am going to ask your Lordship to say that the conduct of Symons is to be condemned; I am going to ask your Lordship to say at least that, under the circumstances such as were present in and around this boat, it is most reprehensible conduct that there should have been any offer of gift in cash or kind which is calculated to influence the minds of the men and seduce them from a sense of their duty, whether it was in fact done with that intention or not.

The next circumstance with which I feel there is a special obligation upon me to deal - again because of the line I took in examination - is in regard to the personal incident of Mr. Ismay after the ship had been struck. Yesterday I was submitting a series of facts upon the evidence, going to show that Mr. Ismay did not occupy the position of an ordinary passenger. That evidence to which I called attention yesterday is still further supplemented by the evidence in regard to what Mr. Ismay did immediately after the accident. On his own showing, and on the evidence of others, the position is this, that he did take upon himself to assist in getting women and children into the boats. Mr. Ismay

has given an account of what happened, and of his state of mind. He says that when he left he knew that the "Titanic" was doomed; he says that when he left he knew that there were hundreds of people upon the ship; he says that he did not know, in fact, whether there were women and children left; he says that when he got into the boat there were no persons on the boat deck, at least on his side of the boat deck. He is asked whether he made any attempt to see if there were other people either on the other side of the deck or down below. He says personally that he did not. He was asked whether he gave instructions to others, and he said, "No."

Now, if the question did not involve large matters of principle of grave import, the question, so far as this Enquiry is concerned, as to whether one life should be saved at the expense of another would be immaterial. But I do submit that a gentleman occupying the position which Mr. Ismay occupied, the Managing Director of this Company, a gentleman who had taken upon himself the duty of assisting at the boats in regard to women and children, had certain special and further duties.

### **Page 799**

I submit, in the first place, that he had no more right to save his life at the expense of any single person aboard that ship than the Captain would have had. I go further and I say this, and say it emphatically, that he did not discharge his duty at that particular moment, at that particular critical time, by merely taking a cursory glance round the starboard side of the boat deck to see if there was any person upon it. He was one of the few persons at that moment who had been placed in possession of the positive knowledge that the ship was doomed, and I say, and say emphatically, occupying his great official position, that his duty was to make both by himself, and as he had taken the duty of looking after women and children, to see that someone else too, made a search elsewhere than in the immediate vicinity of that deck, to see if there were women and children who had not been found and brought up.

*The Commissioner:* My recollection is that according to his evidence he jumped into the boat as it was being lowered.

*The Attorney-General:* Yes.

*Mr. Edwards:* That is so, my Lord. Of course, according to the other evidence, to which I myself called Mr. Ismay's attention, it was that he had got into the boat first, and was himself helping the women and children into it. But for the purpose of the principle which I am now submitting, I say that it matters not whether he had got into the boat at an early stage to help the women and children in, or whether he jumped in at that moment. I say that his duty was to have gone and searched and helped to find some of those women and children who, in fact, he knew were left on the ship when it went down.

*The Commissioner:* You are talking, of course, of a moral duty.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* You cannot be talking about any legal duty.

*Mr. Edwards:* No, my Lord. He was not an officer of the ship; he was not a member of the crew; he stands, of course, in a special category by himself. If the matter began and ended with Mr. Ismay's conduct, it might be left where it was, but if we are to have

managing directors, or other persons commercially responsible for these liners, going aboard ship and taking upon themselves certain functions there, it ought to be clearly laid down that they do it, taking upon themselves further and special moral obligations and duties to the passengers than are possessed by one passenger to another passenger. I should not have attempted to have gone back to this matter, but should have left it where it was in the evidence, if it had not been that at the time I was examining Mr. Ismay, your Lordship said that what I had put to him was rather a matter for observation when I came to address your Lordship, than it was for a question; and I felt that I could not, either in duty to the Court or to myself, leave the matter without putting frankly in the form of an observation, as I have done, what I had put to Mr. Ismay in the form of a question.

*The Commissioner:* Now, before you leave it, will you tell me to what part of this Enquiry the moral duty and the discharge of the moral duty of Mr. Ismay is relevant. I am not at all disposed to enter into the consideration of moral duty and the discharge of moral duty in connection with this Enquiry unless I see that such consideration is relevant to it.

*Mr. Edwards:* Put in that form, it brings it down to this: You are asked in this Enquiry about the relative proportions of the different classes who have been saved. I think it is Question 20: "What was the number of (a) passengers, (b) crew taken away in each boat on leaving the vessel? How was this number made up, having regard to: 1. Sex. 2. Class. 3. Rating? How many were children and how many adults? Did each boat carry its full load, and, if not, why not?" Then 21 is "How many persons on board the 'Titanic' at the time of the casualty were ultimately rescued, and by what means? How many lost their lives? Of those rescued, how many have since died? What was the number of passengers, distinguishing between men and women and adults and children, of the first, second and third classes respectively who were saved? What was the number of the crew, discriminating their ratings and sex, that were saved? What is the proportion which each of these numbers bears to the corresponding total number on board immediately before the casualty? What reason is there for the disproportion, if any?"

The only one relevant to this would be, and, of course, very technically, that your Lordship could say that a passenger might have taken a place in the boat occupied by Mr. Ismay; a woman might have been found to take the place in the boat occupied by him; one of the 53 children might have been found to take the place in the boat occupied by him if he had recognised his special position and gone in search of them. I am not saying whether your Lordship should say that or not, but, at all events, that would make the questions perfectly relevant.

*The Commissioner:* I do not agree with you at present. It might be argued that there was a moral duty upon other men on board to take care that a woman took precedence of him in the boats, and I might, if I sat here to enquire into such questions, have to enquire into the discharge by every male passenger of that moral duty. I do not think I can deal with moral duties.

*Mr. Edwards:* I should not have mentioned it, my Lord, if you had not asked me in what way I thought the matter could be made relevant. If your Lordship had not said when I was questioning Mr. Ismay (I may have been irrelevant then) that it was a matter which ought to be addressed by way of observation to your Lordship, rather than as a question, I frankly should not have returned to it at this stage of the proceedings. Whatever view is

to be taken as to personal conduct in relation to the particular duty cast upon your Lordship in this Enquiry, the matter is of comparatively trivial importance. Now I return to the question of the Board of Trade. I do not know whether your Lordship has these before you, but there are two bundles of correspondence which have been printed by the Board of Trade. Unfortunately, they have not been printed quite in the order in which they should; they are not quite in order of date, and there are certain letters omitted, copies of which have been given to me in typewritten form. I do not know that I need trouble your Lordship to read all these letters.

*The Commissioner:* Have I them, Mr. Attorney?

*The Attorney-General:* No, my Lord, nor have I; I have just asked for them.

*Mr. Edwards:* May I say at once, my Lord, that I regard them as of great importance?

*The Attorney-General:* I am told your Lordship has the correspondence.

*The Commissioner:* One of my colleagues apparently has some correspondence - Professor Biles has it - headed, "The Collision Bulkhead of the s.s. 'Olympic.'"

*The Attorney-General:* Yes; the other is "The Assignment of Freeboard."

*Mr. Edwards:* The other is "The Assignment of Freeboard." Part of the letters in each bundle refer partly to the bulkhead and partly to the freeboard, and they are not in strict order. There are four important letters missing from the print of which I have been supplied with typewritten copies.

*The Commissioner:* Well, I have not got them.

*Mr. Edwards:* May I say at once that I regard these letters as of the very highest importance in this Enquiry, and it is upon these letters that I base my statement with regard to the Marine Department of the Board of Trade, that if they had insisted upon their requirements there might have been quite a different story told in regard to the fate of the "Titanic."

*The Commissioner:* But before you deal with their omission to insist upon their requirements, you

## **Page 800**

must show me your authority for saying that they were entitled to make their requirements.

*Mr. Edwards:* I am obliged to your Lordship for that; I am coming to it immediately. But before I reach that will your Lordship for a moment kindly look at Question No. 2, which your Lordship is asked to decide?

*The Commissioner:* Yes.

*Mr. Edwards:* The learned Attorney-General did suggest that if either of the Counsel representing the different interests in this case thought there should be some addition to or modification of a question, it might, perhaps, be carried out. Now, in Question 2 you are asked to decide this: "Before leaving Queenstown on or about 11th April last, did the 'Titanic' comply with the requirements of the Merchant Shipping Acts, 1894-1906, and the rules and regulations made thereunder with regard to the safety and otherwise of 'passenger steamers' and 'emigrant ships'?" I would respectfully suggest that a further

question be asked: "Or did they comply with the requirements of the Marine Department of the Board of Trade?"

*The Attorney-General:* My friend is in error about this. You cannot alter the Questions after some of the speeches have been made. I called your Lordship's attention originally to how the matter stood. This is done according to Statute and Rules and Regulations prescribing procedure and what happens is that the Questions are formulated by the Board of Trade, and at the end of the case, as I have pointed out quite recently, it is the province of the Board of Trade to add anything to or to amend the Questions. And I did then amend two Questions, and I said that I would consider any suggested amendment which was put forward by my friends, but that was the time to do it. It is quite contrary to the practice, and so far as I know I doubt very much if it could be done when speeches have been made.

*The Commissioner:* I should like to know exactly from Mr. Edwards what he wants done.

*Mr. Edwards:* May I just explain this? I said yesterday that your answer to this Question must be, "No." If you return the answer "No" to this Question, that is, both a reflection upon the builders and also the owners and also the Marine Department of the Board of Trade. Now, the position is this, that the builders did comply with the requirements of the Marine Department of the Board of Trade ultimately; and if there is, as I submit there is, ground for adverse and seriously adverse criticism it is not upon the builders in this respect; it is not upon the owners in this respect, but it is upon the officials of the Marine Department of the Board of Trade, who did not insist upon the builders and owners complying with their requirements.

*The Commissioner:* But can you show me what law there is which entitles the Board of Trade to insist? It is no use insisting if you cannot insist. Now what is the regulation, or law, or section of an Act of Parliament which empowers the Board of Trade to insist on things being done; what are the things that they ought to have insisted upon and could insist upon, and how were they omitted to be done? Now, begin at the first: where is the power given to the Board of Trade to insist?

*Mr. Edwards:* If your Lordship will look at Section 724.

*The Commissioner:* The Act of 1894, is it?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* Read it to me.

*Mr. Edwards:* "(1) The Board of Trade may, at such ports as they think fit, appoint either generally or for special purposes, and on special occasion, any person they think fit to be a surveyor of ships for the purposes of this Act, and a person so appointed (in this Act referred to as a Surveyor of Ships) may be appointed either as a shipwright surveyor or as an engineer surveyor or as both. (2) The Board of Trade may also appoint a Surveyor-General of Ships for the United Kingdom."

*The Commissioner:* Do not read things at large unless you know what is in them. There is nothing in this Section which has any relevancy to it at all.

*Mr. Edwards:* With respect, my Lord - *The*

*Commissioner:* Tell me which words.

*Mr. Edwards:* I have not finished. I have only dealt with the personnel, and now I come to the duties.

*The Commissioner:* What has personnel got to do with it?

*Mr. Edwards:* Everything, my Lord, in this case.

*The Commissioner:* Then you do not require to refer to anything else, if this has got everything to do with it.

*Mr. Edwards:* "The Board of Trade may make regulations as to the performance of their duties, and in particular as to the manner in which surveys of passenger steamers are to be made."

*The Commissioner:* Well?

*Mr. Edwards:* You have pursuant to that, the Regulations issued by the Board of Trade for the survey of the hull, equipment and machinery of steamships; and on page 8, section 16 of those Regulations you have a provision made as to circumstances under which declarations are to be made: "An efficient and watertight engine room and stokehold bulkhead, as well as a collision watertight bulkhead, and an after-watertight compartment, to enclose the stern tube in each screw-shaft, should be fitted in all seagoing steamers, both new and old, and in the absence of any of these the case must be specially referred to the Board of Trade before a declaration is given. As regards other bulkheads, although a thorough subdivision of the ship is desirable, the surveyors should not for the present refuse to grant a declaration because these are not fitted." Below that you have paragraphs (3) and (4), which have been deleted, and there is substituted for those paragraphs the provision in Circular 1401.

*The Commissioner:* Where is that to be found?

*Mr. Edwards:* It should be inserted in your copy.

*The Commissioner:* I have it now.

*Mr. Edwards:* Circular 1401 is: "Instructions to Surveyors, dated February, 1907. Amendment to Clause 16 of the Regulations and Suggestions as to the survey of the hull, equipment and machinery of passenger steamers. Delete third and fourth paragraphs," and so on: "In all sea-going steamers coming under survey for passenger certificate for the first time, the following requirements regarding the height of the bulkheads should be complied with. The collision bulkhead is in all cases to extend to the upper deck." This is, I think, sufficient to show what is required of the surveyors of the Board of Trade. May I say at once that if your Lordship's view be that nothing of this kind is actually enforceable -

*The Commissioner:* How do you mean "enforceable"?

*Mr. Edwards:* I mean enforceable by the Board of Trade. I am addressing myself to the quite specific point which your Lordship was putting to me as to how I show that any of the requirements of the Board of Trade could be insisted upon, and I was seeking to do that by, first of all, referring your Lordship to that section of the Merchant Shipping Act, 1894, which clothes the Board of Trade with certain powers, and I was then seeking to show that, pursuant to those powers with which that section clothes the Board of Trade, the Board of Trade had issued a certain Regulation, and now particularly I was calling attention to that Regulation.

*The Commissioner:* But it is not Section 724 which authorises the Board of Trade to issue directions.

*Mr. Edwards:* Yes, my Lord, Regulations - sub-section (3).

*The Commissioner:* They may appoint surveyors; they may alter their remuneration; they may make regulations as to the performance of their duties, "and in particular as to the

manner in which surveys of passenger steamers are to be made." Now, where are the regulations?

**Page 801**

*Mr. Edwards:* In the document to which I have called your Lordship's attention. If your Lordship will look at that buff-coloured document, it is called "Regulations and suggestions as to the survey of the hull, equipment and machinery of steamships carrying passengers."

*The Commissioner:* Can you tell me what the expression "suggestions" means, because I am quite at a loss to understand? "Regulations" I understand; what are "suggestions"?

*Mr. Edwards:* That I do not know, my Lord.

*The Commissioner:* It occurs to me - I do not know whether I am right - that Regulations are something different from suggestions.

*The Attorney-General:* Yes, certainly.

*The Commissioner:* The one, perhaps, must be complied with, and the other need not necessarily be complied with. *The Attorney-General:* Quite.

*Mr. Edwards:* May I suggest that the meaning is this: the Merchant Shipping Act requires certain Regulations to be made; those Regulations are made, but it is left very much at large as to what particular degree or standard should be insisted upon under a Regulation on a given occasion, and therefore the Board of Trade deem it necessary, so much being left to the discretion of the Surveyor, to offer him suggestions as to how he shall, and the method by which he shall, arrive at a given conclusion to say what the Regulation in the particular case shall be.

*The Commissioner:* Leaving him to exercise his judgment, I suppose?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* Otherwise it would be a Regulation, and he would have no option about the matter at all.

*Mr. Edwards:* Yes, my Lord, that is so.

*The Commissioner:* I think so.

*Mr. Edwards:* Now the particular document to which I have referred is not in the category of a suggestion; that is in the category of a Regulation.

*The Commissioner:* Why do you say so?

*Mr. Edwards:* I was going to tell your Lordship. If you will look at the second page of Circular 1401, the last paragraph of it says that "the above Regulations regarding the height of the bulkheads," and so on.

*The Commissioner:* Yes, it is headed, you know, "Amendment to Clause 16 of the Regulations and Suggestions." That is the way it is headed.

*Mr. Edwards:* I know, my Lord.

*The Commissioner:* And Clause 16 comes among a great many clauses which are also headed "Regulations and Suggestions."

*Mr. Edwards:* Yes, my Lord, I quite recognise that, if I may say so with respect. If your Lordship will now look at the second page of that book your Lordship will see that the very first clause says -

*The Commissioner:* These Regulations and Suggestions?

*Mr. Edwards:* Yes; "are issued by the Board of Trade under the provisions of the Merchant Shipping Act, for the assistance and guidance of their officers in surveying passenger vessels."

*The Commissioner:* Yes.

*Mr. Edwards:* It seems to me, if I may say so with respect, that the position stands rather in this way. Either you can, from these documents, ascertain what were the Regulations pursuant to the Act with which the builders ought to have complied, and regulations which the officials of the Marine Department ought to have insisted upon, in which case you would be able to measure the extent to which they either did or did not comply with their duty; or your Lordship will have to say that these Regulations and suggestions are so inextricably mixed up that it is impossible to tell that which is a Regulation which must be enforced and that which is a suggestion which is merely put in for the guidance of officials. Now, if these things are only put in for the guidance of the officials, they are no more binding than, as your Lordship suggested yesterday, was the case of the standards laid down by the Bulkheads Committee; and we are face to face with this perfectly amazing position that in the matter of shipbuilding in this country, where the responsibility for a declaration of safety is placed upon the Board of Trade, there are no definite and ascertainable Regulations with which there must be compliance as a *sine qua non* for a ship getting its declaration of clearance.

*The Commissioner:* Do you suggest that in every detail there is to be a Regulation which must be complied with?

*Mr. Edwards:* I am not going to say that.

*The Commissioner:* That nothing is to be left to the discretion of the Surveyor?

*Mr. Edwards:* No, my Lord, the Surveyors who have come into the box have told your Lordship - that was the position to which, if your Lordship will remember, I was originally calling attention - that there were no detailed Regulations in existence in the Board of Trade in the same way as Rules and Regulations were laid down, to take a case in point, by a classification society like Lloyd's. And then it was put by one witness after another called from the Board of Trade that they had those Regulations, they had Table C, they had in the matter of bulkheads the standard laid down by the Bulkheads Committee by which they were guided. I think it might be quite convenient here at this stage if this point were cleared up.

*The Commissioner:* Now, be specific; what point?

*Mr. Edwards:* The point as to whether these documents to which I am referring are in your Lordship's view in the nature of Regulations which it was the duty of the officials of the Marine Department to enforce.

*The Commissioner:* Very well. Now, that seems to me a point of some substance. Whether I am entitled to enquire into it under the questions as they are formulated, I do not know, but I am going to ask the Attorney-General.

*The Attorney-General:* Oh, yes, certainly.

*The Commissioner:* Mr. Attorney, do you say - I want you to be careful about it - that these Regulations are Regulations imposed upon the shipbuilder or shipowner, with which he must comply before he is entitled to apply for his certificate; or are they

Regulations supposed to be imposed upon the surveyors of the Board of Trade to guide them in the exercise of their discretion as to issuing a certificate?

*The Attorney-General:* My view is that they are the second alternative which your Lordship puts.

*The Commissioner:* That is my view.

*The Attorney-General:* If you look at (1) it is shown so.

*The Commissioner:* So I think. The shipowner or shipbuilder who is coming to ask for his certificate has nothing to do with this.

*The Attorney-General:* Nothing whatever, but the surveyor who is going down gets these for his assistance and guidance.

*The Commissioner:* What I understand Mr. Edwards to say is this - listen to me, Mr. Edwards, and tell me if it is right, that the surveyor, having received those Regulations and Suggestions which were to guide him in determining whether the certificate was to be given or not, has not paid attention to them, has disregarded them. That is the point, I understand.

*Mr. Edwards:* That is what I say happened.

*The Commissioner:* Now, does that matter come within the purview of those questions submitted to us?

*The Attorney-General:* Oh, yes.

*The Commissioner:* This question is "Before leaving Queenstown on or about the 11th April last did the 'Titanic' comply with the requirements of the Merchant Shipping Acts; 1894-1906, and the rules and regulations made thereunder with regard to the safety," and so on.

*The Attorney-General:* I do not see, myself, any difficulty in that. Of course, I differ entirely from what my friend has said with regard to it, but I see no difficulty. If your Lordship asks me if I

## **Page 802**

think that comes within the questions put in this Enquiry, I should think it comes within No. 26.

*The Commissioner:* Yes.

*The Attorney-General:* It was intended by that question to open up for your Lordship's consideration and for your report in so far as you thought fit, the administration of the Acts by the Board of Trade, and also of the Rules and Regulations under the Acts; and it is purposely put in the widest possible form. I do not think it requires amendment; I think 26 does what is necessary.

*The Commissioner:* These are certainly Rules and Regulations made under the Merchant Shipping Act, 1894; they purport to be so, and I should regard them as such.

*The Attorney-General:* Certainly.

*The Commissioner:* Now, Mr. Edwards.

*Mr. Edwards:* That does not quite get us out of the wood, if I may say so.

*The Attorney-General:* He puts us into it.

*Mr. Edwards:* You have to decide whether the "Titanic" did comply, not only with the requirements of the Act which is put into a category by itself, but also with the Rules and Regulations of the Board of Trade. If there are no such things as Rules and Regulations which were enforceable it does seem to me that that is quite a redundant question. I think it is necessary, before your Lordship can answer that question, to ask a further question as to what are the Regulations with which she ought to have complied.

*The Commissioner:* Who ought to have complied?

*Mr. Edwards:* The "Titanic."

*The Attorney-General:* The builders or the owners?

*Mr. Edwards:* I am taking it in the form of the question.

*The Commissioner:* The difficulty at present is this, that the Rules and Regulations which you are referring me to are Rules and Regulations which have to be observed by the surveyors, not by the owners or builders. The owner or builder goes to the surveyor and says: "There is my ship: now survey it in whatever way you please. You may follow the Rules and Regulations and suggestions given to you by the Board of Trade. I am not concerned with that. You survey my ship, and then, if you feel that you ought to give me a certificate, give it to me." That is all that the shipowner or the shipbuilder has to do.

*Mr. Edwards:* Very well, my Lord.

*The Commissioner:* And then your complaint would seem to resolve itself into this, that the officers of the Board of Trade have not done their duty.

*Mr. Edwards:* Quite; but it is a question in the one case: Had they to comply with certain Rules and Regulations before they issued their certificate? If yes, have they done so? If no, guilty of gross negligence and perhaps something more.

*The Commissioner:* What do you mean by "gross" negligence? Is it anything different from negligence?

*Mr. Edwards:* Only in degree, of course.

*Sir Robert Finlay:* I believe that all the Rules for the surveyors were in fact complied with.

*The Commissioner:* We will come to that next. At present I want to know what the meaning of these Rules is. Then the next question will be, have they been complied with? Now Mr. Edwards, perhaps you might go on to deal with the next question, which is: Have they been complied with?

*Mr. Edwards:* It is just because of this very difficulty, that you can construe these Rules and Regulations either as a standard by which the official or surveyor of the Board of Trade is to be bound in issuing his certificate, or as Rules and Regulations with which the builders must comply, that I do suggest that Question No. 2 is not quite sufficient for the purpose, and that there ought to be a further question. And that is this: "Did the 'Titanic' before leaving Queenstown comply with the Board of Trade Surveyor's requirements?" In the one case, if you say "No, she did not comply with the Rules and Regulations," that is a condemnation of the builder. If on the other hand you say, "Yes, she did comply with the requirements of the Surveyor," then that frees the builder, and your Lordship will have to consider, under Question 26, the conduct of the Board of Trade, with a view to recommendations for the future.

*The Commissioner:* Now will you tell me, if you can, what was the requirement of the Board of Trade - requirement, you know, that is to say, something they are entitled to insist upon - which was not complied with.

*Mr. Edwards:* Yes, my Lord, the requirement which was not complied with was the watertighting of the fore end of the ship; that is to say, the area of deck at the fore end, and also the requirement of the Board of Trade as to the height of the loadline, and also as to the height to which the bulkhead should come.

*The Commissioner:* Now, let me take those down. Give them to me again. What is the first?

*Mr. Edwards:* The first is as to the watertighting of the deck at the fore end of the ship.

*The Commissioner:* Are you sure that is how you want to express it?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* "Watertighting of the deck at the fore end of the ship." What is the next?

*Mr. Edwards:* Then the height to which the bulkheads were carried.

*The Attorney-General:* Will you tell us when you say "the bulkheads," do you mean all, or which?

*The Commissioner:* Which particular bulkheads, or all?

*Mr. Edwards:* If your Lordship uses the term "requirements" as something that they can compel, then it is a case of the collision bulkhead and the first bulkhead abaft the collision bulkhead. If, however, you use the term "requirements" as I was using it, as what was asked for, in the first place, by the surveyor of the Board of Trade, then I say all bulkheads.

*The Commissioner:* We will say "height of all bulkheads," and that will cover everything. What is the next?

*Mr. Edwards:* The next is the height of the loadline disc, and that, of course, is to be treated, as I will show your Lordship in a moment or two, in relation to the height of the bulkheads.

*The Commissioner:* Yes. Now, is there anything else?

*Mr. Edwards:* No, my Lord.

*The Commissioner:* Very well. Now, will you take the watertighting of the deck at the fore end of the ship, and tell me what the requirement is of the Board of Trade with respect to that?

*Mr. Edwards:* Before I proceed with this, may I get quite clearly from your Lordship exactly how I am to understand the position with regard to the Rules and Regulations, because if your Lordship takes one view then I shall address myself quite shortly; if, on the other hand, your Lordship takes another view, then I have to establish my point.

*The Commissioner:* At present, the view I take of these Rules and Regulations which you have put in or referred to, and Circular 1401, is that they are Rules and Regulations binding upon the surveyors of the Board of Trade, and upon no one else.

*Mr. Edwards:* And that the surveyor of the Board of Trade would have no right to issue a declaration of seaworthiness unless there were a compliance with those Rules and Regulations. Is that so, my Lord?

*The Commissioner:* Yes, that is so; but do not be too quick; you must remember this, that a great deal is left to the discretion of the surveyor, and if he honestly exercises his discretion he has done all that the Rules and Regulations require him to do in that respect.

*Mr. Edwards:* That seems to me, probably much more largely than your Lordship is aware of, to qualify the first part of your statement.

*The Commissioner:* You may make a rule of this kind: "You, the surveyor, are to go and inspect, and having inspected, you are to exercise your discretion." Now, that is a rule and a regulation,

### **Page 803**

but it does not bind him to do any particular thing. It simply binds him to exercise honestly his discretion with respect to the matter that comes before him. *Mr.*

*Edwards:* Then, may I say that really contradicts the first part of what your Lordship said, in the light of the particular facts here. May I say that if these Rules and Regulations were designed merely to guide the surveyor, and he might exercise a personal discretion as to the application of those Rules and Regulations, then I feel that that may have been done here, and I should not feel competent to argue, with my lack of technical knowledge, nor do I think the Court would care about it, whether that discretion had been wrongly exercised. If, on the other hand, we are to take these Rules and Regulations as binding upon the surveyor, that is quite a different thing, because every departure from those Rules and Regulations by the surveyor would be in the nature of a dereliction of duty. If your Lordship takes the first view, I will say at once that I should leave the matter entirely with your Lordship as to the personal conduct of the officers of the Board of Trade; I should ask your Lordship to look at the correspondence, and I should address my remarks to the much broader question as to whether, under all the circumstances, it is wise to leave Rules and Regulations rather in the form of non-binding guides and suggestions to the surveyors.

*The Attorney-General:* There is one part of Rule 16 to which I think your Lordship's attention should be directed, more especially having regard to the evidence of the surveyors in this case. If you look at Rule 16, to which Circular 1401 is an amendment, you will see that in the absence of any specific regulation the matter is referred to the Board of Trade before a declaration is given.

*The Commissioner:* I know that; that is the end of the amended Rule.

*The Attorney-General:* But it comes also at the beginning of 16, dealing with the three bulkheads, in respect of which they can make requirements which must be carried out. "A stokehold bulkhead, as well as a collision watertight bulkhead and an after watertight compartment, to enclose the stern tube in each screw shaft, should be fitted in all seagoing steamers, both new and old, and in the absence of any of these the case must be specially referred to the Board of Trade before a declaration is given." Then comes the end, where equally they have to refer to the Board of Trade. I call your Lordship's attention to that, because your Lordship may not remember exactly what took place with regard to the evidence. Mr. Carruthers was examined upon this, and he explained in detail what he did and what took place in London about it. It was referred to London; that was the point of it.

*The Commissioner:* Now let me, Mr. Edwards, refer you to Rule 16, that part of it which has not been altered: "An efficient and watertight engine room should be fitted in all seagoing steamers." Do you suggest that that question of efficiency is not to be left to the man who surveys, or do you suggest that there ought to be Rules and Regulations the observance of which should alone constitute efficiency?

*Mr. Edwards:* What I am suggesting, my Lord, is this, that certainly there should be a definite fixed standard of efficiency, which should be binding upon every surveyor of the Board of Trade.

*The Commissioner:* Just let us test that. Does rivetting constitute any part of the construction of a watertight engine room?

*Mr. Edwards:* Certainly, my Lord. *The*

*Commissioner:* It does?

*Mr. Edwards:* Certainly, my Lord.

*The Commissioner:* Is there to be a Rule and Regulation which says how many blows each rivet is to receive?

*Mr. Edwards:* No, my Lord.

*The Commissioner:* He is to exercise his discretion, then?

*Mr. Edwards:* May I answer the specific question by telling your Lordship exactly what is done? If your Lordship will turn to the report of the Bulkheads Committee and turn to the tables at the end, and if your Lordship will also turn (I think Professor Biles has a copy of it) to Lloyd's Rules and Regulations, you will there see in those two volumes the rules and regulations laid down for rivetting.

*The Commissioner:* Will you read to me one of those rules, so that I may gather how this efficiency is to be regulated by rules.

*Mr. Edwards:* Yes, my Lord. If your Lordship will allow me to complete. If your Lordship will turn to the evidence of Sir Walter Howell given in reply to the Attorney General, you will find that he says that the standard by which the surveyors are guided in ascertaining what is efficient are these things to which I have referred.

*The Commissioner:* Refer to one of them; read it to me so that I may understand it. I want to know what the Rules are that regulate efficient rivetting. Can anyone tell me where those Rules are?

*Mr. Edwards:* Yes, my Lord. I think Professor Biles has a copy of them, and if he will turn to Section 25, on pages 41 and 42, he will see what I am referring to.

*The Commissioner:* Are there any Rules or Regulations which regulate the hammering in of the rivets?

*Mr. Edwards:* No, my Lord.

*The Commissioner:* Then who is to judge whether that work has been properly done?

*Mr. Edwards:* Your Lordship is asked two specific questions, and I think it would perhaps have been better if your Lordship had looked at them.

*The Commissioner:* I am told by the Professor who sits on my left that there are no such Rules, and I do not see how there can be.

*Mr. Edwards:* Not as to hammering, my Lord.

*The Commissioner:* I am told that hammering is a most important part of rivetting. *Mr. Edwards:* There are certain tests - tests when they are forged - as to the character of the

rivets; there are certain tests as to the kind of rivet holes; there are certain tests as to the flanges of rivets.

*The Commissioner:* Are there any Rules or Regulations as to the hammering of them in?

*Mr. Edwards:* No, my Lord.

*The Commissioner:* Do you agree that the hammering of them in is a very important part of the work?

*Mr. Edwards:* Of course, hammering in is always important.

*The Commissioner:* Then you must leave something to the discretion of the surveyor.

*Mr. Edwards:* Quite. May I say this, my Lord, that inasmuch as what the Marine Department of the Board of Trade consider, and have in this Enquiry officially admitted, that they are for, is for the purpose of testing efficiency guided by a combination of rules - those contained in Lloyd's Rules and Regulations, and those contained in the appendix of the Report of the Bulkheads Committee - at least, it would be advisable to see that these Rules and Regulations, or rules and regulations of a similar character down at least as low in detail as these go, might be made part and parcel of the Regulations of the Board of Trade, so that in every case when trouble comes we may know exactly to what there shall be reference for the purpose of judging and testing the conduct of the different interests that may be affected. That is all I say, my Lord.

*The Commissioner:* Very well. Now, let us pass on, and tell me in what respect they neglected the Rules and Regulations as described by you. What is it that they failed to do?

*Mr. Edwards:* Again, my Lord, I have not yet had, with respect, from your Lordship a ruling as to whether I am to treat -

*The Commissioner:* I am not going to make a ruling for shortening your speech. You must deal with it as though I ruled in your favour. Tell me in what respect they failed.

*Mr. Edwards:* I will do that, my Lord. The view that I take with regard to these Rules and

## **Page 804**

Regulations is that compliance with them must be taken as a *sine qua non* for the issue by the -

*The Commissioner:* You have said that already. I want you to tell me now which rules it was that they did not comply with.

*Mr. Edwards:* I will ask your Lordship to look at this Rule 16. The only important point for this purpose at the moment is the paragraph in Circular 1401: "The collision bulkhead is in all cases to extend to the upper deck. If an iron or steel watertight deck or flat is fitted below the upper deck at the after-end of the vessel, and forms the top of the after watertight compartment, the aftermost bulkhead may terminate at the said watertight deck or flat, but if no such watertight deck or flat is fitted, the aftermost bulkhead should extend to the upper deck. When the loadline disc of the vessel is placed at least as low as is required by Table C of the Freeboard Tables for Awning-deck Vessels the remaining bulkheads may terminate at the deck next below the upper deck, but when the disc of vessels other than those of the awning-deck type is placed higher than required by Table C, all the bulkheads should extend watertight to the upper deck. In interpreting the above

Rule, in the case of vessels of the shelter deck type" - and the "Titanic" was held by the Board of Trade, as was given in evidence by two of the surveyors, to have a deck of the shelter deck type - "the deck next below the shelter deck may be regarded as the upper deck, and accordingly the collision bulkhead, as well as the other bulkheads, may terminate at the deck next below the shelter deck, provided the Surveyor is satisfied that the deck in question would not, owing to a deficiency of sheer or for any other reason, be brought dangerously near the water surface in the event of the collision compartment being holed."

*The Commissioner:* That clearly leaves it to the discretion of the Surveyor.

*Mr. Edwards:* With a variation. That is not a discretion that gets rid of the height of the bulkhead in relation to Table C.

*The Commissioner:* I am talking now of what you have just been reading: "Provided the Surveyor is satisfied."

*Mr. Edwards:* Very well, my Lord, that is to say that if the Surveyor were satisfied, the bulkhead could, in this case, terminate at deck D; that is to say the shelter deck here will be deck C, and the upper deck will be deck D, and there is a discretion within the Surveyor anyhow so far as down to deck D is concerned. But there is no discretion in the Rule in the Surveyor as to a watertight bulkhead coming as low as the deck under the upper deck - that will be, in this case, deck E. The only circumstances under which bulkheads may cease at deck E will be in that case where the loadline disc is placed lower than is required by Table C of the Freeboard Tables.

*The Commissioner:* Do tell me, if you can, what was the fault of this ship?

*Mr. Edwards:* What I say, my Lord, is this: First of all, your Lordship will see by that that the height of the bulkhead is to be determined by the loadline disc. The fact, in the case of the "Titanic" is that her bulkheads were completed eighteen months before the Board of Trade awarded or assigned her a loadline disc; so that instead of your having - as I shall submit on the figures in a moment - these bulkheads going right through to deck D - you had some of them terminating at deck E, and the importance of that your Lordship has already recognised by suggesting that Sir Robert Finlay -

*The Commissioner:* Are we getting back to this - that the "Titanic" was an unseaworthy ship?

*Mr. Edwards:* Quite, my Lord.

*The Commissioner:* And that all the policies of insurance on her are void, just as I said yesterday - you cannot help that, of course - and as it was pointed out to me, every ship afloat of this kind is insured by such policies.

*Mr. Edwards:* I quite recognise that, and that is one of the reasons why I have asked your Lordship to say that if these rules and regulations are a mere guide which may be applied at the discretion of the surveyors, then the technical experts may say that there was an error of judgment.

*The Commissioner:* I wonder, if an action were brought upon one of these policies of insurance and the underwriters were to set up this as a defense for not paying, what a jury would say. I can tell you, you know what a jury would say; I know very well. *Mr.*

*Edwards:* What I suggest is this, that when it went - as it is to be hoped under the circumstances it would go - to the highest tribunal of the land, what would be said would be -

*The Commissioner:* I can tell you what the House of Lords would say - I know perfectly well what they would say.

*Mr. Edwards:* I must not ask for a tip, my Lord; but I do seriously suggest on that point that the whole thing will turn upon whether these are binding regulations under the Merchant Shipping Act with which there must have been some compliance, or whether they were a mere guide upon which the surveyor is to exercise his discretion.

*The Commissioner:* May I sum up what your contention is, as I understand it. You say, if they are mere guides to the surveyors, then the shipowners are not affected.

*Mr. Edwards:* Quite.

*The Commissioner:* But if they are requirements in the sense of imposing an obligation upon shipowners, the shipowners are affected.

*Mr. Edwards:* That is so, my Lord.

*The Commissioner:* And then you say, as I understand, if they are mere guides left to the surveyors, they ought not to be mere guides; they ought to be turned into binding rules and regulations. I think you said that.

*Mr. Edwards:* Yes, my Lord. I did not say necessarily these particular things, but you ought to do away with that category of thing called a mere guide or suggestion and make regulations containing whatever the technical experts decide ought to be the proper thing. Before I go to the correspondence I do want to emphasise that point that, according to this rule, the height of your bulkheads should be fixed according to what has been decided to be the loadline. In the case of the "Titanic," the bulkheads were finished and the ship was launched before there was any decision arrived at as to bulkheads.

*The Commissioner:* As to the loadline.

*Mr. Edwards:* Any decision arrived at as to the loadline, and that is borne out by the correspondence. The second point is this, that even when the loadline disc was fixed, it was fixed at such a point that under this rule the "Titanic" was not permitted to have bulkheads below D deck, that is the upper deck; in other words, that she was not, on the line fixed for the loadline disc, entitled to any abatement by this rule. My Lord, you have to refer now to a thing which is very complicated and very technical. Will your Lordship look at the correspondence? This is a matter which I suggest (I am going to submit my points upon it) will have to be quite carefully worked out and checked with regard to one factor. It is not a factor which, under any circumstances, is sufficient to vitiate my submission as to the loadline disc being fixed so low as not to justify any abatement in the height of the bulkhead, but it is a factor which may modify to some extent, and it is a factor with regard to which the materials are not in my possession to enable me to check the factor. If your Lordship will look at the rule, you will see, "when the loadline disc of the vessel is placed at least as low as is required by Table C of the freeboard tables," and so on. Your Lordship has, I think, the "Instructions to Surveyors as to Loadline."

*The Commissioner:* Is that another pamphlet? I do not think we have this. (*A copy was handed to his Lordship.*) Now I have a copy.

*Mr. Edwards:* Before you look in detail at that, will your Lordship please look at page 2 of the printed correspondence, headed, "The Collision Bulkhead of the s.s. 'Olympic.'" There is a letter there dated 30th April, from Mr. Archer, as follows: -

"Sir, - The Surveyor's Report requesting instructions regarding the collision bulkhead of this vessel is forwarded.

"The Board's Regulations (Circular 1401) require that the collision bulkhead is in all cases to extend to the upper deck, but there is a provision that in vessels of the shelter deck type the deck next below the shelter deck may be regarded as the upper deck, subject to the sheer being sufficient. A shelter deck steamer (page 44 of freeboard tables) may for this purpose be defined as one having a greater freeboard, measured from the second deck, than required by Table C, and having all openings in the second deck battened down as on a weather deck. The Surveyor reports that the freeboard of this vessel, measured from the so-called 'upper' deck, will be about 10 feet 9 inches, but the freeboard required by Table C is about 11 feet 2 inches, as shown in detail on the attached sheet. The sheer will also be somewhat less than the standard, and there will be a large number of openings in the 'upper' deck. As the deck marked 'upper' will be nearer the water than the main or second deck of an awning deck vessel, it cannot be regarded as the 'upper' deck within the meaning of the circular. The surveyors should, I think, be instructed to inform the builders that the collision bulkhead must be carried up to the deck marked 'saloon deck,' and that no part of the bulkhead below this deck should be nearer the stern than 1/20 of the vessel's length as required by the circular referred to. "It may be observed that in the event of the upper part of the bulkhead, where marked in red, being damaged by collision there would be some danger of water entering the space above the 'upper' deck, unless the weather conditions were unusually favourable, whence it would pass below down the open stairways."

Just below that you will see a table which gives the particulars. There is the draft of 34 feet 9 inches and freeboard to upper deck 10 feet 9 inches, making a total of 45 feet 6 inches. But the moulded depth is only 45 feet, because you take off 6 inches for the thickness of the deck, from which you measure, and also for the keel. Then you come to the moulded depth of 'upper' deck, 45 feet; then you assume a coefficient of 74 freeboard, Table A. = 13 feet, from which you deduct 3 feet 2 inches - I will show you why that is in a moment, my Lord - giving a total of 9 feet 10 inches with a length correction of 2 feet 1 inch, or a total of freeboard by Table C of 11 feet 11 inches for winter. You knock off 9 inches for summer. Summer, as your Lordship knows, extends from April to September, and as this ship was not sailing until April, it was summer. I am giving the freeboard required for summer of 11 feet 2 inches. The Surveyor reports that at the draft 34 feet 9 inches, the freeboard to upper deck will be 10 feet 9 inches, so that the freeboard to upper deck, less than Table C, is 5 inches. That is how the matter stood, my Lord. Then what happened was -

*The Commissioner:* You have not finished, you know. Is the remainder immaterial? *Mr. Edwards:* No. You will see, if you look just below, that there was some difference in the measurements of the sheer, and Mr. Archer says that it is not material. It is not at all events material for the point which I now desire to make to your Lordship. Your Lordship will have to look at the whole of the correspondence directly.

Now may I ask your Lordship to jump the correspondence and go to, I think it is, the letter of the 20th June, on page 5?

*The Commissioner:* To whom is it addressed?

*Mr. Edwards:* It is from Harland and Wolff, and apparently it is addressed to the Assistant Secretary, Marine Department.

*The Commissioner:* Of what - the Board of Trade?

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* I wish the Minutes said to whom it is addressed.

*Mr. Edwards:* It was apparently sent to Mr. Carruthers.

*The Commissioner:* It begins "Dear Sirs" - in the plural.

*Mr. Edwards:* Yes, but that was the usual form of addressing the Board of Trade Surveyors at Belfast. If you look at the top of that page you will see another letter addressed, "Messrs. The Board of Trade Surveyors, Belfast."

*The Commissioner:* Is this to the Board of Trade surveyors at Belfast?

*Mr. Edwards:* Yes my Lord. If you will look at the letter you will see it says: "With reference to your letter of the 14th instant, as mentioned in our letter of the 3rd instant, we have been considering the question of the load draught of the above vessel, and as it seems probable that several difficulties may be overcome by our doing so, we are prepared to accept a freeboard slightly greater than Table C, say, about 1 inch greater, which will, we estimate, make the load draught about 34 feet 6 inches. The displacement corresponding to this is about 52,000 tons, and the tons per inch 143," and so on. Your Lordship probably has not the letter - it is one of the typewritten letters - but there is a letter dated the 17th May, 1911, of which the Board of Trade have handed me a copy. I can refer you to the same point in Mr. Archer's evidence, where he says that finally they were allowed a load draught of 34 feet 7 inches. Here you will see in the Board of Trade letter which I have read they give a load draught of 34 feet 9 inches. Harland and Wolff suggest an amendment which will give a load draught of 34 feet 6 inches, and finally they were given 34 feet 7 inches. If 34 feet 9 inches load draught gives a deficient freeboard, as is shown in the letter of the 30th April, of 5 inches, then a load draught of 34 feet 7 inches will give a deficiency of freeboard of 3 inches. But there was some mistake in the measurements. Now what I have to take your Lordship to is this. I have got to take your Lordship to Table C and show what in fact for this vessel ought to be the freeboard allowed. Has your Lordship Table C before you?

*The Commissioner:* I have it before me. Can you tell me, Mr. Edwards, for my guidance, what a coefficient of fineness is?

*Mr. Edwards:* If your Lordship will turn to - *The*

*Commissioner:* I want to know can you tell me?

*Mr. Edwards:* It is a certain allowance made for the ascertained buoyancy of the ship. That was the factor to which I was alluding. Messrs. Harland and Wolff contended in this case that it ought to have been a coefficient of fineness of .72, and the Board of Trade contended, as you will see by the letter, that there ought to have been a coefficient of fineness allowed of .74. Apparently there are not in this correspondence the figures which would determine what that coefficient of fineness should be - .72 or .74; and that was the point that I was rather putting would have to be worked out, if I may say so with respect, by one of your technical advisers. The difference on the total is not sufficient to upset what I am contending as to the deficiency of the loadline requirements. Now, my Lord, if you will look at page 75 of this Table C you will find certain measurements given there giving what should be the height of freeboard amidships, that is to say, "measured from

top of main deck at side," varying according to the moulded depth, and the total length given in that table, if your Lordship will look at the fifth column, is, total length 408 feet, and total moulded depth 34 feet. If you will look at the last column your Lordship will see that for steamers above 34 feet moulded depth you have to deduct the following amount from the freeboards given in Table A to obtain the freeboard for Table C. Now your Lordship has to turn back, if you will, to Table A, on page 59; and if your Lordship will look at the sixth column it there gives the moulded depth of 45 feet. We know that the moulded depth of the "Titanic" was 45 feet, so that you have to take the freeboard in that column, if the allowance for the coefficient of fineness be .72, of 12 feet 10 inches, less the deduction found on page 75 of Table C; and if .74, then 13 feet, less the deduction provided on page 75. Having done that, you then have to turn back to Table C, and you will there find, fairly well down the page in the first column, a correction in inches which has to be

### **Page 806**

made for a change of 10 feet in the length. You will therefore have to multiply by a figure which is given in the following column of .8. If you multiply the difference between the figure of 540 feet on page 59 and the total length of the "Titanic" by .8, you get at certain figures. I submit, my Lord, that if those figures are taken they will show that for this ship the required freeboard to the upper deck was 11 feet 1 inch; and that if you take the actual freeboard allowed in this ship it is a fraction under 11 feet. So that there will be the difference between that fraction under 11 feet and 11 feet 1 inch deficiency in freeboard.

*The Commissioner:* It is a deficiency of 1 inch and how much?

*Mr. Edwards:* It is a deficiency of 1 inch on 11 feet, my Lord.

*The Commissioner:* No, it is a deficiency of 1 inch and a fraction of an inch.

*Mr. Edwards:* Yes, my Lord.

*The Commissioner:* Well, how much is it? Is it 1 3/4 inches, or 1 7/8 inches, or what?

*Mr. Edwards:* It is .6 or .06 of an inch.

*The Commissioner:* .06 is very different from .6.

*Mr. Edwards:* The reason, my Lord, is this. If you take the coefficient as contended by the Board of Trade as .74, then it is a deficiency of about 2 inches. If you take the coefficient of .72 as urged by Harland and Wolff, then it is a deficiency of 1.06 inches.

*The Commissioner:* 1.06 inches.

*Mr. Edwards:* That is so, my Lord. Perhaps your Lordship would ask, so as to enable Prof. Biles or one of your technical advisers to get the thing worked out, for the necessary materials from Messrs. Harland and Wolff - or perhaps the Board of Trade have them - upon which to determine whether the coefficient should be .72 or whether it should be .74.

*The Commissioner:* Does it make any difference for the purpose of your point whether it is .72 or .74? In either case, according to you, there was a mistake.

*Mr. Edwards:* In either case there was.

*The Commissioner:* Does it matter whether you take .72 or .74?

*Mr. Edwards:* Except that it becomes a little more -

*The Commissioner:* You aggravate it a little?

*Mr. Edwards:* Yes, I do not object to that word, my Lord. So much, my Lord, for that point.

Now I am going to direct your Lordship's attention to the correspondence. This correspondence is not, as I told your Lordship, quite in consecutive order, and there are four letters here which your Lordship has not got. What I am going to do, my Lord, is to give you broadly the contents of the letters, and then ask your Lordship to direct that the letters be put in the proper order, so that your Lordship can look at them. I shall not take up the time of the Court in reading them. In these letters which are printed your Lordship will find that in the first place the Board of Trade surveyors did ask Messrs. Harland and Wolff to do a number of things. They asked that they should take the collision bulkhead fair up to the deck.

*The Commissioner:* To what deck?

*Mr. Edwards:* To the saloon deck, my Lord.

*The Commissioner:* What is it called - what letter?

*Mr. Laing:* D.

*The Commissioner:* Did not they take it up to D?

*Mr. Edwards:* Not fair, my Lord.

*The Commissioner:* What do you mean by "fair"?

*Mr. Edwards:* Instead of going straight up they stepped it 12 feet forward.

*The Commissioner:* Is there any reason why they should not?

*Mr. Edwards:* Except the view which, I think, you will find held by experts, that a bulkhead which is stepped has not the same resisting strength as a bulkhead that goes fair up. That is the first point.

Then, my Lord, I would call your Lordship's attention to two letters. On page 6 of the Collision Bulkhead correspondence there is a letter of the 20th July from Mr. Carruthers, the surveyor, to Messrs. Harland and Wolff: "With reference to my conversation with your Mr. Andrews regarding the collision bulkhead of this vessel, as you still object to extend the bulkhead on frame 134 up to the saloon deck, I have to suggest as an alternative that a bulkhead should be fitted between the upper and saloon decks at the after-end of the crew space - say, on frame No. 111, this bulkhead and also the upper deck between frames No. 111 and 134 being made practically watertight. The stairways leading to the lower crew space would require to be trunked up to the saloon deck and fitted with steel doors practically watertight, and any other openings in the upper deck, between frames No. 111 and No. 134 similarly trunked up." To which on the 21st July, 1910, Messrs. Harland and Wolff replied: "We are in receipt of your letter of 20th inst., for which we are obliged, and if it will finally satisfy the Board regarding this matter we see no objection, as you suggest, to making the present steel bulkhead, at the after-end of the crew space between the upper and saloon decks, on frame No. 111, watertight, which will serve the same purpose as if the collision bulkhead No. 134 had been carried straight up to the saloon deck instead of being cranked forward about 12 feet on to frame No. 140 as at present. We cannot, however, consider or see what material advantage could possibly be gained by trunking up between the upper and saloon decks the stairways, hatch, and other openings, and making the upper deck watertight forward of frame 112, as if the vessel were damaged forward of this watertight bulkhead, only No. 1 hold and

the firemen's passage could become flooded, while the sketch we submitted to you some time ago shows that especially the forward bulkheads of these vessels, so arranged that there is a large margin of safety with any two compartments flooded." Then, apparently, the Board took the view of Messrs. Harland and Wolff up to a certain point, because you see a Minute of the Board appended: "The builders might be informed that the Board are pleased to note that a bulkhead will be fitted on frame 111 between the upper and saloon decks, but they still consider it desirable for the hatchway and spiral stairways to be trunked up to the saloon decks and made practically watertight. If, however, the builders are still unwilling to do this, they should submit a copy of their calculation of the trim of the vessel when the fore compartment is open to the sea, and the No. 1 compartment and firemen's passage are full of water up to the waterline." Now, my Lord, there is only one other letter to which I want to refer.

*Mr. Laing:* They did supply the figures, you know, and the Board of Trade approved of them. You will find at the bottom of page 8 they approved of them.

*Mr. Edwards:* I was going to say that generally. It is only fair to the builders to say, if your Lordship will look at page 9 of the correspondence, that this appears: "Noted. This vessel is now completed and all the requirements of the Board contained in this Minute have been satisfactorily carried out."

*Mr. Laing:* I would rather you read the one at the bottom of page 8.

*Mr. Edwards:* "With reference to yours of the 10th August enclosing calculation of trim of vessel with No. 1 hold, firemen's passage and forepeak flooded, I have to inform you that this is considered satisfactory, and that the openings in the upper deck leading to the firemen's passage and to No. 1 hold will not now be required to be trunked up watertight to the saloon deck." You remember, perhaps, my Lord, that Mr. Archer, who had made this recommendation, gave certain evidence, and he stated in reply to a question of mine that he thought, in the light of the "Titanic" disaster, it would have been very much better if these requirements at that time had been insisted upon. This is not against the builders at all.

*Mr. Laing:* I think that is a misconception, if I may say so.

*Mr. Edwards:* I do not know that I need call special attention to it. All these letters go to the one point, that in the first place the Board of Trade surveyors do appear to have anticipated the thing, and do appear to have made certain recommendations

## **Page 807**

which, after a discussion with London, and after a discussion with the builders, one by one, they appear to have abandoned.

What I was just going to allude to was this, and it comes to the final point as to the rules and regulations of the Board of Trade. I desire to reiterate what I put in reply to your Lordship's question that the view - I think the right view - is that there should be by the Board of Trade rules and regulations of a binding character; that those rules and regulations should go fairly low down in the gradation of detail; and that there should be standards definite and enforceable by which the surveyors in each locality are to be guided. As to what particular rules and regulations there should be, that is not a matter with which one can entirely deal with here, of course. As to the nature and character of

bulkheads, that has gone to a committee; as to whether there should or should not be watertight decks, that has gone to a committee; as to what I may call the interrelation between the sinkability of the ship and the boat accommodation that has gone to a committee. But there are a certain number of things which are still left open, and here I have to say one or two words particularly on behalf of my friends who are not addressing your Lordship. I am asked, on behalf of Mr. Cotter, to emphasise that the Board of Trade should insist upon an efficient boat drill, in which every member of the crew of a ship may take part. I am also asked, on his behalf, to emphasise the need for there being rules and regulations which shall be insisted upon as to bulkhead door drill. He also desires to commend to your Lordship the recommendation of one or two of the witnesses, that there should be lifebuoys, with acetylene lamp attachments, so that any persons unfortunate enough to be thrown into the sea in a catastrophe of this kind may be seen, and he also asks very specially - it probably will be a matter that your Lordship will rather urge should be considered by the Boat Committee - that attention should be given to the rigid need for the consideration of the method of lowering and raising boats. He also asks me to say - and in this I join with him, although it was very well put by my friend Mr. Scanlan - that in the light of the "Titanic" disaster, and in view of the fact that as yet the unsinkable ship has not been designed, there should be a drastic alteration in the Regulations of the Board of Trade with regard to boat accommodation. Those are also points which I am asked to urge on behalf of Mr. Lewis.

I am not going to take up your Lordship's time on the question of the relative unsinkability of the ship, but your Lordship will remember that when Sir Norman Hill was in the box he produced certain Minutes of Proceedings of a certain Committee. I have had an opportunity of looking through those Minutes, and I am quite sure, bearing in mind that they were the utterances of skilled men, that they will weigh with your Lordship. I am not going to ask your Lordship to trouble to go through all the Minutes, but I would ask your Lordship, particularly to refer to the following pages: 34, 37, 38, 43, 52, 55, 56, 58, 59, and 63. What those Minutes broadly show is this, that at present there is no design that has yet been evolved of a ship that makes her even practically unsinkable, and that, therefore, in the ordinary course of things the possibility must be contemplated of disasters in future; that your Lordship must therefore consider the question of to what extent there should be boat accommodation. Your Lordship will, I hope, in your finding, give as the result of this Enquiry certain suggestions more specific than have yet been made to the Committee as to the considerations to which they should direct their minds in considering an increase in the boat accommodation.

There is only one other point, my Lord, and I have finished, and that is this. Apart altogether from the particular Rules and Regulations of the Board of Trade; apart altogether from the question as to whether these so-called Rules and Regulations are suggestions as a guide, and not Rules to bind - I shall submit to your Lordship, in connection with the final question which your Lordship has to decide, that there has been disclosed in these proceedings an extraordinary state of affairs as to the general outlook on the part of the Marine Department of the Board of Trade in regard to these matters. When one remembers that Sir Alfred Chalmers has been the responsible technical adviser for so many years, and when Sir Alfred Chalmers declares that to him no single Rule or Regulation of the Board of Trade should be altered, when Sir Alfred Chalmers tells your

Lordship that the "Titanic" disaster has no lesson for the Board of Trade, one is, by a lightning flash, given an amazing revelation as to the character and personnel of this Department.

*The Commissioner:* Sir Alfred Chalmers is no longer an official of the Board of Trade.

*Mr. Edwards:* That is true, my Lord, but Sir Alfred Chalmers was the responsible technical adviser at the time that the "Titanic" was being designed. And I ought to say that it was gratifying, it was encouraging, it was relieving that his successor is a man of a totally different view, and I hope that as the result of this Enquiry something may be done.

Now, my Lord, again I desire to thank you for the perfectly amazing patience that you have manifested in a difficult Enquiry. It has not been an easy task for any of us; it has been a sad task; it has been in many parts an unpleasant task, because of the seeking to find those, if any, on whom blame should be attached. It has been the most appalling calamity of its kind in the world's history; but if as the result of this Enquiry, guided by your Lordship's great skill, by your Lordship's profound patience, and by the skilled advice of your advisers - if as the result of this great calamity something is done to make travelling by sea safer; something is done by better equipment, by increased use of system of wireless telegraphy, to diminish the toll of the loss of life at sea, then those fifteen hundred people who have gone to the bottom of the Atlantic will not have died in vain.

*The Commissioner:* Thank you, Mr. Edwards.

*Sir Robert Finlay:* My Lord, it is now my duty to address the Court on behalf of the White Star Line, and in speaking on behalf of the White Star Line I may say, as I have already intimated, that those who represent Captain Smith have put themselves in my hands; and I desire to say, in the first instance, a very few words with regard to Captain Smith. I stated that it was the desire of myself, as representing those to whom he was dearest, that no technical difficulty should stand in the way of a complete examination into the circumstances connected with this great disaster. We desire that these circumstances should be thoroughly probed, and I shall ask the Court when that examination is complete to say that no blame of any sort or kind attaches to Captain Smith, or to those who were associated with him in the navigation of this vessel. No immunity is asked for on behalf of Captain Smith because he is dead. He died on the deck, as many an English captain has died, and as many an English captain will die. But his conduct must be investigated, and I trust that the result of that investigation will be that his character as a skilful commander comes out absolutely untarnished. At the same time I must say this, that I think we might have been spared some of the attacks that have been made upon Captain Smith by Mr. Harbinson and by Mr. Edwards. Your Lordship will recollect the nature of the observations which formed the staple of some considerable portion of both their speeches, to the effect that Captain Smith had been influenced by one who was but a passenger on board the vessel; had deferred to his opinion and had wished to throw the responsibility for the Captain's course of action upon him. May I remind your Lordship of the way in which the position of a Captain with regard to any person on board, be he director or be he owner, was defined in terms not unlike those used by your Lordship. I refer to Captain Rostron's evidence. The passage will be found at page 745 of the transcript, at the top of the page. I say to Captain Rostron: "You gave

evidence in America? - (A.) Yes. (Q.) May I put one passage to you? You were asked this by Senator Smith. I am reading to you from the evidence in America. 'Captain, is

## Page 808

it customary to take orders from a director or a general officer of the company aboard? - (A.) No, Sir. (Q.) From whom do you take orders? - (A.) From no one. (Q.) Aboard ship? - (A.) At sea, immediately I leave port until I arrive at port, the Captain is in absolute control, and takes orders from no one. I have never known it in our company or any other big company when a director or managing owner would issue orders on that ship. It matters not who comes on board that ship, they are either passengers or crew. (Q.) There is no official status and no authority whatever with them? That is correct? - (A.) That is correct. (Q.) Did you know Captain Smith? - (A.) Yes. (Q.) He was a very experienced officer, I think? - (A.) Yes, very. (Q.) Of very high standing? - (A.) Very high indeed." My Lord, it is suggested by Mr. Harbinson and by Mr. Edwards with regard to this officer of great eminence, who died on the deck, that he was guilty of a departure from all the traditions of the Service; that he deferred to the opinion of one, the chairman of the company, who happened to be on board: that he wished to devolve the responsibility upon him; and that he was guilty of abdicating the duty which was incumbent upon him. I do not desire to read at length what was said, but I may refer to page 779 of the Notes of yesterday's Proceedings, setting out Mr. Harbinson's speech on this matter. I may summarise his remarks in this way. He suggested that Mr. Ismay's mere presence on board affected the navigation of the ship. He said it. He said that the Captain, when he handed that telegram from the "Baltic" with regard to the ice to Mr. Ismay, he handed it to him to invite his opinion, and he finally said that he did not accept as true Mr. Ismay's statement that he had no conversation with the Captain upon it.

Then, my Lord, Mr. Edwards said this - I will refer to the page, the imputation is so serious. Your Lordship will find this at page 785, in the second column, at the end of the fourth paragraph from the top: "I suggest that in view of his own evidence" - that is Mr. Ismay's evidence - "there is only one conclusion, and that is that the Captain was anxious that whatever was done should be done upon the responsibility of Mr. Ismay. Well, my Lord - (*The Commissioner.*) I mean by shaking my head that he could not accomplish such a thing. (*Mr. Clement Edwards.*) That may be. (*The Commissioner.*) The Captain could not shift his responsibility. (*Mr. Clement Edwards.*) That may be, my Lord. I at once recognise that whatever pressure may have been put upon him by the owner, he had got charge of that vessel and could not in any way get rid of his legal liability before he got into port. (*The Commissioner.*) Nor his responsibility. (*Mr. Clement Edwards.*) Nor am I suggesting it was an effective thing, but I am leading up to something else." Then at the bottom of that column, at the last line but one on page 785, Mr. Edwards returned to the charge: "I suggest that it was nothing of the sort, but that Mr. Ismay was anxious that there should be a record - I am not suggesting by that anything improper - but that he was hoping for a record first passage for this great ship. One knows what the stress of competition is, and how valuable from the point of view of commercial success, as we know from what is said in the papers, an advertisement of that kind is; and I again suggest, not that he could do it lawfully or legally, but that at all events in order that the

onus - the responsibility - should be with Mr. Ismay and not with the Captain was the purpose for which the Captain handed that message to him."

I say, my Lord, that is a most unworthy suggestion. It is a suggestion that never ought to have been made. It imputes to a man who has died in the discharge of his duty, who is of the highest standing, the highest capacity, that he departed from all the rules by which his profession is guided. It is a suggestion for which there is not a tittle of evidence; and, more than that, it rests on an assumption which is directly negatived by the evidence. It is put that Mr. Ismay was anxious - and that the Captain lent himself to it - that there should be a record passage. If the evidence had been looked at before such a cruel insinuation was thrown out it would have been found that the reverse is the case. Your Lordship has in mind - because I know it was a point to which your Lordship at once called attention - the evidence given by Mr. Sanderson. It occurs at two pages, and by putting them together you get the result - pages 476 and 498. When those two passages are compared, it is obvious that this was not intended to be a record passage nor anything of the kind. In fact, I think I may appeal to your Lordship, and to the experienced gentlemen who sit beside you, as to whether it would be a usual thing to attempt to have what is called a record passage on the first trip of any vessel. Anyhow, that was not attempted, and was not intended with regard to the "Titanic." At page 476 Mr. Sanderson gives the figures with regard to the "Olympic," at Question 19281: "No doubt the White Star keeps a record showing what is the best done by the White Star, and we shall see how this matter stands? - (A.) I can give it to you. The fastest passage the "Olympic" has ever made from Queenstown to New York is 5 days, 7 hours, 29 minutes." And then at Question 19284: "From New York to Plymouth, her fastest passage is 5 days, 14 hours, 32 minutes." There you have got the "Olympic." Then, at page 498, your Lordship had cleared up the question of what the duration of the voyage of the "Titanic" would have been if it had been followed out as was contemplated, arriving on the Wednesday morning. It is Question 19788 - this is still in Mr. Sanderson's evidence - and the Attorney-General is speaking: "Supposing she had left Queenstown at 2.30 on the 11th April and had arrived in New York on the Wednesday morning at 5 o'clock her passage would have taken, allowing, of course, for the voyage westward, five days, 19 hours, and 30 minutes? (*Sir Robert Finlay.*) Arriving on Wednesday morning. (*The Attorney-General.*) Allowing for her arrival at 5 o'clock on Wednesday morning. The record, I think, that was given yesterday of the 'Olympic' from Queenstown was 5 days, 17 hours and 29 minutes." That is a mistake that was corrected three lines further down. (*The Commissioner.*) So that the 'Titanic' would have taken about two hours longer? (*The Attorney-General.*) Yes, if she had arrived at 5 o'clock on Wednesday morning. (*The Witness.*) I think the difference was more than that, my Lord. I think the 'Olympic's' time was 5 days, 7 hours - not 17 hours. (*Mr. Maurice Hill.*) It was 7 hours, my Lord. You will find it on page 476 of the notes. (*The Commissioner.*) What is it, Mr. Hill? (*Mr. Maurice Hill.*) Five days, 7 hours, 29 minutes. (*The Attorney-General.*) Is that right? - (A.) Yes, 5 days, 7 hours, and 29 minutes is correct. (*The Commissioner.*) Then it is a difference of 12 hours? - (A.) Yes, 12 hours." Under those circumstances, my Lord, is it not a little too bad that there should have been laid this foundation for an attack upon the memory of Captain Smith - that they were bent upon making a record passage in the "Titanic," when it is perfectly obvious they were bent on doing nothing of the kind. It was contemplated that they should not

attempt to arrive on the Tuesday evening, but that they should only get in on the Wednesday morning, as it would be more convenient in other respects. So that the whole of the foundation upon which this monstrous charge has been based is not only unsupported, but it is destroyed by the evidence itself. It is further destroyed by the conversation to which I shall have occasion to refer again when I deal with Mr. Ismay's evidence in detail, and from his point of view - the conversation between Mr. Ismay and Mr. Bell at Queenstown. I venture to say, my Lord, that this suggestion ought never to have been put forward - that the Captain handed this telegram from the "Baltic" about the ice to Mr. Ismay to get his opinion, to be told by him what was to be done, or because he was anxious to devolve the responsibility upon him. I say there is no evidence of it whatever. Your Lordship was told that the disaster was one of unparalleled magnitude. That the disaster is unparalleled in its magnitude is no excuse for throwing such aspersions upon the memory of a dead man.

**Page 809**

*(After a short adjournment.)*

*Sir Robert Finlay:* My Lord, there is one other point of a preliminary nature on which I must say a few words, and that arises out of the observations made by Mr. Edwards with reference to Mr. Ismay's getting into this boat and leaving the vessel. Your Lordship asked what was the duty on which Mr. Edwards was insisting, and as far as I understood his position it was this. He said Mr. Ismay had no right to save his life at the expense of any other life.

*The Commissioner:* No moral right.

*Sir Robert Finlay:* No moral right. Mr. Ismay did not save his life at the expense of any other life. If Mr. Edwards had taken the trouble to look at the evidence he would have seen how unfounded was the charge he was levying against the living Mr. Ismay as against the dead Captain Smith. If your Lordship would look at three pages 443, 453 and 464 your Lordship will see that there is not the slightest ground for the suggestion that any other life would have been saved if Mr. Ismay had not got into that boat. The only result would have been that the boat would have gone away with a place empty, no other person would have got into it, and no other life would have been saved. It is on page 443, beginning at Question 18555, "But, except the collapsibles, had every boat been lowered?" - (A.) Every wooden boat was away. (Q.) All the eight on that side? - (A.) Yes. (Q.) Did you see how many passengers were put into this collapsible? - (A.) No, I did not see at the time. (Q.) Did she appear to be full? - (A.) She was very fairly full. (Q.) Would you tell us what happened after you got the women and children in? - (A.) After all the women and children were in and after all the people that were on deck had got in, I got into the boat as she was being lowered away." Your Lordship called attention to that passage, which I have no doubt you had in your memory while Mr. Edwards was speaking. He did not get into the boat till she was being lowered away. Then on page 453, at Question 18866, your Lordship put to Mr. Edwards this: "(Q.) Your point, Mr. Edwards, as I understand, is this: That, having regard to his position, it was his duty to remain upon that ship until she went to the bottom. That is your point? (*Mr. Clement*

*Edwards.*) Yes, and inasmuch - (*The Commissioner.*) That is your point? (*Mr. Clement Edwards.*) Frankly, that is so. I do not flinch from it a little bit. But I want to get it from this witness, inasmuch as he took upon himself to give certain directions at a certain time, why he did not discharge the responsibility even after that, having regard to other persons or passengers? - (A.) There were no more passengers to get into that boat. The boat was actually being lowered away. (Q.) That is your answer? - (A.) Yes." Then at page 464, Question 19058, the Attorney-General says: "The object of these questions I am putting to you, Mr. Ismay, is to draw your attention to this, that, at any rate, when the last boat left the 'Titanic' you must have known that a number of passengers and crew were still on board the vessel? - (A.) I did. (Q.) And you have told us that you did not see any on the deck? - (A.) I did not. (Q.) At least, I think you limited that to passengers; I am not sure you were asked about the crew? - (A.) There were no passengers on deck. (Q.) And you said also that you did not see any as the boat was lowered? - (A.) I did not. (Q.) I am not sure whether you said it in answer to the Court, or whether it is only in the statement I have got from you, but at any rate that was your view; as the boat was lowered and you passed the decks you did not see any passengers on the decks? - (A.) I did not." Now, Mr. Edwards said that Mr. Ismay's plain duty was to have gone away looking for passengers. The boat was being lowered. Mr. Ismay might have gone and looked for passengers; he could not have brought any passenger in time to have occupied the place in that boat, for the boat was actually being lowered; it was not till that moment that he stepped in. Then the question comes to be this: was it Mr. Ismay's duty to remain there, although by doing so he could save no other life, although by doing so he could have done no good to any human being? My Lord, if Mr. Ismay had felt impelled to commit a suicide of that kind, the same kindly critics who are now attacking him would have said that he went to the bottom because he did not dare to face the Enquiry that he knew must follow. I submit to your Lordship that there is no observation of an unfavourable nature to be made from any point of view upon Mr. Ismay's conduct. There was not upon him that duty which the Captain always feels to go down with the ship if there still remains anyone else on board. Mr. Ismay did all he could in the way of helping the women and children. It was only when the boat was actually being lowered and when that place would have gone away empty that he got into it. I submit to your Lordship that Mr. Ismay violated no duty; he violated no point of honour - I will put it as high as that - and that if he had thrown away his life in the manner now suggested it would have been said by those who are now attacking him that he did it because he was conscious that he could not face the Enquiry into the loss of this vessel.

My Lord, I pass from these preliminary matters, and I am glad to do so, and I shall now direct the attention of the Court to the evidence taken under two heads, the first relating to the navigation of the vessel in view of the announcements which had been made with regard to ice; the second relating to the number of boats provided, the use that was made of those boats, and generally the way in which things were managed after the collision had taken place, and it was known that the vessel was in danger.

Now the first of those points depends of course to a great extent upon the question of the ice warnings, and I wish to bring home to the Court the fact that there were only three ice warnings which reached the officers of the "Titanic"; there was the ice warning from the "Caronia," there was the ice warning from the "Baltic," and there was the first message

from the "Californian." The second message from the "Californian" was never transmitted. The answer was, "Keep out; I am busy with Cape Race." The message from the "Mesaba" was never taken to the bridge, in all probability for the same reason, and the message from the "Amerika," which was one sent merely for transmission to Cape Race, was laid aside with the others to be transmitted, and was never, according to the evidence, handed to any one of the officers.

Now the three messages we have to deal with are the "Caronia," the "Baltic," and the first message of the "Californian." I would ask your Lordship to look at this chart, which is on a very much enlarged scale. It is divided into 20 miles squares, and is drawn on a scale of quarter inch to the mile. It sets out in a pictorial way what the state of things, as shown by these messages, was (*handing in the same.*) Your Lordship sees there the interval between longitude 49 and longitude 51, at latitude 42 N., which represents the region where, according to the "Caronia," message, bergs, growlers and field ice were to be found on the 12th April. There is a line indicating the position. Of course, that line does not mean that the whole of that was occupied by a solid barrier of bergs and field ice; only that the message of the "Caronia" showed that there was a good deal of ice in various forms between these two degrees of longitude, and in or about latitude 42 N. Then your Lordship will observe the spot where the ice reported by the "Baltic" is; it is a report of bergs and field ice in 41.51 N. latitude, 49.52 W., as reported by the Greek steamer, the "Athenai"; and lastly, your Lordship will

## Page 810

observe the ice reported by the "Californian," three bergs, five miles to the South of the position of the "Californian." The position taken for the "Californian" there is 42.5 N., as the Captain gave it. The message states 42.3 N. as being its position, so there would be two miles difference - I do not think, for my purpose, it makes any difference - and the message was that the three bergs were five miles to the South of the position of the "Californian" in 42.5 or 42.3 N. and 49.9 W.

That is a picture of what had been brought to the mind of the Captain of the "Titanic," and of the officers. Would your Lordship now kindly look at the message sent by the "Caronia," which was the first in the order of date. It was sent at 9 on the morning of the 14th April, the Sunday - I am taking "Titanic" time throughout for convenience.

*The Commissioner:* Ship's time?

*Sir Robert Finlay:* Yes, 9 a.m. on Sunday, the 14th April. The message your Lordship will find set out at page 374 of the evidence. It is Question 16099. It is addressed to "Captain, 'Titanic,' Westbound steamers report bergs, growlers, and field ice in 42 degrees N. from 49 to 51 W., April 12, Compliments, Barr." Now, the important points to be noticed about that telegram are that it reports bergs, growlers, and field ice in that locality; and, secondly, that it is a report of ice in these various forms having been seen in that locality on the 12th April. That your Lordship will find, I think, is very important, that Westbound steamers reported ice in that locality on April 12th, that is to say, at least 48 hours' before the time when the collision took place, and in all probability a good deal more. I mean a good many hours more, but at least a minimum of 48 hours. When the "Titanic" got that message, that is to say, at 9 in the morning of Sunday, the 14th April,

she was in longitude 43.50 W. and 43.35 N. That does not appear in that large chart, because there really was not room to go so far back and so far up.

The way we get that is this: We know that she turned the corner, that is the corner that she took further to the South, at 5.50. We reckoned back from that at 22 knots, and that brings us to that position.

*The Commissioner:* Which position?

*Sir Robert Finlay:* The position I have given, 43.50 W., 43.35 N. It is marked on this chart which I have before me, if I may show it to your Lordship. (*Handing same to the Commissioner.*) Then if your Lordship will also observe at the same time as that smaller chart is before you the position of the "Titanic" when the "Baltic's" message was received, reckoning in the same way back from the corner where she turned at 5.50, you get the "Titanic" at the time she received the "Baltic's" message at 45.40 W., 42.35 N. She was a little further to the Southward, and of course a good deal further to the West.

*The Attorney-General:* Have you the Titanic's time?

*Sir Robert Finlay:* Yes, the "Titanic's" time was 1.42. Now, my Lord, the message sent from the "Baltic" is set out at page 377, Question 16176. It will, of course, also be in the collection of the various Marconigrams which has been printed for the convenience of the Court.

*The Attorney-General:* It is not in the proces-verbaux, it is in "received and sent messages."

*Sir Robert Finlay:* I almost think it might be more convenient to take it from the shorthand notes.

*The Commissioner:* Perhaps it is.

*Sir Robert Finlay:* "Captain Smith, 'Titanic.' Have had moderate variable winds and clear fine weather since leaving. Greek steamer 'Athenai' reports passing icebergs and large quantities of field ice today in latitude 41.51 N., longitude 49.52 W. Last night we spoke German oil-tank steamer 'Deutschland,' Stettin to Philadelphia, not under control, short of coal, lat. 40.42 N., long. 55.11 W. Wishes to be reported to New York and other steamers. Wish you and 'Titanic' all success. - Commander." That is the message sent by the "Baltic." The third message is the message sent by the "Californian"; that was sent a good deal later. The "Caronia" message reporting ice two days before, on the 12th April, was sent, as I said, at 9 a.m. on the Sunday. The "Baltic" message was sent at 1.42 in the afternoon, and the "Californian" message, the first message from them, which was given to the officers was at half-past 7 or 7.25 - it is variously given - on the Sunday. It was a message sent to the "Antillian" and overheard by the Marconi operator on board the "Titanic." That message your Lordship will find at page 201, Question 8943: "To Captain, 'Antillian,' 6.30 p.m. apparent time, ship; latitude 42.3 N., longitude 49.9 W. Three large bergs five miles to Southward of us. Regards. Lord." As I said, Captain Lord, in his evidence, gave the latitude as 42.5 N., but the telegram puts it at 42.3 N. I do not think for my purpose it makes any difference. It would make two miles difference, of course. The "Titanic" at the time she got that message at 7.30 p.m. would be in 48.12 W., 41.52 N. With regard to the "Caronia" message and the "Baltic" message the receipt is admitted by the officers and admitted on all hands. With regard to the first message from the "Californian," no officer has spoken of it, but Bride, the Operator, says he did take it on to the bridge, and, of course, there is no contradiction; so that it may be taken that

message was received on the bridge. Bride, your Lordship may recollect by mistake - some confusion I should think with the New York time - put it at 5.30; it really was 7.30 or 7.25. Bride did say 5.30, but that must be a mistake. On the evidence, it stands that Bride gave it to someone, we do not know to whom, some officer on the bridge, at 7.25 or 7.30.

*The Commissioner:* I think Bride says it is the only telegram that he had any recollection of.

*The Attorney-General:* Yes.

*Sir Robert Finlay:* With regard to all the other messages, that from the "Mesaba," which warned about that great oblong which your Lordship remembers is drawn on a chart which was handed up by my friend the Attorney-General, showing the great oblong which was first delineated by the Solicitor-General in the course of the case -

*The Commissioner:* Do you suggest, Mr. Attorney, that I ought to take into consideration any other telegram than the three which Sir Robert Finlay has referred to.

*The Attorney-General:* No, my Lord, we cannot carry them further than they have been carried. They got to the Marconi room, but this is as far as we can take them.

*The Commissioner:* My view at present is that we ought not to fix the ship with knowledge of any telegram except those three. I do not think we ought to do it.

*The Attorney-General:* I assented to that.

*The Commissioner:* I only ask you because, if you are going to say that we ought to take into consideration others, I think you had better let us know.

*The Attorney-General:* I assented to that view some days ago when your Lordship put it.

*The Commissioner:* You did.

*The Attorney-General:* Yes; I am not departing from it. I said we could not take it any further, and I was not going to attempt to prove any more.

*The Commissioner:* Then I do not think you need trouble about this, Sir Robert.

*Sir Robert Finlay:* I was only going to say this: I think I may put it higher than that it is not proved; I submit it is proved that we did not get them.

*The Commissioner:* But that does not matter, because I am going to proceed on the assumption that you only had the three.

*Sir Robert Finlay:* May I be allowed to make only one observation - I am quite satisfied with what your Lordship has said - and it is this, that the reason why we did not get them is this: the message from the "Mesaba" and the second message from the "Californian" came to the operator when he was busy with Cape Race.

*The Commissioner:* That is, no doubt, the explanation to my mind at present - that he was busy with private telegrams, and he did not think those were of any significance, and he put them aside.

## **Page 811**

*Sir Robert Finlay:* I do not know whether the system might be amended, but it is quite obvious that if the operator is busy with private telegrams, which are paid for in addition to the lump rate which covers ship's messages, of course he is naturally and properly

enough, from the point of view of his company, anxious to get on with that branch of his business, and puts aside the others.

*The Attorney-General:* Oh, no; I do not know whether my friend bears in mind the evidence which has been given, and I thought it was beyond question that that is just what he must not do; all other messages have to be put aside for navigation messages.

*The Commissioner:* The rule, no doubt, is, as I remember it, that telegrams affecting the navigation of the ship are to be given precedence of all. That is the rule.

*The Attorney-General:* Yes.

*The Commissioner:* But whether Phillips attended to the rule is another matter.

*Sir Robert Finlay:* Your Lordship recollects, with regard to one message from the "Californian," that the answer was: "Keep out; I am busy with Cape Race." That was the message with regard to ice.

*The Attorney-General:* The question as to whether Phillips did it or did not is a matter which is very difficult to inquire into further; but my friend's observation was directed to the general system. Your Lordship will remember that we went into it with great care, and I produced the rule and showed exactly what the precedence is, beginning with the distress message first, and then navigation messages, and proceeding then to Government messages, or, rather, Government messages before navigation, and then going on to the private messages.

*Sir Robert Finlay:* Yes.

*The Attorney-General:* It was very clearly stated.

*Sir Robert Finlay:* I am not in conflict with the Attorney-General at all about that. What I am upon is the desirability of the rules being more rigidly observed.

*The Commissioner:* That may be. If I come to the conclusion that Phillips did not follow his directions I may have to say something about it; but unless I am very well satisfied that he neglected his duty I shall not say anything.

*Sir Robert Finlay:* It is only fair to remember that Phillips is dead, and we have not his account. But what is established is this, that these messages did not reach the bridge, and the only observation I want to make is this, that it is a very great calamity that these messages, particularly the "Mesaba" message, did not reach the bridge. The "Mesaba" message was, as Mr. Lightoller said when his attention was called to it, one of a very startling nature, and the whole of this calamity might have been averted, and in all probability would have been averted, if that "Mesaba" message, which arrived very late, not very long before the collision, about 11 o'clock I think, had been taken down and taken to the Captain or to the officer in charge on the bridge. But that was not done. The same thing applies to the "Amerika" message. The "Amerika" message was received much earlier in the day; it was received between one and two, but it was received only for transmission to the Hydrographic Department via Cape Race. It is quite clear that what happened to the "Amerika" message was this: it was put aside to be dealt with along with the mass of Marconigrams that were to be sent off as soon as they got in touch with Cape Race, which happened at 8.30, and from 8.30 onwards down to the time of the collision the press of work in dealing with Cape Race, private messages to Cape Race and messages from Cape Race, was very great, and kept the operator very busy indeed. What I do suggest is that while I agree with the Attorney-General that the rules are excellent, attention might be called to the vital necessity of the Marconi operator always postponing

any business in which he may happen to be engaged for a matter of that kind. I only refer, by way of illustration, to what happened to the witness, Bride. Your Lordship recollects that a message arrived to the "Titanic" about ice. He was busy with his accounts, and he went on with his accounts. Then twenty minutes afterwards he heard that same message being repeated to another vessel, and he took it down and handed it over. He says, and it may be the case, that if he had not overheard it being sent to another vessel he would have asked the vessel that sent it to repeat the message. That may be, but at the same time I think that it is a point which requires emphasising, that as soon as the Marconi operator gets a message, whether it is intended for another ship primarily, or whether it is directed to the ship on which he is, postponing everything else if it relates to ice, or a derelict, or anything of that kind, he should communicate with the officer in charge on the bridge or with the Captain himself.

*The Attorney-General:* I only wish to say this. I quite follow my friend's suggestions with regard to that, but he has made certain observations, and although he may not mean them to cast a reflection upon Phillips, I cannot help thinking they do, and if that is intended we ought to have had an indication at a very early stage in this matter. When we discussed the "Mesaba" your Lordship indicated that you could not see at present that that message had got to the bridge; I agreed that upon the evidence that was the position and there was no means of proving it. And, therefore, in your Lordship's view, that message was to be left out. I remember quite well, when I handed up this document to your Lordship, which had been compiled, giving the five telegrams which had been received with regard to ice, I pointed out specifically that I was not going to deal with the "Mesaba" because of what had been said. I treated that as out of the case altogether, and, so far I have understood hitherto, that it has been since we adopted that view. *The Commissioner:* I do not understand Sir Robert Finlay to say more than this: the "Mesaba's" message did arrive; it does not, as far as the evidence goes, appear to have been delivered on the bridge, and if it was not delivered on the bridge - there is always an "if" - then it is desirable that the attention of the men in the Marconi room should be directed to the importance of it.

*The Attorney-General:* I should not have objected and should not object to anything which was stated which would indicate that it was not taken to the bridge, and my friend is entitled to suggest to your Lordship that you should say, if you think it right in view of the evidence which has been given, that special attention should be given to navigation messages. The point I am upon is that upon the evidence which is all we have to deal with, those special directions are given. My friend's observations which he has just made certainly indicate this, as I follow him, that if that message had been delivered it would have made, according to the argument he put before you, or might have made a very important difference. If he is going to say that, I am equally entitled to say, and shall say - I give this notice of it at once in consequence of what my friend has said - that I cannot leave it where he left it, or rather where your Lordship left it when you asked me the question, and I left it out of the case. After what my friend has said, I cannot leave it there. It seems to cast a serious reflection, upon the man who received it. The suggestion is that he was not carrying out his duty, which was to give the navigation message to the bridge, and my friend says if that is the case it was important that there should be special directions given.

*The Commissioner:* It has nothing to do with the Enquiry.

*The Attorney-General:* I agree; but I do object to this being said after my saying in answer to your Lordship that I treated this as being a message which had not been received at all, and it was ruled out of the case, and nothing further was done. I object to my friend making these observations which, however much he may disclaim the intention do carry with them a reflection upon the person in charge.

*The Commissioner:* They are observations which have nothing to do with the Enquiry.

*The Attorney-General:* I agree, but if they are made it makes it necessary for me to reply to them.

## **Page 812**

*The Commissioner:* Here are three messages which are admitted to be received. What Sir Robert Finlay has to do, in my opinion, is to satisfy me, if he can, that in face of those three messages this ship was justified in going at 22 knots an hour.

*Sir Robert Finlay:* I accept that absolutely.

*The Commissioner:* That is the real point. Let us leave out the "Mesaba" altogether. *Sir Robert Finlay:* Be it so, my Lord. Now, the first observation I wish to make is this, that ice in the sea is not fixed. A good many observations have been made in some quarters as if, when you had notice of an iceberg being at a particular point, you were to proceed as if the berg were moored in that quarter and change your course if you were heading there. Of course, an iceberg is not fixed. Captain Rostron dealt very effectively with that point. He said, of course you do not change your course even in the case, as I gathered he intended, if you are heading for that spot where the berg is reported; of course you do not change your course, because the iceberg is itself moving. It is exactly like two vehicles crossing one another. One is heading for the spot where the other is, but both are moving, and the vehicle that is heading for the other continues on its course; it passes over the spot where the other vehicle was, but where, owing to its motion, it is no longer. It would be absurd to proceed on the idea that when an iceberg is reported as being at a particular spot you are to take it as if it were going to remain there. An iceberg drifts in a manner which I shall deal with presently. With regard to field ice it is somewhat different. Field ice does not drift to the same extent, and its direction in this locality would not be quite the same.

Your Lordship has observed that this Marconigram related to bergs and to field ice. Now the drift of icebergs in this locality it is impossible to ascertain with entire accuracy but what we do know is this: You are in the region of the Gulf Stream. The Gulf Stream runs there in a direction to the north of east, and it runs at the rate of something like 2 or 3 knots. That is stated in the volume of the "United States Pilot," which has been so often referred to, at page 11. It is of course, rather rough; various rates are given; I will not read the whole passage. The direction, as appears on the chart, of the Gulf Stream, is to the north of east, roughly E.N.E. Now that would take field ice in that locality in an easterly or slightly north-easterly direction. With icebergs it is different, because, under the Gulf Stream, you have the Labrador Current running in a southerly direction. The Gulf Stream is, I suppose, some 50 or 60 fathoms deep, and underneath that you have the cold Labrador Current running. May I again refer your Lordship to the "United States Pilot,"

Part I., at page 12, and page 34. They say the Labrador Current is "very irregular in its action, but attains at times a velocity of from 20 to 30 miles a day; vessels therefore find no difficulty in working to the westward when anywhere northward of the Gulf Stream; and vessels crossing the Gulf Stream should be on the look-out for it." Then at page 34 you have this passage with regard to ice: "These icebergs are sometimes over 200 feet in height, and of considerable extent; they have been seen as far south as latitude 39 deg. N., to obtain which position they must have crossed the Gulf Stream, impelled by the cold Arctic Current underrunning the warm waters of the Gulf Stream. That this should happen is not to be wondered at when it is considered that the specific gravity of fresh water ice, of which these bergs are composed, is about seven-eighths that of sea water; so that however vast the berg may appear to the eye of the observer, he can in reality only see one-eighth of its bulk, the remaining seven-eighths being submerged and subject to the deep water currents of the ocean. The track of an iceberg is indeed directed mainly by current, so small a portion of its surface being exposed to the action of the winds that its course is but slightly retarded or deflected by moderate breezes." The wind at this time, what wind there was, had been, I think the evidence is, from the south-west; then it dropped in the afternoon of the Sunday. Any effect the wind had had would be to move it in a north-easterly direction; but that would be a negligible quantity, because the motion of the berg, as of field ice, is really determined by the currents. This berg, your Lordship remembers from the evidence, was some 60 or 70 feet high. If you take seven times that you get a good deal over 400 feet under water, which would take it down to the influence of the cold southerly stream.

*The Attorney-General:* A little higher than that.

*Sir Robert Finlay:* My friend says that the iceberg was higher than that.

*The Commissioner:* The iceberg was higher because we know something fell on the deck; but I do not quite follow you when you say that a part of the iceberg would be seven times deeper in the water than the part which stood up above the water.

*Sir Robert Finlay:* Yes.

*The Commissioner:* That does not at all follow.

*Sir Robert Finlay:* The bulk under water is seven times the bulk above water.

*The Commissioner:* Yes, but that is quite a different thing.

*Sir Robert Finlay:* It may be different; but one cannot enter into a very nice calculation. Where you have a berg which is larger, say 80 feet or 90 feet - *The Attorney-General:* Eighty feet.

*Sir Robert Finlay:* I will take it at 80 feet - above the water. You have seven times that bulk below, and the chances are overwhelming that that reaches down to the Labrador Current and is operated upon in the manner suggested.

*The Commissioner:* What depth is the Labrador Current?

*Sir Robert Finlay:* I suppose about 50 fathoms - that is 300 feet.

*The Commissioner:* That is a very great depth, you know.

*Sir Robert Finlay:* But the bulk below water being seven times that above water, unless there is some great abnormality of shape, you get the lower part of the iceberg in the Labrador Current.

*The Commissioner:* That may be so; that is all you can say.

*Sir Robert Finlay:* I do not desire to be dogmatic about it, but one thing which is perfectly plain is that it either is or it is not. If it is, the iceberg will be taken by the Labrador Current in a Southerly direction, and making allowance for the influence exerted by the Gulf Stream on the upper part of the submerged portion, it will go in a South-Easterly direction. The Labrador Current will take it South, and the Gulf Stream would tend to take it East-North-East roughly; the resultant would be the course of the berg. If the berg does not reach below the Gulf Stream then it will go East-North-East with the Gulf Stream. And with regard to the field ice, that of course does not reach down to the cold Labrador Current, which is running Southward. Any drift of the field ice depends entirely upon the Gulf Stream, and its direction will be - I am speaking, of course, very roughly - East-North-East.

It is very difficult for us to endeavour to reproduce what passed through Captain Smith's mind when he got the information of which he was in possession, but I think he may undoubtedly have come to this conclusion, that it was desirable to hold on as did 10 miles further South than his regular track before turning the corner, and for this reason. If, as was probable, the bergs which had been reported were under the influence of the Labrador Current they would be going in a Southerly direction - South by East - and they would be going at a rate which would certainly take them well to the South of the altered course which he took.

*The Commissioner:* Do you object to my interrupting you?

*Sir Robert Finlay:* I am much obliged.

*The Commissioner:* It seems to me that the fact that he had three icebergs - I am speaking of icebergs at present - notified to him, not only ought to have been conveyed to his mind that there were

## **Page 813**

those three, but also that there might be many others.

*Sir Robert Finlay:* There might be, yes.

*The Commissioner:* I should like you to deal with that - if it is a fair inference from the Marconigram, that there may be others.

*Sir Robert Finlay:* There may be others.

*The Commissioner:* Coming down South.

*Sir Robert Finlay:* Yes.

*The Commissioner:* Coming across his course.

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* How, then, do you justify what he did?

*Sir Robert Finlay:* Does your Lordship mean in the matter of speed?

*The Commissioner:* Yes, I do, indeed.

*Sir Robert Finlay:* I justify it, my Lord, in this way, and I will deal with that point at once. I was going to take up two other points first, but I will go at once to that.

*The Commissioner:* Do not let me interrupt you.

*Sir Robert Finlay:* I prefer doing it for this reason; it is the crucial point in the case. A great deal of evidence has been directed to it, and the evidence is absolutely

overwhelming that no one in the Atlantic trade lowers speed in consequence of ice being reported.

*The Commissioner:* I am disposed to agree with you about that; but then I have to find out the cause of this disaster, and I have to say what, in my opinion, it was. Now the cause of the disaster, the effective cause of this disaster it appears to me - I suggest to you, at all events - was her going at this great speed when there was in fact an iceberg in the way. If the speed had been one-half or less than one-half the probability is that this catastrophe would have been averted.

*Sir Robert Finlay:* It might or might not, my Lord.

*The Commissioner:* It might or might not, and I distinguish - I shall be very glad if I can continue to distinguish - between what may be called an error of the Captain's judgment and negligence. But whether it be negligence or error of judgment does not affect the question what was the cause, the effective cause of the accident.

*Sir Robert Finlay:* Before I proceed to deal with the evidence about speed, let me call your Lordship's attention to what a very near thing it was here. I am going to deal with the look-out by and by - I am taking it out of the order I proposed, but I think your Lordship's order is, perhaps, better. When the iceberg was reported they starboarded. If they had not starboarded, if they had run right on there would have been a great shock, and one, probably two, compartments near the bows would have been stove in, and all those who were in the berths in that part of the ship would have been killed, but the ship would not have sunk.

*The Commissioner:* That is Mr. Wilding's suggestion.

*Sir Robert Finlay:* Yes, and I think that it is borne out by all the probabilities, because though there would have been a tremendous shock, it is impossible to suppose that you would have had the extensive opening made along the side of the vessel which was made under the circumstances that took place. Now suppose the officer on the bridge had held on his course and an Enquiry had taken place, what would have been said of any man who, under such circumstances, had held on his course and gone full tilt at the iceberg? The severest censure the Court could have pronounced would have been visited upon him.

*The Commissioner:* He would not have done that. He would have stopped and reversed, but still gone stem on.

*Sir Robert Finlay:* Stopped and reversed and gone stem on, but the stopping and reversing would not have had time to produce an effect such as to prevent the consequences which Mr. Wilding described here.

*The Commissioner:* No.

*Sir Robert Finlay:* So that, my Lord, it stands in this way: if he had done that you would have had a number of people killed; you would have had great damage to the forward part of the vessel; but the passengers and crew, at all events with the exception, perhaps, of some of the third class passengers forward, would have escaped with their lives and without any serious inconvenience. That is what would have happened. But it was not an error of judgment to starboard: it was the right thing to do.

*The Commissioner:* I am not sure, but I do not think it matters. If Mr. Wilding is right that that vessel would never have sunk at all, and that you would have, at most, killed a couple of hundred people if you had gone straight stem on to the ice, if he is right about

that, then it was a foolish or a wrong thing to starboard and so damage the ship that she could not float and 1,300 people were killed.

*Sir Robert Finlay:* Surely, if there ever was a case of being wise after the event it is illustrated by that proposition.

*The Commissioner:* I quite agree, and nobody in his senses, in my opinion, could blame the man who starboarded the helm. It might be a much better thing, as Mr. Wilding says, to have gone stem on, but nobody would blame the man who starboarded his helm.

*Sir Robert Finlay:* On the contrary, he would have deservedly incurred the most severe blame if he had not starboarded.

*The Commissioner:* I am not sure. How can you say that, if you once admit the statement that by going stem on he would have preserved the lives of 1,300 people?

*Sir Robert Finlay:* For this reason, my Lord: You must look at things as they are, as they present themselves to the minds of those on the bridge at the time.

*The Commissioner:* Of course you must; but how you can say that he would have been blamed if it be the fact that by going stem on he would have saved 1,300 lives that were subsequently lost?

*Sir Robert Finlay:* Not 1,300.

*The Commissioner:* Whatever the number was.

*Sir Robert Finlay:* Say 20 or 30.

*The Commissioner:* Twenty or 30 what?

*Sir Robert Finlay:* I beg your Lordship's pardon. I thought you were referring to the number of lives that would have been lost by going stem on.

*The Commissioner:* Oh, no. If this man, Murdoch, had gone straight stem on to this berg, if Mr. Wilding is right, the result would have been that 1,300 lives which were lost would have been saved.

*Sir Robert Finlay:* Yes; but no one would have known what the result of starboarding would have been, and any Court would have said that Mr. Murdoch was guilty of the grossest possible negligence in not trying to avoid that berg. What happened was this: One must work it out by seeing how the thing presents itself to those who have to deal with it.

*The Commissioner:* Nobody could blame Mr. Murdoch for trying to avoid the berg; all I say is, and all I mean is that, if Mr. Wilding is right, then starboarding the helm was not a wise thing to do.

*Sir Robert Finlay:* Your Lordship will forgive me; as it turned out, a great many lives were lost, but no one could have foreseen that.

*The Commissioner:* No.

*Sir Robert Finlay:* What one has to apply one's mind to is this: Suppose Mr. Murdoch had held straight on, only stopping and reversing, what would any Court have said about his conduct? He could not then have brought home to the mind of the Court that if he had starboarded he would have been caught by this point of ice which would have ripped up his side like a sardine knife. He would have been told: "You are guilty of the grossest possible negligence; if you had starboarded, you would in all probability have avoided that berg."

*The Commissioner:* But in point of fact, he did not avoid it by starboarding.

*Sir Robert Finlay:* I know he did not.

*The Commissioner:* What it did was to rip up the whole side of the ship.

*Sir Robert Finlay:* We are upon the question of whether he did the right thing, and I say, not only could he not be blamed, as your Lordship has said, for starboarding, but he would have deserved the severest blame if he had not starboarded. One cannot judge of the thing by the

## **Page 814**

light of after events. What happened was this. By starboarding, as one of the look-out men said to the other, it appeared as if it were a near shave. They avoided the body of the berg, but there was this projecting spike which caught the starboard bow under the water, ripped up the vessel for some six watertight compartments, so that the vessel ultimately sank. That was an extraordinary accident, a very extraordinary accident, and all the circumstances are circumstances that I daresay never happened in the history of the world before and may never happen again.

*The Commissioner:* But you know we are getting away from the point to which I wanted to direct your attention. With the knowledge that there was a possibility of finding icebergs right in the track, how is the speed of 22 knots an hour justified? That is the point.

*Sir Robert Finlay:* I am coming back to that, if I have made clear my position that not only could he not be blamed for starboarding, but he would be deserving of the severest blame if he had not. I very confidently submit that to the judgment of the Court when this question comes to be considered, but I will go on at once now to the question of speed.

*The Commissioner:* I do not think the starboarding has anything to do with it at present. What I mean is that that speed ought not to have been on the ship in the face of those Marconigrams.

*Sir Robert Finlay:* With great deference I submit, when the evidence is looked at, the Court cannot come to that conclusion. Can it be said that Captain Smith was guilty of negligence by doing that which had been done by every vessel in this trade for a long series of years? I will call attention presently to the evidence on the point, because I think the effect of the evidence must a little have faded from your Lordship's mind, having regard to what your Lordship said a few minutes ago. But before calling attention to the evidence as to the uniform practice, I desire to call attention to the fact that it had worked well and given admirable results in practice, and I will test that by taking three sets of tables coming from perfectly different quarters. Will your Lordship take first the table produced by the Board of Trade? Your Lordship will find it at page 580, Question 22142. These are the statistics produced by the Board of Trade, and they show that from 1892 to 1901 three and a quarter million passengers were carried across the Atlantic, that system of keeping full speed, though ice is reported, being maintained all the time. During that time only 73 were lost. From 1902 to 1911 six million passengers were carried across the Atlantic, that is Question 22148 on the same page, but out of those six millions only nine were lost. I very much doubt whether, if the practice of slowing down had been adopted, the loss would not have been very much greater, for a reason I will give presently. The second set of statistics are those of the White Star Line for 11 years. It is on pages 496

and 497. The first number I am giving is excluding the "Titanic": 2,179,594 passengers had been carried by the White Star Line during those 11 years. There had been only two deaths from collision. It does not appear it was by icebergs; in fact, I do not think it was, it was by ships. There were only two deaths. How can it be said that there was something wrong with a system which yields such a result as that? Every one of these vessels had been keeping up speed after ice was reported, and yet I gather the Attorney-General is going to ask the Court to find negligence on the part of the Captain of the "Titanic" for doing what every Captain during all that time had done.

*The Commissioner:* I do not think it is necessary for him to ask that; he may ask it, but I do not think it necessary.

*Sir Robert Finlay:* If he asks it I certainly hope he will not get it. I submit he cannot. I do not know what line my friend is going to take about this.

*The Commissioner:* What he is going to ask is what was the cause of this accident.

*Sir Robert Finlay:* Was there blame?

*The Commissioner:* He might ask that as well, but the real question is, What was the cause of the accident, the effective cause?

*The Attorney-General:* I think it is right, my Lord, that my friend should know the argument I am going to address to your Lordship. As I said a little earlier in the Enquiry, I shall submit to your Lordship certain considerations, upon which I should ask you to come to the conclusion that there was negligent navigation of the vessel in going at this pace under the circumstances. I think it is right my friend should know. Of course, it is no part of my case to do more than to put these considerations before the Court, and the Court will judge whether that is so or not. It is not a question whether I succeed in establishing it or not, but I think it is right that the Court should have certain considerations before it in order to come to a conclusion upon them.

*The Commissioner:* Are you going to invite us to exclude from the calculation the question of whether there was an error of judgment?

*The Attorney-General:* Oh, no, certainly not. There are the two considerations. Your Lordship has put them. You may say it was an error of judgment which did not involve negligence.

*The Commissioner:* Yes.

*The Attorney-General:* There is something to be said upon that.

*The Commissioner:* But whether it be negligence or error of judgment does not affect the question of what was the cause of the disaster. The cause of the disaster was not negligence; the cause of the disaster was not error of judgment; the cause of the disaster was the collision with the iceberg.

*The Attorney-General:* That is what was occurring to me, my Lord, and therefore if you are going to find whether or not there was an error of judgment or negligent navigation, if you are going to find anything of that kind - and I submit that one must give consideration to it, because you have to determine what is to happen in the future, which is a very important matter, much more important even than the very disastrous calamity into which we are enquiring -

*The Commissioner:* What will happen in the future is a very different thing from what has happened in the past. *The Attorney-General:* I know.

*The Commissioner:* Because in the future this calamity will always be known, and people must alter their conduct with reference to what they know.

*The Attorney-General:* I should be sorry to press it unduly; but your Lordship has had evidence in this case of the White Star Line that they think it is perfectly legitimate to do it, and, indeed, according to Mr. Ismay's evidence, assuming you have a clear night and the other conditions which of course, he assumed, it would be right to go as fast as you possibly can in order to get out of the region in case you might be overtaken by fog.

*The Commissioner:* I know, but we must judge about that.

*The Attorney-General:* I know, but that is one of the things I want to deal with when I come to address your Lordship, and I shall submit that it is quite a wrong view to take. I shall also submit to your Lordship that it does not decide it to say that a number of competing lines have done the same thing for a number of years. It does not decide it; I do not say it is not an element.

*The Commissioner:* I daresay Sir Robert Finlay is going to say what Mr. Bruce Ismay said, that it is the right thing still to do it.

*The Attorney-General:* Yes.

*The Commissioner:* That, in my opinion, is a very different thing from the question whether it was the right thing at the time.

*The Attorney-General:* I know there are different considerations which would apply; I quite agree.

*Sir Robert Finlay:* My Lord, with regard to what is to be done in the future, if any recommendation can be made which will render the passage across the Atlantic even safer and more completely immune from loss of life than it was previous to this great catastrophe, that will be a most beneficial

## **Page 815**

result of the Enquiry. But I am concerned at present with the question whether the Captain was at fault. That is the question I am addressing myself to. I did not desire to enter, certainly not at the present time, into the question of the future, if your Lordship should make any recommendation on the subject; nor did I desire at the present time to deal with the question of whether any recommendation as to the future should be made. But what I am pressing most respectfully upon the Court with all the emphasis in my power is this, that it is perfectly impossible to find that Captain Smith was to blame when he did what everyone in the trade had done for years with such admirable results in the way of avoiding accident.

The statistics do not rest there because you have a third set from Sir Norman Hill. They are framed on a different principle. His statistics are at page 663, and they show that there had been 32,000 voyages across the Atlantic in 20 years; that in that time there had been 25 accidents, defining as an accident anything that involved either the loss of life or the loss of the ship, and that in those 25 accidents 68 passengers and 80 crew were lost. That was the total loss on 32,000 voyages. Surely by the light of experience, by the light of these figures, the three sets of statistics from different quarters, one sees that it is under all normal circumstances possible to see an iceberg in time to avoid it, and that this

accident must have been the result, as I hope to satisfy the Court beyond all reasonable doubt, of an extraordinary combination of circumstances, and that there was not any fault of any kind on the part of Captain Smith. I submit there was not even an error of judgment. Negligence, I submit, is out of the question, and cannot be found in face of the evidence which I am going to call attention to with regard to the uniform practice. Error of judgment, I submit, there was none, because a man does not commit an error of judgment because he does something which in the result is followed by unfortunate consequences. A man may do the rashest possible thing, and the consequences may be most beneficial, but he is rash all the same; a man may do the wisest possible thing and the results may be disastrous, but he was wise all the same. One cannot judge by the result which happened in the particular case as to the wisdom or unwisdom of the course taken. My very respectful submission is that negligence there certainly was none, and that there was not even an error of judgment, but that Captain Smith acted rightly in following the usual course.

Now, my Lord, there is a very good reason indeed why they should not slow down when in the neighbourhood of icebergs, and it is this, that you are apt to have fog coming on when you are among icebergs, and if fog comes on when you are among icebergs it is a very dangerous thing indeed.

*The Commissioner:* But is it? If you are in a fog and you are conscious that there are icebergs about why cannot you stop?

*Sir Robert Finlay:* Of course you would have to stop.

*The Commissioner:* I have been told that they do go ahead as quickly as they can sometimes through a fog; that is, I suppose, for the purpose of getting through the fog and out of it?

*Sir Robert Finlay:* Your Lordship will recollect what Mr. Sanderson said with regard to that.

*The Commissioner:* I know; I remember it. He said some vicious person had stated it.

*Sir Robert Finlay:* There was an alternative, my Lord.

*The Commissioner:* Or foolish, was it?

*Sir Robert Finlay:* Or ignorant. But I am not quoting that for the sake of the epigrammatic form in which Mr. Sanderson put it; I am putting it merely as the statement of a person who knows if any one does what the practice of liners is under those circumstances. And Mr. Sanderson was only putting in very emphatic form a statement that, as a matter of fact, the ocean liners do not go full speed ahead through fog. Suppose you do become involved in a fog among icebergs, then you would have to stop altogether. I do not know then that would deliver you from all danger of accident; if you have these icebergs drifting about and coming grinding up against your vessel I do not know that you would be immune from damage even in that case.

*The Commissioner:* But they do not drive about.

*Sir Robert Finlay:* I did not say they drive; they drift about. I respectfully put it to your Lordship that what was said by Mr. Owen Jones, of the "Canada," on page 666, on this point is sound. It is Question 23708, where, after he had been dealing with the practice, he is asked: "(Q.) Where you have ice about, in your experience are you liable to have fogs? - (A.) Very liable. (Q.) Does that, in your judgment, afford any reason for the practice you have always pursued as to speed? - (A.) Yes, we always make what speed

we can. (Q.) Just tell us, in your own way, what effect that fact has on your practice as to speed? - (A.) Well, we always try to get through the ice track as quickly as possible in clear weather. (Q.) If fog came on while you were there? - (A.) It would increase the danger very much. We have to slow down or stop." Under those circumstances, experience having shown that you can see an iceberg in time unless under such extraordinary circumstances as happened here, I put it to your Lordship that it is impossible to say there is any error of judgment in following the usual practice. Now I propose to direct your Lordship's attention to the evidence with regard to the practice on this point. The first is the evidence of Mr. Lightoller at page 309, Question 13726: "(Q.) You have had great experience of the North Atlantic at all times of the year. Just tell me, when a liner is known to be approaching ice, is it or is it not in your experience usual to reduce speed? - (A.) I have never known speed to be reduced in any ship I have ever been in in the North Atlantic in clear weather, not on account of ice. (Q.) Assuming that the weather is clear? - (A.) Clear." Then on page 328 he is asked again about this at Question 14368: "(Q.) Do you know any reason for those boilers being off? - (A.) Merely that there was no wish for the ship to travel at any great speed. (Q.) There was no reason, I take it, why you should not go fast; but in view of the abnormal conditions, and of the fact that you were nearing ice at ten o'clock, was there not a very obvious reason for going slower? - (A.) Well, I can only quote you my experience throughout the last 24 years, that I have been crossing the Atlantic most of the time, that I have never seen the speed reduced. (Q.) You were asked by my Lord this forenoon how an unfortunate accident like this could have been prevented in what you describe as abnormal circumstances? - (A.) Yes. (Q.) Is it not quite clear that the most obvious way to avoid it is by slackening speed? - (A.) Not necessarily the most obvious. (Q.) Well, is it one way? - (A.) It is one way. Naturally if you stop the ship you will not collide with anything. (Q.) There is no reason why you might not slacken speed on this voyage; you were not running to any scheduled time? - (A.) No. (Q.) If you happened to be on the bridge in command yourself could you take it on your own responsibility to slacken speed, or would you require to communicate with the Captain? - (A.) Communicate with the Captain. (Q.) And the speed, therefore, could only be diminished by the Captain's orders? - (A.) No, I would not go so far as to say that the speed could only be diminished by that. Let me give you an instance. Suppose I had seen the smallest scrap of ice, supposing we had passed a little bit of the field ice that was knocking about on the other side of this pack ice, had I seen any indication of the vicinity, proof positive of the vicinity of ice, I should very probably have telegraphed myself at the same time that I sent word to the Commander."

*The Commissioner:* "Telegraphed" means he would have slackened speed?

## **Page 816**

*Sir Robert Finlay:* Yes.

*The Commissioner:* Let us consider. "Had I seen any indication of the vicinity of ice," and then he qualifies it by "proof positive of the vicinity of ice." "Had I seen any indication of the vicinity of ice I should very probably have telegraphed." *Sir Robert Finlay:* I think one must take the earlier part of the sentence, my Lord: "Supposing I

had seen the smallest scrap of ice, supposing we had passed a little bit of the field ice that was knocking about on the other side of this pack ice, had I seen any indication of the vicinity" - that is a little bit of the field ice that was knocking about - "I should very probably have telegraphed myself at the same time that I sent word to the Commander."

*The Commissioner:* Did not he have the most distinct information that ice was in the vicinity?

*Sir Robert Finlay:* But what Mr. Lightoller is referring to is ice of a totally different kind. He is talking about large bits of field ice knocking about. They would not be seen like an iceberg. He is talking of bits of field ice knocking about so that the vessel would come bumping up against them.

*The Commissioner:* Yes, but he is being asked about ice generally.

*Sir Robert Finlay:* His only qualification is, "Supposing we had passed a little bit of the field ice that was knocking about on the other side of this pack ice, had I seen any indication of the vicinity, proof positive of the vicinity of ice" -

*The Commissioner:* If he gets a telegram telling him he is going through an ice region in which he will be in the vicinity of ice he will not slacken speed, but if he sees a bit of ice in the water he will?

*Sir Robert Finlay:* No, my Lord, the two things are perfectly different. Where you have bits of ice in the water is one thing; icebergs is another. The bits of ice in the water cannot be seen as easily as an iceberg, and they are an indication that you are close to field ice. That is really dealing with a different thing, my Lord.

*The Commissioner:* Well, I do not know. Take the earliest of the three telegrams that referred to field ice.

*Sir Robert Finlay:* As well as to bergs.

*The Commissioner:* Yes, the "Caronia" and the "Baltic" both.

*Sir Robert Finlay:* Yes.

*The Commissioner:* Now, the "Caronia" telegram or the "Baltic" telegram came at 1.50.

*Sir Robert Finlay:* The "Baltic."

*The Commissioner:* Yes; that was the telegram which, upon calculation, indicated that they would get into the region of ice at 9.30.

*Sir Robert Finlay:* Get into the longitude where that was reported.

*The Commissioner:* Well, the "Caronia" would indicate that they would get into field ice at 9.30.

*Sir Robert Finlay:* No, my Lord, that they would get to the longitude where it had been reported, reported two days before.

*The Commissioner:* Yes, I know that; but what I mean is this: If he knew that it had been there, two days before if you like, is it not an indication that he might expect to find it there then?

*Sir Robert Finlay:* My Lord, that ice would most certainly, as I shall submit to your Lordship, have gone to the Southward of his track. I hope to satisfy your Lordship (I turn aside to deal with the question of speed) that it was not the "Caronia" ice, that it was not the "Baltic" ice and that it was not the ice dealt with in the first message of the "Californian" that this ship collided with. Because as regards the "Californian" ice and

the "Baltic" ice, that was far to the Eastward of where the collision happened; it could not be that. As regards the "Caronia" ice, even allowing for a drift of only half a knot that ice must have got to the Southward of the track which the vessel was pursuing. It must have been another berg of which no intimation had been given. All that he could do was to take the track which he thought best adapted to give a wide berth to the field ice, and a track which was not so far South as to get into contact with the "Baltic" and the "Caronia" ice which by that time would have gone, drifting away under the influence of the Labrador Current, to the Southward. If it did not reach the Labrador Current it would be going to the Eastward, so that he would be just as safe as regards icebergs as he would be as regards field ice. But that I shall return to, my Lord. I turned aside to deal with the question of speed.

*The Commissioner:* It is pointed out to me that the "Baltic" telegram indicated to the Captain that there was field ice South of the limit of field ice indicated by the route chart?  
*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* Have you the route chart? Let me explain to you the suggestion that is made. The "Baltic" telegram would convey to the Captain's mind that the field ice was to the Southward of the limit indicated on the chart for field ice.

*Sir Robert Finlay:* Yes, certainly.

*The Commissioner:* Very well. Now that would show apparently that the Gulf Stream was not bringing that ice to the East, but that the Labrador Current was bringing it down to the South.

*Sir Robert Finlay:* Your Lordship is referring to the field ice?

*The Commissioner:* Yes, I am referring to field ice. First of all, it was a singular thing and a thing which Captain Smith would have noticed, that the "Baltic" telegram indicated field ice at a point considerably South, some miles to the South of the limit of field ice as depicted upon the route chart; and if it was somewhat to the South it must have been brought, one would suppose, by what you call the Labrador Current.

*Sir Robert Finlay:* Not the field ice at that point, my Lord; it would be brought by the Labrador Current further North, but where the field ice which came down with the Labrador Current struck the Gulf Stream we do not know; and the Labrador Current may have brought down this field ice further to the West, and then being caught by the Gulf Stream it would move slowly in an Easterly direction until it got to the spot where the "Baltic" reported. Your Lordship sees the Labrador Current is on the surface further North.

*The Commissioner:* In answer to that observation it is said that we have the fact that the temperature fell something like 10 degrees, I think it was in two hours, and that would show that the force in operation was the Labrador Current and no other.

*Sir Robert Finlay:* Not necessarily, my Lord. Your Lordship is aware of the extreme difficulty of saying what the fall in temperature is due to. It is certain that it is no clear indication of the presence of ice. As was said by, I think, Sir Ernest Shackleton, if the temperature dropped suddenly when there is no wind at all he would consider that as putting him on guard against ice; but if it drops when there is wind, nothing of the kind.

*The Commissioner:* But there was no wind.

*Sir Robert Finlay:* There was till 3 o'clock.

*The Commissioner:* Yes.

*Sir Robert Finlay:* And the temperature began to drop on the Sunday, as your Lordship pointed out.

*The Commissioner:* Yes, but the great fall was on the Sunday afternoon and evening.

*Sir Robert Finlay:* But it had been falling.

*The Commissioner:* Yes, there had been a very marked change. I agree it had been falling, but there was a very serious change in the afternoon of Sunday.

*Sir Robert Finlay:* Let me point out how the observation which your Lordship made with regard to the "Baltic" field ice is met. The Labrador Current running in a Southerly direction is on the surface until it crosses the Gulf Stream. Then being much colder it goes under the Gulf Stream. Till it has impinged on the Gulf Stream it is running on the surface, and it would bring that field ice to any point in the Gulf Stream. Then when the field ice got into the Gulf Stream it would be carried in an Easterly direction. That would account for its being found at the spot where the "Baltic" reported it. It does not follow that the field ice and the bergs have kept company all the

## **Page 817**

way. The bergs, of course, going down, a great many of them, into the cold Labrador Current below the Gulf Stream, take a different direction, but the field ice is only susceptible to the Gulf Stream as soon as it has impinged upon it; but then it is first brought down by the Labrador Current.

*The Commissioner:* I have here the changes in the temperature of the water. At 7 o'clock it was 43°, at 7.35 it was 39°; at 9 o'clock it was 33°; and at 9.50 it was 32°.

*Sir Robert Finlay:* On the morning of Sunday?

*The Commissioner:* No, in the evening.

*Sir Robert Finlay:* Yes.

*The Commissioner:* And it is suggested to me that that is an indication that the vessel was in the Labrador Current. I may say also that it is also suggested to me that you are, perhaps right in saying that the Labrador Current when crossing the Gulf Stream descends and goes under the Gulf Stream.

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* Because it is colder water.

*Sir Robert Finlay:* There is no doubt about that, my Lord. If I may again refer to the passage on page 34 of Part I. of the "United States Pilot," the Admiralty directions. I think it is conclusive: "These icebergs are sometimes over 200 feet in height and of considerable extent; they have been seen as far south as latitude 39° N., to obtain which position they must have crossed the Gulf Stream impelled by the cold Arctic current underrunning the warm waters of the Gulf Stream. That this should happen is not to be wondered at when it is considered that the specific gravity of fresh water ice, of which these bergs are composed, is about seven-eighths that of sea water; so that however vast the berg may appear to the eye of the observer, he can in reality only see one-eighth of its bulk, the remaining seven-eighths being submerged and subject to the deep water currents of the ocean. The track of an iceberg is indeed directed mainly by current, so small a

portion of its surface being exposed to the action of the winds that its course is but slightly retarded or deflected by moderate breezes."

*The Commissioner:* I must correct something that I said, Sir Robert; I made a mistake, I think, I gave you the temperatures from 7 to 9.50, but it is not clear that those were water temperatures; and if they were air temperatures their significance is not nearly so great as it would be if they were water temperatures.

*Sir Robert Finlay:* I am much obliged to your Lordship. May I recur to the answer given by Mr. Lightoller about his slackening speed if he saw bits of ice knocking about. That would indicate two things: first you could not see a comparatively small bit of ice as you could a great object like an iceberg so as to avoid it; and secondly, it would mean this, that he was very near field ice. He is not speaking at all of the propriety of slackening speed when an iceberg has been notified; on the contrary, he had said in the distinctest possible way in the passage which I first read that he would not do anything of the kind. May I go on, and I think his further evidence will show clearly what he meant. Perhaps I had better read some further passages at page 329 in this connection. He is asked about his instructions from the White Star Line at Question 14,378: "Is there anything mentioned in those instructions about what you should do when you are in a region in which ice has been reported? - (A.) There is nothing that refers particularly to ice." That is as distinguished from the Canadian trade, where your Lordship recollects the direction about field ice. Then Question 14385: "Now in your evidence in America you narrate a conversation which took place between yourself and the Captain when he was on the bridge with you. Senator Smith asks you, 'Was anything else said?' and you say 'Yes; we spoke about the weather, the calmness of the sea, the clearness, about the time we should be getting up towards the vicinity of the ice, and how we should recognise it if we should see it, freshening up our minds as to the indications that ice gives of its proximity. We just conferred together generally for 22 minutes? - (A.) That is right. (Q.) The principal thing you had been talking about was ice? - (A.) Naturally. (Q.) Did you decide then when you first saw the ice you would stop or slacken speed? - (A.) No. (Q.) Do you mean to say that the policy of the Captain and you was to go right ahead at 21 1/2 knots? - (A.) No; I do not mean to infer that. (Q.) Unless there was a haze? - (A.) No, not necessarily unless there was a haze. Had we come across ice, as I just said, in any degree, whether the Commander had been on the bridge or not, I should have acted on my own initiative. (Q.) You freshened your minds up as to the indications? - (A.) Quite so."

*The Commissioner:* Just stop there for a moment: "Had we come across ice, as I just said, in any degree, whether the Commander had been on the bridge or not, I should have acted on my own initiative." What does he mean? What would he have done? *Sir Robert Finlay:* If he saw a berg head he would have ported or starboarded as the case might be, and if he got among loose ice -

*The Commissioner:* Do you think he means that?

*Sir Robert Finlay:* I do; he means to include that form of initiative. He also includes what I think your Lordship's mind is upon, slackening speed if he saw bits of ice knocking about; and for two reasons, first that you cannot avoid them as you can an iceberg, and secondly because it would indicate that you were in the immediate vicinity of field ice. I think it includes both cases.

*The Commissioner:* But at all events it does include the possibility of slackening speed.

*Sir Robert Finlay:* Oh yes, in the case to which he had referred in Question 14375. Then Question 14394: "Well, they ultimately discovered the ice you know, and the man on the bridge did not? - (A.) You say the man on the bridge did not. I may say I discussed that immediately on the 'Carpathia.' That is about the conversation on the 'Carpathia.'" *The Commissioner:* But, stopping there for a moment, as to the man on the bridge - there was only one man there, Murdoch; the other one was in the chart house I think - I am not by any means sure that he did not see the ice just as soon as the men in the crow'snest.

*The Attorney-General:* He did not see it before; he may have seen it as soon, I agree. *Sir Robert Finlay:* It is very likely he did, because the command to starboard came very quickly indeed.

*The Commissioner:* Yes, indeed, you find in some evidence that it is suggested that the order to starboard was given before the gong.

*The Attorney-General:* That is only a suggestion.

*The Commissioner:* It is only a suggestion.

*Sir Robert Finlay:* Your Lordship may remember the expression is: "The wheel was put over, the head was beginning to go round while I was still at the telephone."

*The Commissioner:* Yes, I have not got my mind at the moment on the passage in the evidence.

*The Attorney-General:* 14394 is the question, I think.

*Sir Robert Finlay:* "I may say I discussed that immediately on the 'Carpathia' with the look-out men - not necessarily discussed it, but asked them questions whilst their minds were perfectly fresh, and the look-out man told me" - that is the look-out man of the "Titanic" - "told me that practically at the same moment he struck the bell he noticed that the ship's head commenced to swing, showing that the helm had been altered probably a few moments before he struck the bell, because the ship's head could not have commenced to swing."

*The Commissioner:* That is what I mean. The Attorney-General is quite right, and that seems to indicate to me that possibly the man on the bridge had seen the ice even before he heard the bell.

*Sir Robert Finlay:* It may be, or simultaneously.

*The Commissioner:* We are perhaps a little off the point, but that also seems to indicate to me that there must have been something in the atmospheric conditions which prevented them seeing this berg until it was so close at hand that they could not avoid it.

**Page 818**

*Sir Robert Finlay:* I am much obliged to your Lordship; and that is a point upon which I shall lay the greatest possible stress. I do not attempt to deal with it at the moment, only for the reason that it would take a little time.

*The Commissioner:* Then you will not forget that Captain Rostron told us about the uncertainty that he found during the time that he was making for the place of the disaster, in the detection of icebergs, seeing some at a considerable distance and not seeing others until they were close upon him.

*Sir Robert Finlay:* It was one iceberg you will remember that he particularly did not see till he was very close upon it.

*The Commissioner:* A quarter of a mile, I think.

*Sir Robert Finlay:* He was, of course, further south than the scene of the disaster when that took place. It really provokes a suspicion that the iceberg may have been the same iceberg which had been seen from the "Titanic." She had gone further south by that time. It is, of course, pure speculation, but it was so exceptional a thing that that iceberg was not seen under the special conditions with regard to the absence of surf; it was black; there was neither wind nor swell and therefore that iceberg was not seen as soon as it would have been. There is something very special about that. But that takes me to another head.

*(Adjourned to To-morrow, at 10.30 o'clock.)*

# Wreck Commissioner's Court,

SCOTTISH HALL,

BUCKINGHAM GATE,

*Wednesday, 26th June, 1912.*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### **THIRTY-FIRST DAY.**

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. w. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## Page 820

*Sir Robert Finlay:* My Lord, I was calling attention yesterday to the evidence of the practice as to keeping speed although ice was reported, and I had begun by reading a portion of the evidence of Mr. Lightoller. I think I was reading at page 329 when the Court adjourned. I will complete reading the passage I was upon, and one other short passage in the evidence of Mr. Lightoller before I call attention, as shortly as possible, to the other evidence on this point. I read Question 14394 yesterday, and some discussion arose upon it with regard to the officer on the bridge having seen the iceberg at the same time apparently as the look-out men. Then Question 14395 is: "I take it then that your position is to justify the conduct of the Captain and those who were navigating the "Titanic" from 11 o'clock till the collision? - (A.) Yes. (Q.) In going ahead at 21 ½ knots, although you all knew that you were in the presence of ice? - (A.) Well, you hardly state it correctly when you say we knew we were in the presence of ice. We did not; we only had reports to go on. (Q.) You had no reason to disbelieve those reports? - (A.) On the contrary, we had, having so many years gone across and never seen ice though it is repeatedly reported. (Q.) I suggest to you it would have been a much safer thing to have believed the reports which you had from a number of sources as to the presence of ice than to have acted in disregard of the warnings you had received from other ships, and gone ahead at the rate of 21 ½ knots an hour until the collision occurred? - (A.) In the view of after events, of course, we form a totally different opinion. It would naturally have been safer, we can see now, not to have gone ahead at all." It is not correct to suggest, as that question does, that they disregarded the warnings of ice; on the contrary, the Captain gave strict injunctions to keep a careful look-out for ice. He followed the practice, which had been universally followed, of not slackening speed, but special caution was given to everyone to be on the look-out for ice, and the Captain, your Lordship will recollect, gave an injunction to the officer left in charge of the bridge that if there was the slightest haze coming on or anything of that kind, he should be called at once. He went into the chart room, close by.

*The Commissioner:* No precautions were taken with the exception of that direction to keep a careful look-out?

*Sir Robert Finlay:* Yes.

*The Commissioner:* There was nothing else done?

*Sir Robert Finlay:* Nothing else, I suggest, could be done in conformity with the ordinary practice.

*The Commissioner:* It has been said by some gentlemen who have been in the witnessbox that it would be a proper thing to put a man - one, at all events - in the eyes of the ship.

*Sir Robert Finlay:* That suggestion has been made, my Lord, and I have a full note of the witnesses who dealt with that point, to which I propose calling your Lordship's attention. At the present moment I will merely say that in the cases where a man was put in the bows of a ship usually there was only one man in the crow's-nest. They said they doubled the look-out, but, the evidence here was that the crow's-nest was a better place in the "Titanic" for seeing from than the bows would have been. *The Commissioner:* You will point out that evidence.

*Sir Robert Finlay:* If your Lordship pleases.

*The Commissioner:* The advantage of putting a man in the bows of the ship, as I understand, is this, that it brings him nearer to the object.

*Sir Robert Finlay:* A little nearer it does.

*The Commissioner:* And nearer to the waterline.

*Sir Robert Finlay:* I was going to say, the great advantage of having a man in the bows is where you have a boat where the stem is only 14 feet from the water, as in the "Nimrod," Sir Ernest Shackleton's boat. There, as he says, you see an iceberg much better if you are near the waterline, and you are there; but here the difference is only 30 feet. The stem, I suppose, is 60 feet above the water, and the crow's-nest is some 30 feet higher.

*The Attorney-General:* I thought 40 feet from the deck was the evidence.

*Sir Robert Finlay:* Not from the forecastle.

*The Attorney-General:* From the well deck, you mean.

*Sir Robert Finlay:* I think so. All I mean is that the great object of having a man on the stem ceases to exist when you have got a stem as high as it is necessarily in a vessel like the "Titanic." The conditions are absolutely different from those of the "Nimrod." In certain other cases, of course, they put a man on the stem, having one man in the crow's-nest. Of course, my Lord, it is a very vexed question whether it is better to have your two men together or only one man at each place. Your Lordship called attention at this point, I think, as the case was going on, and there is a good deal to be said either way. On the whole I submit that the balance inclines in favour of the practice of having two men, because they are a certain check on one another. They may talk but, on the other hand, if a man is by himself he may doze, and undoubtedly two pairs of eyes are better than one; and no man is likely to go to sleep if his fellow is there by his side, seeing what he is doing. I admit the point may be an arguable one, but my submission is that, on the whole, the practice on the "Titanic" was the sounder practice in having the two men together. Then Question 14399: "And that is what, at all events, in the light of your present knowledge, good seamanship would have dictated? - (A.) Not necessarily good seamanship. (Q.) Extra good seamanship? - (A.) No, not seamanship at all. (Q.) In the light of the experience you have had it is what you would do now? - (A.) In the view of our reports we have had in other voyages, if I say in the light of good seamanship or extra good seamanship, we should have stopped, the thousands of ships that have crossed the Atlantic would likewise have stopped, and then you come to the end of your tether. (Q.) I

do not say they would have stopped? - (A.) Well, or slowed down.” I need not read further on that page. Then on page 330, and this is the last passage I propose to read from Mr. Lightoller’s evidence at Question 14413 - I must read the answer immediately preceding, “I do not say I should bang on at all,” that was the phrase in the question - “ I do not approve of the term banging on. (Q.) I mean drive ahead? - (A.) That looks like carelessness, you know; it looks as if we would recklessly bang on and slap her into it regardless of anything. Undoubtedly we should not do that. (Q.) What I want to suggest to you is that it was recklessness, utter recklessness, in view of the conditions which you have described as abnormal, and in view of the knowledge you had from various sources that ice was in your immediate vicinity, to proceed at 21 ½ knots? - (A.) Then all I can say is that recklessness applies to practically every commander and every ship crossing the Atlantic Ocean. (Q.) I am not disputing that with you, but can you describe it yourself as other than recklessness? - (A.) Yes. (Q.) Is it careful navigation, in your view? - (A.) It is ordinary navigation which embodies careful navigation. (Q.) Is this your position, then; that even with the experience of the “Titanic” disaster, if you were coming within the near vicinity of a place which was reported to you to be abounding in ice, you would proceed with a ship like the “Titanic” at 21 ½ knots? - (A.) I do not say I should. (Q.) At nighttime, and at a time when the conditions were what you have described as very abnormal, surely you would not go on at 21 ½ knots? - (A.) The conditions were not apparent to us in the first place; the conditions of an absolutely flat sea were not apparent to us till afterwards. Naturally I should take precautions against such an occurrence.” With regard to the question which is implied in what Mr. Scanlan said there as to what he would do in the future, may I say this, that of course by the light of this very great calamity it may be

## **Page 821**

that your Lordship may see your way to making some recommendation with regard to the future. I feel sure, having regard to what has fallen from your Lordship, in the course of this case, that no such recommendation will at all trench upon what must always be, as your Lordship pointed out, the great security in cases of this kind, namely, the vigilance and judgment of the Commander of the ship. No rigid Rule can be laid down; but I am perfectly certain (and I think I speak not only for those whom I represent, but for everyone sailing the seas) that any recommendation which the Court may make with regard to the future will, of course, receive the most respectful and the most careful attention from those engaged in this traffic. What I am upon is this, that with all respect I say that it is impossible upon this evidence to say that there was any negligence on the part of those who were on board the “Titanic,” and who were merely following that practice which had been followed by everyone engaged in the Atlantic trade for a long series of years, and followed, as the statistics show, with most excellent results in the way of absence of casualty.

Then Question 14419 is: “And what precautions would you take if you would not slow up or slow down? - (A.) I did not say I would not slow up. (Q.) Cannot you say whether you would or not? - (A.) No, I am afraid I could not say right here what I should do. I

should take every precaution, whatever appealed to me. (Q.) I suggest to you, if you acted carefully and prudently, you would slow up, and that if you did not slow up you would be acting recklessly. You know you have described the conditions of abnormality as having been apparent at the time while you were on your watch. You have told my Lord that at great length; and in your conversations with the Captain did not you discuss that? You have said that you did not recognise that the sea was flat. I want to recall this to your mind." Then the Note is read to him first with regard to freezing - a conversation with the Commander on the bridge about the cold, and he says: "We then commenced to speak about the weather. He said, "There is not much wind." I said, "No, it is a flat calm, as a matter of fact." He repeated it; he said, "A flat calm." I said, "Yes, quite flat, there is no wind." I said something about it was rather a pity the breeze had not kept up whilst we were going through the ice region. Of course, my reason was obvious; he knew I meant the water ripples breaking on the base of the berg? - (A.) Yes. (Q.) Was not all that amply sufficient to let you and the Captain know that you were in circumstances of extreme danger? - (A.) No. (Q.) I do not think anything would convince you that it was dangerous that night? - (A.) I have been very much convinced that it was dangerous. (Q.) I mean that the conditions you have described were dangerous? - (A.) They proved to be. (Q.) What I want to suggest is that the conditions having been so dangerous, those in charge of the vessel were negligent in proceeding at that rate of speed? - (A.) No."

Now, the whole of those questions ignore the fact, which I shall show on the evidence existed, namely, this: that those on the bridge of the "Titanic" could not from that height know that there was this absence of swell which was the fatal feature in the tragedy. That there was no wind, they knew; that there was no swell, they did not know, because, as has been said, you cannot, looking down from that height, see that there is no swell, and it was only when the boats were lowered into the water that they saw that it was an oily sea, perfectly flat and no swell, a condition, which, as Sir Ernest Shackleton, I think, said, might never occur again.

*The Commissioner:* Do you draw a distinction between no wind and no swell?

*Sir Robert Finlay:* My Lord, the terms are not always used with perfect accuracy. Sometimes the term is used in one way and sometimes in another, but the idea I wish to convey is this, as was explained, I think, by Mr. Lightoller, in answer to a question put by your Lordship, that although they knew there was an absence of wind, they did not and could not know that there was no swell. If there had been a swell there would have been the water breaking at the foot of the berg, though not to the same extent.

*The Commissioner:* Are you sure of that?

*Sir Robert Finlay:* So he says, my Lord. That is all the evidence.

*The Commissioner:* It occurs to me that a mere swell would not cause any breaking of water.

*Sir Robert Finlay:* The evidence is that it would.

*The Commissioner:* If the evidence states it I must be guided by the evidence.

*Sir Robert Finlay:* If your Lordship pleases.

*The Commissioner:* And by what my colleagues advise me. But what I mean is this; apparently in the conversation with the Captain, Lightoller pointed out that there was what he calls a perfectly flat calm.

*Sir Robert Finlay:* Yes.

*The Commissioner:* And then you want to say that is consistent with there having been a swell?

*Sir Robert Finlay:* Yes.

*The Commissioner:* That is my difficulty; is it consistent with a swell?

*Sir Robert Finlay:* I think your Lordship will find it is on looking at another part of Mr. Lightoller's evidence. I will turn aside now, if your Lordship thinks it desirable, to go into that.

*The Commissioner:* No, I would rather you went on.

*Sir Robert Finlay:* It is in the recollection of my friend, the Attorney-General, as well as my own, that Mr. Lightoller said distinctly that they could not from the deck see the absence of swell, and that if there had been a swell there would have been a breaking of the rollers at the bottom of the berg. On that point may I recall to your Lordship one passage in Sir Ernest Shackleton's evidence at page 720, Question 25063? The Attorney-General puts this question to Sir Ernest: "According to the evidence - I am only dealing with one part of it - perhaps the most striking part - during the afternoon on this particular occasion on 14th April of this year, the temperature was reported to be falling so much so that the Captain ordered the carpenter to see that the water in his tanks did not freeze. Would that be any indication to you? - (A.) If I knew what the mean temperature of that locality was for that month of the year, and there was a great variation, then I would certainly think there was some abnormal disturbance in the ice to the North. Of course, that particular night was an abnormal night at sea in being a flat calm; it is a thing that might never occur again. (Q.) That is what Mr. Lightoller says. You say apparently it is very rare to get such a flat calm as there was that night? - (A.) I only remember it once or twice in about 20 years' experience - the sea absolutely calm, without a swell, as it was recorded to have been."

*The Commissioner:* We know, or we have been told - whether it is true or not is another matter - that the water soon after the calamity was so smooth, with so little motion on it, that the boats which were lowered into it were not lifted sufficiently to disengage them from the tackles. *Sir Robert Finlay:* Yes.

*The Commissioner:* That appears to me to support the view you are putting forward. It is suggested to me that the swell would not possibly affect the bottom of the berg, it would not lift it, because the bulk of the berg down below would not be affected by the swell.

*Sir Robert Finlay:* No, but what I do say is this: I think there is evidence in support of what I am saying, and I do not think there is any evidence to the contrary, that where you have a swell on a great body of ice like a berg the swell will break upon it just as it would upon a rock.

*The Commissioner:* There seems to be some difference of opinion amongst my colleagues about that.

*Sir Robert Finlay:* The evidence is all one way upon that point, and your Lordship sees the importance Sir Ernest Shackleton attached to it. What he says in the two answers I have just read

is perfectly clear to show that in his opinion the absence of swell was a most important factor, and it can only have been in this way, that if there had been a swell you would have had the same thing happening -

*The Commissioner:* That must be what he means.

*Sir Robert Finlay:* There is a great deal of other evidence about it which I will call attention to presently.

*The Commissioner:* My attention has been drawn again to the evidence that Gill gave. Gill was on the "Californian," and he says at page 433, at the bottom (18179), "(Q.) While you were in your cabin did you hear the noise of ice? - (A.) Yes. (Q.) What kind of noise was it? - (A.) A grinding noise. (Q.) Grinding against your ship's side?" This is field ice, of course.

*Sir Robert Finlay:* Yes.

*The Commissioner:* "Yes; I was as close to the ship's side as I am to you; it kept me awake; I could not sleep for it. (Q.) Was it a noise of thick field ice? - (A.) No, just a grinding, rubbing noise."

*Sir Robert Finlay:* The "Californian" was at a distance which is variously estimated; it certainly was not nearer than seven miles.

*The Commissioner:* That may be, but it appears to me that if you had a swell seven miles away -

*Sir Robert Finlay:* Oh, but that might take place without being a swell.

*The Commissioner:* There must be some motion.

*Sir Robert Finlay:* Any current, even a slight current.

*The Attorney-General:* In a current the ship and the ice would move together.

*Sir Robert Finlay:* The "Californian" is brought up by the ice; it is heading, if I recollect rightly, North-East, and you have got the ice somehow passing by the ship's side, rubbing against it and making this noise.

*The Commissioner:* It is suggested that the ship and the ice would move together, and that, therefore, you would have no rubbing.

*Sir Robert Finlay:* It is difficult to argue from an expression of that kind, because nothing was put to this witness about there being a swell there, and the evidence is precise and definite to the effect that when the boats got down to the water there was absolutely no swell.

*The Commissioner:* That is the evidence from the "Titanic." *Sir*

*Robert Finlay:* Yes.

*The Commissioner:* I was talking for the moment of the evidence of Gill from the "Californian."

*Sir Robert Finlay:* The difficulty about that is this: That point was never pressed on Gill. No question was put as to there being no swell. All he said was: "I was kept awake by the rubbing of the ice." That might perfectly well be the vessel swinging. *The*

*Commissioner:* But swinging consequent upon what?

*Sir Robert Finlay:* Most certainly she swung round. Your Lordship recollects how her position changed. You do not have a vessel where it is brought up in that way absolutely motionless; it cannot very well be, and the vessel and the lumps of ice do not move at exactly the same rate. I submit there is a fallacy latent in the idea that because the ice and

the vessel move together there would not be that rubbing noise. They would not move at the same rate.

*The Commissioner:* I do not know that you are not right, but it appears to me that the difference in the way of the ship and the ice might produce that rubbing sound.

*Sir Robert Finlay:* I submit it would.

*The Commissioner:* One thing you point out is that it was not in the same position. *Sir*

*Robert Finlay:* It was not in the same position. Without pursuing any further the effect of Mr. Gill's evidence, I hope I have said enough to show the extreme danger of disregarding precise, positive and uncontradicted evidence as to the state of things where the "Titanic" was, and having recourse to any inferences from what -

*The Commissioner:* You understand that the evidence must be read with the experience of the gentlemen who advise me.

*Sir Robert Finlay:* Entirely, and I am very glad your Lordship has such expert assistance, and your Lordship has had considerable experience elsewhere, of course, in matters of this kind, and I am very glad that this evidence will be appreciated by minds that have gone through that previous experience.

Now, my Lord, I have finished reading all I wish to in this connection in Mr. Lightoller's evidence. I do not know what course your Lordship thinks it desirable for me to take with regard to the other evidence. There is a very large body of evidence. I understood your Lordship to say yesterday that there was a large body of evidence, and no contradiction that this had been the uniform practice in the Atlantic trade.

*The Commissioner:* Well, that is my impression of the evidence.

*Sir Robert Finlay:* Perhaps your Lordship, having regard to the enormous importance of the point, would think it well that I should just go through it. *The Commissioner:* I would very much rather you did, Sir Robert.

*Sir Robert Finlay:* If your Lordship pleases. Then I will take every witness who deals with the point.

The next witness that I call attention to is Captain Lord. I took Mr. Lightoller first as being on the "Titanic." Now Captain Lord, the Captain of the "Californian," at page 157, Question 6701, was asked: "Later on did you have to stop on account of ice? - (A.) I had to stop and reverse engines. (Q.) Would you tell us what time it was? - (A.) 10.21 p.m.," and then he gives the latitude and longitude.

Then on page 163, at Question 7047: "(Q.) Why did you double the look-out? - (A.) Because we had passed bergs during the afternoon, and we had had a report of bergs from Eastbound steamers. (Q.) You had reported to the "Titanic" that you had passed ice at half-past 6 that day? - (A.) Yes. (Q.) You doubled the look-out. You had one man at the crow's-nest? - (A.) Yes, and one man right in the bows of the ship." Question 7056, I am reminded, is very important. It is in another connection, it is true, but in passing it I just call attention to it. "(Q.) Did you find it better for detecting ice to have a man right in the bows like that? - (A.) Well, I do not know. This is my first experience of field ice. I think I saw the ice myself before they did." I was about to pass it for the moment because it is in another connection and will come in again on the question of the look-out and having a man in the bows.

Then on page 164, at Question 7112: "(Q.) When you first had warning of the presence of ice, did you slow down? - (A.) No. (Q.) You did not slow down? - (A.) No. (Q.) Is it not usual to slow down in the presence of ice? - (A.) No, not in clear weather. (Q.) At what speed were you going? - (A.) Eleven knots. (Q.) But if you are in a haze is it usual to slow down? - (A.) In an ice district, yes." There you have the practice of Mr. Lord, submitted to you by Mr. Lord, and what he himself did in conformity with that practice. Although he knew that ice was about he did not slow down.

*The Commissioner:* You see, the reason they do not slow down in clear weather is this, that according to their experience they have always time to steer clear of an obstacle.

*Sir Robert Finlay:* Yes.

*The Commissioner:* That is their reason, but, then, that reason did not apply to this particular night.

*Sir Robert Finlay:* Yes, but owing to circumstances which could not - *The*

*Commissioner:* Which were abnormal.

*Sir Robert Finlay:* Yes, that is really the whole point of the case; the case turns upon that.

*The Commissioner:* To my mind - I am speaking without any consultation with my colleagues - it is a truism to say that there should be no slowing down if the circumstances are such as to enable

## **Page 823**

you without any doubt to avoid obstacles without slowing down.

*Sir Robert Finlay:* I entirely agree.

*The Commissioner:* The whole object of slowing down is to enable you to avoid the objects which are in your way, and if you can avoid the objects in your way without slowing down, you do not slow down; at least, I should think not.

*Sir Robert Finlay:* I entirely agree.

*The Commissioner:* It does not appear to me to matter in the least whether the ship is going 11 knots or 50 knots, if it be true that you could always avoid the obstacle. Of course, you must first assume that it is true that you can always avoid an obstacle; if you can, then the speed is of no consequence; but if you cannot, or if there is a danger of you not being able to avoid the obstacle, then it becomes most important to reduce the speed.

*Sir Robert Finlay:* Then, of course, comes the practical application of what your Lordship has mostly justly characterised as a truism. The experience of the Atlantic trade and the statistics show that you can in clear weather in all ordinary circumstances see a berg in time to avoid it. Here there were abnormal circumstances which, as has been said by several witnesses, might never occur again, or might not occur once in a hundred years, that led to the accident, and that alone. I say with some confidence that no one can take these three sets of statistics with regard to the absence of casualties, the very small number of deaths on passages across the Atlantic relatively to the enormous traffic when this system was being uniformly pursued of going right ahead in clear weather at the same speed - no one, I say, can look at those statistics and fail to see that they were perfectly justified, these men of experience in this particular branch of navigation, the

North Atlantic, in their belief that in clear weather you could see the ice in time to avoid it. If that were not the case you could not have had such statistics as those which are before the Court.

The experience in this matter is worth any amount of theory about it. Here you have this uniform practice of 20 years and you have, I venture to say, an extraordinary absence of casualty. It is perfectly impossible that you could have had that low percentage of casualties if the system on which they were proceeding was not a sound one. And it was sound, because in clear weather you could see a berg in time to avoid it. That is my submission to your Lordship on that part of the case. The whole importance of the matter is when one comes to translate the general proposition, which your Lordship justly characterised as a truism, into practice. The practical question is, can you in clear weather see a berg in time to avoid it? And the answer I say is demonstrated, by the experience of 20 years, to be that you can; and the answer to the question, "How did the 'Titanic' not see it in time?" is supplied by the fact that the circumstances were extraordinary and abnormal, and such as may never occur again.

*The Commissioner:* You have not overlooked the fact that this was what you might call an abnormal ship. She was a very long ship, and a very big ship, and the circle in which she could turn was a large one.

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* It was not easy for that ship to turn a circle which would enable her to avoid anything in front of her.

*Sir Robert Finlay:* She was a big ship, undoubtedly.

*The Commissioner:* And that was a circumstance known to the Captain.

*Sir Robert Finlay:* But your Lordship recollects there were a great many other ships not very much less. I forget the lengths of the "Lusitania" and the "Mauretania," but they are not very far short. For all practical purposes I do not suppose there is much difference.

*The Commissioner:* I am told they were about 90 ft. shorter than the "Titanic."

*Sir Robert Finlay:* That does not make very much difference. Then your Lordship recollects the great big German liners. It is not as if this were a new departure altogether. This was a gradual growth; it had been going on. May I call your Lordship's attention to that Table which shows very well the history of the White Star Line; and, of course, it can be compared with the lengths of other vessels which are in evidence. It was handed in to the Court. I have it in the "Shipbuilder." My friend has a separate copy. *The Commissioner:* Yes, I have that.

*Sir Robert Finlay:* I only refer to it in a casual way at this moment for the purpose of showing how the lengths went on gradually increasing. The diagram slopes up from the left-hand side, with variations, of course, getting longer and longer. You have the "Adriatic" and the "Baltic," and then finally you have the "Titanic" and the "Olympic." That growth was going on gradually, but side by side with that growth in the White Star Line was going on the growth in the other vessels. I quite appreciate the point, but I submit to your Lordship that there is nothing in the additional length of the "Titanic" to render it improper to adhere to the ordinary practice which had always been pursued in this matter.

*The Commissioner:* I should have thought that the great length of this ship might make a difference, whether considerable or not, I cannot say, in the difficulty of avoiding an object.

*Sir Robert Finlay:* My Lord, is not the answer with reference to any suggestion of negligence that may be made on that score supplied by the fact that there are other ships, which, for practical purposes, are as big, which have adhered to the same practice? It is a matter which I suggest cannot be imputed as negligence to any officer in charge of the vessel that he did not vary from the ordinary practice in a way which no other Commander in charge of vessels which were approximately the same length, not very much shorter, did.

*The Commissioner:* Well, I interrupted you. You were giving us a list of the witnesses who had spoken to the practice.

*Sir Robert Finlay:* Yes, my Lord. Your Lordship will understand I am really most grateful for these interruptions, because I am very glad to have my attention called to anything passing in the mind of the Court. I might pass over points which may turn out to be important unless I were indebted to your Lordship for intimations of this kind. I was reading Mr. Lord's evidence at page 164, and I think I had read all that is material, and I need not read any more.

Then I pass to Mr. Moore, the Commander of the "Mount Temple." That is one of the Canadian Pacific boats. It is on page 208, at Question 9261: "(Q.) Have you instructions from your Company as to what to do when you meet ice? - (A.) We are not to enter field ice under any conditions. (Q.) Just tell us what your instructions are? - (A.) I have not got them here; they do not happen to be in these sailing orders, although I have them. Those instructions we usually get that we are not to enter field ice, no matter how light it may appear. (Q.) Not even in daylight? - (A.) At any time. We are not to enter field ice at any time, no matter how light it may appear. (Q.) When you got warning there was ice ahead, what precautions did you adopt? - (A.) I simply steered down. I went further down to the Southward. (Q.) Did you decrease your speed? - (A.) Not at all; it was daylight. (Q.) What is your highest speed? - (A.) About 11 knots."

*The Commissioner:* Then, of course, he does that which, if done in time, gets him out of the region of field ice.

*Sir Robert Finlay:* He went further to the Southward; he got only five miles to the South of the berg. I will show your Lordship, when I deal with what Captain Smith did, that he went further to the Southward, and went to the Southward on a course which, so far as the information that he

## **Page 824**

had about ice was concerned there was every probability would be a perfectly safe one.

*The Commissioner:* We will come to that.

*Sir Robert Finlay:* Yes, I do not propose to turn aside at the moment to deal with that. Then at Question 9379 -

*The Commissioner:* Will you read 9316?

*Sir Robert Finlay:* Yes, my Lord: "Now would you consider it safe in the neighbourhood of an ice-field, provided your boat had the power, to go ahead at 21 knots an hour? - (A.) It would be most unwise to go that speed at nighttime." I think with that must be read Question 9407: "And when you say it is not wise to go at 21 ½ knots - I think your expression was in the neighbourhood of ice - did you mean field ice? - (A.) Field ice. (*The Commissioner.*) And you have never gone through field ice except when you went to the position where the "Titanic" was lost? - (A.) No; I do not pass any ice at all."

*The Attorney-General:* The original question is "in the neighbourhood of an ice-field."

*Sir Robert Finlay:* Yes; there might have been a slight ambiguity as to the meaning of the term "ice-field" in Question 9316, but that possible ambiguity is removed by Question 9407, which shows he was speaking of field ice.

*The Commissioner:* I understand Question 9316 to refer to field ice. An ice-field, I think, means field ice.

*Sir Robert Finlay:* So far as the field ice of which we had intimation was concerned we did not see anything of it, and we should not see anything of it.

*The Commissioner:* I do not think that is very important.

*Sir Robert Finlay:* What is important is that, having regard to the Easterly drift the field ice would have, so far as it had any drift at all - it would drift with the Gulf Stream - the course the Captain took was certain to avoid it, and, as a matter of fact, he did avoid it and avoided it effectually. Then at Question 9379, on page 210, my friend, Mr. Laing, puts this question to the Witness: "Have you had a long experience in the North Atlantic trade? - (A.) Twenty-seven years. (Q.) And do you run to Montreal in the summer and St. John's in the winter? - (A.) Yes. (Q.) Have you ever tried using binoculars for your lookout? - (A.) No. (Q.) Is that a new idea to you? - (A.) Yes, it is. (Q.) With regard to yourself, on this voyage did you get a Marconi notice that ice was about? - (A.) Yes. (Q.) Was it fine, clear weather? - (A.) Yes. (Q.) Did you keep your speed? - (A.) I did. (Q.) I suppose in time you saw ice? - (A.) I saw no ice at all until I went back to the "Titanic's" assistance."

*The Commissioner:* But I suppose when he says here that he kept his speed, he means in the daytime.

*Sir Robert Finlay:* I do not think so, my Lord - "fine, clear weather." All the witnesses say they all do so night or day so long as it is clear weather.

*The Commissioner:* His speed was only 11 knots.

*Sir Robert Finlay:* As your Lordship said just now, it does not make any difference in the principle really. Your Lordship will remember Sir Ernest Shackleton, whose boat, the "Nimrod," had an outside speed of 6 knots, used to slow down to 4 knots when he got among the ice which he had to navigate - navigation, of course, of a very different kind from what we have to deal with in the North Atlantic. I will not enlarge upon that, because I shall comment upon Sir Ernest Shackleton's evidence by and by.

Then the observation which I make upon Mr. Moore's evidence is this, that he speaks to the same practice as every other witness who knows the trade speaks to, and his observation about the danger of going at 21 ½ knots is confined to field ice. This gentleman was in the Canadian trade.

Then Mr. Hayes of the "Adriatic," on page 569 -

*The Commissioner:* I think I am right in saying that the "Mount Temple" went to the Southward 26 miles?

*Sir Robert Finlay:* But Southward of the ice only 5 miles.

*The Commissioner:* But Southward of the course.

*Sir Robert Finlay:* I cannot at the moment give your Lordship the precise number of miles South of the course; he went five miles South of the Southernmost ice that had been reported to him.

*The Commissioner:* Yes, but is it right to say that he steered to a position 26 miles South of the ordinary track?

*Sir Robert Finlay:* I will have that worked out, my Lord; I cannot answer your Lordship at the moment.

*The Commissioner:* Was the "Mount Temple's" course the same as the "Titanic's"? *Sir Robert Finlay:* No, I do not think so.

*The Commissioner:* I think not.

*Sir Robert Finlay:* No.

*The Commissioner:* And if it was not, I am in confusion about this.

*Sir Robert Finlay:* May I call attention to a passage in the evidence of this witness, which I think makes the matter clear? It is on page 207, near the beginning of Mr. Moore's evidence. At Question.9224 he says he was going West, "on our sixty-second voyage West." Then at Question 9226 he is asked, "On the 12<sup>th</sup> April did you receive a message from the "Corinthian," informing you that there was ice? - (A.) On the 13<sup>th</sup> April. (Q.) Where was that ice? - (A.) 42 deg. 15 min. N. and 49 deg. 48 min. W.; 41 deg. 25 min. N., 50 deg. 20 min. W."

*The Commissioner:* What does that mean?

*Sir Robert Finlay:* I suppose it is between these limits: "(Q.) In consequence of that information did you alter your course? - (A.) I did. (Q.) When you got that information what course were you on? - (A.) About S. 65 deg. W. (Q.) And in consequence of that information to what did you alter your course? - (A.) Just a little to the Southward of that, because I went straight down to 50 deg. W." That "52 deg." should certainly be "42 deg." Instead of going down to 52 deg." - that is 42 deg. - "and 47 deg. W., I went down to 50 deg. W. and 41 deg. 20 min. N."

Now, your Lordship sees what he did. He did not turn at the ordinary corner. Your Lordship recollects that on the chart the corner is marked. He did not turn there; he ran down to 50 deg. W. and 41 deg. 20 min. N.; that is to say, he took a course that took him 5 miles to the South of the ice that had been reported.

*The Commissioner:* Did that take him out of the ice-field as advised in the telegram; it took him clear?

*Sir Robert Finlay:* As advised in the telegram which he got from the "Corinthian." What he did, my Lord, was to continue his course, instead of turning at the corner. He continued his course until he got to a point 5 miles South of the most Southerly ice that had been reported to him. So that your Lordship sees how like his proceedings up to a certain point were to those of the "Titanic." He did not turn at the corner, he ran on, and he ran on until he got to a latitude which was 5 miles South of the most Southerly ice that had been reported to him; he went on at his ordinary speed, 11 knots.

*The Commissioner:* He did not steer clear of the ice-field that is advised to him. By the "ice-field" I mean the space over which the ice was.

*Sir Robert Finlay:* I hope to prove to demonstration that the "Titanic" did escape all the ice that had been reported to her. She was struck by what must have been another berg.

*The Commissioner:* What I mean is the telegrams advised her of the existence of icebergs and field ice within a certain parallelogram.

*Sir Robert Finlay:* That telegram never got to the bridge; that is the "Mesaba" telegram.

*The Commissioner:* See if I have it right now. Did the course steered by the "Titanic" take her about five miles South of the nearest ice of which she had advice?

*The Attorney-General:* The "Mount Temple," I think your Lordship means. *The*

*Commissioner:* No, I am talking about the "Titanic" now.

## **Page 825**

*Sir Robert Finlay:* Yes, about that, my Lord.

*The Commissioner:* That is what I am told - four or five miles. I am taking the three telegrams.

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* And none other. She was South of all the ice.

*Sir Robert Finlay:* She was South of the position.

*The Commissioner:* Of all the ice referred to in these three telegrams?

*Sir Robert Finlay:* Yes.

*The Commissioner:* And the nearest ice referred to in these three telegrams was over four or five miles to the North.

*Sir Robert Finlay:* Certainly. I will deal in detail by-and-by with the course that the Captain took and his reasons for it, because, of course, one has to bear in mind that while the bergs are drifting and may be drifting Southward if they are so bulky as to get through the Gulf Stream down to the Labrador Current below, the field ice and any bergs which are not so bulky as to get down through the Gulf Stream to the Labrador Current will be drifting Eastward. And I shall show your Lordship, I hope, that the Captain had very good reasons for going just as far South as he did and not further. I hope to show beyond all doubt that the berg which struck the "Titanic" was not a portion of any ice which had been reported to him.

*The Commissioner:* You have gone away from the point to another point.

*Sir Robert Finlay:* But the points your Lordship puts are so important that I do not like to pass them by, but I want to clear them up as I go along. *The Commissioner:* You are quite right.

*Sir Robert Finlay:* Now I have finished with Mr. Moore's evidence, and I pass on to the evidence of Mr. Hayes, of the "Adriatic," on page 569. He states his experience in the first column on that page, and at Question 21804 he is asked with regard to the matter upon which the Court is engaged. He is first asked about the look-out.

*The Commissioner:* Tell me, to begin with, what line this gentleman belongs to.

*Sir Robert Finlay:* The "Adriatic," the White Star Line. Then Question 21809 and the following questions are devoted to the look-out. I will not read them, because I shall have

to deal with the look-out by itself. At Question 21814 he is asked: "Did you proceed at the same rate of speed? - (A.) At the same rate of speed. (Q.) You made no alteration? - (A.) No alteration. (Q.) Is that the practice in your line, so far as you know? - (A.) It is the practice all over the world, so far as I know - every ship that crosses the Atlantic. (Q.) To make no alteration in speed, notwithstanding that you may have been advised of the presence of ice? - (A.) Ice does not make any difference to speed in clear weather. You can always see ice then. (Q.) The experience of the "Titanic" shows you cannot always? - (A.) There were abnormal circumstances there which nobody has ever experienced before. (Q.) But you said you can always see it? - (A.) In clear weather, I am talking of. (Q.) Now I want to ask you, at night - supposing you are steaming at night, and it is reported that along the course you are following you will come into an ice-field, according to your view would you make any reduction in the rate of speed? - (A.) None, till I saw the ice. (Q.) None till you saw the ice? - (A.) No. (Q.) If you saw it too close it would be too late? - (A.) But you would not see it too close in clear weather. (Q.) What? - (A.) You would not see it too close in clear weather. That is my experience. (Q.) Of course, I am only asking you according to that. Is this right then? Supposing the weather is clear, and a proper look-out is being kept, you would be able to see ice at sufficient distance to enable you to avoid it? - (A.) Certainly. (Q.) That is what you mean? - (A.) That is what I mean. (Q.) Whatever your rate of speed? - (A.) Whatever my rate of speed. (Q.) And supposing you have an iceberg which is 60 to 80 feet high from the sea level, how far off do you think you would see that on a clear night? - (A.) Six or seven miles, I should say. I have seen it 10 miles. (Q.) What is it that you see; what is it first calls your attention to the fact that there is an iceberg there? - (A.) You see a light there; the ice is light. (Q.) You mean light against the horizon? - (A.) It is like looking at that piece of paper on the wall; you can see the brightness." Then I think he pointed across to the plan of the "Titanic."

*The Attorney-General:* Yes.

*Sir Robert Finlay:* "Colour - something which attracts your attention? - (A.) The brightness of it attracts your attention. (Q.) And is that the way you distinguish it at night? - (A.) That is the way you distinguish it any time; you see the colour of it. It is differentiated from land in the daytime. (Q.) Have you ever been very close to an iceberg yourself? - (A.) Not in clear weather. I have steamed in between them. They have been scattered all over about the course on either bow, and I have gone on my course steering between them at nighttime. (Q.) I should assume that was in the daytime from what you tell me? - (A.) At nighttime, approaching Belle Isle. (*The Commissioner.*) Going full speed? - (A.) Going full speed."

*The Commissioner:* What was the speed of this man's ship?

*Sir Robert Finlay:* The Attorney-General asks the question, my Lord: "What is your full speed? - (A.) 18 knots; the "Laurentic" was 18 knots. (Q.) That was on the Canadian service? - (A.) Yes. (Q.) Of the White Star Line? - (A.) Of the White Star Line. (*The Commissioner.*) That is in the track North? - (A.) Yes, by Belle Isle. (*The Attorney-General.*) Where you would meet more ice and expect to meet more ice than on this track? - (A.) Yes. (Q.) Is that your invariable practice? - (A.) Everybody's invariable practice, as far as I know. (*The Commissioner.*) No, not everybody's, because we have had evidence about the Canadian Pacific boat, I think it was. (*Sir Robert Finlay.*) Not on

this point, my Lord.” That was cleared up. That related to the notice about field ice; they were not to enter field ice at any time. I endeavoured to summarise it at page 570 in the first column. “(Sir Robert Finlay.) I think it stops there - they are not to enter field ice - because it is given more in detail in our Rule, which was issued to vessels using that track, the Northern track, to Canada, and it was pointed out that even if there is a lane it may very likely be a lane which does not go very far. It is no use to enter the ice. (The Attorney-General.) It does not really stop there, it goes further. The next is: ‘When you got warning there was ice ahead, what precautions did you adopt? - (A.) I simply steered down. I went down further to the Southward,’ and he says his highest speed was about 11 knots.” That is referring to the evidence of Mr. Moore. (Sir Robert Finlay.) He is asked: ‘Did you decrease your speed? - (A.) Not at all; it was daylight. (The Attorney-General.) He steered further to the Southward.’”

*The Commissioner:* If it had been night he would?

*The Attorney-General:* It is the qualification of the answer before. The Witness does say it was daytime.

*Sir Robert Finlay:* All the other evidence of the witnesses who deal with night say it makes no difference.

*The Commissioner:* But that answer plainly indicates a distinction in the man’s mind.

*Sir Robert Finlay:* Not necessarily, my Lord. Very often a man saying - *The*

*Commissioner:* Well, it is a matter for observation, perhaps.

*Sir Robert Finlay:* He puts in a circumstance which is perfectly true, but he would have done the same, even if that circumstance had not existed. Then the Attorney-General in the second column on page 570 says: “Then he is asked if he makes any change in the look-out, and he says: “If we expect to see ice we always double the look-out.” That is how it stands, I think. We shall have to consider later the evidence already given. (To the Witness.) I only want to get your view. Supposing you had had a report of field ice ahead, not of icebergs, would you still steam full speed ahead? - (A.) Till I saw that

## **Page 826**

ice in clear weather, yes. (Q.) Even at nighttime? - (A.) On a clear night.” Your Lordship sees that deals with that point. “(Q.) What I do not quite understand is this: Where there was an iceberg of from 60 to 80 feet from the sea level, and it was not seen until within half a mile away, how do you account for that if it was a clear night? - (A.) I was not there on that night. (The Commissioner.) That is my difficulty. (The Attorney-General.) I agree. (The Witness.) There must have been some abnormal conditions which misled them. (The Commissioner.) Or there was a bad look-out. (The Attorney-General.) Either one or the other. (The Witness.) I do not think there was, my Lord. I have known the two men, and there is no carelessness. (The Attorney-General.) I am not going to ask you to say there was a bad look-out on another White Star Line boat; do not think that. - (A.) No, not against the men.” I do not think the Attorney-General and the Witness were quite on the same point there. The Attorney-General’s question was ironical, and the Witness was answering in all simplicity and good faith.

*The Attorney-General:* That is quite right.

*Sir Robert Finlay:* Therefore, I think I am entitled to claim the evidence of this witness as entirely bearing out the evidence I have already called attention to as to practice both by day and by night. Then Mr. Passow, who is a Captain in the American Line, at page 571, is the next witness. He has a British Master's certificate and has been in command as master for the last 28 years. He has been serving in the Inman Line and now in the American Line. Then at Question 21856 he is asked: "The Inman Line, as we know, has become an American line, and you passed on from the British company's service into the service of the American company?" - (A.) Yes. (Q.) I think you have crossed the Atlantic some 700 times? - (A.) About that. I have never kept an accurate record, but about 700 times. (Q.) And at the present moment you are in command of the "St. Paul"? - (A.) Yes. (Q.) She is one of the American Inman Line boats? - (A.) Yes. (Q.) What speed boat is she? - (A.) About 20 knots. (Q.) I think I can shorten your evidence in this way: Have you heard the evidence of the last gentleman who was in the box? - (A.) Yes. (Q.) Did you hear the statements of fact that he spoke to? - (A.) Yes. (Q.) And the expressions of opinion that he uttered? - (A.) Quite so. (Q.) Do you agree or disagree with the statement of facts? - (A.) I agree with it. (Q.) With regard to the expression of opinions, do you agree or disagree? - (A.) Yes." That means he agrees with the expression of opinion.

Then, on the same page, I asked him, at Question 21872: "Do you see a great deal of ice on the tracks you follow?" - (A.) On the Northern track we see a great deal. (Q.) You have had a very large experience of ice? - (A.) I have had a very large experience of ice. (Q.) I do not know whether your Lordship caught the last answer of the witness. He said that on that track, which he described as going 30 miles South of the Virgins, they saw a great deal of ice, including field ice. You have had a very large experience of ice? - (A.) Yes, a large experience of ice. (Q.) Did you ever slacken your speed for ice as long as the weather was quite clear? - (A.) Not as long as it was quite clear - no, not until we saw it. If it was field ice, of course we kept out of it if we could. We get into it sometimes. (Q.) Was that the same by night and by day? - (A.) The same by night and by day, as long as the weather was absolutely clear." Then he deals with the question of binoculars. Then at Question 21880 he is examined by the Attorney-General. "(Q.) I want to understand one thing. You said you never altered your speed because you could always depend upon seeing the ice in sufficient time? - (A.) As long as the weather is perfectly clear. (Q.) Has the disaster to the "Titanic" caused you in any way to modify your view? - (A.) I do not think so. Of course, I was not there, and I did not see what they looked like. But I have never seen an iceberg of that size that you could not see on a perfectly clear night, and far enough off safely to clear it. I have seen a piece, quite a small piece, that you could see some distance off. (*The Commissioner.*) If you are right, and if this was - as we have been told by a great many witnesses it was - a perfectly clear night, how do you account for the collision? - (A.) I cannot account for it at all. They say it looked like a black iceberg, but I have never seen a black iceberg. I never saw anything but a white one, and that you can see on the darkest night. You can see field ice, too, on the darkest night in time enough for you to get out of the way of it. (Q.) We have had an explanation given of it by Mr. Lightoller. He said, that the sea was absolutely flat - there was not, as I understood him, even a swell - and that the consequence of that was that there was no surf of any kind round the base of the iceberg. By the base, I mean the margin on the waterline, and that, therefore, one of the best indications for the seeing of ice was absent. What do you think

about that? - (A.) I think you would see the surf round it at a shorter distance than you would see the iceberg, if it was a large one. The ice has a phosphorescent appearance. (Q.) I should have thought, that, as a seaman, you would have had some sort of explanation to suggest? - (A.) I cannot think of anything, because they say the ice was dark blue, almost black. I never saw an iceberg like that in my life, and I have seen a good deal of ice too. (Q.) Does that lead you to infer that they are mistaken when they say it was black? - (A.) I would not like to say that, my Lord. I do not know, of course; I was not there, but I never saw an iceberg of that kind. (Q.) Have you ever seen a growler? - (A.) These low bergs? (Q.) Yes? - (A.) Very seldom. (Q.) What is the colour of a growler? - (A.) White. (Q.) The same as an iceberg? - (A.) The same as an iceberg, only a smaller one. That is what I understand by a growler - a low-lying berg. We always see those. (Q.) If there was any haze, I suppose it would be seen from the bridge? - (A.) The berg? (Q.) No. If there was any haze the haze would be seen? - (A.) Immediately. As soon as there is the slightest beard on the green light and we are in the ice region we slow down, because you cannot say how far you can see, but when it is absolutely clear we do not slow down for ice. (Q.) Of course, if there had been a haze you could have accounted for it? - (A.) Yes. (Q.) Would a bad look-out account for it? - (A.) Yes, but I do not believe there are bad look-outs on any Atlantic steamers. I do not believe that. (Q.) There were two men in this crow's-nest and there were two officers, I think, on the bridge. You do not suppose there could have been a bad look-out? - (A.) No, I should not think so. I never knew a bad look-out on these steamers, especially when you are in the ice region - not necessarily because ice was reported, but from longitude 41 to 51 we are always looking out for it. (Q.) If a haze comes on, is it the duty of the man in the crow's-nest to report it to the bridge? - (A.) No, Sir, it is not; we would know it quicker than he would, or just as quick, because we always see the little blur on the green light." It is what he has referred to as the "beard"; it is a familiar expression. *The Commissioner*: Yes, I know what it means.

*Sir Robert Finlay*: "(Q.) It is the business of the man on the bridge to notice it? - (A.) Yes. (Q.) And to give directions accordingly? - (A.) Call the captain of the ship immediately. (*Further examined by Sir Robert Finlay.*) (Q.) May I suggest one question with regard to what the witness said as to what Mr. Lightoller said? You said that you thought that if there had been a swell the white of the waves breaking at the foot of the iceberg would not be seen further than the iceberg itself? - (A.) I do not think it would be seen as far, unless there was a sea on. Then you would see the breakers just like breakers breaking on the beach. (Q.) I am speaking only of an ordinary swell? - (A.) No, I should think you would see the berg first. (Q.) You are speaking of the icebergs of which you have experience - white icebergs? - (A.) Yes." Your Lordship remembers he said he

## Page 827

had never seen a black iceberg. "(Q.) Suppose you had a black iceberg? - (A.) I would not see it, I suppose. (Q.) Would the white of the waves, if there was a swell, be seen further under those circumstances? - (A.) Oh, yes, of course, according to the amount of sea. (Q.) You were speaking of the white icebergs with which you are familiar? - (A.) Quite so, yes."

The next witness is Mr. Owen Jones, of the "Canada." That is one of the vessels of the Dominion Line. It is at page 664, Question 23612: "Tell us what you did when you found yourself in the neighbourhood of the ice. That is what we want to know? - (A.) It was some hours later when we came to the ice. (Q.) Whenever it was, what did you do? - (A.) When I saw the ice I stopped. (*The Commissioner.*) This was pack ice? - (A.) Yes. (*The Solicitor-General.*) What sort of ice? - (A.) Pack ice. (Q.) You stopped altogether, did you? - (A.) Yes, I stopped altogether. I let my ship run her way off, and then I gave her a touch ahead, so as to get close to the ice, so as to inspect it. (Q.) Was this in daylight or at night? - (A.) At night, 11 o'clock at night. (Q.) Then you say you gave your ship a touch ahead to get close to the ice to have a look at it? - (A.) Yes. (Q.) What did you find? - (A.) Broken ice and lanes between them, so I decided it was safe for me to go through. (*The Commissioner.*) To go through? - (A.) Yes, my Lord. (*The Solicitor-General.*) At what speed did you go through? - (A.) Oh, very slow; I picked my way clear of the broken pieces. (Q.) And did you succeed in getting through? - (A.) Yes, I was through about daylight the next morning, about 6 o'clock. (Q.) After you got the messages about the ice did you continue going on full speed ahead until the ice was reported by the lookout? - (A.) Yes, certainly. (*The Commissioner.*) Now, I see the object. (*The Solicitor-General.*) That is the point. (*To the Witness.*) Is that, in your opinion, the usual practice? - (A.) Certainly, always. (*The Commissioner.*) What speed were you going at? - (A.) 15 knots. (*The Solicitor-General.*) Is that your full speed? - (A.) Yes. (Q.) What was the weather? - (A.) Dark and clear. (*The Commissioner.*) Suppose you had had a 22-knot boat, would you have gone 22 knots? - (A.) I should think it would be just as safe to go full speed with 22 knots. (*The Solicitor-General.*) What was the distance at which the ice was picked up? You are going your 15 knots, and it is reported, and then you say you stopped and ran on to reach it. Do you know how far ahead of you it was seen and reported? - (A.) Well, I saw the glare of it; I should say about 3 miles off. (Q.) You did yourself? - (A.) Yes, and I saw the ice itself fully a mile and a half. (Q.) Then I understand you stopped, let your vessel come to a stop, and then felt your way on to inspect it? - (A.) Yes."

I think I should read a passage at the very end of page 664, Question 23646: "With your experience on a clear night, have you always been able to detect ice by this ice-blink? - (A.) No, not by the ice-blink; the ice-blink does not always occur. (Q.) Then, if it is not the ice-blink which enables you to see it, what do you see it by? - (A.) You see the ice itself. (Q.) Can you suggest to us at all why it should be, if a good look-out is kept, that a ship would not see ice until she is close upon it? - (A.) No. (Q.) You cannot imagine? - (A.) No; I have always seen ice in plenty of time on a clear night."

Then at page 666, Question 23708: "(Q.) Where you have ice about, in your experience are you liable to have fogs? - (A.) Very liable. (Q.) Does that, in your judgment, afford any reason for the practice you have always pursued as to speed? - (A.) Yes, we always make what speed we can. (Q.) Just tell us, in your own way, what effect that fact has on your practice as to speed? - (A.) Well, we always try to get through the ice track as quickly as possible in clear weather. (Q.) If fog came on while you were there? - (A.) It would increase the danger very much. We have to slow down or stop." *The Commissioner:* Are there many cases reported of collisions with icebergs?

*Sir Robert Finlay:* Very few, my Lord.

*The Commissioner:* I think there are very few indeed.

*Sir Robert Finlay:* Very few.

*The Commissioner:* There was one a good many years ago.

*Sir Robert Finlay:* The "Arizona" I think your Lordship is referring to. *The*

*Commissioner:* Is that the only one?

*Sir Robert Finlay:* I think that is the only reported case, as far as I know.

*The Commissioner:* I mean a reported case.

*Sir Robert Finlay:* It will be in the early eighties.

*The Commissioner:* This is 1880.

*The Attorney-General:* Of course, you could not get the ordinary collision action; you have that difficulty.

*The Commissioner:* That is so.

*Sir Robert Finlay:* Not *in rem* against an iceberg.

*The Commissioner:* But there have been a very large number of Wreck Enquiries, and I was wondering whether any wreck had been reported where the cause of the wreck was collision with an iceberg.

*Sir Robert Finlay:* I am not aware of any Wreck Enquiry under such circumstances. *The*

*Commissioner:* Then such an accident as this is of very rare occurrence, I should think.

*Sir Robert Finlay:* Yes; and of course, my Lord, that is one of the circumstances to which I appeal, as showing that the practice that has always been pursued is a reasonable practice.

*Mr. Cotter:* There have been heaps of collisions with icebergs, my Lord, but not wrecks.

*The Attorney-General:* Yes, certainly.

*Mr. Cotter:* The "Lake Champlain," only last year, was in collision; the "Arizona" was in collision, and several have been in collision.

*The Commissioner:* Are not those cases reported anywhere?

*Mr. Cotter:* The Board of Trade will have the facts, my Lord. *Sir*

*Robert Finlay:* There was no loss of life in the "Lake Champlain." *Mr.*

*Cotter:* No, but she was in collision; she struck an iceberg.

*Sir Robert Finlay:* Did she do any damage?

*Mr. Cotter:* Yes, she bent in her bows.

*Sir Robert Finlay:* Still, the fact remains that there have been extremely few, and the absence of casualties is what the Table shows.

*Mr. Cotter:* There is one case, if I may bring it to your Lordship's notice. The White Star Line steamer "Naronic" left Liverpool in 1903, and was never heard of again. All her crew went down with her.

*The Commissioner:* Yes, but do we know anything about the cause of the wreck? *Sir*

*Robert Finlay:* No, it may have been a derelict, or anything, or a leak. She was not a passenger ship.

I have finished Mr. Owen Jones's evidence, and I now pass on to the evidence of Captain Cannon's, the next witness, on page 666. He says he has been 36 years going to sea and in the service of the Atlantic Transport Company for nearly 25 years, and in command for

over 20, and during the whole of that time he has been sailing in the North Atlantic, and at Question 23719 he is asked: "London and New York, Boston, Philadelphia and Baltimore? - (A.) Yes. (Q.) And before that at times you were sailing in the North Atlantic? - (A.) Yes, quite a time. (Q.) In the course of your experience have you met icebergs and also field ice? - (A.) Yes. (Q.) Have you ever met ice-fields on the Southern outward and homeward tracks which were agreed in 1898? - (A.) No, I have never seen field ice on the Southern track. (Q.) You have never seen field ice? - (A.) No. (Q.) Have you ever seen icebergs? - (A.) Yes, several. (Q.) On the outward track or the homeward track? - (A.) On both tracks. (Q.) At this time of year, we are speaking of in April? - (A.) Yes. (Q.) Often? - (A.) No, not often; they do not get down as early as that, as a Rule."

Then at Question 23733: "There is only one further question I want to put to you. When you do sight an iceberg, do you reduce your speed

## **Page 828**

or do you keep your speed? - (A.) I keep my speed. (Q.) What is the speed of the vessel? - (A.) Sixteen knots. (Q.) You keep your speed; that, of course, is, I suppose, in the day or it might be at night? - (A.) Both day and night. (Q.) The question I put to you, and you have answered, is when you have sighted an iceberg? - (A.) Yes. (Q.) Then you have time, I suppose, from what you said, to get clear of the iceberg going at the speed at which your vessel then is? - (A.) I have never had any difficulty to clear when I have met ice ahead. (Q.) Does that mean that you see the ice some distance ahead? - (A.) Yes. (Q.) How far as a Rule? - (A.) Well. I have seen it over three miles and at less distances. (Q.) Are you speaking of the day or night? - (A.) At night. (Q.) Do you mean you would see it further in the daytime? - (A.) Yes, decidedly, in clear weather. (Q.) At night you have seen it at three miles and sometimes less? - (A.) Yes. (Q.) And supposing that your lookout is properly kept and that the night is clear, is there any difficulty in your sighting an iceberg at sufficient distance to enable you to steer clear of it? - (A.) None whatever. (Q.) And supposing you received reports of icebergs in a latitude and longitude which you would expect to be crossing during the night, would you take any precaution as regards speed? - (A.) I should maintain my speed and keep an exceptionally sharp look-out until such time as I either had the ice-blink or some sight of ice ahead or in the track of the vessel. (Q.) What would be the exceptionally sharp look-out you would keep? - (A.) I mean with reference to everybody concerned by my cautioning them and giving my officers instructions to inform the look-out to be on the alert. (Q.) Where is your look-out stationed? - (A.) In clear weather under ordinary circumstances in the crow's-nest. (Q.) How many do you carry there? - (A.) One. (Q.) Would that be the only man on the lookout in clear weather, except the officers on the bridge? - (A.) That would be the only one. (Q.) And supposing you were sailing at night and had to keep this exceptionally sharp look-out which you have told us of because of having had ice reports, would you increase the number of men on the look-out or not? - (A.) No, not in clear weather. (Q.) Do you mean that you would go on steaming at the same speed with your man in the crow's-nest, and that is all? - (A.) That is all. (Q.) You do not put anybody apparently in the stem head? - (A.) No, not unless the weather becomes hazy or any difference to

ordinary clear weather. (Q.) If the weather does become hazy it would be better to put a man on the stem head, I understand? - (A.) A man goes there immediately.”

Then he is asked with reference to the “Titanic.” Perhaps I had better read it. “(Q.) You have heard the distance at which it is said that this iceberg was first seen on the “Titanic.” Do you know it? - (A.) I do not know it. (Q.) At any rate, not more than half a mile. The exact distance, I agree, is difficult to state, but not further than half a mile it is said to have been. (*The Commissioner.*) I should have said not so much. (*The Attorney-General.*) I am putting it at the extreme purposely. That is the extreme distance at which it is put. (*To the Witness.*) Suppose it was a little less than half a mile, can you account for the look-out man not having seen it if it was a clear night? - (A.) No. (Q.) And supposing it was a clear night, no haze, ought the look-out man in the crow’s-nest to have seen it? - (A.) They should have done, I should imagine. (Q.) And if the iceberg is 60 to 80 feet high from the water-level, at what distance do you think it ought to have been seen? - (A.) My experience would be that you would see it at least two miles. (Q.) At least 2 miles? - (A.) Yes. (*The Commissioner.*) Then ought not the men on the bridge to see it? - (A.) Yes. (Q.) They ought to see it? - (A.) Yes.”

Then your Lordship puts this question: “Have you seen black ice? - (A.) No, my Lord; I have not seen black ice, but the ice varies considerably in its appearance. (Q.) Have you seen many icebergs? - (A.) Yes, my Lord. (Q.) And you have never seen a black iceberg? - (A.) No.” Then on page 630, my Lord, he speaks of the signals which were in use before Marconigrams were invented, and how they used to get signals about ice. “23793. When you got those signals did you slacken speed? - (A.) No. (Q.) Has the practice in that respect been the same the whole time you have known the trade? - (A.) Yes. (*The Commissioner.*) What is the speed of your vessel? - (A.) Sixteen knots. (*Sir Robert Finlay.*) That is her top speed? - (A.) Yes. (*The Commissioner.*) Now, assume you had under your command a vessel of 22 knots, would you slacken speed then? - (A.) Not in clear weather. (*Sir Robert Finlay.*) Now, would you describe to us the appearance of the icebergs in your experience, what do they look like as regards colour? - (A.) In day or night? (Q.) Well, take first, day? - (A.) In the day they appear as a white glistening mass, irregular in shape, white. (Q.) Then at night? - (A.) At night they throw off an effulgence that can be seen. I have seen the outlines of an iceberg by taking a bearing over seven miles. (Q.) It is what is called ice-blink? - (A.) Yes, it is an effulgence thrown off the berg or ice because the ice absorbs the light by day and throws it off at night. It would look like a large mass of luminous paint. That is the description one might venture upon. (Q.) It has taken in the light of the sun during the day and throws it off at night? - (A.) Yes. (Q.) Anyhow, that is the effect you see? - (A.) Yes. (Q.) Have you ever seen a black berg? - (A.) No. (Q.) In your experience are icebergs dark or black? - (A.) I have seen them much darker. Might I explain an experience of mine some years ago which will give you possibly an idea of the difference in the colour? (Q.) If you please? - (A.) When I was Chief Officer of our “Michigan” I saw an iceberg capsize in the daytime. What appeared prior to the iceberg capsizing as a white glistening mass, after the sea had subsided and the water run off the portion that was then exposed, was apparently dark blue. (Q.) Have you ever come across an iceberg that looked of that colour? You say you saw this one capsize? - (A.) Yes, in the daytime. (Q.) And then did you notice its colour? It was quite different from what it was before? - (A.) It was different in outline and

different in colour. (Q.) Very well. Before it capsized it was white, I suppose, as you have described? - (A.) Yes. (Q.) Then after that it was dark blue. Have you ever seen another iceberg of that dark colour? - (A.) No, only that one that capsized. (Q.) Where there is a swell or a little wind, does the water break at the foot of the berg? - (A.) Oh, yes. (Q.) Now, supposing you had a dark blue berg such as you have described, dark in colour, what would the effect of the water breaking at the foot of it with a swell or wind be as regards what you would see? - (A.) Well, it would show whiter at the base. (Q.) But in your experience the bergs have been white except with this one exception? - (A.) With the exception of this one, which I saw in daylight and noticed the difference in the colour; all of them have been discernible at nighttime, and, of course, in the day. (Q.) In addition to the look-out you have the officers on the bridge? - (A.) Yes. (Q.) And if you hear of ice do you tell them all to be on the look-out, to be on the alert? - (A.) Yes, the watch is mustered on the bridge, the officer inspects them, and instructs them specially to keep their eyes open. (Q.) In your experience, is the practice of all as regards speed though ice has been reported the same that you have stated, to keep up speed? - (A.) Yes, to maintain speed until the ice is seen.”

Then on the next page in the second column your Lordship puts this question: “Do you know the circumstances in which this collision is alleged to have taken place? - (A.) Only from what I have read in the Press. (Q.) Very well. Just assume this: A perfectly clear night, a perfectly flat sea, and no wind, and therefore nothing in the nature of surf round the edge of the iceberg. Would those circumstances, in your opinion, make the sighting of an iceberg difficult? - (A.) Yes, it would increase the difficulty of seeing it. (Q.) Are those circumstances very rare? - (A.) Yes. (Q.) A perfectly flat sea, no swell, no ripple? - (A.) They are

## Page 829

extremely rare in the North Atlantic. (Q.) But still such circumstances are sometimes found? - (A.) Yes, my Lord. (Q.) How far do you suppose you would see an iceberg in those circumstances? - (A.) I should say a mile. (Q.) A vessel going 22 knots an hour sighting an iceberg a mile away can, I suppose, clear it? - (A.) Yes. (Q.) Now can you explain to me why the “Titanic” did not clear? - (A.) It is possible for the iceberg to extend under the water a considerable distance from the portion seen above. (Q.) But that scarcely agrees with the facts here, because some ice fell on the deck? - (A.) That could easily occur with the concussion, my Lord. She was going at high speed; it may have crushed against the vessel’s side and come up on deck. (*The Attorney-General.*) No, everybody says it fell on the deck. (*The Commissioner.*) I understand your suggestion to be that the part of the berg that they saw was not that which struck the vessel, but that it was part of the berg underneath the water that struck the ship? - (A.) I say that is possible.” I think that must have been so from the facts as we now know them. “23843. Which extended some way from the berg which stood up? - (A.) Yes, it is quite possible. I have only read the newspaper reports. (Q.) Have you any other explanation? That does not satisfy me very well. Do you think a bad look-out would account for it? - (A.) I think they had a good look-out there, my Lord. (Q.) Never mind whether you think they had a good one or not? Would a bad look-out account for it? - (A.) Yes. (Q.) Can you account

for it in any other way - a bad look-out and going at the rate of 22 knots an hour? - (A.) They should have seen the berg in time to have cleared it. (Q.) You think they should? - (A.) Yes. (Q.) That means to say, taking you as a skilled man in navigation, you think there must have been bad navigation somewhere? - (A.) No, I do not think that, my Lord.” Then your Lordship expresses a doubt as to the question. “23849. (*The AttorneyGeneral.*) There is one question on what your Lordship has said. (*To the Witness.*) Before this accident to the “Titanic,” had it ever occurred to you that on a specially calm night and a specially clear night it would be more difficult to detect an iceberg? - (A.) Oh, yes. (Q.) So that a skilled navigator would expect that it would be more difficult on a specially calm night and on a specially clear night? - (A.) Yes, it would be more difficult in the calm. You see, the sea causes an extra warning breaking against the berg.” I think your Lordship realises that that witness says expressly in some passages, and implies throughout, that the swell would break against the berg and would cause a white foam, and that, in the case of a black berg, would be specially noticeable. Then, my Lord, Mr. Ranson, of the “Baltic,” gives evidence on pages 717 and 718. I do not think anything was put to him by the Attorney-General in chief on this subject. As my friend says, he was called on another point, but having been called Mr. Scanlan put this question to him on page 718: “24978. What is your individual practice if ice is reported? - (A.) How do you mean, clear weather or foggy weather? (Q.) At night? (*The Commissioner.*) At night, in clear weather? - (A.) We go full speed whether there is ice reported or not. (Q.) As far as you know, is that the practice of all liners on this course? - (A.) It is.” Then at 24982 I ask him this question: “With regard to your speed, you know the practice in the Atlantic if the weather were clear and ice reported, do you keep up your speed? - (A.) We keep up our speed. (Q.) And is that your invariable practice? - (A.) It has always been my practice. (*The Commissioner.*) What is the speed of your boat? - (A.) Sixteen knots. (*Sir Robert Finlay.*) You said the speed of your boat, the ‘Baltic’ was 16 knots? - (A.) Yes.

(Q.) Have you been on other boats in the Atlantic? - (A.) - Yes. (Q.) Faster boats? - (A.) Yes, the ‘Oceanic,’ the ‘Majestic,’ and the ‘Teutonic.’. (Q.) How many knots an hour would they make? - (A.) Twenty to twenty-one (Q.) Is the practice you have spoken of one which prevailed with regard to ships of that class as well as your boat, the ‘Baltic’? - (A.) Yes. (Q.) You know, of course, the Atlantic well (A.) Yes. (Q.) Was that practice always pursued by all Masters of liners? - (A.) Yes, for the last 21 years, to my knowledge.” Then, my Lord, Mr. Pritchard, the Captain of the “Mauretania,” gives evidence at page 732.

*The Commissioner:* Are you going back to Sir Ernest Shackleton’s evidence?

*Sir Robert Finlay:* Yes, I will take him by himself, my Lord. Mr. Pritchard, at page 732, says he has been retired for two years, and has left the sea. His last command was the “Mauretania”: “25172. I believe for 18 years you have commanded Cunard steamships sailing between Liverpool and New York? - (A.) Yes. (Q.) Have you heard the evidence in this case with regard to the weather conditions which existed when the “Titanic” struck? - (A.) Yes. (Q.) You know them? - (A.) Yes. (Q.) Now, what practice did you follow with regard to maintaining your full speed or reducing your speed, assuming similar conditions, and assuming you had information that there was a probability of your meeting ice on your course? - (A.) As long as the weather is clear I always go full speed.

(Q.) You always have done so? - (A.) Yes. (Q.) What was the speed of the “Mauretania”? - (A.) 26 knots.” Then at 25186 Mr. Scanlan asks: “If there was any difficulty at all in seeing would you reduce your speed? - (A.) Well, if it was hazy, yes. (Q.) If it was a flat calm and you expected ice - you were warned of ice and knew you would meet ice in the course of the night - would you double the look-out? - (A.) No, as long as the weather is clear.” Then he is examined by myself. He states that he has been for 51 years at sea; has had a Master’s certificate for 37 years, and he says that not only does he keep his course in clear weather, but he maintains full speed. “25219. And was that the universal practice in your experience? - (A.) Yes.” That is the evidence of Captain Pritchard, of the “Mauretania.”

Then Mr. Young, of the “City of Rome,” of the Anchor Line, gives evidence at page 733. He also has left the sea. He says that he was travelling for 35 years across the Atlantic from Glasgow. “25224. Are you familiar with ice-fields and icebergs? - (A.) Quite. (Q.) Do you know the weather conditions which existed when the “Titanic” struck the iceberg? - (A.) I understand it was a dead calm. (Q.) It was a dead calm; it was a clear night? - (A.) Yes. (Q.) No sea? - (A.) No sea. (Q.) And no moon. Now, assuming those to be the conditions, and assuming that you had had information that there was a probability that you might be travelling through a region of the sea at night where you might meet icebergs, would you or would you not reduce the speed of your vessel? - (A.) No, Sir. (Q.) What was the fastest vessel you ever commanded? - (A.) The “City of Rome” - 17 knots. (Q.) One other matter. With regard to look-out at night, when you have been informed that you may be passing icebergs, what provision did you make for your lookout under such circumstances? - (A.) The same as other times, as long as it was clear - two men in the crow’s-nest. (Q.) You had two men in the crow’s-nest? - (A.) Yes, I had two men in the crow’s-nest. (Q.) And nobody on the stem head? - (A.) Not when it is perfectly clear.” Then at 25233 I asked Captain Young: “If ice were reported; would you keep your course, as well as maintain your speed, in clear weather? - (A.) I should keep my course and maintain my speed. (Q.) How many years were you in the New York trade, crossing the Atlantic? - (A.) About 37 years.” Then in consequence of a suggestion from your Lordship, I put this: “Suppose you were told there was field ice, would your practice be the same, or different? - (A.) Just the same. (Q.) Has that been the universal practice in the trade as long as you have known it? - (A.) As far as I know, yes. (Q.) All ships have done so? - (A.) I think so.”

Then, my Lord, there is a question a little further down that perhaps I ought to read with regard to the temperature. There is a curious

## **Page 830**

mistake in the printing here - it is a printer’s error at Question 25242. That question should not appear in Mr. Hugh Young’s evidence; it is the evidence of Mr. Stewart, the next witness. Reading the evidence, I could hardly believe my eyes when I saw the following questions, and then it turned out that Mr. Stewart’s name ought to have been printed above Question 25242. It is a mere misprint.

*The Commissioner:* Yes, I noticed that. The name of Stewart comes immediately before 25242.

*Sir Robert Finlay:* Yes. He had commanded the "Empress of Britain." He had been in the Beaver Line all the time it ran, 35 years; had been in the North Atlantic trade for 38 years; continued in the Canadian Pacific when the Beaver Line was taken over by them he continued with the Canadian Pacific for three years until he retired. The last vessel he commanded was the 'Empress of Britain.' "The 'Empress of Britain' was the fastest ship I ever commanded - 18 knots." "25252. Do you know the weather conditions which existed when the "Titanic" struck? - (A.) I have read about them in the newspapers. (Q.) See you have them accurate. It was a clear night, no moon, no swell, no sea, and stars? - (A.) Yes. (Q.) Given those conditions, and that you had command of a ship, and were given information that you might meet ice, and that your course would take you through the place where you might meet ice, and meet it at night, would you reduce your speed? - (A.) No, not as long as it was clear. (Q.) Not as long as it was clear? - (A.) No. (Q.) I am going upon the assumption that you might meet icebergs - you would not reduce your speed? - (A.) No. (Q.) If you had information that you might meet field ice, would you still maintain your speed? - (A.) Until I saw it, and then I should do what I thought proper." Then he says that in clear weather he has the ordinary look-out. Then over the page, at page 734, this occurs. "25260. Would you maintain your course as well as your speed if ice were reported? - (A.) Yes. (Q.) And has that been the invariable practice in the North Atlantic? - (A.) It was with me. (Q.) And as far as you know, with others? - (A.) As far as I know, with others. (Q.) Did the "Empress of Britain" carry many passengers? - (A.) Yes. (Q.) First, second and third? - (A.) Yes. (Q.) What was her tonnage, about? - (A.) I could not tell you now, she was a large ship. (Q.) She was a big boat? - (A.) Yes. (Q.) Of 18 knots? - (A.) Yes. (Q.) How many people did she carry, about? - (A.) Oh, I suppose about 2,000 altogether."

Then, my Lord, there is the evidence of Mr. Fairfull, of the s.s. "Tunisian," of the Allan Line also, on page 734. For 21 years he was sailing in command of the Allan Line steamships across the Atlantic. He had heard the evidence of the last two gentlemen: "25272. Is your practice in accordance with theirs? - (A.) All except that when we get to the ice track in an Allan steamer, besides having a look-out in the crow's-nest, we put a man on the stem head at night." Then, my Lord, you say you did not hear what he said, and the witness repeats the answer: "25274. Whether it is clear or not? - (A.) Yes." Then he is examined by me. He was crossing the Atlantic on the 14th April in the "Tunisian"; he was there and had ice reports. I do not think his evidence came to anything. Then there is the evidence of Mr. Braes, also of the Allan Line, at the bottom of the same page, page 734. He agrees with the evidence of the last four witnesses; his practice is just the same: "25287. Is your practice when you may be meeting ice at night similar to their practice? - (A.) Just the same. I never slowed down so long as the weather was clear." "25290. In your experience is that the universal practice in the Atlantic? - (A.) I never knew any other practice."

Then, my Lord, there is the evidence of Mr. Apfeld, the Flemish gentleman of the Red Star Line, who came from Antwerp, on page 746, Question 25575. He is the Marine Superintendent of the Red Star Line, a Belgian line of steamships; he lives in Belgium;

his vessels sail from Antwerp to New York, Philadelphia, Boston and Baltimore, and they carry passengers and mails. He has been for 39 years at sea and five years as Marine Superintendent. He has been with the Red Star Line for 32 years. "25583. When you have been navigating in the region of ice, have you changed your course or speed? - (A.) Never. I slow her down in the case of fog or thick weather, otherwise not. (Q.) Is that the case, although ice has been actually reported to you? - (A.) I would not slow her down. (Q.) Have you examined the deck logbooks and the engine logbooks of the steamers of your line running the Atlantic passage during April last? - (A.) I have." Then he gives the names of the six vessels: "25587. Do these logbooks show whether those vessels passed ice? - (A.) Some of them. (Q.) Which of them? Can you remember the 'Lapland' and the 'Manitou'? - (A.) The 'Lapland,' the 'Finland,' and the 'Manitou,' and I believe the 'Zeeland.' (Q.) They all passed ice? - (A.) Yes. (Q.) Where were they going to - to New York? - (A.) They were going to New York, except the 'Manitou' said the 'Minomini,' which were going to Boston. (Q.) Did they change their course or their speed? - (A.) Absolutely not. The 'Manitou' slowed down after she entered the field ice. She went into field ice at full speed for about an hour, and then the field ice became thick, heavy lumps amongst it, and her Captain slowed her down for about an hour. He reduced speed for fear of damaging the propeller."

*The Commissioner:* Then there is another man named Tride?

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* You need not trouble about him.

*Sir Robert Finlay:* He is a Captain in the Red Star Line. My Lord, I say that that makes a body of evidence of extraordinary clearness and strength, and I further say there is absolutely no contradiction. I say that with reference to the evidence to which I am now coming of Sir Ernest Shackleton. Sir Ernest Shackleton's experience has, of course, been an experience of quite a different nature. My Lord, I ought also to have called attention before passing from these witnesses - it was an accidental omission - to the Table which was drawn up at your Lordship's request, summarising the results with reference to the vessels which were crossing the Atlantic at this time in this neighbourhood. *The*

*Attorney-General:* I presume you are also going to call attention to Captain Rostron's evidence on the point?

*Sir Robert Finlay:* Certainly. This is a typewritten document. I had better run through the table: "Californian" - already dealt with by Enquiry. "Antillian" - no ice. I need not read what is written under the head "Instructions to Commanders of Vessels" and "Ship and Engineers Logbooks." Then there is the Anchor Line: "No vessels in actual vicinity, but 'Caledonia' was warned by wireless of field ice, course altered to Southward to avoid it. Sighted ice 9th April. Date, between April 6th and 9th." Then under the head of "Instructions to Commanders of Vessels" there appears: "Course to be altered on ice being seen or reported. In the event of fog, speed to be reduced. No book of Instructions and Regulations sent." Then there is the Canadian Pacific Railway Company, Canadian route: "Mount Temple" - evidence already produced in Enquiry.

"Montrose" - log shows vessel maintained speed when in sight of and passing ice and later slowed down on account of thick weather. The attached letter from the Canadian Pacific Railway suggests that stoppages and reductions in speed on account of ice are recorded, but this is not borne out by the logbook." Then under the heading of

“Instructions to Commanders of Vessels”: “If weather thick or unfavourable, speed to be reduced. Safety of passengers and cargo is the first consideration.” Then there is the Allan Line, Canadian Route, “Parisian,” received wireless message *re* presence of ice, which was also sighted. Weather clear, so speed not reduced. Course altered when ice sighted. “Carthaginian.”

## Page 831

received message *re* presence of ice, but none seen. This vessel took a Southerly course, but no record to show reason for this. Then under the heading of “Instructions to Commanders of Vessels.” “Field ice not to be entered, if possible to avoid it; but, if entered, speed to be reduced. The vessel’s course and speed are secondary considerations compared with the safety of the ship.” Then the Cunard Line. “Copies of wireless messages were sent to Secretary, General Post Office, on the 2nd May. “‘Carmania’ encountered field ice during foggy weather; vessel stopped. When fog lifted vessel proceeded slowly, passing field ice. ‘Mauretania,’ - On approaching ice region deviated to the Southward; this vessel sighted the ‘Baltic’ during the forenoon of the 15th April and received news of the ‘Titanic’ disaster before altering course. ‘Anconia’ - No ice sighted.” The instructions to commanders are similar to those in other cases: Captains to use their discretion, but safety of the ship and passengers is the first and only consideration.” There are the same instructions in the case of Furness, Withy and Co., which had no vessels in the vicinity on this occasion. The White Star Line I need not deal with, as Mr. Sanderson has been called. Then with regard to the Dominion Line, Captain Jones of the “Canada” has been called, so that is answered, and in the case of the Canadian Northern Steamship Company no reply has been received. The HamburgAmerika Line - “Have sent telegram (20<sup>th</sup> June) as follows: Referring your letter (6<sup>th</sup>

June), we will answer your questions Saturday after arrival ‘President Lincoln.’ Other informations not possible before arrival of ‘Prince Adalbert,’ 28th June.” *The Commissioner*: What am I to do about that?

*Sir Robert Finlay*: We have not got it, my Lord. If we get it, of course it will be handed to your Lordship.

*The Commissioner*: If it comes I should like to see it. *Sir*

*Robert Finlay*: Certainly, my Lord.

*The Commissioner*: You do not object, Mr. Attorney.

*The Attorney-General*: Oh, no. As soon as we get it your Lordship shall have it. We have been collecting it.

*Sir Robert Finlay*: The Norddeutscher Lloyd say: “Steamers were going full speed as long as the weather kept clear. The s.s. ‘Bremen’ reduced to 8 knots on the 20<sup>th</sup> April from 2.20 to 4.20 a.m. in the ice region because it was rainy weather.” There is a letter from the Norddeutscher Lloyd Company. It is dated the 18th June, my Lord, and is about five pages from the end of the bundle.

*The Commissioner*: Is this letter from the Norddeutscher in German?

*The Attorney-General*: I should think it was in German by the look of it.

*The Commissioner:* So I think. The date is in German.

*Sir Robert Finlay:* It has been translated.

*The Commissioner:* I should like to see the letter itself.

*Sir Robert Finlay:* I do not think the date being in German is a necessary indication that the letter was in German. You constantly get a letter from a German firm with the date in German and the letter itself in English.

*The Commissioner:* I want to see the original letter, if I can, if it is in German.

*The Attorney-General:* We will send and see, my Lord. We have not got it here.

*The Commissioner:* It says here, "Our steamers were going full speed." I expect if you read the German you will find that it really means, "Our steamers do go at full speed."

*The Attorney-General:* I should think that is very likely, but we will send for the letter.

*Sir Robert Finlay:* I rather think that this is the letter as sent.

*The Commissioner:* It may be. Of course, if it is written in English, and this is the expression in it, there is nothing in the contention.

*The Attorney-General:* If you look at the letter it makes it clear that this is a summary. My Lord has not got the letter yet.

*Sir Robert Finlay:* Your Lordship will find it about the middle of the bundle. All the letters are annexed. It is headed "Bremen," and is addressed to "Messrs. Keller, Wallis and Co., London." We duly received your favour of the 7th instant and enclosed letter of the Board of Trade of the 6th instant. We have made all the enquiries we could since, and beg to answer to the questions as follows: (A.) The original telegrams received by those of our steamers that were in the Western Atlantic when the "Titanic" disaster happened have been delivered to the Supreme Court, London, by the Marconi Company already. (b) Our steamers were going full speed as long as the weather kept clear. The s.s. "Bremen" reduced to eight knots on the 20<sup>th</sup> of April from 2.20 to 4.20 a.m. in the ice region, because it was rainy weather. (c) Our Captains are bound to keep the track, though they have the right to leave it as soon as they think it being necessary for the safety of the ship." I think this bears clear evidence, my Lord, of it having been written in English by a German.

*The Commissioner:* Does it not bear evidence of having been written in German and translated by an Englishman?

*Sir Robert Finlay:* No, my Lord, because an Englishman would not have said "As soon as they think it being necessary." He would have said, "As soon as they think it necessary for the safety of the ship." "We put it to the own judgment of our Captains" - here again that is German-English - "to alter their course, reduce speed, or take any other precautions they think necessary for a safe navigation. We include Nr. 215 of 'Der Leuchtturm,' in which there is on page 857 an article giving true and full information on this object."

*The Commissioner:* This letter has been written by a German who has a far better knowledge of English than most Englishmen have of German. *Sir Robert Finlay:* It is quite intelligible.

*The Commissioner:* What is the article in "Der Leuchtturm"?

*Sir Robert Finlay:* It is on the next page; it is rather long.

*The Commissioner:* Has anyone read it?

*Sir Robert Finlay:* I have glanced over it, and it did not strike me as being very illuminating - not as illuminating as the title of the periodical. I will just read a few sentences and any more that my friend desires. *The Attorney-General:* I do not think it helps at all.

*The Commissioner:* I have looked through it, and I did not notice anything that would assist us.

*The Attorney-General:* It does not tell us anything we did not know.

*Sir Robert Finlay:* We have had so much read that unless it is necessary I will not read it. Now, my Lord, I propose to call attention to the evidence of Sir Ernest Shackleton, but perhaps I had better take Mr. Rostron's evidence first.

*The Commissioner:* This evidence of Captain Rostron appears to me to be important. *Sir Robert Finlay:* If your Lordship pleases, I will take it now. His evidence begins at page 740. A great deal of his evidence is directed to matters of fact with which we have nothing to do. I rather think that I had better read some evidence on page 742, although what is directly relevant on this point is on page 745. I think you will agree that that is a convenient course.

*The Attorney-General:* Yes, I think so.

*Sir Robert Finlay:* It will save reading it again afterwards. He says at the very bottom of page 741: "(Q.) 25405. And you intended, as I follow you, to pick her up on the port bow? - (A.) Yes, on the port side; that was the lee-side; but just after I saw his light I saw an iceberg right ahead. Then, of course, I starboarded - I could not port - to get away from the berg; so I starboarded to make it more convenient for the boat I was going to pick up, and I picked it up on the starboard side. (Q.) How close was the iceberg which you

## Page 832

saw? - (A.) Well, when we had stopped, when daylight broke, it was something less than a quarter of a mile away. (Q.) I should like to follow that to understand it. Had you seen that iceberg before? - (A.) No, it was the first I saw of it. We were close up before we saw it. (Q.) Was day breaking at all? - (A.) No, it was perfectly dark at the time. (Q.) And you had men on the look-out? - (A.) Yes, we had doubled our look-outs. (Q.) Had you men in the crow's-nest? - (A.) Yes. (Q.) When you say you doubled the look-out, does that mean you had also men in the eyes of the vessel? - (A.) Yes. (Q.) Right on the stem? - (A.) Yes. (Q.) Two? - (A.) Two, and one on the look-out, one in the crows-nest, and two in the eyes. (Q.) Is that your practice? - (A.) No, we have one in the crow's-nest and one forward. (Q.) Your practice is to have one in the crow's-nest and one forward? - (A.) At night. (Q.) Do you take any particular precautions if you have received ice reports? - (A.) Always. (Q.) Is that what you do? - (A.) Yes, immediately I started round, before I knew we should be up to the ice; in fact, as soon as I got this report, and I had put her on the course for the "Titanic's" position, I doubled the look-outs at once, and took all the precautions I possibly could. (Q.) Was that the first iceberg that you had seen? - (A.) Oh, dear, no. (Q.) I mean on this particular night? - (A.) Oh, no; the first iceberg we saw was at a quarter to 3. (Q.) I wanted you to tell us about that. You saw one at a quarter to 3? -

(A.) We saw about half-a-dozen - in fact, more than that. I was moving about to get between them up to 4 o'clock. (Q.) No ice-field? - (A.) No ice-field. We were not up to the ice-field then. (Q.) Only icebergs. Take the first one you saw about a quarter to 3; how far off was it when you first saw it - when it was reported to you? - (A.) I should think it was about a mile and a half to two miles away. (Q.) And with regard to the others, I think you say you saw about six up to 4 o'clock? - (A.) Yes, about six. (Q.) Did you see all those at about the same distance? - (A.) Yes, about the same distance - from one to two miles. (Q.) Then, I understand, when you came to the last one - you will correct this if I am wrong - as far as I gather from your evidence, you did not see that till it was somewhere about a quarter of a mile off? - (A.) That is so; at daybreak I saw it was between 25 and 30 feet high. (Q.) Will you explain to us a little more in detail why it was that you did not see this iceberg, the one which you found about 4 o'clock, earlier? - (A.) I cannot tell you, we were all on the look-out. (Q.) It was rather low? - (A.) It was low. (Q.) Twenty-five to 30 feet. I do not know whether you can tell us what the height of your fore-castle was from the waterline? - (A.) Yes, the fore-castle head would be just about 30 feet. (Q.) Your two men were on the look-out, then, in the eyes of the vessel? - (A.) Yes. (Q.) No report had been made to you? - (A.) No. (Q.) Who was it saw it first, do you know? - (A.) Yes, I saw it first. (Q.) Before the look-out men? - (A.) Yes, we saw all the icebergs first from the bridge. (*The Commissioner.*) I do not understand that. (*The Attorney-General.*) You were on the bridge with your officers, I presume? - (A.) Yes, the whole time. (Q.) And each time, if I follow you, that an iceberg was seen, you picked it up first on your bridge? - (A.) Either one of my officers or myself, before the look-outs. (Q.) Did you pick it up by sight, or by naked eye, or with binoculars? - (A.) At first with the naked eye. (Q.) Do you find that you pick them up better with the naked eye than with binoculars? - (A.) It all depends. Sometimes yes, at other times not; it depends. (Q.) How was it neither of the look-out men saw it or reported it to you? Why did not they see it before you? - (A.) Well, of course, they had all had warning about keeping a look-out for growlers and icebergs previous to going on the look-out, and on the look-out, also, you must understand, unless you know what you are looking for, if you see some very dim, indistinct shape of some kind, anyone could take that as nothing at all. Merely some shadow upon the water, or something of that kind; but people with experience of ice know what to look for, and can at once distinguish that it is a separate object on the water, and it must be only one thing, and that is ice. (Q.) So that what it really comes to is this, if I follow you correctly, that it requires a man with some knowledge of icebergs, some experience of picking them up, before he can detect them at night? - (A.) Precisely. (Q.) That is to say, before he could detect them unless they were very close to him? - (A.) Yes. (Q.) Do you employ on the "Carpathia" special look-out men or are they some of your seamen who are told off as look-out men? - (A.) No, the seamen take it in turns, the whole watch right through. There are no special look-out men." That, my Lord, was with reference to the evidence we have had that on the "Titanic" there were special look-out men employed. "25441. So far as you know, had any of these men any experience in being amongst icebergs? - (A.) Not to my knowledge, but I should imagine some of them must have had, because several of them have been in the Cunard Company for years. (Q.) On this North Atlantic track? - (A.) Oh, yes. (Q.) And if they had been on this track for some years they must have seen icebergs? - (A.) I think so, yes, they must have done.

(Q.) Does it mean that on your bridge you and your officers were quicker at detecting them than any of the men on the look-out? - (A.) Well, about 75 percent of the objects that are seen at sea every day or night are picked up from the bridge first. Naturally the officer will take more interest in these things than a look-out man. I always trust to the bridge preferably to the men. (*The Commissioner.*) That is the point I had in my mind. I do not see any advantage in putting men in the eyes of the ship if you can pick up things from the bridge before them? - (A.) It does not necessarily say we shall pick them up quicker from the bridge, but naturally an officer is more on the *qui vive* - he is keener on his work than a man would be, and he knows what to look for. He is more intelligent than a sailor. (*The Attorney-General.*) And he has to act? - (A.) He has to act, certainly. (Q.) He relies upon his eyesight, assisted by the look-out? - (A.) Yes, that is the position; we are assisted by the look-outs. (Q.) If I followed correctly what you said, you rely in the main upon what is seen from the bridge by the officers? - (A.) Yes. (Q.) Of course, it may be that the officer is, for the moment, attending to something else - his attention may be distracted by something else which is happening, and in that case he would have to depend on the look-out? - (A.) Well, the only thing is, supposing an officer is looking on the port side and there is an object on the starboard side, and the seaman happens to be looking on the starboard side, naturally he might detect it first and he would report it." In passing may I suggest that is a reason for having two men in the crow's-nest - that you would be able to cover a wider field, the one looking on the port side and the other on the starboard side? Two pairs of eyes will cover a wider range than one pair might: "25450. (*The Commissioner.*) Were you on the bridge? - (A.) I was. (Q.) You cannot account to me for your seeing some of these bergs a couple of miles away, but not seeing this particular one till it was about a quarter of a mile away? - (A.) No. (Q.) You cannot account for it? - (A.) No. (Q.) It happened to yourself? - (A.) I cannot account for it at all. (Q.) It did happen to yourself? - (A.) Yes, it did happen." I submit that is a very important answer, my Lord. "25451. (*The Attorney-General.*) That would seem to indicate a considerable risk in going through the ice region, does it not? - (A.) Yes. (*The Commissioner.*) Is that a common experience, that when you are amongst icebergs you will detect one two or three miles away, and another not till it is within a quarter of a mile. Is that within your experience? - (A.) No, I do not think it is common experience. I think it is rather uncommon, as a matter of fact. (*The Attorney-General.*) Rather uncommon? - (A.) I think so. (Q.) I want to understand this a little more if we can.

### Page 833

If I correctly followed you, you said you only saw this one at about a quarter of a mile distance from you by the streak of a star upon it? - (A.) No, the first one I saw was about one and a half to two miles away; that was the one we saw at about a quarter to three, with the streak of the star. That was the first one we picked up; it was a large one. (Q.) That one we understand, but this last one that you saw about 4 o'clock. When you were getting ready to pick up the boat on the port side, was there anything at all special about the colour of that iceberg? - (A.) No, but I suppose it must have been because of the shadow or something of that kind, that we could not make it out before. I cannot account for it. (Q.) Does it sometimes happen? - (A.) Yes, very often. (Q.) It may be the iceberg

presents to you a luminous appearance? - (A.) Yes. (Q.) Or it may be it presents to you a dark appearance? - (A.) Exactly. (Q.) That is what you would ordinarily expect when you are looking out for icebergs, is it? - (A.) Yes. (Q.) You cannot tell from which side you are going to see it? - (A.) No. (Q.) Or how it is going to present itself to you in appearance? - (A.) No. (Q.) So that if I follow what you have said, you would always have to be prepared for an iceberg which presented a dark appearance to those who were looking out for it? - (A.) Yes. (*The Commissioner.*) I do not understand where the shadow comes from; there is nothing to create a shadow. There were no clouds in the sky? - (A.) No, my Lord, there were no clouds, but the shape of the iceberg itself might account for it. Now, this iceberg was about 30 feet high and the sides were rather precipitous. If the side had been more of a slope, do not you think that slope would have given off some shadow. If you have a greater surface and there is anything in the theory about 'blink,' you would have more blink if you had a greater surface, and so you might have a dark place if the iceberg itself had a crevice in it or a break. I can imagine that, but I do not know where the shadow comes from. (*The Attorney-General.*) I do not profess to know sufficiently about it. It may depend upon the angle of refraction - I do not profess to be able to explain it better than that. (*To the Witness.*) At what speed were you going when you saw this iceberg about a quarter of a mile from you? - (A.) I should think we were making something about 15; the engines had been stopped for about three minutes - probably between 13 and 15 knots at the time. (Q.) But slowing all the time? - (A.) Oh, it was slowing all the time - yes"; and so on. I do not think I need read any more upon that page. Then I turn on to page 745, the very first Question on that page.

*The Attorney-General:* I think, Sir Robert, you might read the next three or four questions.

*Sir Robert Finlay:* On page 743?

*The Attorney-General:* Yes. You broke off for a moment to go to something else, and then you got back to the iceberg. You will find it at the bottom, at 25470.

*Sir Robert Finlay:* I will read it with pleasure. "25470. Will you tell me, when you starboarded, how close did you get to the iceberg? - (A.) When daylight broke I consider the iceberg was then a little under a quarter of a mile away. (Q.) I am not quite sure that we have got it correctly yet. When you saw this iceberg I rather understood that it was then about a quarter of a mile away from you? - (A.) Between a quarter and half a mile. (Q.) Then you say, although your engines had stopped and had been stopped for something like three minutes, you were still making somewhere about 13 to 15 knots? - (A.) Yes. (Q.) Then I want to know how close it was - you had an iceberg within your range of vision, then - you went to the iceberg when you starboarded? - (A.) This was the boat over *here*. (*Describing.*) I did not know the distance off. *Here* was the iceberg right ahead. I was coming along *there*; I saw the iceberg right ahead *here*, and I saw the light was on my port bow. Of course, I could not see the boat itself, but only the light when he showed the flare. I came along *here* and starboarded, and brought her *here*. Then I saw the light on my starboard side. I saw the light showing; it was getting close. I went full speed astern. I went a little bit past the boat before I could get the way off the ship, and I came back again, because they sang out from the boat that they had only one seaman, and could not handle her. I brought the ship back to the boat. When the boat was alongside of me daylight broke, and I found the berg was about a quarter of a mile off. (Q.) Had you

been any closer to the berg than that? - (A.) No, that was the closest I had been. (Q.) That answers what I wanted to know. Bearing round like that in answering the helm, she was still about a quarter of a mile from you? - (A.) Yes.” That finishes it on that page. Then, my Lord, I turn to page 745, the first Question on the page, “25516. I am dealing with the number of icebergs you saw. From a quarter to 3 to 4 o’clock you picked up with the eye six icebergs? - (A.) Yes. (Q.) When it cleared up and got daylight, and you were more or less in the same place, you found yourself surrounded by icebergs? - (A.) Yes. (Q.) You have told us there were a great many, and some of them 150 to 200 feet high? - (A.) Yes. (Q.) But the point I wanted to be quite clear about was that these icebergs must have been close to you without your seeing them? - (A.) They must have been, yes. (Q.) I wanted to know if you could tell us how far off the nearest one was, leaving out the one which was only a quarter of a mile from you, of which you have told us in detail. How far off was the nearest berg, so far as you can tell us, of 150 to 200 feet high, when full daylight came and you could see plainly? - (A.) Somewhere about three or four miles. (Q.) That would be about the closest? - (A.) Yes, that would be about the nearest. (Q.) That would seem to indicate that it must have been particularly difficult to pick them up by the eye that night? - (A.) Under certain circumstances, yes. Of course, it all depends what you are looking for. If you know what you are looking for you pick them up better than a man who does not know what he is looking for. (Q.) Was there anything, so far as you know, peculiar in the atmospheric conditions that night? - (A.) No, I never saw a clearer night. It was a beautiful night.” I call your Lordship’s attention to that particular answer, in view of the evidence about which we have heard a great deal, and which may be referred to a great deal more - the evidence of the look-out men as to haze: “I never saw a clearer night. It was a beautiful night.”

*The Commissioner:* For myself I do not believe there was a haze at all. There may have been a haze of a foot or two at the base of the berg.

*The Attorney-General:* I think, my Lord, I may save time if I say this. I have looked into this evidence very carefully; and particularly in view of what my friend Mr. Scanlan said - he directed attention to all the particular portions of evidence which bear upon this - I am not going to ask your Lordship to say (I do not think on the evidence one can ask your Lordship to say) that there was a haze. I think the evidence on that point is the other way, so far as it is material to this particular point.

*The Commissioner:* I am quite satisfied on that.

*Sir Robert Finlay:* I think the haze was a myth, possibly originating in a black berg coming out of the blackness, and that one of the look-out men thus developed the theory of a haze; but I need not trouble about that after what has been said.

*The Commissioner:* I do not think so.

*Sir Robert Finlay:* “I never saw a clearer night. It was a beautiful night. (Q.) So far as you could see, you ought to have been able to pick them up easily, or comparatively easily? - (A.) Comparatively easily, yes. (Q.) If you are looking out for them? - (A.) If you are looking out for them. (Q.) If you are not particularly directing your attention to picking up icebergs, you might not see them, although they are close to you? - (A.) That is so. May I give you one more instance? (Q.) Yes, do? - (A.) We starboarded for this iceberg, which we saw ahead. When daylight broke and we were picking up the

passengers from the first boat, I was looking round, and 200 yards on my port quarters I saw a lump of ice 20 feet long and 10 feet high,

**Page 834**

which we had not seen at all. (Q.) I think there is only one other matter I want to ask you about. You have navigated for a good many years on this North Atlantic track? - (A.) Yes. (Q.) And you have often seen icebergs on this track? - (A.) Yes. (Q.) Have you seen them during this particular month, April, on this track? - (A.) I never remember seeing ice in April on the track. (Q.) Supposing you had had a wireless message giving you the position of icebergs, and an ice-field or ice-fields, which you would reach in the ordinary course of things within a few hours, what precautions would you take when approaching that region, if any? - (A.) A great deal would depend. Do you mean at nighttime? (Q.) Yes? - (A.) Well, it is very hard to say what I should do, but I think I should do my best to get out of it, to avoid that position. But if an iceberg is reported it is no use altering your course and trying to avoid it when you do not know where it is. From the time it was reported near the vessel it may have drifted four or five or ten miles, and you might as well keep on your proper course. But if it is an extensive ice-field, we know it covers some area, and of course with an ice-field, I think I should try to get out of it; otherwise I do not know. (Q.) You mean you would not go out of your course? - (A.) Yes, for an icefield, but for an iceberg, no. I do not think I should. I should rely upon keeping a lookout, and the weather and things of that kind. (Q.) You would attempt to keep out of the way of ice-fields and alter your course, but for icebergs you would go on your course and depend upon picking them up with your eye, and then avoiding them when you have picked them up? - (A.) Yes. (Q.) I think you have already told me, but I should like to make quite sure of it, that you would take special precautions with regard to the look-out by putting men in the eyes of the vessel? - (A.) Yes. (Q.) When you had an ice report? - (A.) Yes. (Q.) As well as having a man in the crow's-nest? - (A.) Yes. (*The Commissioner.*) Do you put two men in the crow's-nest, or one? - (A.) I only put one. (*The Attorney-General.*) And two in the eyes? - (A.) Yes. (*The Commissioner.*) In the "Titanic" they had two in the crow's-nest, and it occurred to me it would be almost better to have only one. I do not know whether that is right. (*The Attorney-General.*) The same idea in your Lordship's mind would apply to the two men in the eyes. (*The Commissioner.*) I am not sure. (*The Attorney-General.*) They cannot talk so easily, I agree. (*The Commissioner.*) In the crow's-nest they are rubbing shoulder to shoulder. (*The Attorney-General.*) Yes, it is not quite so easy, I agree. (*To the Witness.*) I have one other matter I want to know. Supposing you had had a report of the character that I have indicated to you of icebergs and an ice-field in the regions which you are bound to cross, when you approach that region, would you take any precautions with regard to the safety of your vessel? - (A.) Well, a great deal would depend on the weather and the atmospheric conditions. (*The Commissioner.*) Suppose it is perfectly clear? - (A.) If it is a perfectly clear night, and I was sure of my position and everything else, unless I knew there was a lot of ice about, I should feel perfectly justified in going full speed. (*The Attorney-General.*) But if you thought there was a lot of ice about you would not do it, I gather? - (A.) No, I would not. For one or two bergs I should feel perfectly justified in

going full speed. (*The Commissioner.*) I suppose it is a matter for the judgment of the man in charge of the ship? - (A.) Absolutely. (*The Attorney-General.*) Which again, I suppose, must depend upon the atmospheric conditions as to whether he can see clearly ahead? - (A.) Yes. We have to take a whole lot of things into consideration in a thing of that kind. It is not one or two; it is many." Then some questions are put to him by myself. The first passage I have read with regard to the practice at sea, and I do not think there is any other question asked that I need read. That practically ends the evidence of Mr. Rostron upon this point. So that your Lordship sees that Mr. Rostron agrees with the evidence that we have had. He says if it was a clear night he was perfectly justified in going full speed, and then he describes what his practice would be with regard to the course. He says an iceberg is a moving object, so that it is no use altering your course because you are told there is an iceberg ahead of you; by the time you have got to that spot it will have moved on just as a crossing ship would. With regard to field ice, it is another matter, because that may occupy an extensive area, and it may be desirable to alter your course to keep out of the way of field ice altogether. So that I therefore submit, my Lord, that the evidence of Mr. Rostron - although he was called primarily on another point - as a gentleman of great experience, strongly confirms the evidence given by all those who were in this trade, and whose evidence he in no respect contradicts, but agrees with.

*The Attorney-General:* I only want to say, in case my friend may think that I agree with what he says, that I do not agree with that. My view is that Captain Rostron's evidence does not agree with the evidence of the other Captains who have been called. I think it is different in very material respects in the passages that have been read by my friend. I agree with a great deal of the comment that my friend has been making with regard to the other Captains' evidence - there are one or two observations I shall make when I come to deal with that - but substantially, as I said in an earlier stage of the case, I agree that the evidence he has called of the Captains, does show that their practice is to continue at full speed, provided it is a clear night and they can see ahead.

*Sir Robert Finlay:* Certainly, and Mr. Rostron does not contradict it.

*The Attorney-General:* I do not agree.

*The Commissioner:* He qualifies it.

*Sir Robert Finlay:* I should be glad if the Attorney-General would call my attention to the passage in which it appears that he does qualify it.

*The Attorney-General:* I have read it. First of all he qualifies it by saying, if he knows there is a lot of ice about, that would make a difference, and then he says, "If I knew there were one or two bergs it would make no difference." But obviously he thinks that if he knew of more than that - that there was more ice about than that - it would make a difference. The question is, I think, substantially the question put by my Lord at 25541. Perhaps it would be better just to read the question before, so that my friend may see the point I am relying upon. And, my Lord, I would add also, before I read this - I am not going through the evidence in detail of Captain Rostron on it - I rely very strongly upon what he actually saw - I am going to comment on that and upon his indication and statement in evidence of what he had seen before with regard to icebergs of darker colour. But that is general. That is the evidence which I shall rely upon when we come to discuss the question as to whether there was anything abnormal in meeting what I will

call - and I think accurately - a dark looking iceberg; that is a question which, of course, will form the subject of a good deal of discussion.

*The Commissioner:* Are you going to suggest that the circumstances on this night were not abnormal?

*The Attorney-General:* Do you mean of the weather?

*The Commissioner:* Yes, I do.

*The Attorney-General:* No.

*The Commissioner:* I mean the atmospheric conditions in which it was necessary to look-out and detect the iceberg. The effect on my mind of this evidence is this, that there was a combination of circumstances on this night of very rare occurrence, which made it extremely difficult to ascertain with certainty the position of any ice of any kind.

*The Attorney-General:* If I may say so, without putting it quite as high as your Lordship does, I agree. My view is also that there was certainly a combination of circumstances in this case which were exceptional, that is to say, they were out of the ordinary. But I want to indicate this also, so that my friend may know the argument - which I have no doubt he already does from the questions which I have put - that I am going to address to your Lordship. My submission will be that, notwithstanding

## **Page 835**

they were not ordinary conditions, they were conditions against which it behoved a prudent man to guard; and I wanted to add that the moment they knew that the conditions were exceptional - although I agree that on Mr. Rostron's evidence he did not know that there was no swell - yet those circumstances of which he did know necessitated, I am going to submit, extreme care, and may I add one thing further - that the highest standard of care apart altogether from the particular conditions of this night must be applied to a case of this kind in a passenger vessel like the "Titanic." Those are general observations which I indicate to my friend of course for the purpose of his dealing with them. But the question I am upon now is as to what a prudent Commander would do if he had had ice reports, and that, my Lord, is to be found at Question 25540, where I put this question to him: "Supposing you had had a report of the character that I have indicated to you of icebergs and an ice-field in the regions which you are bound to cross, when you approach that region, would you take any precautions with regard to the safety of your vessel? -

(A.) Well, a great deal would depend on the weather and the atmospheric conditions.

*(The Commissioner.)* Suppose it is perfectly clear? - (A.) If it is a perfectly clear night, and I was sure of my position and everything else, unless I knew there was a lot of ice about, I should feel perfectly justified in going full speed." I say that is a very qualified answer, or a qualified answer as compared with that of some of the other

Captains. Then I will read again the question put to him by me: "But if you thought there was a lot of ice about you would not do it, I gather? - (A.) No, I would not for one or two bergs. I should feel perfectly justified in going full speed."

*The Commissioner:* And you will not forget this, that assuming as I do - and I think you think I ought to do it - that the only three messages which ought to be taken into account are the three that I have already mentioned. *The Attorney-General:* Yes.

*The Commissioner:* The Captain of the “Titanic” would imagine himself to be out of the field or region in which the ice was advised - South of it. He would imagine himself to be South of the region. You will not forget that because it seems to be relevant having regard to what you have just read in Mr. Rostron’s evidence, in which he says: “If I knew that I was” -

*The Attorney-General:* “Sure of my position and everything else.”

*The Commissioner:* “Unless I knew there was a lot of ice about.” Of course, I do not know what “about” means; I must use my own discretion about that. It may mean to the North or the South; it may not mean exactly in his course. “About,” that is to say, ice that may possibly come into his course.

*The Attorney-General:* Yes, I shall argue, when I come to deal with the question, that, apart altogether from the question of whether the “Titanic” would, if she had pursued her course without alteration along this track, have come within the region of the icebergs and ice-field as reported to her; that, apart altogether from that, supposing that the Captain was right - I am assuming this because of an argument which my learned friend has indicated -

*The Commissioner:* You are helping me very much in indicating to Sir Robert what it is you are going to say.

*The Attorney-General:* Supposing he was right in assuming that the Captain was justified in thinking that having gone this seven to ten miles, as he did, to the South, before he turned the corner, and then pursuing his course, and getting back to the track - that, having done that, he had got out of the way of the particular ice that was reported - my submission will be that he ought to have been still extremely careful, because of the fact that this seems to have been such an abnormal circumstance that there should be ice in this track where it was reported, in the month of April, contrary to the knowledge and experience of men, with the exception of one or two experiences of Sir Ernest Shackleton, during the last 25 years. My submission will be that the moment he knows of that - that he is not dealing with a detached iceberg or with detached icebergs, or with a detached ice-field, but what he has to reckon upon is that there is an abnormal state of things for this particular year, and that he must expect to see the icebergs and ice-fields along this track, he must keep a special look-out. That is the point.

*The Commissioner:* I quite appreciate that, and then I think - you have thought about it, no doubt - you will have to remember that he has to make up his mind as to what is best to be done with reference to these abnormal circumstances.

*The Attorney-General:* Certainly.

*The Commissioner:* And that, to come back to what I said a long time ago, it may have been an error in his judgment rather than negligence, because a man may make, as we all know, a mistake which is due sometimes even to too great care.

*The Attorney-General:* Certainly.

*The Commissioner:* I do not say anything of that kind happened in this case - but a mistake and negligence are very, very different things.

*The Attorney-General:* Of course, you have to bear in mind, and those who are assisting you have had it constantly present in their minds, that the importance of this Enquiry is really as to the view which your Lordship will form for guidance as to the future. *The Commissioner:* May I say something about that. Much has been said about it, and

something has been said about it by the witnesses. This accident has added enormous knowledge to the experience that men will have to be guided by in the future; but whether, in view of the knowledge that people had at the time of the disaster, it was negligence is another matter. If the same thing were to happen tomorrow, with this knowledge in the minds of men, I can scarcely conceive that it would not be negligence of a very gross kind, because they now know what apparently, if this evidence is right, they did not know then, and that knowledge adds to the experience.

*The Attorney-General:* No doubt. In the argument which I shall address to the Court, I shall draw the distinction, and have done throughout, at any rate in my own mind, between what would be negligence up to this date of the 14th April. Whether with all the knowledge and experience that navigators had at that time they had to take special precautions such as reduction of speed, towards which there has been so much attention drawn in this case, is, of course, a point which will require, and to which I have no doubt your Lordship will give, very careful consideration. And, apart altogether from that, assuming for the moment that your Lordship comes to the conclusion that, taking into account all the circumstances - the atmospheric conditions, the very flat calm sea, no swell, and so forth - assuming that you, with this combination of circumstances, come to the conclusion that there was no negligence on the part of those navigating, but that there was, nevertheless, in view of what happened, an error of judgment - your Lordship's view about that really depending upon what actually happened as proving that there was an error of judgment as distinguished from negligence, that I can quite appreciate. Of course, those are matters which, as I have indicated, are considerations for the Court. I am very glad it is no part of my duty to urge the Court to find negligence against those who were responsible for the navigation, to strain the evidence in that way. Mine, fortunately in this respect, is not an advocate's duty in that sense. All I have to do - and I think it my duty to do it in view of the evidence that has been brought forward here - is to put the considerations before you for your judgment; and that is all.

*The Commissioner:* You are in the position of a prosecuting counsel in a criminal case, in fact; that is to say, your duty is to take care that the facts are fairly placed before the Court.

*The Attorney-General:* Quite.

*Sir Robert Finlay:* I think my friend is not really in that position. I think he is on one of these Enquiries in a semi-judicial position.

## **Page 836**

*The Attorney-General:* I agree. I think my Lord would say, and I should agree with him, that as a prosecuting counsel, you are also in a semi-judicial position.

*Sir Robert Finlay:* The prosecuting counsel is bound to show the utmost generosity to a man on his trial, but I put the duty of the Attorney-General on an Enquiry of this kind rather higher than that.

*The Attorney-General:* I do not think there is any difference between us about it, or between my Lord and me. Now, my Lord, when we have dealt with that part of the case, then comes that portion of the Enquiry which I say, with all respect, is the more important part, because it is designed to protect the public in the future. However lamentable it may

have been, we cannot help what is past, but we can do something, or your Lordship can, with the assistance that you have, towards making some recommendations for the protection of the public in the future. My Lord, it is in that connection that I think all this evidence to which my learned friend, Sir Robert Finlay, has just been calling attention, is of such importance; because as I appreciate the evidence which has been given, and certainly the evidence of Mr. Sanderson and of Mr. Ismay, their view is - I am not complaining of it at all, of course, and I quite appreciate why they say it - but their view is that notwithstanding what has happened, that notwithstanding the disaster to the "Titanic," the practice which hitherto had existed was a perfectly right practice, and apart altogether from recommendations which may be made by the Court, would be continued. I mean by that that their view is that it would be right to continue it. Of course I have not the slightest doubt that any indication from the Court would be accepted by the White Star and other lines as sufficient to make them change the practice, but if there had been no such Enquiry, the view seems to be held by many of those gentlemen who have been called before you that they have no reason to modify the opinion which they have expressed as to what is prudent navigation in the circumstances, and I am very anxious about that, and very anxious that we should have from your Lordship -

*The Commissioner:* That is quite right, and I am very anxious about it too. I have not heard Sir Robert Finlay yet suggest that the course that was taken on this night would now be a wise and proper course if the same circumstances were to arise again. *The Attorney-General:* I think I heard my friend say it yesterday afternoon, and I thought he said it based upon the evidence of Mr. Ismay and Mr. Sanderson.

*Sir Robert Finlay:* I do not think Mr. Ismay and Mr. Sanderson profess to be experts on this matter. Their evidence was merely with reference to what they knew the practice always had been.

*The Commissioner:* Am I to understand that even with the knowledge that has been gained by this unfortunate accident, the practice of continuing at full speed ought still to be continued?

*Sir Robert Finlay:* Not necessarily at all, my Lord. We have had a flood of additional knowledge. The incursion of the ice further South must have profoundly modified the conditions, and I may say on behalf of the White Star Line, as I have said already, I think, that any intimation that the Court may see its way to make as to the practice in the future will, of course, receive complete attention.

*The Attorney-General:* It is not a question for discussion between us. I quite appreciate that they would be very glad to follow, and would follow out most completely, no doubt, any recommendation your Lordship makes. But I wanted to direct attention to the evidence; and I shall show your Lordship when I come to deal with the evidence that whatever my friend Sir Robert may say, which would naturally be quite what you would expect of him in the circumstances, that is not the view which has been taken by those who have been called before you.

*The Commissioner:* If they take the view that notwithstanding the experience they have gained, these ships ought to be navigated at full speed in circumstances such as there were on this occasion, I at present should venture to differ from them.

*The Attorney-General:* Yes, my Lord. What I am saying is only directed to the future.

*Sir Robert Finlay:* The evidence of these witnesses was directed to the past, and what the

practice always had been. Your Lordship made reference to what should take place with the knowledge of this disaster. I think that if your Lordship would look at Question 25531 onwards, it is by no means clear that all these answers of Mr. Rostron's are not given with reference to what he would do now. Your Lordship sees there is no contradiction throughout; there is never a suggestion of a contradiction as to the practice in the past. As far as Mr. Rostron goes, he does not differ from it at all, and these questions quite admit of the construction that he understood my friend's questions to be

“What would you do now?”

*The Commissioner:* That may be. I will have to examine the questions and answers to see whether that is so or not. But I quite agree with the Attorney-General that the importance of this Enquiry is to ascertain whether the practice is one which must be altered. The importance of this Enquiry has to do with the future. No Enquiry can repair the past.

*Sir Robert Finlay:* If your Lordship pleases, that observation of mine, if it is well founded, very much strengthens the effect in my favour of the whole of Mr. Rostron's evidence. At question 25541 he says: “If it is a perfectly clear night, and I was sure of my position and everything else, unless I knew there was a lot of ice about, I should feel perfectly justified in going full speed.” Then, my Lord, there is one other observation I may be permitted to make. I put it to the Court that there is nothing in what I have read of Mr. Rostron's evidence - and I have read everything in the least material on this point - that it all qualifies the body of evidence to which I have already called attention. And further than this, the question is negligence on the part of Captain Smith. One consideration that can never be dismissed from the mind is this: I do not ask that Captain Smith should not be found to have acted negligently if the evidence shows it; but one can never dismiss from one's mind the fact that he is not here to give the reasons. I am sure the Attorney-General will agree that that is a most cogent observation, and must turn the scale in this case.

*The Attorney-General:* Quite.

*The Commissioner:* You may be quite sure that I shall be most careful. I shall require the negligence to be proved so that I cannot escape from it.

*(After a short adjournment.)*

*The Commissioner:* There is one question and answer in Captain Rostron's evidence I want to draw your attention to, Sir Robert, Question 25465, at page 743.

*Sir Robert Finlay:* “So that, if I follow what you have said, you would always have to be prepared for an iceberg which presented a dark appearance to those who were looking out for it? - (A.) Yes.” If that means that black bergs are common, I think it is wrong, but I do not think Captain Rostron can have meant that. I may say that Captain Rostron, as appears from the American evidence, had not been much on the Atlantic. My friend, Mr. Maurice Hill, has been good enough to supply me with references to the American evidence. He was appointed to the “Carpathia” on the 18th January of this year, 1912. The “Carpathia” was in the New York and Mediterranean trade, which, of course, involved crossing the Atlantic. Then in the American evidence the same gentleman

appears as commanding the “Carpathia” and the “Pannonia” during 1911; that is Mediterranean and New York in the same way. Then previous to that he says,

**Page 837**

“I was Captain of several other smaller cargo boats running between Liverpool and the Mediterranean.”

*The Commissioner:* Well, you do not come across icebergs there.

*Sir Robert Finlay:* No, your Lordship will see that that was in answer to a series of questions put to the witness by the Attorney-General. He had previously given two answers to your Lordship which were perfectly specific and distinct. One is at the bottom of page 742, Question 25450. Your Lordship said to him: “You cannot account to me for your seeing some of these bergs a couple of miles away, but not seeing this particular one till it was about a quarter of a mile away? - (A.) No. (Q.) You cannot account for it? - (A.) No. (Q.) It happened to yourself? - (A.) I cannot account for it at all.” Then at the top of the next page, Question 25455 “Is that a common experience, that when you are amongst icebergs you will detect one two or three miles away and another not till it is within a quarter of a mile? Is that within your experience? - (A.) No, I do not think it is common experience. I think it is rather uncommon, as a matter of fact.” I think the answer must really refer to this: Your Lordship will recollect it is in evidence already that where an iceberg has been torn off from the parent iceberg, if I may use the expression - the side where it has been torn off if the rupture was at all recent is much darker; where it has been exposed for a long time to the sun and air it is white, so that one side is darker than the other. But even then, as the witness who testified to this said you have a white glimmer over the top of the black side, coming from the white side, which is the other side. I think that what Captain Rostron says must refer to that. But in any case his experience, dating from the beginning of the year 1911 in the American trade does not compare with that of the many Commanders who have been called before the Court, and who are all unanimous about this that a black berg is a very rare thing. *The Commissioner:* Very well. You have dealt now, I think, with all the evidence upon that part of the case.

*Sir Robert Finlay:* Except Sir Ernest Shackleton.

*The Commissioner:* Oh, yes, except Sir Ernest Shackleton.

*Sir Robert Finlay:* Sir Ernest Shackleton’s evidence is at page 719. I will read his evidence, which will include that which bears directly upon this point. “(Q.) You have had a large experience of ice? - (A.) Yes. (Q.) I want you to help the Court with your views, as a result of your experience, first of all with regard to the visibility of ice in clear weather. Take icebergs first? - (A.) That entirely depends on the height of the iceberg. Take an iceberg of about 80 feet high, and the ordinary type of iceberg that has not turned over, you could see that in clear weather about ten to twelve miles. (Q.) At night? - (A.) Not at night, no. I would say, providing it was an ordinary berg, about five miles on a clear night. (*The Commissioner.*) At night? - (A.) Yes, at night. (*The Attorney-General.*) You said provided it was an ordinary berg? - (A.) Yes. (Q.) Are there bergs which present a different appearance in colour? - (A.) There are many bergs I have seen that appear to

be black, due to the construction of the berg itself, and also due to the earthy matter and rocks that are in all bergs. In fact, in the South many of these so-called islands, and charted as islands, must have been big bergs with earthy matter on them. Again, after a berg has capsized, if it is not of close construction, it is no more porous, and taking up the water does not reflect light in any way. (Q.) Have you had large experience of this particular track? - (A.) Not much, only four or five times." It turned out afterwards that he had crossed four or five times as a passenger. He had been only once across except as a passenger, and that was when he was 17 years old in an early voyage. The other experiences, four or five times, were as a passenger. And may I say at once with reference to Sir Ernest Shackleton's evidence that Sir Ernest Shackleton is a recognised expert with regard to South Polar ice; he did most admirable work there, and work of the most interesting kind. The book that he wrote about it is a most fascinating book; but the conditions under which he worked with regard to ice were absolutely different from those which prevail in the North Atlantic, where his only experiences were as a passenger on four or five occasions. Going to the South Pole - he got very near it - he had got into great masses of ice. He had to thread his way through them, turning and twisting, to use his own expression, to get through; sometimes he got a run of a few miles; at other times he had to go with constant evolutions. That is a very different thing indeed from the conditions which prevail in the North Atlantic, although if the icebergs continue to encroach further South in the manner in which they have recently been showing a tendency to do the conditions may be more assimilated to those of the South Pole. But at all events at present trade with the South Pole has not developed. So that what Sir Ernest had to do was to thread his way through these great masses of ice where there were no other vessels about at all, with a vessel, the "Nimrod," of 300 tons with her bows only 14 feet from the water, while the crow's-nest was 90 feet from the water; so that it is obvious that the position of the man on the stem so near the water, having regard to Sir Ernest's evidence, would be of much greater value for the purpose of seeing a berg as they approached it.

"Have you had large experience of this particular track? - (A.) Not much, only four or five times. I have seen ice in the North Atlantic. (Q.) Have you ever seen ice of this particular dark character to which you have referred in the North Atlantic? - (A.) Yes, twice. (*The Commissioner.*) In the North Atlantic? - (A.) Yes. (*The Attorney-General.*) Was that on the outward route to the States? - (A.) On the outward route, yes - once outward and once homeward. (Q.) Do you remember about what time it was of the year? - (A.) In about April, I think, 1897, and again in May, 1903, and again in June, 1910, but that was further north. (Q.) Is this right that you have seen altogether on the North Atlantic tract ice on four or five occasion? - (A.) Yes. (Q.) That is four or five voyages? - (A.) Yes. (Q.) Extending over a very considerable period of time? - (A.) That is so. (Q.) Beginning in 1897? - (A.) Yes. (Q.) Out of those four or five times is it right that you twice saw those dark-coloured icebergs? - (A.) I would not like to say on the last two occasions. My memory will not serve me more than that, I have noticed on one occasion at least more than one berg that did not reflect light."

As regards darkness - it is not necessarily the same thing as blackness and all he says is he has noticed bergs on these occasions that did not reflect light. Then it goes on "(Q.) What I meant was - I want to follow your evidence - that of the four or five occasions of

which you have spoken, two of them were occasions on which, as I understood you, you have seen ice of this dark colour? - (A.) Yes, but I would like to add that I have seen at the same time other ice - ice of a different colour. (Q.) Yes, I see what you mean - there would be other ice of a different colour, but amongst it you saw twice icebergs of this dark colour." The Witness does not accept "this dark colour," he says, "of darker colour, yes." Then there is a question as to about how often it was. Then he says in answer to Question 25032, "I was certain of the 'other occasion,' but I qualified it only inasmuch as that on the same occasion I saw different coloured ice. (*The Commissioner.*) Am I to understand that you saw several bergs on these five voyages that you have spoken of? - (A.) Yes, my Lord. (Q.) Or only one berg on each occasion? - (A.) No, on one occasion there were several bergs. On the first occasion, I remember it was a low-lying berg which was evidently a capsized berg. (Q.) You only saw one berg? - (A.) That is all I remember. (Q.) Then on the second occasion you saw several bergs? - (A.) Yes. (Q.) Did you see several on the other three occasions? - (A.) No, my Lord; some of them were

### Page 838

just small pieces. I would not call them big bergs, not like the southern bergs. (Q.) Are they called growlers? - (A.) I have never heard that term applied to them, but I believe it is a well-known term. I have read of such, but we never call them growlers; we call them floe bergs when they were not the height of an actual big berg carved off from the land, but a berg that had capsized, having worn out underneath. (*The Attorney-General.*) You have spoken of the distance at which you would see bergs. You told us, I think I am right in saying, ten or twelve miles in the daytime on a clear day, and five miles on a clear night? - (A.) Yes. (Q.) How far would you see one of these dark bergs on a clear night, assuming it to be 60 to 80 feet high? - (A.) It might be only three miles, depending on the night and depending almost entirely on the condition of the sea at the time. With a dead calm sea there is no sign at all to give you any indication that there is anything there. If you first see the breaking sea at all, then you look for the rest and generally see it. That is on the waterline. I do not say very high, because from a height it is not so easily seen; it blends with the ocean if you are looking down at an angle like *that*." I suppose he indicated an angle similar to that which you would look down if you were in the crow's nest, 90 feet high. "If you are on the sea level it may loom up. (Q.) That would rather suggest that your view would be that you could detect bergs of that kind better at the stem than you could at the crow's-nest? - (A.) Better, the nearer you are to the waterline. When we navigated in thick or hazy weather there was always one man on the look-out and one man as near the deck line as possible. (Q.) That is thick or hazy weather? - (A.) Yes, that is thick or hazy weather, or even clear just the same. (Q.) What I want you to tell my Lord is; do you think it is of advantage in clear weather to have a man stationed right ahead at the stem as well as in the crow's-nest? - (A.) Undoubtedly, if you are in the danger zone; in the ice zone.

He afterwards explains what he meant when you had ice reported to you, would you take precautions as to the look-out? Supposing you only had men in the crow's-nest, would you take any other precautions? - (A.) I would take the ordinary precaution of slowing down, whether I was in a ship equipped for ice or any other, compatible with keeping

steerage way for the size of the ship. (Q.) You would slow down? - (A.) I would slow down, yes. (Q.) And supposing you were going 21  $\frac{3}{4}$  to 22 knots, I suppose that would be the better reason for slowing down? - (A.) You have no right to go at that speed in an ice zone.”

He afterwards explains what he meant when you get into what he calls an absolute ice region. He is a little indefinite as to what constitutes an ice region. But it is quite clear that Sir Ernest Shackleton’s mind is running upon his own experience when he got into an absolute ice region, threading his way through those masses of ice on his way to the South Pole.

*The Commissioner:* I have no doubt Sir Ernest Shackleton had a definite meaning, but I do not know it. What is the definite meaning of an ice zone?

*Sir Robert Finlay:* I put it to him afterwards when I examined him, and he was not definite about it. I will read what he said. It is left very indefinite, but I think what he had in his mind was where you have a large collection of ice comparatively close together or in patches, as in regions through which he threaded his way when he was going Southward to the South Pole, or Northward on his return. I think that is what he means. But it is left very vague. I tried to get it more specifically from him afterwards. “You have no right to go at that speed in an ice zone. (*The Commissioner.*) And you think that all these liners are wrong in going at this speed in regions where ice has been reported? - (A.) Where it has been reported I think the possibility of accident is greatly enhanced by the speed the ship goes. (Q.) We have been told that none of these liners slow down, even though they know that they are going through an ice region - that is to say, a region where there are icebergs? - (A.) I have been in a ship which was specially built for ice” - that was the “Nimrod” - “but I took the precaution to slow down because you can only tell the condition of any ice you see; there may be projecting spurs, and you may suddenly come across them. (Q.) What was the speed of the boat you were in? - (A.) She was only six knots at full speed. She was 40 years old. (Q.) Do you mean to say that you slowed down a vessel of six knots? - (A.) Yes, I always did. (Q.) Then what did you get to? - (A.) We got very near the South Pole, my Lord. (Q.) What speed did you get down to? - (A.) We slowed down to about four knots. At her best she did six knots. (Q.) At her best she did six knots; that was not the ship that you got near to the South Pole in? - (A.) Yes, that is the ship; she was very old she was very small.” She was a wooden ship of 300 tons. I suppose she would have been employed as a whaler in her hot youth, Greenland, and then in her old age she went near to the South Pole. *The Commissioner:* Retired, so to say.

*Sir Robert Finlay:* “She was very old; she was very small. (*The Attorney-General.*) I still want you to give me your attention with regard to the look-out. You have told me your views with regard to speed. Suppose you had two men in the crow’s-nest, and it was a clear night, and you were going through a region in which ice had been reported, would you put any person in the bow for a look-out? - (A.) I would put a look-out man in the bow or as near to the waterline as possible, even on a clear night, but I would only have one man in the crow’s-nest. (Q.) Your idea would be that of the two men when coming into an ice region, one should go to the bow and one be in the crow’s-nest? - (A.) My main reason for saying one man in the crow’s-nest is that I think one man gives more attention to the work in hand than two men. (*The Attorney-General.*) There is a good deal

to be said for that. (*The Commissioner.*) Yes, I think so. (*The Attorney-General.*) If I follow you correctly your view is, it is better on a clear night passing through an ice region to have a man as near the waterline as possible? - (A.) Yes. (Q.) Which would be preferable, the bow or the crow's-nest? - (A.) I would have a man in both, one in the crow's-nest and one in the bow; and if I may say this I would prefer in a liner to go where there is known danger than to go in a Southerly route, where you may occasionally get a berg, because some of these bergs drift from the North, very big bergs drift down into navigable waters, where no one would expect to find them; and then a ship comes to damage; whereas if you are looking for danger you guard against it more, or ought to. (Q.) I think we have been told they drift from North to South? - (A.) Yes, by the Labrador Current. (Q.) One other matter I wanted you to tell us about, and that is with regard to the use of glasses" - I need not trouble about that. Then Question 25060 "I ought to ask you this: Is there any indication of the proximity of ice by the fall of temperature? - (A.) Unless the wind is blowing from a large field of ice to windward there is no indication at all by the methods that are used now, and it is a very poor thing to go upon, is the change of temperature. The film of fresh water that covers the sea is so thin that by dipping in a bucket you do not pick up that thin cold water, and if the temperature of the air is approximately the temperature of the sea there is practically no haze; it is only when the water is warmer or the air is warmer that the haze occurs. There are no methods that I have heard of before this that can really give you an indication of approaching ice by ordinary temperature methods. (Q.) Supposing you were approaching an ice region, that is, a region in which you had ice reported to you, and you found the temperature getting colder, would that be any indication to you that you were getting close? - (A.) No, it depends upon whether there was a wind or not. (*The Commissioner.*) On this occasion we were told that, at all events, from 3 o'clock in the afternoon, there was no wind. (*The Attorney-General.*) No wind, and the temperature

## Page 839

fell very much. (*The Witness.*) Then if there was no wind, and the temperature fell abnormally for the time of the year, I would consider I was approaching an area that might have ice in it. (*The Attorney-General.*) According to the evidence - I am only dealing with one part of it - perhaps the most striking part - during the afternoon on this particular occasion on 14th April of this year, the temperature was reported to be falling, so much so that the Captain ordered the carpenter to see that the water in his tanks did not freeze. Would that be any indication to you? - (A.) If I knew what the mean temperature of that locality was for that month of the year and there was a great variation, then I would certainly think there was some abnormal disturbance in the ice to the North. Of course, that particular night was an abnormal night at sea in being a flat calm; it was a thing that might never occur again. (Q.) That is what Mr. Lightoller says." *The Commissioner:* Let us stop there for a moment. There was undoubtedly a very rapid fall in the temperature. I assume there was a fall in the temperature of the air. There was no wind. How can that fall in the temperature of the air be connected with the presence of icebergs some miles away?

*Sir Robert Finlay:* I submit that according to all the evidence it is a very uncertain indication indeed.

*The Commissioner:* I have not grasped it before, but I understand what Sir Ernest Shackleton says about the temperature of the water. The only way in which an iceberg affects the temperature of the water is by the ice of the iceberg dissolving and forming a skin or thin coating of melted ice, that is to say, water which has just been ice on the surface of the water.

*Sir Robert Finlay:* Yes.

*The Commissioner:* And that will not go to any depth.

*Sir Robert Finlay:* No.

*The Commissioner:* Nor do I know how far it would spread.

*Sir Robert Finlay:* It is very difficult indeed to say. Of course, if the water coming from the iceberg were colder it would find its way down below the water, which is of a higher temperature.

*The Commissioner:* Below the water of the temperature of the sea.

*Sir Robert Finlay:* Yes, it would take some time, of course; it would not happen at once - just as the Labrador Current goes underneath the Gulf Stream as your Lordship has heard from "The United States Pilot." The Gulf Stream is a comparatively warm stream as many parts of the British Isles experience owing to its effect at the end of its course on the coast.

*The Commissioner:* In Ireland.

*Sir Robert Finlay:* Yes, and the West of Scotland, and it is said also to get round the North of Scotland for a very little bit. But the Labrador Current comes down, as your Lordship knows, from the great opening between Greenland and the Labrador Peninsula. It comes down there with a Southerly course. Then after a time it impinges upon the Gulf Stream. It goes under the Gulf Stream owing to the temperature of the water, the Gulf Stream being some 50 fathoms deep or it may be a little more; and then the Labrador Current, when it has got past the Gulf Stream, which is a pretty wide stream, reappears on the Southern side.

*The Commissioner:* I think that appears in the book you have referred to so often. *Sir*

*Robert Finlay:* It does, my Lord. These considerations, I think, have considerable importance when we come to estimate the reasons which probably actuated the Captain of the "Titanic" in the course which he took.

"You say it is apparently very rare to get such a flat calm as there was that night? - (A.) I only remember it once or twice in about twenty years' experience - the sea absolutely calm, without a swell, as it was recorded to have been."

I submit that is a very important answer indeed, and it agrees with the other evidence. Then Question 25065 is: "(Q.) And if I followed correctly what you said earlier it would make it more difficult to pick up an iceberg with the eyes? - (A.) Decidedly. (Q.) If you had this calm sea? - (A.) Yes, decidedly so. (Q.) Although it was a clear night? - (A.) Yes. (Q.) There would be no indication of the water breaking round it? - (A.) No, there would be none in a condition like that. It takes very little sea and very little swell, with the northern bergs which are submerged about seven times to one above, for what we call a splash to get up and give you an indication." Where you have a white iceberg, such as is

common, such as all the witnesses describe as the sort of iceberg that they have known, you see them as you see that great cartoon there; but where you have a black berg, which is very rare, a berg which in all probability had recently capsized, then the entire absence not only of wind but of swell is of the most vital consequence, because you are deprived of the breaking of the water at the foot of that black berg which would produce a white line, which would be visible and which would call attention to the berg. It is not of great consequence if it is a white berg because that is seen a long way off, as all the witnesses have said; but if it is that very rare thing, a black berg, like this, then if you have a perfectly calm sea, absence of all wind, and absence of all swell, it is fatal, because the black berg does not catch the eye as the white resplendent berg catches the eye, and you are deprived of the invaluable guide of the water breaking at the foot of it. But there comes in the importance of what Sir Ernest Shackleton and many other witnesses say, that such a sea as that is a thing in the Atlantic which might never occur again. "I only remember it once or twice in about 20 years' experience - the sea absolutely calm, without a swell, as it was recorded to have been"; and then he adds "It takes it once or twice in about 20 years' experience - the Northern bergs which are submerged about seven times to one above, for what we call a splash to get up and give you an indication." I submit that is of crucial importance.

Then he describes the phenomenon of the ice-blink which shows a luminous effect on the iceberg.

*The Commissioner:* I do not know that it is very important, but I do not know what produces the ice-blink.

*Sir Robert Finlay:* We had one theory about which I confess I have some doubts given by one of the commanders, that the sunlight is absorbed during the day and given out at night. I am not satisfied myself about the correctness of that theory; but I suppose it is a sort of phosphorescent light from the white iceberg which has been subject to the influence of the sun all day. I do not believe it is the sunlight being absorbed and given out; but that blink undoubtedly does come. There is no doubt about that.

*The Commissioner:* A great many people talk about this ice-blink and I was wondering whether it was caused by the reflection of the starlight upon the crystals.

*Sir Robert Finlay:* I do not think so, my Lord; I have no satisfactory theory.

*The Commissioner:* Let me read this to you. It is out of "The United States Pilot," 1909 edition, at page 35: - "During a fog or in the darkest night, the proximity of the position of an iceberg may frequently be known if a good look-out is kept by a peculiar whitening of the fog known as ice-blink." I do not know whether there is any other reference to iceblink in this book.

*Sir Robert Finlay:* I am not aware that there is, my Lord, but they have not been speaking about fog.

*The Commissioner:* It is not a very clear passage.

*Sir Robert Finlay:* No, it is not at all clear.

*The Commissioner:* Because they apparently assume one of two conditions, either a very dark night or a fog.

*Sir Robert Finlay:* If you get a very dark night without a fog how can you have a peculiar whitening of the fog which is not there?

*The Commissioner:* That is what I mean.

*Sir Robert Finlay:* I think it is really a condition independent of the fog. It is undoubtedly a

## Page 840

sort of light given off from the iceberg. What the theory of it is I am unable to explain. In the second part of this same book, my Lord, at page 22, there occurs this passage: "Both by day and night the ice-blink is almost always visible on the sky towards the ice. Ice-blink is a bright yellowish white light near the horizon reflected from the snow covered ice and seen before the ice itself is visible." Of course, if there is reflection there must be some source from which the light is proceeding, which is reflected, and they say that in the darkest night or even in a fog you may have it; so that it is left somewhat obscure what the precise explanation of the phenomenon is. About the fact there is no doubt whatever.

I had better read what Sir Ernest Shackleton says about it. It is at page 721, Question 25069. "(Q.) We have been told of the phenomenon of the ice-blink? - (A.) Yes. (Q.) Would that be affected at all by the night we have had described or is it a variable thing. - (A.) On a night such as you have described, if there was a big field of ice, the blink would most certainly be seen very, very clearly. If there was really what we call big fields, miles and miles of ice, then you would see the edge, what we call the water sky, that is where the ice-field ends. (Q.) But you would not expect to get the ice-blink with an iceberg? - (A.) No, I would not." I confess I do not quite understand that answer in view of all the other evidence and the passages from "The United States Pilot" which have been referred to. "(Q.) Does that mean it does not throw off any of its luminosity? - (A.) Well it does not reflect any light that there may be, one single berg; it takes ice in the mass to do that; it is like a whole lot of deck lights along the side of a ship; they look one glare instead of isolated things."

The evidence is absolutely unanimous that in the North Atlantic - I do not know how it is near the South Pole - the ice-blink is expected. You do not always see it, but it is a very common thing, and from an iceberg.

Then he is examined by myself. He gives the tonnage of his boat. That is Question 25074. I find I overstated it; it is not 300 tons, it is 227 tons.

*The Commissioner:* Did Sir Ernest Shackleton navigate the seas down to this point in a wooden ship of this sort?

*Sir Robert Finlay:* Yes, he did. He started from New Zealand. It was a most gallant exploit. I suppose a bigger boat might have had very great difficulty in getting through. Your Lordship sees he had to pick his way painfully through enormous fields of ice, bergs to the right, bergs to the left and bergs in front, which no bigger boat could have achieved. He very nearly got to the South Pole; he did get to the Magnetic South Pole. Then at Question 25075 he is asked: "How high was it on the fore-castle at the stem above the water? - (A.) When we were loaded it was about 14 feet; 14 feet from the fore-castle to the waterline." That of course displaces the importance of all the evidence he had given about the propriety of having a man on the fore-castle. It is a different thing altogether to a man on a fore-castle 14 feet above the water from having a man on the fore-castle some 60

feet above the water. "From the crow's-nest it was about 90 feet."

*The Commissioner:* Where was the crow's-nest on this ship?

*Sir Robert Finlay:* On the foremast.

*The Commissioner:* At the head? *Sir*

*Robert Finlay:* Very high up.

*The Commissioner:* You are speaking of the "Nimrod"? *Sir*

*Robert Finlay:* Yes.

*The Commissioner:* It seems to me as if the crow's-nest must have been at the top of the mast.

*Sir Robert Finlay:* Yes. He said to me, I think, that the "Nimrod's" crow's-nest was about the same as that on the "Titanic," 90 feet. *The Commissioner:* That would be ninety feet.

*Sir Robert Finlay:* They are about the same height, so that in that respect at least the "Nimrod" was equal to the "Titanic." "(Q.) Then the comparison you are making is between the height of ninety feet in the crow's-nest on your foremast? - (A.) Yes. (Q.) And a height of fourteen feet on your stem? - (A.) I do not make a comparison. I say from ninety feet, which is the crow's-nest of the "Titanic," we will say, which equals our crow's-nest, and from the waterline, as near as we can get it. If we could have got right down to the waterline we would have done so. The advantage lies in being as near the waterline as possible. You suffered from a disadvantage, certainly, in the "Titanic," by not being able to get as near the waterline as we did in the 'Nimrod.' (Q.) If I gather rightly, your view is that if you are near the waterline, it is an advantage in seeing icebergs? - (A.) Yes. (Q.) And that is an advantage which a small boat like yours, which most of us have read about, has. You had that advantage in that boat? - (A.) We had that advantage over other vessels to a certain extent. (Q.) Your outside rate was six knots? - (A.) Yes. (Q.) You slowed down in ice to four knots? - (A.) Yes. (Q.) You say you slowed down. I suppose you experienced in going to the South Pole a very great deal of ice? - (A.) Yes, a great deal. We first got into the vanguard of the ice before we got to the heavy pack, and then we got into the region of icebergs, where we had to turn and twist." That explains what he had in his mind, I think, the region of icebergs.

"Sometimes we would have eight hours' run, but ice suddenly comes up in front of you, and then you slow down at once. (Q.) The pace you speak of, four knots, was when you were among the ice, "turning and twisting, as you have described it? - (A.) Yes, when we were in the region. I would not like to compare in any way the North Atlantic, with its comparatively few bergs, with the South, but if I were going 20 knots, I would want to get down to the steerage way just as when I am going six knots I want to get down to four knots. (Q.) But you do not compare the state of things which you found, as you were approaching the South Pole, where you had to turn and twist among the icebergs and masses of ice, with what prevails in the North Atlantic? - (A.) No, I do not compare it. The point I look at is, when you get a very fast speed, you must slow down, even as we in narrow waters had to slow down in our little ship. (Q.) Slow down to four knots? - (A.) We did. (Q.) What do you suggest a liner should slow down to? - (A.) I am not qualified to give an opinion, but I should suggest a liner should slow down sufficiently to give her steering way, which is, of course, more than the full speed of my own smaller ship. (Q.)

What do you estimate would give a vessel like the "Titanic" steering way? - (A.) I am not qualified to say. I do not know enough of the turning movement of ships over 10,000 tons. I should say 10 knots." It is now agreed 6 knots. *The Commissioner:* It is agreed at 6 knots.

*Sir Robert Finlay:* Yes. "Is your suggestion that all liners in the Atlantic should slow down to 10 knots" - that should be 6 knots now - "as soon as they know that they may come across an iceberg? - (A.) As soon as they know they are in an absolute ice locality, which they can tell now because of the wireless."

That is the passage I referred to before as containing his idea as to what is an absolute ice locality.

"(Q.) My expression was, 'as soon as they know they may come across an iceberg'? - (A.) No, I do not say that. (Q.) What do you mean by an absolute ice locality? - (A.) The locality where it is reported, and where it is generally known that more than one iceberg will be met - where you are likely to meet masses of ice floating about. (Q.) Assume one or two icebergs are reported; do you say that if the vessel may pass near one of these icebergs she ought to reduce her speed to 10 knots? - (A.) No, I do not. I do not say just for one iceberg or two icebergs or ten icebergs if they are nowhere near one another, but if there is a general indication of ice in the locality within a certain area which is fairly well known, a vessel ought to be slowed accordingly at nighttime. (Q.) At nighttime? - (A.) Yes, only at nighttime, unless it is thick in the day. (Q.) Can you

## **Page 841**

give me an idea of the extent of the indication of ice that you say should lead to the reduction to 10 knots. You would not reduce for one or two or ten icebergs? - (A.) No. I would reduce if I heard that ice was generally reported, specifically from more than onequarter. I am taking very modern methods, that is that ice is reported by wireless. (Q.) If it is reported you mean you have something, I will not say equaling, but approaching the collection of icebergs through which you had to thread your way? - (A.) Oh, no; the ice is generally known in the Atlantic. (Q.) But one or two or ten would not be sufficient. I wish only to understand exactly what you mean by the absolute ice region, which you think should lead to slowing down to ten knots an hour? - (A.) I should say that if ice was reported in any quantity, bergs and floes, when the vessel is anywhere near that latitude and longitude and had a late report of, say, even the day before, at nighttime she should slow till she was past that latitude and longitude in which icebergs and floe ice were seen. (Q.) Do you think that the practice in the North Atlantic has been all wrong for the last 20 or 30 years? - (A.) I do not say that. I say a certain state of things has evolved in the last few years by public desire and competition."

If I may take an illustration, I think what the witness had in his mind was something similar to the state of things shown in that oblong. Your Lordship remembers the parallelogram which was indicated by the "Mesaba" message, not received on the bridge. There, as Mr. Lightoller said, "If we had got that message I am certain we should not have gone ahead." That is the sort of state of things that Sir Ernest Shackleton obviously

has in his mind which would approximate to what he had to encounter on the way to the South Pole.

Then at Question 25099 your Lordship says: "You say what? - (A.) I say the state of full speed as evolved in the last few years with the great public desire for speed. (Q.) To get to their journeys end? - (A.) Yes. (*The Attorney-General.*) By competition? - (A.) Yes. (*Sir Robert Finlay.*) You have been following this case I take it? - (A.) I have to a certain extent. (Q.) And you know we have had evidence as to the practice existing among gentlemen who have been in the trade for 25 years? - (A.) Yes; I think the gentlemen that have been in the trade for 25 years have been acting under the instructions of their owners."

Now that only illustrates Sir Ernest's complete ignorance of the conditions prevailing in the North Atlantic trade. He had crossed the Atlantic four or five times as a passenger, and then we have this which is really an echo of what has appeared in some newspaper; it is not a point upon which he can pretend to speak as an expert.

"(Q.) Have you any ground for saying that? - (A.) No more than a general feeling that I have had and the feeling I have had that when the owner is on board you *go*." Really that is only interesting as showing that Sir Ernest was out of his element. Towards the South Pole he is supreme, but when he gets into the North Atlantic he is no better than any ordinary man.

"(Q.) And supposing the owner is not on board? - (A.) I do not want to make surmises, and I do not want to lay down any particular Rules; but there is a general feeling among people at sea that you have to make your passage. If you do not make your passage it is not so good for you. That is only my own personal point of view. I do not know whether I should not refuse to answer this particular question."

*The Commissioner:* It certainly is by no means an uncommon impression that a good passage may improve a Captain's position in the eyes of his employer, and that a bad passage will hurt it.

*Sir Robert Finlay:* But not a good passage involving risk, because nothing is more serious for the Company than an impression getting abroad that risks are run.

*The Commissioner:* I should think one of the greatest disasters the White Star Line ever had is this - I mean in their own financial interests.

*Sir Robert Finlay:* Yes, incomparably, from every point of view of course. Your Lordship knows that for the eleven years before there had been only two accidents to passengers. Of course, if the enormous loss of life which unfortunately took place on this occasion had been spread over all the period, the eleven years, it would have only yielded 0.038 - thirty-eight one-thousandths of 1 percent. But it is all compressed. It strikes the imagination, and then people speculate as to how it happens, and they say "Oh, Sir Ernest says there is this terrible competition and racing across the Atlantic and record passages." Your Lordship has the evidence, and can appreciate all that sort of talk at its true worth. Then at Question 25106 I say "You have been in the North Atlantic trade to some extent yourself?" I put that question in all ignorance, because in the earlier part of his examination he spoke of his four or five passages across the Atlantic, and I thought he had been professionally engaged. Then he says, "I have only been as a passenger. Well, once in 1891 I was across the Atlantic in March. (Q.) Were you in command of a vessel? - (A.) No, I was only seventeen years old then. (Q.) But the other times you speak of in

the North Atlantic you have been merely as a passenger? - (A.) Yes, that is all. (Q.) But apart from this voyage when you were seventeen, of ice in the Atlantic you have had no experience? - (A.) I have had no experience, no, of actual ice in the North Atlantic. I happen to be aware of the conditions though. (Q.) Now with regard to the coldness, the connection of cold with the presence of icebergs. You know of course of the Labrador Current? - (A.) Yes. (Q.) Is the cold very often due to the Labrador Current? - (A.) I would not say that so much, but I would say the breaking up of the ice was due to the Labrador Current. I mean it comes down with the Labrador Current, but the other current goes to the North." He is speaking of the Gulf Stream which does not run North exactly, but it runs to the North of E. E.N.E. has been given as its direction, and I think that is approximately correct.

"It is sometimes very clearly defined, but then again these currents sometimes come far out of their usual route. (Q.) You would not say, I suppose, that a fall in temperature was anything like a certain indication of the presence of ice? - (A.) No, I would not at all. (Q.) Not at all? - (A.) Excepting under very definite conditions, such as a dead calm and a sudden fall in the temperature, because if you are in colder water, and as I said before you have not an equal temperature of the air, then you have a haze. If both the air temperature and the water temperature are the same the effect is that the weather is clear." Then your Lordship points out, what is the fact "My recollection is that the fall of temperature began on the Saturday. (*The Attorney-General.*) Yes, it did; it became more acute on the Sunday afternoon. (*The Commissioner.*) It gradually fell and fell rapidly, but began Saturday. (*The Attorney-General.*) Yes. We know very little of the wind on the Saturday. (*Sir Robert Finlay.*) I think we have information on the morning of the Sunday that there was wind. (*The Commissioner.*) There was wind of a kind up to three o'clock in the afternoon of the Sunday, and then it fell and became dead calm." That is correct. "(*Sir Robert Finlay.*) Yes. The point is the cold had begun before the wind dropped. (*The Commissioner.*) Oh, it began on the Saturday. (*Sir Robert Finlay - To the Witness.*) I think you said that the importance you would attach to a fall of temperature in this connection was if there was a dead calm? - (A.) Yes. If the sea and the air are about the same temperature I would consider ice; but all those methods, such as dipping up water in buckets to get the temperature are no good." Then there is the re-examination by the Attorney-General, who says as Question 25115: "We have been speaking hitherto about icebergs; but supposing you had a wireless telegram to the effect that there were icebergs and a large quantity of field ice in the region which the ship had to cross, would that in any way accentuate the risk - which you say

## Page 842

would be run? - (A.) The field ice? (Q.) Yes? - (A.) I think field ice for a ship of the class of any ocean liner is almost as bad as an iceberg, because going at a speed like that the kinetic energy is so enormous and field ice is very often 20 feet deep; it is like running on a rock almost."

Then Mr. Cotter puts a question about searchlights, but I do not think I need trouble about that. Then Question 25120: "(Q.) I should like you to answer this. If you can see the berg at a sufficient distance to clear it, is there then any object in reducing speed? -

(A.) My Lord, if there is one certain iceberg and one berg alone, or two or three bergs, there is no object in reducing speed, but if you are in an area where there is floe ice and bergs which might perhaps be met at any moment, where if you put the helm hard a-port you might run into another one, then there is need. (Q.) We have no evidence that the "Titanic" saw what you call floe ice, pack ice, or anything of that kind. There were telegrams warning the ship of the existence of such ice. But taking icebergs, if you can see them at sufficient distance to avoid them, is there any object in slowing down? - (A.) I do not consider there is any need to slow down if you can see every iceberg at a sufficient distance to avoid it, but I doubt if you could when you come into such a region."

That is the old question of the absolute ice region. "Now, I am going to ask you about that. We have been told that on this night the conditions were very peculiar, that the sea was as flat as a table top, and that there was no sort of swell, and therefore nothing that would make a ridge round the waterline of the iceberg on which the eye would fall. We have been told that this iceberg was black, and it has been said that in those circumstances it is very difficult to detect the existence of a berg in time to avoid it. Is that so? - I agree with that, my Lord. I think it would have been a very difficult thing with a ship going at that speed to have done so. (Q.) Do you think the speed makes any difference in picking up a thing? - (A.) I do not know about picking up, but slower speed gives you a longer time from the time you see it at the same distance. (Q.) Of course, it does. I did not understand your observation. Now, you know these conditions as they have been described - whether accurately or not I do not know - but they have been described to us. How far off do you think the men in the crow's-nest, if they had been attending to their business and not talking to each other, ought to have seen this berg? - (A.) I would not like to put a definite figure on it but I should think the men in the crow's-nest saw that berg about as soon as you would ordinarily expect a man to see it." That is under these conditions. "That means they saw it just as the ship was striking the berg? - (A.) Had not some three minutes elapsed from the time it was reported? (*The Commissioner.*) I think not."

*The Commissioner:* Oh no, that is a mistake.

*Sir Robert Finlay:* Yes. "(*The Attorney-General.*) It is rather difficult to say. We know what was done, and we have to estimate the time. (*The Commissioner.*) She was right on the berg before any time elapsed? - (A.) I should think, my Lord, that in the case of that particular berg it would be a very difficult thing to pick it up at all. A man might have said to his companion "Do you think you see anything?" but arising out of that I should like to say that all officers, as far as I know, and Captains of ships in modern times, are only too ready to hear reported from the crow's-nest, or wherever it is, any report of any sort even though the light reported is not there."

*The Commissioner:* Well, that is what some other witnesses have said.

*Sir Robert Finlay:* It can be only be helping to relieve the monotony of life on board ship; I should have thought a report of what does not exist is not helpful.

*The Commissioner:* What I mean is this. I think it was in answer to Mr. Laing one of the witnesses said that a man would never be reprimanded for reporting - even though he was mistaken, and there was nothing to report.

*Sir Robert Finlay:* Certainly, I entirely agree in that, because it would be a very great mistake to leave an impression on the minds of the men that they were committing an offence by reporting when they thought they saw something, even if it turned out not to be there.

*The Commissioner:* I do not know whether it was Mr. Laing, but somebody said he thought that if that went on for very long the connection of the look-out man with the ship would be speedily terminated.

*Sir Robert Finlay:* To put a very strong case, suppose a man were flogged every time he reported an object which turned out not to be there, I should think it would very seriously interfere with the efficiency of the look-out. It is evident you must not censure the man. On the contrary, you praise him for reporting what he thinks he sees even if it turns out not to be there. But that is a different thing from saying that you are glad to have reported what does not exist. You are very glad the look-out men are zealous.

*The Commissioner:* I understand he means he is glad the man reports even though there is nothing there, because it shows he is anxious to do his duty.

*Sir Robert Finlay:* That is obviously what he means.

*The Attorney-General:* One of my friends says he remembers that Sir Ernest added *sotto voce*." It used to be different in my young days."

*Sir Robert Finlay:* It is put very neatly in Mr. Lightoller's evidence at the top of page 326, Question 14294. "I will put this to you" - it is by Mr. Scanlan - "Supposing a man on the look-out fancies he sees something and strikes the bell, and it turns out not be anything, I should think he would be reprimanded? - (A.) He is in every case commended. (*The Commissioner.*) I do not understand that. Is he commended when he signals that there is something ahead when there is nothing ahead? - (A.) Yes, your Lordship," and it is obvious for the reason your Lordship has just indicated.

*The Commissioner:* Then it was Mr. Scanlan made the observation?

*Mr. Scanlan:* It is in the next question, my Lord.

*Sir Robert Finlay:* Question 14296. - "(*Mr. Scanlan.*) If he did it frequently in a journey, would not the commendation take the form at the end of the voyage of paying him off and dispensing with his services? - (A.) Not at all. The man is not an absolute fool; he knows that if he is trying to keep a good look-out, particularly amongst ice, and he suspects he sees anything, he will strike the bell, if it turns out to be nothing he may come on the bridge and say, 'I am sorry that I struck the bell when there was nothing,' but he is invariably told, 'Never you mind, if you suspect that you see anything, strike the bell, no matter how often.'" That, I think, makes the matter perfectly clear.

Then Question 25127 on page 723, "(Q.) I am not quite following you, I am afraid. Do you want to convey this to me that that berg would be within one hundred feet of the stem of the ship before it would be seen? - (A.) No. I should think a berg of that type would be seen somewhere about perhaps three quarters of a mile away, not more. (Q.) Well, threequarters of a mile - would it be less than three-quarters of a mile? - (A.) It might be; I do not know. (Q.) I am putting one hundred feet to you. - (A.) I think it ought to be seen long before 100 feet. (Q.) What would you say would be the shortest distance that this berg would be seen by the men in the crow's-nest on a clear night? - (A.) The shortest distance from the ship? (Q.) Yes, on a perfectly clear night, and under these conditions of

a flat sea and possibly black ice? - (A.) I would not like to express an opinion because I have never actually seen a berg so close to a ship. I have never seen any ice quite exactly like that which was described. I have seen it in the winter time in the ice, but then we were always absolutely stationary. (Q.) My difficulty is this, and I am afraid you cannot help me, but I cannot understand how the men in the crow's-nest and the men on the bridge - there were two I think, one, at all events, on the bridge - failed to see this iceberg until it was practically in contact with the ship? - (A.) I think that iceberg was such a very little thing. It

### **Page 843**

was such a small thing and the conditions were so bad, that a man on watch, even two hours on watch, might have his eyes strained, and the officer on watch might have his eyes strained and might just miss that particular berg. In running round the horizon his eyes might hop over this particular thing. (Q.) But there were three pairs of eyes, there was a man on the bridge and two men in the crow's-nest? - (A.) I think that is a possibility. (Q.) Is it a probability? - (A.) I think it is a probability. I think they might not see such a thing."

*The Commissioner:* I do not understand that. I doubt if the witness means what I suppose him to mean by those words. Is it a probable thing that three men, all looking ahead using their eyes, should overlook anything of that kind. That presupposes that they can see it, but that they do not see it.

*Sir Robert Finlay:* I think what the witness means is, when would they see it. I do not think he means that they would overlook it when it might be seen. I think he is dealing with the question when would they see it - when ought they to have seen it? I so understand it.

*The Commissioner:* It is very little use criticising the actual expressions used. One must gather the meaning.

*Sir Robert Finlay:* Yes, the general scope. Then the answer to Question 25132 is important. "I think that iceberg was such a very little thing, such a small thing and the conditions were so bad, that a man on watch, even two hours on watch, might have his eyes strained, and the officer on watch might have his eyes strained and might just miss that particular berg. In running round the horizon his eyes might hop over this particular thing. (Q.) But there were three pairs of eyes." Then he is asked about the probability and possibility. "I think they might not see such a thing. (Q.) Then do you really mean to say that on a fine night with a flat sea the probable thing is that every ship will come in contact with an iceberg that happens to be on its course? - (A.) No, my Lord, I think it is an abnormal case entirely. (Q.) I am putting an abnormal case - an extraordinarily flat sea and black ice; do you think if there happened to be an iceberg in the course of that ship she must run up against it although there are three men on the watch? - (A.) The next time somebody may see it a little earlier; it is possible to see it a little earlier, but I do not like to express an opinion. (*The Commissioner.*) You said the probability was the ship would run up against the iceberg. (*The Attorney-General.*) Your Lordship will remember she is going 700 yards a minute, and it would not take long. (*The Commissioner.*) I know that. (*To the Witness.*) Then you know nothing about the turning circle of this ship? - (A.)

I do not. (Q.) So that you cannot tell how she could avoid it. Well, now I want to know this - do these bergs extend sometimes under the water any considerable distance from the part that is visible? - (A.) It depends; if the berg is capsized it may extend perhaps 200 yards or more, depending on the size of the berg. Some bergs that are five miles long, which are rarely seen in the Atlantic, may extend 200 or 300 yards, what we call a spur, but not more than that. (Q.) So that the bottom of a ship might strike an iceberg before it reached what you may call the locality of the part that is uppermost. - (A.) Yes, before it actually struck the part above water. (Q.) But you think in an extreme case only 200 yards? - (A.) Yes, an extreme case. (Q.) Did you say 200 yards? - (A.) I have seen spurs 200 yards away, but I think a couple of hundred feet would be about the average for a spur. A lot depends upon the sort of ice - what sort of mountain it came off, and how it was formed, and what its specific gravity is, whether it is worn down in the current by the temperature of the water. (Q.) But the bottom of the berg may extend under the water any distance, from 200 feet to 600 feet? - (A.) Yes. (Q.) Away from the visible berg itself? - (A.) Away from the visible vertical side of the berg? (Q.) So that the bottom of the ship might strike a berg any distance from 200 feet to 600 feet away from the visible berg? - (A.) Yes, that is my opinion, my Lord. There are no doubt other people who have also got perhaps slightly different opinions on it, but in the main, generalising, it is so. (Q.) I rather gather from what you have said to me - I am not sure that I ought to ask you this question, but I am going to ask it all the same - that you think it quite possible that the men were keeping as good a look-out as they could? - (A.) Yes, that is what I do think. (Q.) That is what you want to convey? - (A.) Yes, but I did say earlier, and I still say, I think it is an advantage to have only one man in the crow's-nest. (Q.) It has occurred to me; one knows what men are - when they are standing together - they began to talk sometimes? - (A.) I know I used to in my early days. (Q.) Then there is another question I am not sure I ought to ask you. Supposing it had been the invariable practice to navigate ships of this kind, following the usual track to America, at full speed, notwithstanding ice warnings, in your opinion, would a Captain who had been brought up in that trade be justified in following the practice. Now, do not answer that question if you do not like, and I will not ask it, Sir Robert, if you do not want me to ask it. If you have not formed any opinion about it, I will not press you to give me an answer? - (A.) We sailors all form opinions, my Lord, like other people, but it opens such a very wide question of relationship between owners and captains that I am not competent to answer it. I think it would be a natural thing for a Captain who had been brought up in a line doing the same thing, to continue doing it. But in view of the fact that there is wireless now, I think any accident could be avoided. (Q.) Well, yes, that is quite true. If you are right in saying that the better thing would be to reduce the speed to half speed - about 10 or 11 knots, and if you are right in saying that this berg might be approached practically without any warning to the look-out, it seems to me you would have an accident all the same, 11 knots or 22 knots. You would have to reduce it to about 4 knots? - (A.) Well, it would be better to do that. (Q.) Oh, yes, I quite agree. Now I want to ask you this question. Suppose that it took this ship 37 secs. to turn her two points, and that in that time she would travel 1,300 feet - supposing those to be the facts, and the helm was put hard astarboard as soon as the berg was sighted, the berg must then have been sighted more than 400 yards off? - (A.) Yes. (Q.) That would be so, of course? - (A.) Yes."

*The Commissioner:* And that is so.

*The Attorney-General:* Yes, clearly.

*Sir Robert Finlay:* That is the whole of the evidence upon that point. My respectful submission to the Court is that we have completely established our case and that there is nothing in the evidence of Sir Ernest Shackleton when understood by the light of his experience and the special nature of that experience which in any way detracts from the full force of our evidence. Under those circumstances my first point is that it is impossible to say there was any negligence on the part of those who managed the "Titanic."

Now the next point I wish to make perfectly clear is this. The witnesses all say: "We continue to go full speed if the weather is clear." Now I want to show your Lordship that the weather this night was, as Mr. Rostron said, perfectly clear: "I never saw a finer night" was his expression. I shall be very short on that.

*The Commissioner:* At present - I do not want you to satisfy me about it, because I am satisfied about it - unless the Attorney-General tells me he is going to suggest the night was not perfectly clear.

*The Attorney-General:* Oh no, when I told your Lordship I was not going to suggest there was a haze that was intended to cover this point. I take it it was a perfectly clear night.

*The Commissioner:* I think it is the view of all the gentlemen with me.

*Sir Robert Finlay:* I am obliged to your Lordship. That will save a good deal of time. Then with

## **Page 844**

regard to the question of doubling the look-out and putting a man on the stem head, I do not know whether the Attorney-General is going to say that ought to have been done. If so, I must refer to the evidence.

*The Attorney-General:* I think that must be considered, yes.

*Sir Robert Finlay:* Now, the evidence with regard to that is rather voluminous, but I will take it as shortly as possible. The first witness who says anything in relation to the point at all is Jewell at page 17, and his reference to it is extremely distant. They are Questions 12 and 13; in fact, he merely gives the number of the look-outs. "(Q.) Are there two forward? - (A.) No, not in clear weather; we take two hours each. (Q.) Let us just get it clear. There was you and there was Symons in the crow's-nest. Were there no other look-out men on duty? - (A.) No, not so long as the weather was clear"; and then he says the weather was clear.

*The Commissioner:* Who is this man.

*Sir Robert Finlay:* Jewell, my Lord, one of the look-outs on the "Titanic." He was not on duty at the time this iceberg was sighted. He came on duty at 8 o'clock and remained there till 10.

*The Commissioner:* This man was on from 8 to 10; I do not think it is of much importance.

*Sir Robert Finlay:* No, I said it was rather remote, my Lord. Then Hichens is more to the point on page 47.

Then Hichens was the Quartermaster, your Lordship will recollect. This is in answer to Mr. Scanlan at Question 1296. "Is it usual on board liners in circumstances of danger to double the watches - the look-out? - (A.) That is always so, Sir. (Q.) Had the watch been doubled or augmented - increased in any way - on this occasion? - (A.) Not that I am aware of. They do not double the watches on the bridge, where there are three officers on the bridge, two junior officers taking eight-bell watches, and the senior officer taking command of the bridge. (*The Commissioner.*) Do they double that watch? - (A.) No, Sir. (*Mr. Scanlan.*) What watches do they double? - (A.) In ships where they are not manned with so many officers, and when they are nearing the shore in foggy weather they might double the watches. (Q.) Is it usual in circumstances of danger to station a watchman at the bows - a look-out man? - (A.) I cannot say. He cannot see so well as the man can see in the crow's-nest. (Q.) I am asking you, is it usual or not? - (A.) In some ships, Sir, they do station a man there. (*The Commissioner.*) As well as in the crow's-nest? - (A.) I have not seen that, my Lord - not a man stationed forward and stationed in the crow's-nest too."

*The Commissioner:* What experience has this man?

*Sir Robert Finlay:* He is a Quartermaster, my Lord; I think he had been at sea for a considerable time. He says at the beginning of his evidence that he was a Quartermaster. I do not think it appears how long he had been at sea." (A.) I have not seen that, my Lord - not a man stationed forward and stationed in the crow's-nest, too. (*Mr. Scanlan.*) If a watchman was stationed at the bow he would be considerably nearer the water than the man in the crow's-nest? - (A.) Yes, that is so, Sir." Well, it is the difference between 60 and 90 feet.

*The Commissioner:* I have read this evidence down to Question 1307.

*Sir Robert Finlay:* Very well, then I need not trouble with it. *The*

*Attorney-General:* 1321 might be of use.

*Sir Robert Finlay:* "This was my first time in the North Atlantic, Sir," and then there are questions put to him about the number of men in the boat, and so on.

That does not come to very much. He says sometimes it is done; it comes to more than Jewell, but not very much. Hichens merely says that he has never seen a man in the crow's-nest, and a man also in the stem, but he knows it may sometimes be done in circumstances of danger. Then, my Lord, there is the evidence of Lee, at page 77. *The*

*Commissioner:* Hichens said this in answer to me. I put the question to him: "Have you ever seen a man in the bow when there are men in the crow's-nest? - (A.) Never, my

Lord. (Q.) Did you ever hear such a thing? - (A.) Never, my Lord." *Sir Robert Finlay:* Is this Hichens, my Lord?

*The Commissioner:* Yes. Questions 1306 and 1307.

*Sir Robert Finlay:* I thought I read it; I had it marked.

*The Commissioner:* No, I told you I had read it. I stopped you from reading it. You said something to the effect that this witness stated that he had heard of it; that is inconsistent with his answers to those questions.

*Sir Robert Finlay:* I will look and see whether I am right; I thought what he was saying there was that he had never seen it himself. *The Commissioner:* He says he never heard of it.

*Sir Robert Finlay:* Your Lordship is perfectly right. That qualifies, I think, what I thought he had said before.

*The Attorney-General:* He has seen a man in the bow, but not in the crow's-nest as well.

*Sir Robert Finlay:* At Question 1300 Mr. Scanlan asked him. "Is it usual in circumstances of danger to station a watchman at the bows - a look-out man? - (A.) I cannot say. He cannot see so well as the man can see in the crow's-nest. (Q.) I am asking you, is it usual or not? - (A.) In some ships, Sir, they do station a man there." That is what led me to say what I did, but he contradicts that when your Lordship puts it to him. I read Question 1302.

*The Commissioner:* That is what you had in your mind, 1302.

*Sir Robert Finlay:* 1301 I had in my mind and then the qualification in 1302, when in answer to your Lordship, he says: "I have not seen that, my Lord - not a man stationed forward and stationed in the crow's-nest, too." That qualifies the answer which Mr. Scanlan got in 1301, and it is finally dispelled by the answers to 1306 and 1307 to your Lordship with regard to the practice. That goes to show that in Hichens' experience it was unknown and that he had never heard of it.

Lee's evidence is at page 77, and I think when Lee's evidence is analysed it comes to this, that they have a look-out man in the bows in the fog.

*The Commissioner:* This is one of the men who were on the look-out.

*Sir Robert Finlay:* Yes. "(Examined by Mr. Scanlan.)" - at 2596 - "When you are at sea in a fog is it a usual practice to station a watchman at the bows in addition to the look-out in the crow's-nest? - (A.) The captain of the ship has to be responsible for that kind of thing. (Q.) Just tell us whether in your experience it is usual to do that? - (A.) If the captain of the ship thinks it is necessary. (Q.) Have you seen it done? - (A.) I have. (Q.) Have you seen it done frequently? - (A.) Frequently." The question was in a fog your Lordship sees.

*The Commissioner:* I do not think this is very relevant.

*Sir Robert Finlay:* Then he is pressed as to whether there was not a haze at the time, and at 2617 (*Mr. Scanlan.*) asks this: "Would it have been easier to have observed the iceberg from the bow than from the crow's-nest? - (A.) I cannot answer you that. (Q.) When you have been on other ships, have you ever been at watch on the bows? - (A.) Yes. (*The Commissioner.*) Was there a crow's-nest on that ship? - (A.) Yes. (Q.) And was there somebody in the crow's-nest as well? - (A.) Yes. (Q.) And somebody on the bridge as well? - (A.) That was off the banks of Newfoundland." Your Lordship knows how special the conditions are there.

"(Q.) Was there somebody on the bridge as well? - (A.) Two quartermasters were there, and the officer of the watch. (Q.) What ship was this? - (A.) The "Minnehaha." (Q.) What line does she belong to? - (A.) The Atlantic Transport. (Q.) Is she a mail boat? - (A.) No, sir. (Q.) (*Mr. Scanlan.*) As you have been stationed both in the crow's-nest and in other lines on the bows, I want you to give us your opinion as to whether it would be easier to see the iceberg if you were stationed at the bows than in the crow's-nest. (*The Commissioner.*) He has given you an answer to that which I believe to be quite true, that he does not know," and there the matter ends.

Then Question 2668 on page 78 Mr. Harbinson says this: "(Q.) I think you said that off the banks of Newfoundland on previous occasions there has been an additional man in the bows - an additional look-out? - (A.) Yes. (Q.) How many times in your experience? - (A.) In the Navy they have extra look-outs on each side of the foc'sle, and may be aloft as well. (Q.) But you yourself have seen it on boats you have been previously employed on? - (A.) Yes."

On the banks of Newfoundland they are liable to a vast amount of fog there. I think that is all in Lee's evidence which has any bearing at all upon this point.

Then Poingdestre at page 86. He is an A. B. and he says in answer to Mr. Scanlan in Questions 3153 to 3159: "(Q.) Well, you have done look-out duty, I think you said? - (A.) I have. (Q.) On the forecastle head? - (A.) Yes. (Q.) On what kind of ships? - (A.) On the Royal Mail boats, and also on the 'Oceanic' and the 'Teutonic.' (Q.) And those are ships which have crow's-nests as well? - (A.) Yes. (Q.) On those boats has it been the practice to have, as well as the look-out man in the crow's-nest, a look-out man at the forecastle head? - (A.) Yes, and the White Star liners always do have one. (Q.) From your experience, is the forecastle head a good place from which to keep a look-out? - (A.) Well, it is. (Q.) (*The Commissioner.*) Is it better than the crow's-nest? - (A.) No, my Lord. (*Mr. Scanlan.*) Would it be better for icebergs than the crow's-nest? - (A.) No." Then if your Lordship will turn to page 89 it would appear he was referring to the practice in hazy weather. It is Question 3335.

*The Commissioner:* What is the meaning of 3157? It is quite contrary to my notion of the practice of the White Star Line.

*Sir Robert Finlay:* Quite contrary. But he is referring, I think, to hazy and foggy weather.

*The Commissioner:* It may be, but I am sure it is quite contrary to the general practice.

*Sir Robert Finlay:* It is, my Lord. I think it is dispelled on turning to page 89, where he explained what he really meant at Question 3335, he is asked by my friend Mr. Laing this question: "(Q.) Now, when you say that in the White Star Line they have a man forward in the forecastle head as a look-out as well as in the crow's-nest, do you mean in dense fogs? - (A.) No, in any hazy weather whatever. (Q.) In foggy weather? - (A.) Yes. (Q.) Then they have a man forward on the look-out? - (A.) Yes, they generally put two extra men on the look-out."

*The Commissioner:* Yes, that explains it.

*Sir Robert Finlay:* Your Lordship says: "There was no fog on this night, was there?" and the Witness says, "No, my Lord." That removes the misapprehension which his first answer might have been calculated to create.

Then there were one or two answers in the evidence of Mr. Lord, the captain of the "Californian." I do not know whether I read those answers in his evidence when I was referring to him on another point. It is on page 163, Question 7041.

*The Commissioner:* It has been read to me by somebody, but I cannot tell whether you read it.

*Sir Robert Finlay:* Then I probably read it, my Lord. I endeavoured to read anything which related at all to the matter when I was going through the evidence.

*The Commissioner:* But what I want is to have it on the Note. It is sufficient to indicate the Question.

*Sir Robert Finlay:* It is Question 7041. That is what he did. It runs on Question 7056 on the same page. Question 7056 brings it rather to a point. (Q.) "Did you find it better for detecting ice" - that is the man on the forecastle head - "to have a man right in the bows like that? - (A.) Well, I do not know, this is my first experience of field ice. I think I saw the ice myself before they did."

*The Commissioner:* He means from the bridge, I suppose.

*Sir Robert Finlay:* Yes. Then on page 164, Question 7100, Mr. Scanlan, who is very strong upon this point, puts this Question.

*The Commissioner:* That is the fog and the haze again.

*Sir Robert Finlay:* Yes. In a fog and a haze. That extends to 7102, and I need not read that.

Then at page 166, Question 7172, Mr. Harbinson says to Mr. Lord, "Now I want to put a further question to you about the look-out men. You have a crow's-nest on your boat? - (A.) Yes. (Q.) Is it an able-bodied seaman you keep posted there usually? - (A.) Yes, always. (Q.) Is it a most responsible position? - (A.) Oh, I suppose it is. (Q.) To detect danger ahead? - (A.) Yes. (Q.) Do you think that the responsibility of that position would be better satisfied if a junior officer was also posted in the crow's-nest along with the able-bodied seamen? - (A.) Do you mean in my own ship? (Q.) In any ship. I ask you now from your general experience as a captain and a seagoing man? - (A.) No. If you have an officer on the bridge, I think that is quite sufficient."

Then on page 167, Question 7251, in answer to myself he says this: "(Q.) Now with regard to your own vessel, where is the best point for a look-out, on the stem or the crow's-nest, in your vessel? - (A.) The man in the crow's-nest on a clear day would see a light further than a man on the forecastle head of the ship would; but sometimes in hazy weather it is possible to see better from the forecastle head than it is from the crow's-nest. (Q.) And with regard to ice, where would that be best seen from? - (A.) On a clear night I think you would see just as well from the crow's-nest as you would from the foc'sle head. (Q.) You had one man only in the crow's-nest? - (A.) One only. (Q.) And one only on the stem? - (A.) On the foc'sle. (Q.) As a matter of fact, I think you said that you saw the ice before either of them? - (A.) I reversed the engines myself before they reported it. Just as they were reporting it I had reversed the engines."

Then Mr. Moore, at page 208, Questions 9267 to 9276, says this: I may have read them because I read a great deal of Mr. Moore. My friend Mr. Laing thinks I read this. *The Commissioner:* Well, you did not. Take Question 9270.

*Sir Robert Finlay:* "(Q.) If you expect to see ice, do you double the look-out? - (A.) Oh, yes. (Q.) When you double the look-out, just explain to my Lord what you do? - (A.) Put an extra hand on the forecastle head, besides the look-out in the crow's-nest. (Q.) In ordinary circumstances have you two men in the crow's-nest? - (A.) Only one. (Q.) And one on the forecastle head? - (A.) Yes or on the forward bridge. We have a look-out on the forward bridge. (*The Commissioner.*) Not in ordinary circumstances. (*Mr. Scanlan.*)

No. (*To the Witness.*) In ordinary circumstances have you any man stationed at the forecastle head? - (A.) No. (Q.) Supposing there was ice ahead of you would you double the look-out? - (A.) Certainly. (*Mr. Scanlan.*) I think your Lordship will observe that I want to make this point, that in any circumstances of danger there should be a look-out man on the forecastle head as well as in the crow's-nest. (*The Commissioner.*) I understand that point. (*Mr. Scanlan.*) Supposing there happened to be a haze ahead, would you then put a look-out man on the forecastle head? - (A.) Yes."

Then on page 210, Question 9396, "(*Mr. Laing.*) With regard to the look-outs, do you put a man on the look-out on the forecastle head in foggy weather? - (A.) Yes. (Q.) And hazy weather? - (A.) Yes. (Q.) Weather in which you blow your whistle; is that what you mean? - (A.) Even when we do not. When it is really necessary to blow the whistle we always put a man in the crow's-nest, and when we meet ice we put a man forward on the look-out on the forecastle head. (Q.) That is in hazy weather? - (A.) Yes. (Q.) Do you usually carry one man in the crow's-nest? - (A.) At nighttime; not in clear weather in the daytime. (Q.) In the daytime you do not have a look-out at all? - (A.) We have an officer on the bridge. (Q.) But you do not have a man in the crow's-nest or one on the forecastle head? - (A.) No. (Q.) But at night you have, as a Rule, a man in the crow's-nest? - (A.) Yes. (Q.) But if it is hazy weather, a man on the bow as well? - (A.) Yes." That is all

## Page 846

in Mr. Moore's evidence which has any bearing upon this point.

Then Mr. Wynn, the Quartermaster, at page 301, Question 13378, "Is it usual to station look-out men in the ships you have experience of in the bows? - (A.) Yes. (Q.) As well as in the crow's-nest? - (A.) Yes. (*The Commissioner.*) Always in foggy or hazy weather. (*Mr. Scanlan.*) Is it usual when there is ice about? - (A.) No." Mr. Scanlan was examining Mr. Wynn, one of the Quartermasters. That shows it is only in foggy or hazy weather. Then Mr. Lightoller at page 304, Question 13520: "(Q.) What was the practice in the "Titanic" as far as this voyage is concerned about having a look-out man anywhere else?" - that is besides the crow's-nest. "(A.) In anything but clear weather, we carry extra lookouts. (Q.) But where do you put them? - (A.) If the weather is fine, that is to say, if the sea allows it, we place them near the stem head; when the weather does not allow us placing them at the stem head, then probably on the bridge." That is in anything but clear weather.

*The Commissioner:* They had actually had extra look-out men on this voyage.

*Sir Robert Finlay:* I had not observed that, my Lord. *The*

*Commissioner:* It is the next question, 13524.

"(Q.) Had there been, as far as you remember, any occasion since she left Southampton to have extra look-out men? - (A.) Yes, and we had had them."

*Sir Robert Finlay:* The next question is: "(Q.) But at this time it was clear and fine? - (A.) Yes."

Then Mr. Lightoller, on page 330, returns to this point. With regard to the special lookout men that the White Star Line employed. It is at Question 14426, and it runs on to 14441. This is in examination by Mr. Scanlan: "(Q.) I will pass from that point. Amongst

the precautions which it would be proper to adopt, would it not be desirable to station more look-outs, more look-out men on the bows or the stem head? - (A.) Anything which would be conducive to avoiding danger. (Q.) Would that be conducive to avoiding danger? - (A.) It might be. (Q.) I am speaking to you as a man of great practical experience? - (A.) I could not exactly say whether look-outs in the stem head would be. We do not place very much reliance on them; we hope they will keep a very good lookout, but those men in the first place are not regular look-out men," - the point is the "Titanic" employs special look-out men for the crow's-nest. If they double the look-out they have to put an ordinary A.B. - "and you have not the same control over them as you have over the look-out men. They have nothing to sacrifice in the way of a good berth, which the look-out man's is. (Q.) I think the difference between a regular look-out man and an irregular look-out man - that is, an ordinary A.B. - is 5s. a month? - (A.) Five shillings a month in pay and a difference in watches and a difference in work on board the ship. (Q.) But there is no passing of an examination to go from one grade to the other? - (A.) Yes. (*The Solicitor-General.*) Is there? - (A.) Yes. I should explain to you it is customary when a ship is running for all look-out men to have an eye test as well as the Quartermaster's. That does not apply necessarily to A.B.'s. (*Mr. Scanlan.*) I was going to ask you about the eye test" - I do not think I need read that.

*The Attorney-General:* You need not read that as far as I am concerned.

*Sir Robert Finlay:* Then 14440: "(Q.) Did the six look-out men on the "Titanic" sign on in any special way? - (A.) I believe they signed on as look-out men. (Q.) But you do not know of your own knowledge? - (A.) No, I could not say for certain."

I think that is all Mr. Lightoller's evidence upon this matter.

***(Adjourned to tomorrow, at 10.30 o'clock.)***

# Wreck Commissioner's Court,

SCOTTISH HALL,

BUCKINGHAM GATE,

*Thursday, 27th June, 1912.*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### THIRTY-SECOND DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. w. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## Page 848

*Sir Robert Finlay:* My Lord, I was calling attention to the passages in the evidence which dealt with the question of the look-out - the suggestion that there ought to have been extra look-out men on the stem. I had finished what Mr. Lightoller said on that point, and I now call your Lordship's attention to what is said by Fleet with regard to the practice on the White Star Line, of carrying special look-outs. It is very short, and it is connected, of course, with this question of look-out. It is on page 414, Questions 17446 down to 17452. He says that in the White Star Line they carry special look-out men, that he was one of them who signed on as a look-out man, that that was his work, and that is the practice on the White Star Line. Then he is asked at Question 17452: "(Q.) To have special look-out men. Do you know whether it is the practice on other lines? - (A.) I do not know; it is the only company I have been on the look-out."

Summarising, it is that the White Star Line employs special look-out men who have advantages in the way of pay and otherwise, and they are devoted to that work. The ordinary A.B.'s are not employed in rotation upon it, as they are upon some of the other vessels which we have heard about.

Then Hogg on page 416 gives evidence on the same point in Questions 17487 down to 17493. He is asked "How long have you been a look-out man? - (A.) I went one trip in the 'Adriatic' and three days on this ship. That is all. (Q.) And you have also been employed in ships of the P. and O. Company and the Royal Mail? - (A.) Yes. (Q.) The Union Castle? - (A.) Yes. (Q.) And other lines? - (A.) Yes, and other lines. (Q.) And you have acted as look-out, I suppose, in some of those lines? - (A.) They do not carry lookout men; everybody takes their turn. (Q.) You have acted as look-out, but you did not sign as look-out? - (A.) That is so. (Q.) In these other vessels, as far as I understand you, there was no question of signing as look-out man. It is only in the White Star that has happened in your experience? - (A.) Yes."

Then Mr. Ismay was asked a question on this point at page 447, Question 18701. Mr. Scanlan was examining. "(Q.) You do not issue any similar instructions to your Captains? - (A.) We carry two look-outs always. (*The Commissioner.*) In the crow's-nest? - (A.)

Yes. (*Mr. Scanlan.*) But you do not issue instructions; you carry two look-outs for fair weather and foul weather? - (A.) Yes. (Q.) Who are there constantly day and night? - (A.) Yes. (Q.) What I am trying to get from you is this: Do you take any extra precautions in circumstances of danger, such as the proximity of ice? - (A.) No. (Q.) You do not? - (A.) No. (Q.) I put it to you that it would be a reasonable precaution and justified by your recent experience, to give such an order? - (A.) That is a matter which is entirely in the hands of the Commander of the ship; he can put extra look-outs if he wishes to, at any time. (Q.) But do not you think it is a matter on which you might give instructions to your Captains? - (A.) I think it is unnecessary to give those instructions. (Q.) You think the Captains should do it themselves? - (A.) If they think it necessary. (Q.) And double the look-out? - (A.) If he thinks it necessary. (Q.) Did you know that on the night of the accident the weather conditions made it difficult to keep the look-out and to see ice? Did you know that? - (A.) I did not. (Q.) And that the state of the weather was giving considerable anxiety to the Captain, or giving some anxiety to the Captain and to Mr. Lightoller? - (A.) I did not. (*The Commissioner.*) Does Mr. Lightoller say the weather was giving him any anxiety? (*Mr. Scanlan.*) He describes the weather conditions as being quite abnormal, my Lord. (*The Attorney-General.*) Yes, because it was so good. (*The Commissioner.*) My recollection is that he said you could see perfectly well," and so he did. The most striking point of abnormality was the one of which they were not aware until the boats reached the water.

Then there is a longish extract read by Mr. Scanlan, in a passage which your Lordship will recollect. Mr. Scanlan goes on: "At other points of his evidence also, my Lord, this point is brought out. Of course, he does state, in spite of that, that it was easy to see; but what I suggest is that this statement from Mr. Lightoller, taken in conjunction with the evidence of the three men who have spoken to a haze, shows that it was very difficult to see that night. (*Sir Robert Finlay.*) I must point out that Mr. Lightoller is there speaking by the light of what he knew. (*The Commissioner.*) I know. As I understand Mr. Lightoller, if you had put 50 men on the look-out in those peculiar abnormal conditions that he talks about, this berg would not have been seen. (*The Attorney-General.*) That is so, my Lord. (*The Commissioner.*) That is right, is it not? (*Mr. Scanlan.*) I do not think it is, my Lord. (*The Commissioner.*) Well, two could not see it - three could not see it, because there was a man on the bridge - and according to him they could not see it because it could not be seen; therefore, it seems to me to follow that if you put 50 men on the look-out they would not have seen it. (*Mr. Scanlan.*) I wish to recall this to your Lordship's recollection. One man saw it - that is the man in the crow's-nest, Fleet. (*The Commissioner.*) He saw it when it was too late. (*Mr. Scanlan.*) He stated to your Lordship that if he had had glasses he could have seen it in sufficient time to have made the difference." That point has now gone. That is really all in Mr. Ismay's evidence on that point.

Then Mr. Sanderson is asked about the practice at page 485, Question 19946. "(Q.) Does it suggest itself to you as a reasonable thing, that at nights the look-out should be increased? - (A.) At nights, ordinarily, no. (Q.) At nights when ice is expected? - (A.) If it is clear I should think two men would see the ice as well as six. (Q.) Now, I want to put this to you: Do you think, with your knowledge and experience, which, of course, is very extensive, that it would be advantageous when running at night in a region where ice is

expected to station a look-out man at the stem head in addition to the look-out men in the crow's-nest? - (A.) Reasonable - if the Commander thought it would help him, he would do it undoubtedly, but as to whether it is reasonable or not I cannot say. There could be no harm in it, certainly - (Q.) Do you think it is a desirable thing to do? - (A.) I really do not think so. I think two men on the look-out in clear weather are sufficient for any purpose, whether it is for ships or ice or anything else, but perhaps when it was hazy it would be advisable. (Q.) Do you think, for the purpose of detecting ice, that it is not desirable to have always a man stationed at the stem head at night? - (A.) The term "desirable" bothers me. If you say "desirable" it might be desirable to have a score of people there, but I do not think it is necessary. (Q.) Do you think, as a practical man, that it should be done? - (A.) No."

Then there is a question on sight tests for the look-out men. Mr. Sanderson says they have such tests. "I am informed that they have experienced difficulty in Southampton in getting men with sight certificates, but it is our wish that it should be done as far as possible. (Q.) And that only men with sight certificates should be got for this purpose? - (A.) Yes, that is right."

Then Captain Bartlett, at page 566, says he thinks it is not necessary to have a man on the stem. At Question 21723 Mr. Scanlan asks: "A suggestion has been made that for the discovery of ice the best position for the look-out man is at the stem head. Do you agree? - (A.) In hazy weather, yes. (Q.) And at night when ice is expected? - (A.) Not a clear night, no. (Q.) On a night when it is difficult to see? - (A.) It is hard to see how that can be if it is clear."

Then Captain Hayes, the Captain of the "Adriatic," at page 569, Question 21808, is asked by the Attorney-General, "When you are approaching an ice region, that is to say, the position in which ice has been reported to you,

## **Page 849**

do you take any precautions? - (A.) I take precautions according to the weather. (Q.) Supposing the weather is clear? - (A.) We keep an ordinary look-out, which is always an excellent one. (Q.) Do you mean the ordinary look-out in the crow's-nest? - (A.) Yes, and on the bridge, and I personally stay round. (Q.) You do not put anybody in the bows? - (A.) Not in clear weather. (Q.) Not in clear weather or fine weather? - (A.) Clear weather must be fine. (Q.) Do you mean, not when you can see clearly, but when you have a smooth sea? - (A.) I do not take the sea into consideration at all. It is as long as the weather is clear." And then he goes into the question of the rate of speed.

Then Captain Passow, the Captain of the "St. Paul," on page 571, at Question 21863, says he agrees with the evidence that has just been given by Captain Hayes, the last preceding witness. Then Captain Steel, at page 575, Question 21978. Mr. Scanlan puts this to him: "If it was found, as is stated by Mr. Lightoller, that he had observed from six o'clock to ten o'clock on the night of the 14th of April that it was more difficult than under normal circumstances to see an iceberg, would that suggest to you from the point of view of seamanship that a double look-out should have been set that night? - (A.) No. (Q.) Do not you think it would be desirable to place an extra look-out man on the bows? -

(A.) No.”

I think the assumption of fact in that question is erroneous. Mr. Lightoller never said it was more difficult in normal circumstances to see an iceberg. I mean, he never said he knew it then. What he did say was that when they found the sea was absolutely still, without any swell at all, then that showed him that there had been a difficulty which, when he was on the bridge, he had been quite unable to realise, of course. There was no statement by Mr. Lightoller that he had found out, when on watch, that it was more difficult that night to see an iceberg.

*The Commissioner:* You are not quite right about that, but you are right, I think, to this extent, that he had not appreciated the absence of one important circumstance that would indicate the presence of ice, namely, the swell. I do not think you can put it higher than that.

*Sir Robert Finlay:* That is enough for my purpose. I do not find that Mr. Lightoller anywhere says that when he was on the bridge there were any circumstances which brought to his mind that it was more difficult on that night to see the iceberg. On the contrary, he says it was a perfectly clear night, and the arrangement that the Captain made was that if it became in the least hazy, so that it should become difficult to see, the Captain, who had only gone into the chart room, should be called at once. *The*

*Commissioner:* I remember it quite well. It all comes in the conversation that Lightoller says he had with the Captain.

*Sir Robert Finlay:* Yes.

*The Commissioner:* For my own part, I doubt that conversation a good deal. People have extraordinarily accurate memories at times, and that seems very accurate. *Sir*

*Robert Finlay:* Yes; but, my Lord, it is a very natural conversation. I daresay the words are not exactly those used.

*The Commissioner:* I was making the observation in your favour.

*Sir Robert Finlay:* I accept that, my Lord. In reproducing a conversation, one throws it, of course, into conversational form; the words used may not have been exactly those which were employed - but still they give the effect of what passed. But my point is this, and I think what your Lordship has said, bears it out, that Mr. Lightoller never said that he or anyone on the bridge thought that there was anything in the circumstances of the weather that night to make it more difficult than usual to see an iceberg.

*The Commissioner:* He says this, that there was an absolute absence of wind, of motion on the sea. It was a calm sea. He talks about it, and the Captain says it is a pity. I think he uses the very words, “It is a pity.”

*Sir Robert Finlay:* Yes, he said so to the Captain.

*The Commissioner:* He said it was rather a pity the breeze had not kept up.

*Sir Robert Finlay:* Yes, he does not go beyond that; but still, if there had been a swell, there would have been enough to call attention to the iceberg; not so good, of course, as if there had been a strong wind. All I mean is, I think it is put a great deal too high in the question which is addressed by Mr. Scanlan.

*The Commissioner:* Oh, that you must expect; we have all done that in our time. *Sir*

*Robert Finlay:* The vital point, the absence of swell, was one which no one realised until they got down to the water. That is the point.

Then Mr. Owen Jones's evidence is at page 665 -

*The Commissioner:* I think if you would read the references, the numbers of the questions, that will be sufficient, because I shall have to look at all this.

*Sir Robert Finlay:* If your Lordship pleases.

*The Commissioner:* And only read those parts that you think are of great significance.

*Sir Robert Finlay:* If your Lordship pleases. That will relieve me of a great deal of trouble. I think if all records run to such a length as this and one were to give the number of the question, such as 23598, one would need to introduce some system of units such as they have for giving the distance of a fixed star. It would shorten matters a little. On page 665, Question 23653, Mr. Scanlan asks what provision had he for a look-out, and he said: "Two men on the look-out. (Q.) Where? - (A.) One in the crow's-nest and one on the stem head. (Q.) Was your one man on the stem head put on at night? - (A.) Yes, he was put on that night; just as we got on to the ice track. (Q.) Did you consider it a proper precaution to put a man at the stem head when ice was reported? - (A.) It had been always our custom; we have always done that for the last 27 years. (Q.) At night? - (A.) Yes. (Q.) Whether ice is reported or not? - (A.) In the ice track." If you have only one man in the crow's-nest; and they proceed on the principle of having one man, then on the ice track he would have a second man on the stem; but the evidence here is that the look-out from the crow's-nest in the "Titanic" was rather better than from the stem. Then Captain Cannons, at page 666, Questions 23746 down to 23752, says that in clear weather he would not double the look-out even in ice. I think I have fairly summarised his evidence. He says that he carries one man on the look-out in the crow's-nest in clear weather, and only that one in clear weather, except the officers on the bridge; that he would not increase the number of men on the look-out in clear weather, but would go steaming on with one man in the crow's-nest, and that is all. The difference he makes, and this is the important answer, is in 23751: "(Q.) You do not put anybody, apparently, in the stem head? - (A.) No, not unless the weather becomes hazy, or any difference to ordinary clear weather. (Q.) If the weather does become hazy it would be better to put a man on the stem head, I understand? - (A.) A man goes there immediately." Then at Question 23765 Mr. Scanlan returns to the charge upon this point. He says: "(Q.) If there is any difficulty at all in seeing ahead at night, would it be in accordance with your practice to double the look-out? - (A.) Yes. (Q.) You think that would be the proper thing to do? - (A.) If there was any haze at all, yes, immediately. (Q.) Apart from haze, if there was what has been described here as a flat calm, and the conditions were such that it would be more difficult than on an ordinary clear night to see an iceberg ahead, would you double the look-out? - (A.) Not in perfectly clear weather. (Q.) If it is calm is it more difficult to see an iceberg? - (A.) I have not found it so." So that it comes to this, according to the evidence of Captain Cannons, as long as the weather is perfectly clear there is no occasion to double the look-out.

## **Page 850**

*The Attorney-General:* Whilst your Lordship has that before you - it saves so much turning to it afterwards - would your Lordship read the next two questions, which bear

upon what Mr. Lightoller describes as the one abnormal condition of which he had no knowledge.

*Sir Robert Finlay:* I will read that: “(Q.) If it is calm is it more difficult to see an iceberg? - (A.) I have not found it so. (*The Commissioner.*) Do you think it is more difficult to see an iceberg when the sea is flat and with the weather quite clear? Do you think the flat sea prevents you from seeing an iceberg as readily as you would do if the sea were rough or rippled? - (A.) No. (Q.) You do not believe in that? - (A.) No. (*Mr. Scanlan.*) If any condition of the weather prevented you from seeing clearly you would double the look-out? - (A.) Decidedly.”

Of course, that answer, like other answers which were given by some of the other witnesses, relates to the fact that their experience has been of white icebergs - the great white iceberg, they see that. The value of the ripple is enormously enhanced, of course, if the iceberg is dark. With a great white iceberg you see it as you see that cartoon on the wall.

Then at Question 23850, on page 669, he modifies, on re-examination by the Attorney-General what he had said on the point to which the Attorney-General called attention. I had better begin a little higher to make it intelligible. At Question 23834 the Attorney-General says: “Just assume this: A perfectly clear night, a perfectly flat sea, and no wind, and therefore nothing in the nature of surf round the edge of the iceberg. Would those circumstances, in your opinion, make the sighting of an iceberg difficult? - (A.) Yes, it would increase the difficulty of seeing it. (Q.) Are those circumstances very rare? - (A.) Yes. (Q.) A perfectly flat sea, no swell, no ripple? - (A.) They are extremely rare in the North Atlantic. (Q.) But still such circumstances are sometimes found? - (A.) Yes, my Lord.” These questions were put by your Lordship. Then your Lordship puts this: “How far do you suppose you would see an iceberg in those circumstances? - (A.) I should say a mile. (Q.) A vessel going 22 knots an hour, sighting an iceberg a mile away, can, I suppose, clear it? - (A.) Yes.” Then your Lordship asks how he explains that this iceberg was not seen. He says it may extend under the water a considerable distance from the portion seen above, and so on. I have read that passage. Then Question 23849: “(*The Attorney-General.*) There is one question on what your Lordship has said. (*To the Witness.*) Before this accident to the ‘Titanic’ had it ever occurred to you that on a specially calm night and a specially clear night it would be more difficult to detect an iceberg? - (A.) Oh, yes. (Q.) So that a skilled navigator would expect that it could be more difficult on a specially calm night and on a specially clear night? - (A.) Yes, it would be more difficult in the calm. You see the sea causes an extra warning, breaking against the berg.”

*The Commissioner:* That is inconsistent with what he said before.

*Sir Robert Finlay:* Yes, he modifies what he said before. When he gave the first answer, that seems really to have been in his mind was what I indicated before; his experience was with white bergs, and the value, of course, of the fringe of white is not so great where you have a great mass of white berg; you do not really want that. It is an extra guide, but its value is nothing as compared with what its value is if you come across that rare phenomenon a black berg, such as we had on the present occasion. Then the evidence of Captain Ranson, the Captain of the “Baltic,” is at page 676, Question 24981.

Mr. Scanlan says: "Do you double the look-outs at night? - (A.) No, not in clear weather."

Then Sir Ernest Shackleton gave evidence on this point, but I read that yesterday, and I need not read it again. It is on page 678, down to page 681.

Then Captain Pritchard, the Captain of the "Mauretania," at page 732, states that his practice is the same, that he doubles the look-out in fog, but not in clear weather. That is at Questions 25178 down to 25187. He is in command of the "Mauretania." Question 25178 is -

*The Commissioner:* I have read it.

*Sir Robert Finlay:* If your Lordship pleases. And the following questions bear out what I said as the result of his evidence; he doubles the look-out in foggy but not in clear weather.

Then Captain Young, the Captain of the "City of Rome," on the following page, from Questions 25230 to 25232, says: "With regard to look-out at night, when you have been informed that you may be passing icebergs, what provision did you make for your lookout under such circumstances? - (A.) The same as other times, as long as it was clear - two men in the crow's-nest. (Q.) You had two men in the crow's-nest? - (A.) Yes, I had two men in the crow's-nest. (Q.) And nobody on the stem head? - (A.) Not when it is perfectly clear."

Then Mr. Stewart, at Question 25258: "(Q.) With regard to look-out, if you have information that you may meet ice, either field ice or icebergs at night, do you take any special precautions with regard to the look-out? - (A.) In clear weather we have the ordinary look-out. (Q.) Where is that ordinary look-out kept? - (A.) In the crow's-nest." That, I think, completes the evidence on that point with regard to the look-out. I submit that the enormous preponderance of the evidence is that, as long as the weather is clear, you simply go on with your ordinary look-out. Some gentlemen speak about doubling the look-out if they are in the ice region, but then they went on to say that in ordinary circumstances they have only one man in the crow's-nest. They put on another man, and put him on to the stem. Where you have two men in the crow's-nest I submit that the evidence amply justifies the course which was pursued on board the "Titanic," and that any charge of failure to do anything that could be reasonably required entirely breaks down so far as this head is concerned.

I am reminded that I accidentally omitted to give Mr. Fairfull at page 734. I had marked him, but overlooked it. Mr. Fairfull, at Question 25272, says - *The Commissioner:* I have read it.

*Sir Robert Finlay:* I submit, taking the evidence *en bloc*, and appreciating its effect, the enormous preponderance of evidence is in favour of the course which the "Titanic" adopted.

Captain Rostron's evidence your Lordship knows I have read. So much with regard to that.

Now, my Lord, I proceed to deal with the circumstances under which the vessel came into collision with this iceberg. My submission is that this collision was due to circumstances which are quite unprecedented, and could not have been anticipated. They were very rare, and the witnesses, in various forms of expression, speak to their rarity. I think Sir Ernest Shackleton's expression was, "You might never encounter it once in your

lifetime,” and so on. It is an extraordinary combination of circumstances, unprecedented, and such as might not occur for another century.

Now, in the first place, you had a black berg. That is a very rare thing, as I shall show your Lordship from the evidence. In the second place, there was no swell, so that there was perfect calm, the sea like oil. That, again, I will show your Lordship from the evidence, is an extraordinarily rare circumstance in the Atlantic. It was the combination of these two circumstances which led to this iceberg not being seen sooner than it was. Now, I will take those in their order and just group the evidence, as shortly as possible, with reference to each point.

That it was a black berg is proved by Fleet, by Lee, and by Lucas. I will give your Lordship the references to those. At page 410 Fleet says this. At Question 17276 the Attorney-General asks:

### **Page 851**

“Now, describe to my Lord what it was you saw? - (A.) Well, a black object. (Q.) A black object. Was it high above the water, or low? - (A.) High above the water.” Then, on page 414, at Questions 17467 down to 17469, I put this question: “Now, just one or two questions with regard to the iceberg. Did you describe it when you gave evidence in the United States, on the other side of the water, as a black mass when you saw it? - (A.) Yes. (Q.) And did you say that you estimated that it was 50 ft. or 60 ft. above the water? - (A.) Did I say that? No, I said it was little higher than the fore-castle head when he asked me that. (Q.) I will just read you what you said on the 23rd April, at page 16, about it. ‘I reported an iceberg right ahead, a black mass,’ Is that right? - (A.) Yes, that is right. (Q.) And then on page 18, this is also on the 23rd April - this question is put to you: ‘How large did it get to be finally when it struck the ship? - that is the iceberg? - (A.) When we were alongside it was a little bit higher than the fore-castle head. (Q.) The fore-castle head is how high above the waterline? - (A.) 50 feet, I should say. (Q.) About 50 feet? - (A.) Yes. (Q.) So that this black mass, when it finally struck the boat, turned out to be about 50 feet above the water? - (A.) About 50 or 60. (Q.) 50 or 60 feet above the water? - (A.) Yes. (Q.) And when you first saw it it looked no larger than these two tables? - (A.) No, Sir.” The passage ends there, I think. In both these passages he describes it as a black mass.

Then Lee at page 73 says the same thing at Question 2441 and the two following questions. The Attorney-General puts this question: “What did it look like? It was something which was above the fore-castle? - (A.) It was a dark mass that came through that haze, and there was no white appearing until it was just close alongside the ship, and that was just a fringe at the top. (Q.) It was a dark mass that appeared, you say? - (A.) Through this haze, and as she moved away from it there was just a white fringe along the top. That was the only white about it, until she passed by, and then you could see she was white; one side of it seemed to be black, and the other side seemed to be white. When I had a look at it going astern it appeared to be white. (Q.) At that time the ship would be throwing some light upon it; there were lights on your own ship? - (A.) It might have been that.” That is a very probable explanation.

Then Lucas speaks to the colour of the fragments of ice that were thrown upon the deck. On page 50, Question 1427, speaking of the ice on the deck, he says, when he is asked what colour it was: "It was a darkish white."

Now, my Lord, a black berg is a very unusual phenomenon indeed. Your Lordship will recollect that Mr. Lightoller, in his evidence, when referring to the description that had been given of the berg, said that he thought it must have been recently capsized. Then there was a very interesting piece of evidence given by Captain Cannons further on, when he told us that on one occasion he had seen an iceberg capsize. It had been a white object, the ordinary iceberg, perfectly white. It turned over, and then he had a black mass presented to him for the only time in his experience.

There are four witnesses who deal with this point. Captain Cannons is at page 667, and at question 23762 your Lordship asks the Witness: "Have you seen black ice? - (A.) No, my Lord; I have not seen black ice, but the ice varies considerably in its appearance. (Q.) Have you seen many icebergs? - (A.) Yes, my Lord. (Q.) And you have never seen a black iceberg? - (A.) No." Then at page 668 the same Witness is asked at Question 23804: "Have you ever seen a black berg? - (A.) No. (Q.) In your experience are icebergs dark or black? - (A.) I have seen them much darker. Might I explain an experience of mine some years ago, which will give you possibly an idea of the difference in the colour." I need not read again the account of the capsizing of the iceberg, because it was given so dramatically that I am sure it is in the memory of everyone.

*The Commissioner:* He describes the colour as dark blue.

*Sir Robert Finlay:* Yes, that was in daylight, of course, my Lord. Then at Question 23810 he is asked: "Have you ever seen another iceberg of that dark colour? - (A.) No, only that one that capsized. (Q.) Where there is a swell or a little wind, does the water break at the foot of the berg? - (A.) Oh, yes. (Q.) Now, supposing you had a dark blue berg such as you have described, dark in colour, what would the effect of the water breaking at the foot of it, with a swell or wind, be, as regards what you would see? - (A.) Well, it would show white at the base. (Q.) But in your experience the bergs have been white except with this one exception? - (A.) With the exception of this one which I saw in daylight and noticed the difference in the colour, all of them have been discernible at nighttime, and, of course, in the day."

Then Captain Passow, at page 571, Question 21882; your Lordship puts this question to him: "If you are right, and if this was, as we have been told by a great many witnesses it was - a perfectly clear night - how do you account for the collision? - (A.) I cannot account for it at all. They say it looked like a black iceberg, but I have never seen a black iceberg." Captain Passow, of course, was a man of great experience in the Atlantic: "I never saw anything but a white one, and that you can see on the darkest night. You can see field ice, too, on the darkest night in time enough for you to get out of the way of it. (Q.) We have had an explanation given of it by Mr. Lightoller. He said that the sea was absolutely flat - there was not, as I understood him, even a swell - and that the consequence of that was that there was no surf of any kind round the base of the iceberg. By the base, I mean the margin on the waterline, and that, therefore, one of the best indications for the seeing of ice was absent. What do you think about that? - (A.) I think you would see the surf round it at a shorter distance than you would see the iceberg, if it was a large one. The ice has a phosphorescent appearance. (Q.) I should have thought

that, as a seaman, you would have had some sort of explanation to suggest? - (A.) I cannot think of anything, because they say the ice was dark blue, almost black. I never saw an iceberg like that in my life, and I have seen a good deal of ice too. (Q.) Does that lead you to infer that they are mistaken when they say it was black? - (A.) I would not like to say that, my Lord. I do not know, of course; I was not there, but I never saw an iceberg of that kind. (Q.) Have you ever seen a growler? - (A.) These low bergs? (Q.) Yes? - (A.) Very seldom. (Q.) What is the colour of a growler? - (A.) White. (Q.) The same as an iceberg? - (A.) The same as an iceberg, only a smaller one. That is what I understand by a growler - a low-lying berg.”

*The Attorney-General:* Before passing from the page my friend read - he began at 21882 - would your Lordship mark the two earlier questions. I do not want my friend to bother to read them, but it will save my going back to them.

*Sir Robert Finlay:* It is on the question of speed?

*The Attorney-General:* Yes, it is on another subject. That is why I will not trouble you to read them, but I want my Lord to mark them.

*The Commissioner:* It has been read.

*Sir Robert Finlay:* I read it in connection with speed, I think.

*The Attorney-General:* I do not think so.

*The Commissioner:* I know it has been read, but when it was read I do not know.

*Sir Robert Finlay:* Then Mr. Lightoller at page 322, Question 14203, is asked by your Lordship: “Do not let me interrupt you; you were going to particularise the circumstances which you say combined to bring about this calamity. There was no moon, no wind, and no swell; is there anything else? - (A.) The berg into which we must have run in my estimation must have been a berg which had very shortly before capsized, and that would leave most of it above the water practically black ice. (Q.) You think so? - (A.) I think so; or

## **Page 852**

it must have been a berg broken from a glacier, with the blue side towards us; but even in that case, had it been a glacier, there would still have been the white outline that Captain Smith spoke about; with a white outline against, no matter how dark a sky, providing the stars are out and distinctly visible, you ought to pick it out in quite sufficient time to clear it at any time. That is to say, providing the stars are out and providing it is not cloudy. You must remember that all the stars were out and there was not a cloud in the sky, so that, at any rate, there was bound to be a certain amount of reflected light.”

On the subject of ice-blink which your Lordship mentioned yesterday, my attention has been called by Mr. Wilding to the fact that two different phenomena have been rather grouped together under the head of ice-blink. One is a sort of reflection in the sky, such as one sees from the lights of a town in the sky. That, I believe, is the ice-blink proper. The other is a sort of phosphorescent appearance from the white of the iceberg itself directly, and not by way of reflection from the sky. The ice-blink of which Sir Ernest Shackleton spoke, I think, was from the sky, and it is found in connection particularly, as I understand it, with large ice-fields. You have a reflection from the ice of the same

nature, speaking generally, as the reflection from the sky where you have a number of lights burning at one spot. I am confining myself at present to the evidence with regard to the fact that a black berg is very unusual; and without going through it all, I may just recall to your Lordship's memory that the witnesses who have described icebergs have spoken of them as white objects, and here you have very precise evidence that this phenomenon of a black berg is so rare that men who have spent their lives in the Atlantic have never seen it.

I do not propose to read again any passages in the evidence of Captain Rostron and Sir Ernest Shackleton, having some bearing upon the question of the black berg, because I read it all yesterday, and it is in your Lordship's recollection.

Then the second point of an extraordinary nature on this evening was that there was no swell at all. I first propose following the same order that I have taken with regard to the blackness of the berg, to establish the fact that there was no swell, and, secondly, to establish the fact that such a calm is extremely unusual on the Atlantic.

Now, with regard to the fact of the perfect calm, take first on page 19 what Jewell says.

*The Commissioner:* By a perfect calm you mean no swell.

*Sir Robert Finlay:* Yes, that there was no swell; that there was no wind is conceded. *The*

*Commissioner:* Yes, I think so. I have very little experience, but I am astonished to hear that there could be no swell in the Atlantic.

*Sir Robert Finlay:* It is an extremely rare condition, met with once in a long lifetime; perhaps not at all.

*The Commissioner:* It makes one wonder whether there was not a swell.

*Sir Robert Finlay:* Well, we have very precise and positive evidence about it. *The*

*Commissioner:* Yes.

*Sir Robert Finlay:* At page 19, Question 142, Jewell is asked: "Was the sea smooth? - (A.) Yes, very smooth." He is speaking of the time when he had left the ship and was in the boat. "Question 140: And you were told to remain in the water below that gangway? - (A.) Yes. (*The Solicitor-General.*) Those were your orders. How far off from the side of the ship did you keep? - (A.) We kept right alongside. (Q.) Was the sea smooth? - (A.) Yes, very smooth."

*The Commissioner:* Do you read a very smooth sea as meaning no swell? *Sir Robert Finlay:* I think it means it there, my Lord. I do not say it would be satisfactory if it rested there. All that Jewell says is that it was very smooth. The other witnesses show there was not even a swell, but one would infer from his saying that it was very smooth that there was not a swell. One does not speak of a sea where there is a swell going as a smooth sea. It is, of course, absence of wind, but the sea when the swell is on is certainly not smooth. However, that is cleared up effectually by the other witnesses.

Then Lee, at page 73, Question 2403, is asked, "And no wind? - (A.) And no wind whatever, barring what the ship made herself. (Q.) Quite a calm sea? - (A.) Quite a calm sea." That is all that he says on the point.

Then we come to Joughin, the baker, on page 142, Question 6084, "Did it keep calm till daylight, or did the wind rise at all? - (A.) It was just like a pond." That is conclusive, I submit, to show that when the first witness spoke of its being perfectly smooth it meant that there was no swell.

*The Commissioner:* I do not think it matters very much, but some breeze, I think, did get up before daylight. *Sir Robert Finlay:* Yes.

*The Commissioner:* But what you are upon is the condition of the sea at the time of the collision.

*Sir Robert Finlay:* Exactly.

*The Commissioner:* It is of that condition of things, if it is to be taken in the sense in which you contend, which, if you were sitting on the deck would not cause any movement of the rail up and down that you might look at. It would be perfectly steady - no wind and no swell.

*Sir Robert Finlay:* I doubt on these very big ships whether with a mere swell there would be any noticeable movement of the rail. The ship strides over such a space in the sea that I doubt whether one would appreciate the fact that there was no swell by looking at the rail, for I doubt whether there would be any appreciable movement of the rail even if there were a swell. And there is distinct evidence to the fact that from the deck you could not realise that there was no swell, and that that fact was realised only after the people got down to the water. Your Lordship reminded us yesterday of one piece of evidence, that it was so still that it affected the disengaging of the falls.

I had just read what Charles Joughin, the baker, says about its being like a pond, and he had the best opportunities of observation, because you will remember he was swimming about, and he gave a very interesting account.

*The Commissioner:* I remember it very well; he went through a strange experience. *Sir Robert Finlay:* Yes, and he was a very plucky fellow, because he recognised the perfect propriety of the action of the man who shoved him off the raft he was endeavouring to get on. Joughin said in a disinterested way, which few people could emulate, that he now realised that if he had got on it he would probably have caused the upset of the raft, because it was full to its utmost capacity, and he thought the man was quite right in shoving him away.

Then Fleet, on page 410, deals with this point also at Question 17246: "The sea, we know, was very calm? - (A.) The sea calm." This is an examination by the AttorneyGeneral.

I am taking now Lightoller and Pitman. Mr. Lightoller is on page 305, at Question 13569, and eight questions on: "(*The Solicitor-General.*) I am glad he should add it. (*To the Witness.*) Tell us what you were going to say? - (A.) In the event of meeting ice there are many things we look for. In the first place, a slight breeze. Of course, the stronger the breeze the more visible will the ice be, or, rather, the breakers on the ice. Therefore, at any time, when there is a slight breeze you will always see at nighttime a phosphorescent line round a berg, growler, or whatever it may be; the slight swell which we invariably look for in the North Atlantic causes the same effect, the break on the base of the berg, so showing a phosphorescent glow. All bergs - all ice more or less - have a crystallised side. (Q.) It is white? - (A.) Yes; it has been crystallised through exposure, and that in all cases will reflect a certain amount of light, what is termed ice-blink, and that ice-blink from a fairly large berg you will frequently see before the berg comes above the horizon. (Q.) Now, let

me follow. Was there any breeze on this night? - (A.) When I left the deck at 10 o'clock there was a slight breeze - Oh, pardon me, no; I take that back. No, it was calm, perfectly calm. (Q.) And there was no breeze. Was there any? - (A.) As far as we could see from the bridge the sea was comparatively smooth. Not that we expected it to be smooth, because, looking from the ship's bridge very frequently with quite a swell on, the sea will appear just as smooth as a billiard table, perfectly smooth; you cannot detect the swell. The higher you are the more difficult it is to detect a slight swell. (Q.) That means, then, does it not, that if you are on the bridge and you are relying on the fact that there may be a slight swell, you really cannot tell from the bridge whether there was a swell or not - a slight swell? - (A.) We look at it rather the other way - that, though the sea may appear smooth, we pretty well know that there is a swell, though it may not be visible to the eye, nor yet have any effect on the ship." That, I submit, bears out what I ventured to submit in answer to your Lordship's question just now, "It is a most rare occurrence? (Q.) You mean there nearly always is a swell in the North Atlantic? - (A.) This is the first time in my experience in the Atlantic in 24 years, and I have been going across the Atlantic nearly all the time, of seeing an absolutely flat sea. (Q.) Do you agree from that experience that this was an occasion when it was an absolutely flat sea? - (A.) Absolutely flat. (*The Commissioner.*) Not in fact, but to all appearance? - (A.) In fact, my Lord. (*The Solicitor-General.*) He means in fact, my Lord. (*The Commissioner.*) Do you mean there was no swell at all? - (A.) I mean to say that the sea was so absolutely flat that when we lowered the boats down we had to actually overhaul the tackles to unhook them because there was not the slightest lift on the boat to allow for slacking unhooked."

That, I think, ends what the witness says in this passage in that connection. So that there you have it, my Lord, that you may have a swell and no effect on the ship, and from the deck you could not distinguish by the appearance of the sea as to whether there was a swell, which there almost invariably is, or whether, as once in a lifetime happens, it is a perfect calm without any swell at all.

*The Commissioner:* It is pointed out to me, Sir Robert, that he never had had the experience which would have enabled him to say whether there was a flat surface such as he described before, because he had never been in a boat. The only way to find it out was being in a boat and being unable to disengage the tackle.

*Sir Robert Finlay:* Yes.

*The Commissioner:* That is the only way to find it out, and unless he had had experience of that kind before, his experience of 24 years was of no use.

*Sir Robert Finlay:* That is a perfectly just observation as far as it goes, but at the same time I think we have from other witnesses the statement - I think among them Sir Ernest Shackleton - that the absence of swell is an extraordinarily rare phenomenon.

*The Commissioner:* I have been on the ocean a good deal, according to my own view of the matter, and I do not remember any occasion when there was absolutely no motion of the ship.

*Sir Robert Finlay:* It is certainly very rare indeed, my Lord.

*The Commissioner:* It is very slow and very pleasant, but it is there.

*Sir Robert Finlay:* On a big ship my impression is that you do not notice a mere swell, unless it is a very big thing indeed after a storm; that there is really no motion on the ship, because the ship extends over such an extent of the sea. In a small boat, of course, you get it very much, because the boat rises and falls with the swell, but on a big steamer you do not. Of course, that accounts for the fact that people are so much more seasick in small boats than in big steamers. The steadiness of the steamer prevents you being sensible of the motion of the sea, and the sea from the deck looks perfectly calm.

*The Commissioner:* There is the possibility that the vessel and the boat will move simultaneously and to the same extent upwards and downwards; and if that took place, then the tackle would remain fastened to the boat, and the fact that the tackle did not become disengaged would have no significance.

*Sir Robert Finlay:* I submit, my Lord, that that is very improbable, because you have the great mass of the ship and the small mass of the boat. The great mass of the ship is, as experience every time one goes to sea shows, very little, if at all, affected by the swell; the small boat is affected.

*The Commissioner:* Would that be so if there were a very long swell?

*Sir Robert Finlay:* I submit so, my Lord. You may have a swell so big after a storm that it affects by its motion even a big ship, but my point is, and I submit it answers the observation your Lordship mentioned as a possible one, that the amount to which the small boat is affected would be absolutely different from the amount to which the big ship was affected, and it is that which you have to look at on the question of disengaging the tackle.

*The Commissioner:* I suppose a small boat in a swell does move relatively much more than a large vessel would.

*Sir Robert Finlay:* Yes, that is my point.

*The Commissioner:* I am not sure about it.

*Sir Robert Finlay:* It is so, my Lord.

*The Commissioner:* It depends on the length of the swell and the height also.

*Sir Robert Finlay:* Oh, it does, but I do not think it can be doubted that the small boat will be very much more affected by the swell than a big ship.

*The Commissioner:* However, here is Lightoller actually looking at a boat, and at the tackle, and with the large steamer at that time alongside of it, and this is the expression of his opinion.

*Sir Robert Finlay:* That is his observation.

*The Commissioner:* I mean his opinion on the state of things at that time - based upon his observation.

*Sir Robert Finlay:* Yes, and I submit the fact is proved by the evidence of all these previous witnesses "like a pond," "perfectly smooth," and so on. Then you have Mr. Lightoller saying that when he got down he realised what he had not been able to realise from the deck, that there was no swell at all. One knows perfectly well that the degree of motion on a ship varies with the size of the ship. Comparing, at one end, a small boat with the "Titanic" at the other end, of course the difference is tremendous. But it goes through all gradations. In a small steamer there is a great deal more effect produced by the swell than there is on a large steamer, and the larger the steamer the less the effect produced is. One has experienced that in going in what used to be considered a big boat,

although I confess they have got to be comparatively small as compared with the enormous vessels that are made now.

Then, my Lord, on page 306, Question 13615, there is an answer describing that conversation with the Captain to which your Lordship referred just now. I do not know that I need read it; it is fresh in your Lordship's recollection. I will read it if your Lordship wishes.

*The Commissioner:* Do you mean the conversation on the bridge?

*Sir Robert Finlay:* Yes, my Lord.

*The Commissioner:* It has been read three or four times.

*Sir Robert Finlay:* Yes, I will not read it again, my Lord.

*The Commissioner:* It is to be found in the Note of the American Evidence, and it is to be found in the Note of this Evidence, and it has been read several times. Mr. Scanlan read it

-

*Sir Robert Finlay:* I only mentioned it in order that it might not be supposed I was passing it over. Then on page 307, Question 13672, the Solicitor-General says: "(Q.) Of course, if there was no swell so that you could not at all rely on the breaking of the water against the edge of an

## **Page 854**

iceberg or growler, it would be particularly hard to see, would it not? - (A.) It would be more difficult if it was not of any size. (Q.) Whereas an iceberg that is more out of the water, on a fine night, you thought would probably show you some white side or white edge? - (A.) Yes. (Q.) And on a fine night you would be able to see the whiteness? - (A.) Yes. (Q.) Was that the reason you repeated the message about growlers? - (A.) Yes." That was to keep a sharp look-out for ice and growlers, your Lordship remembers.

Then on page 322 there is a group of answers, some 13 in all, beginning at Question 14196: "(Q.) Right up to the time the ship went down, is it your view that the conditions were the same as they were between 6 and 10? - (A.) Precisely. (Q.) Can you suggest at all how it can have come about that this iceberg should not have been seen at a greater distance?" Then the witness gave an answer which I think is perfectly in your Lordship's mind. Your Lordship has referred to it more than once. I think I will read it again. It is an important answer, and perhaps it might be well if I read it.

*The Commissioner:* We have had it read several times.

*Sir Robert Finlay:* I agree, my Lord; it is present to all of us, I think. Question 14199 is the conical question: "And most particular of all, in my estimation, is the fact - a most extraordinary circumstance - that there was not any swell. Had there been the slightest degree of swell, I have no doubt that berg would have been seen in plenty of time to clear it."

Then, at Question 14207, there is a question put by your Lordship in continuation of former questions: "The iceberg, in your opinion, had probably quite recently turned turtle? - (A.) Yes. (Q.) And was displaying black ice with nothing white about it - that is it, is it not? - (A.) That is about it. (Q.) Does that, in your opinion, account for the man on the look-out not seeing the iceberg? - (A.) Yes."

Then on page 327 he is asked some questions bearing on this point, at Question 14330 and the four following questions. Mr. Scanlan says: "This night you have described as being a particularly bad night for seeing icebergs. Is not that so? - (A.) I do not think I mentioned that word "bad," did I? (Q.) You did not mention that word, but I wish you not to misunderstand me. I am not purporting to give your exact words. You said it was realised at the time that it would be more difficult on account of there being no wind and the sea being a level calm? - (A.) Yes, that is right. (Q.) Added to that, you had the condition of there being no moon? - (A.) Yes. (Q.) And the other conditions which you described to my Lord. Were not these circumstances which would indicate to any experienced officer that it was necessary to take extra precautions for safety? - (A.) As a matter of fact, we were unaware of the sea being flat. All the precautions were taken which we thought necessary. (Q.) Do you say you were not aware then that the sea was flat? - (A.) No. (Q.) At all events, it was more difficult then than under normal circumstances to see an iceberg. You observed that yourself from 6 to 10? - (A.) Yes. (Q.) Although there were abnormal difficulties, you took no extra precautions whatever? - (A.) Have I said so? (Q.) I suggest to you that you took no extra precautions whatever? - (A.) But I did." The precautions were the very special instructions to everyone on the bridge and on the watch to keep a sharp look-out for ice and growlers.

The last passage in Mr. Lightoller's evidence on this point is at page 330, Question 14421. This is the conversation repeated again in answer to Mr. Scanlan. *The Commissioner*: Yes.

*Sir Robert Finlay*: Then, my Lord, Pitman's evidence bears on this point also. It is not so voluminous as that of Mr. Lightoller with reference to it, but it bears on it. It is at page 352, Question 15206, and the following Questions: "(Q.) Would it not have been possible to have lowered the boats half filled and then filled them down the companion ladders? - (A.) No, not if there had been the slightest bit of swell. (Q.) But under the conditions that actually took place, it would have been possible" - that is to say, the sea being like a pond; that is what the question refers to - "(A.) Yes, but we did not know it was so calm until we got into the water. (Q.) I suppose you knew that there was not a heavy swell on, did you not? - (A.) We did not; you could not tell from that ship."

Then on page 359, Question 15509: "(Q.) Is it your evidence that even at that distance it was very difficult to make out that this was an iceberg - to make out what it was? - (A.) To make out what it was, yes. (Q.) Was that on account of the weather conditions or the condition of the atmosphere? - (A.) I think it was due to the conditions that were then prevailing at the time, a calm, oily sea."

My Lord, I submit it is conclusively established that there was an absence of swell; that that was a circumstance which prevented there being a break at the bottom of this dark berg which would have led to it being detected long before it was in fact. Having established that, I hope conclusively, in point of fact, I desire to call your Lordship's attention, as shortly as may be, to the evidence that shows that such a calm as that, such an absence of swell, is a most extraordinary circumstance in the Atlantic. Mr. Lightoller says, at page 305, Question 13574, that he never saw it on any other occasion. I have read the passage, I think, just now, and I need not read it again.

Captain Cannons says, on page 669, Question 23835: “Are those circumstances very rare? - (A.) Yes. (Q.) A perfectly flat sea, no swell, no ripple? - (A.) They are extremely rare in the North Atlantic.”

*The Commissioner:* You ought to read the next.

*Sir Robert Finlay:* If your Lordship pleases: “(Q.) But still, such circumstances are sometimes found? - (A.) Yes, my Lord. (Q.) How far do you suppose you would see an iceberg in those circumstances? - (A.) I should say a mile.”

*The Commissioner:* The point is that such circumstances are sometimes found. *Sir Robert Finlay:* Sometimes, but very rarely, and the combination of an iceberg just capsized, in all probability, so that it was black - the combination of that which is a very rare thing, so rare that many gentlemen who have spent their lives on the Atlantic have never seen it, with the entire absence of swell, which is also a very rare thing, is, of course, still more unlikely to happen.

Then, my Lord, Sir Ernest Shackleton, at pages 720 and 721, is asked about this at Question 25063.

I will read the latter part of the answer. I need not read the question nor the earlier part of the answer, but at the top of page 721 he says: “Of course, that particular night was an abnormal night at sea, in being a flat calm; it is a thing that might never occur again.

*The Commissioner:* I suppose by the expression “a flat calm” he means no swell? *Sir*

*Robert Finlay:* Yes, obviously, my Lord, of course no one would say that in the Atlantic you may not have an absence of wind.

*The Commissioner:* I am quite sure of this, that in the Atlantic with no wind, but a great swell which you may have, nobody in his senses would call the sea a flat calm; I would not.

*Sir Robert Finlay:* No, my Lord.

*The Commissioner:* I am told that a seaman would call it a flat calm. I have been sitting in a ship with no wind when I have seen the rail go up to the sky and down again - and it never occurred to me that anyone would call that a flat calm. But I am told it would be called a flat calm.

*Sir Robert Finlay:* It would not be a flat calm for practical purposes for anyone who was not proof against seasickness.

*The Commissioner:* Is Sir Ernest Shackleton, by any chance, here?

*Sir Robert Finlay:* The next answer, I think, makes it as clear as if he were here himself, my

## **Page 855**

Lord: “(Q.) That is what Mr. Lightoller says. You say apparently it is very rare to get such a flat calm as there was that night?”

*The Commissioner:* And his answer is: “I only remember it once or twice in about 20 years’ experience - the sea absolutely calm, without a swell.”

*Sir Robert Finlay:* Yes, “as it was recorded to have been.”

*The Commissioner:* I suppose if you talk about the sea being absolutely calm it does mean an absolutely flat sea?

*Sir Robert Finlay:* That explains what he means when he talked about a flat calm in the previous answer. It demonstrates that Sir Ernest Shackleton, when he talks of a flat calm there, meant not even a swell.

*The Commissioner:* He speaks in the very next question about the swell.

*Sir Robert Finlay:* Yes. (Q.) And if I followed correctly what you said earlier, it would make it more difficult to pick up an iceberg with the eyes? - (A.) Decidedly. (Q.) If you had this calm sea? - (A.) Yes, decidedly so. (Q.) Although it was a clear night? - (A.) Yes. (Q.) There would be no indication of the water breaking around it? - (A.) No, there would be none in a condition like that. It takes very little sea and very little swell, with the Northern bergs, which are submerged about seven times to one above, for what we call a splash to get up and give you an indication."

Now, my Lord, I submit that is enough to show the great rarity of this phenomenon, the absence of swell. The absence of swell is proved to have existed. The presence of the black berg is proved to have existed, and it is proved that that is a most unusual phenomenon; and the combination of the two, of course, was extraordinary. There was a fatality about this which might not occur in 100 years or more.

*The Commissioner:* There is the other phenomenon: assuming that there was a good look-out, as I am disposed to think there was, there is undoubtedly the fact that this berg was not seen until it was close upon the nose of the ship.

*Sir Robert Finlay:* Yes, and that can only be accounted for by the two combined circumstances of the black berg, and the absence even of a swell. These two unusual circumstances were combined. That is, of course, an extraordinary combination; and it was that which led to this berg not being seen before. There was a sharp look-out. The men had been specially cautioned to look-out for icebergs and for growlers, and they were looking out; there was a good look-out both from the bridge and from the crow'snest. It was not seen. The answer to the question why it was not seen is simply this, that you had an unexampled state of things, because two very rare things happened to be combined on that one occasion.

And then, my Lord, the circumstances of the accident itself are of the same extraordinary nature. As soon as the berg is reported the order was given, "Hard-astarboard." Judging by looking to what followed upon that order, it might be said: "It is a pity it was given," but it would have been a most grossly improper thing not to give the order. "Error of judgment." if used with reference to that order, can only be in this sense that, as things turned out, it was unfortunate - most unfortunate.

*The Commissioner:* It may have been; it depends entirely upon Mr. Wilding's view. That it was good seamanship I suppose no one doubts.

*Sir Robert Finlay:* No; in fact, it would have been outrageously bad seamanship to hold on even with reversing.

*The Commissioner:* The only thing is that, if Mr. Wilding is right, then running stem on would have caused the loss of 200 lives, but would have saved the ship and the other lives that were lost.

*Sir Robert Finlay:* I think that is very probable, my Lord.

*The Commissioner:* That is what Mr. Wilding means, I suppose.

*Sir Robert Finlay:* I think it is so, judging from what we know from this vessel; if you had run right on to the berg there would have been a tremendous shock, and all the people in the forepart of the ship would have been killed, particularly the firemen.

*The Commissioner:* But she would not have scraped a hole right along her side, and she would not have foundered.

*Sir Robert Finlay:* No.

*The Commissioner:* That is what he says.

*Sir Robert Finlay:* That is so. That is manifestly so, because if you hit the iceberg end on it does not matter if there is a projecting spike.

*The Commissioner:* It is not worthwhile discussing it. Have we got anything to do with it? We are all agreed that Murdoch was quite right in doing what he did.

*Sir Robert Finlay:* Yes, and it would have been grossly wrong if he had not given the order.

*The Commissioner:* Yes.

*Sir Robert Finlay:* And the extraordinary thing is, my Lord - and this completes the sum of remarkable circumstances which attended this accident - that they almost avoided it altogether. It was only the third extraordinary circumstance of there being at the corner, just as they were clearing this iceberg, a projecting spike which caught the starboard bow and proceeded to rip it up for six compartments, which caused this deplorable catastrophe.

*The Commissioner:* I do not know that it was ripped up continuously. It seems to me, from my view of the evidence as to the character of the injuries to the ship, that there were several separate holes.

*Sir Robert Finlay:* That is Mr. Wilding's view, my Lord. It is clear from Mr. Wilding's evidence that in his view it was not a rip up such as would be made by a knife put into a space between the lid of a box and the box itself - a ripping up continuously - but that it was a series of stabs.

*The Commissioner:* It is pointed out to me that it is rather difficult to understand that. It may have been one projecting piece of the berg which struck the ship and then ran along the side, but which did not open the side at each part of the lining as it went along to the same extent. It opened it differently as it went along, that is to say the plates bulged back inwards and broke or cracked or became unriveted in different places.

*Sir Robert Finlay:* That is so, my Lord. Certainty is impossible, because the vessel is now two miles deep at the bottom of the Atlantic. We can only say what is probable, and I confess, if I may tell my own mind, that I do not feel quite satisfied that one can be sure it was done by a succession of stabs.

*The Commissioner:* It is rather difficult to know how a succession of stabs could be delivered by the berg.

*Sir Robert Finlay:* Mr. Wilding's view is - and on a point of this kind one would pay the greatest attention possible to Mr. Wilding's opinion; he has been of so much service in this case - his opinion is that the first stab was when the starboard bow struck under the waterline; then that the vessel sheared off a little, swinging round, and then another stab is delivered in the next compartment, and so on. At any rate, Mr. Wilding, although he does not think it the most probable theory, thinks it is not at all impossible that the ice,

having penetrated on the starboard bow, ran along continuously ripping the thing up until it got to No. 6 compartment, when there was no further wounding. Certainty is perfectly impossible in the matter.

*The Commissioner:* It is merely speculation.

*Sir Robert Finlay:* Yes, and it does not really affect the case. The only observation I was making was that there was a most extraordinary combination of circumstances here, because your Lordship remembers how the one look-out man said to the other: "That is a narrow shave." He thought they had escaped it; it seemed that they had; and the effect was so slight that instead of there being a tremendous shock as there would have been if they had gone full tilt into the iceberg all that the people heard was a grating noise as if it was running along gravel.

## **Page 856**

*The Commissioner:* It was a noise that terrified the Captain; I am sure of that.

*Sir Robert Finlay:* Yes, and some of the passengers were wakened up by it.

*The Commissioner:* It woke him up.

*Sir Robert Finlay:* It woke up the Captain, but some of the passengers described how they simply turned round and went to sleep again. The Captain was not asleep; he was in the chart room.

*The Commissioner:* It brought him out of his cabin.

*Sir Robert Finlay:* It brought him out of the chart room. And that, my Lord, leads me to call your Lordship's attention to the fact that Captain Smith was close at hand and ready.

*The Commissioner:* So I understand. Can you tell me how far exactly the door of the Captain's room was from the bridge?

*Sir Robert Finlay:* I cannot give you it in yards. It is absolutely close.

*The Commissioner:* I know, but "absolutely close" is rather indefinite.

*Sir Robert Finlay:* It is a few yards, or a few feet. Your Lordship will remember going from the bridge into the Captain's chart room when you visited the "Olympic." I have no doubt then your Lordship walked from the bridge into this room.

*The Commissioner:* I did, but unfortunately I do not remember these things. The Captain was dressed, I think, was not he?

*Sir Robert Finlay:* Yes, the Captain was dressed. I am going to show that presently by the evidence.

*The Commissioner:* And I should like to know. Was he in his sitting-room?

*Sir Robert Finlay:* No. The expression used, I think, is "the Captain's chart room." I take it that it was the navigation room, which is immediately forward of the Captain's sitting-room.

*The Commissioner:* I think it means the place marked as the navigation room.

*Sir Robert Finlay:* I think so, my Lord.

*The Commissioner:* It is practically on the bridge.

*Sir Robert Finlay:* It is, my Lord; it is really on the bridge. It is under cover. If your Lordship will look at this larger plan it shows it more clearly, and it shows the chart table, which is in the navigation room. (*The plan was handed to his Lordship.*)

*The Commissioner:* If he was sitting in that room I suppose he would be sitting with a bright light.

*Sir Robert Finlay:* It depends, my Lord. Of course, if he were looking at the chart or anything of that kind he would, but a man may go in there simply to rest.

*The Commissioner:* Do we really know anything about the light in his room at the time that he came out?

*Sir Robert Finlay:* I do not think we do; there is no evidence about it. All I mean is this, that a man may be resting in his room dressed and ready to go out, and yet have turned down the light because it is a great relief to the eyes to have the light down.

*The Commissioner:* But there is no evidence about it.

*Sir Robert Finlay:* There is no evidence about it one way or the other.

*The Commissioner:* Because, you know, if he came out of the bright glare of an electric light on to the dark bridge, it would take him some time - we know by our own experience - to get the eye accustomed to the change from light to darkness.

*Sir Robert Finlay:* It would, undoubtedly. However, I do not think anything turns upon that, because what had happened had happened when he came out.

*The Commissioner:* But it may be a point that he should not have been away from the bridge in these circumstances, so that he could not the moment he came on to the bridge realise what was taking place.

*Sir Robert Finlay:* Of course, in the first place, we do not know that the light was on. It may or it may not have been. In the second place, there was absolutely no circumstances of danger, so far as was known. He left word, "If the slightest haze comes on, call me," and he was sitting close at hand. Under those circumstances I submit that it could not be said -

*The Commissioner:* There is always that conversation which Mr. Lightoller remembers with such distinctness.

*Sir Robert Finlay:* I submit that does not come to very much, my Lord. Would your Lordship kindly look at Mr. Boxhall's evidence with regard to this on page 376. Mr. Boxhall was on duty from 8 to 12. "16923. Was there any message during the time you were on duty, from 8 to 12, received by any of the officers on the bridge? - (A.) Not to my knowledge. (Q.) You know of none. Was Captain Smith on and off the bridge during your watch? - (A.) Frequently. (Q.) At what intervals did he come on the bridge? - (A.) The first time that I remember seeing Captain Smith was somewhere in the vicinity of 9 o'clock, but from 9 o'clock to the time of the collision, Captain Smith was around there the whole of the time; I was talking to him on one or two occasions. (Q.) Were you talking to him on the bridge? - (A.) Sometimes in the officers' chart room and sometimes at his chart room door." The officers' chart room is just on the other side of the vessel, your Lordship will recollect. "16927. What were you talking about? - (A.) I was discussing some stellar bearings I had had. I was also standing at his chart room door while he pricked off the 7.30 stellar position of the ship. (Q.) Was anything ever said by the Captain about any such message as that that the 'Mesaba' sent? - (A.) No, none whatever." He was recalled really to negative the "Mesaba" message being received, so that it is quite plain that the Captain was close at hand. He was close at hand, and was going on to the bridge. Then on page 334 in the evidence of the same witness, Mr.

Boxhall (what I have already read was Mr. Boxhall's evidence when he was recalled) you will see Question 15352: "Did you see anything done with regard to the watertight doors?" - (A.) I saw Mr. Murdoch closing them then, pulling the lever." That is the lever on the bridge. "15353: And did the Captain then come out on to the bridge? - (A.) The Captain was alongside of me when I turned round. (Q.) Did you hear him say something to the First Officer? - (A.) Yes, he asked him what he had struck. (Q.) What conversation took place between them? - (A.) The First Officer said, 'An iceberg, sir. I hard a-starboarded and reversed the engines, and I was going to hard a-port round it but she was too close. I could not do any more. I have closed the watertight doors.' The Commander asked him if he had rung the warning bell, and he said 'Yes.' (Q.) Did the Captain and the First Officer go to the starboard side of the bridge to see if they could see the iceberg? - (A.) Yes. (Q.) Did you see it yourself? - (A.) I was not too sure of seeing it. I had just come out of the light, and my eyes were not accustomed to the darkness." Then he left the deck and went down. So that your Lordship sees that those two passages prove conclusively that the Captain was close at hand. He was going on to the bridge out of the room which really forms part and parcel of the bridge, and was backwards and forwards.

*The Commissioner:* I think the light would be turned up in his room; I should think so.

*Sir Robert Finlay:* It may have been. It must have been turned up when he was pricking off the stellar bearings.

*The Commissioner:* That is what occurred to me. I am told that was at 10 o'clock. *Sir*

*Robert Finlay:* That is so, my Lord. Very often a man turns down the light if there is nothing that he wants to do, merely as a relief to the eyes. It may or may not have been; there is no evidence to the point one way or the other. Then there is one other passage which shows how ready the Captain was to come out. That you will find at page 38, Question 1025, in the evidence of Hichens. Hichens is asked what happened after the collision: "1025. Tell us what you heard in the way of command? - (A.) Just about a minute, I suppose, after the collision, the Captain

## **Page 857**

rushed out of the room and asked Mr. Murdoch what was that, and he said, "An iceberg, sir;" and he said, "Close the watertight door." (*The Commissioner.*) Wait a minute. A minute after the collision Captain Smith - (*The Attorney-General.*) Came out of his room on to the bridge, do you mean? - (A.) Yes, Sir. He passed through the wheelhouse on to the bridge. (Q.) He rushed out of his room through the wheelhouse on to the bridge? - (A.) Yes. (Q.) And asked Murdoch, "What is that?" - (A.) Yes." So that it is quite clear that Captain Smith was not lying down; he was not asleep; he was ready, and he came out at once dressed. And your Lordship remembers that Mr. Murdoch, who was left in charge on the bridge, was an officer of very long experience. He had an extra-master's certificate; he had been on the "Olympic," and he was a man that the Captain was perfectly justified in leaving in charge. There were no special circumstances of danger. On the contrary, the Captain had said, "If the least haze comes on fetch me at once." Then your Lordship recollects that an entry had been made in the night order book with regard to the ice, and that the messages had been stuck up in the chart room in the usual way. Will your Lordship look at page 308, Question 13700, in the middle of the second

column. The Witness, Mr. Lightoller, asks if he may say one fact that he had just remembered: "13700. Do? - (A.) Speaking about the Commander, with reference to ice, of course, there was a footnote on the night order book with regard to ice. The actual wording I cannot remember, but it is always customary. Naturally every Commander in the night order book issues his orders for the night, and the footnote had reference to keeping a sharp look-out for ice. That is initialled by every officer. (Q.) Who was it that took the ship over from you at 10 o'clock? - (A.) Mr. Murdoch. (Q.) Mr. Murdoch, the First Officer."

Then, my Lord, I need not go through the evidence which is clear and explicit as to the fact that special caution was given to the officers on the bridge and to the look-out men to be on a sharp look-out for ice, icebergs and growlers. I submit that everything was done, by the light of things as they were then known, that prudence could suggest. Now, may I return to a point which I have already touched upon to some extent, and that is as to what the Captain did in another respect - changing his course, that is to say, leaving the track by continuing to the Southward. May I ask your Lordship for this purpose to glance again at the large chart which I handed up showing the ice that had been reported. I ask your Lordship to look at this for the purpose of showing the position of the ice which had been reported to the officers; secondly, for the purpose of showing that the ice which had been reported did not strike the "Titanic"; that the "Titanic" successfully avoided that ice owing to the course that the Captain took; and, in the third place, that the alteration in course which the Captain made was a most proper alteration to make, under the circumstances, for the reasons which I shall submit to your Lordship. A good many questions were asked as to why there were no special instructions given by the White Star Company, or by any Company indeed, to the officers with regard to ice. I think the answer was that which was indicated by your Lordship more than once, when this class of question was put: "What special instructions can you give?" There were special instructions with regard to the field ice on the Northern route - the Canadian route, as it is called - not going into field ice.

*The Commissioner:* At all.

*Sir Robert Finlay:* At all. That is a very special matter incidental to that route. If the ice continues to go further South, as it has been doing of late, it may be necessary to issue a similar notice with regard to field ice on tracks which hitherto have been absolutely immune from it. But we are face to face - and Captain Smith on the "Titanic" has had the first bitter experience of it - with a new state of things - the ice encroaching a great deal further to the South than has hitherto been the case. No special instructions could be given, as your Lordship pointed out, except that it is a matter that must be left to the Captain. He is told to make the safety of the ship and the passengers the first concern, and it must be left to his judgment what is to be done in any particular case. Now, my submission to your Lordship is that the alteration of course which he made was an eminently judicious one, and that, as a matter of fact, he did avoid the ice which had been reported, and that the iceberg which struck him must have been other ice which had not been reported at all. What he did was to continue on the track past the corner; he turned 10 miles further.

*The Commissioner:* There is a little discrepancy between your chart and the course you have marked on it, and the chart as my colleagues have marked it, working back from the point of collision.

*Sir Robert Finlay:* I hope it is not very serious.

*The Commissioner:* I do not think it is very serious; there is a little discrepancy. *Sir*

*Robert Finlay:* I do not think a slight discrepancy one way or the other will affect the argument.

*The Commissioner:* I do not think it does.

*Sir Robert Finlay:* Might I know what it is, my Lord, for the sake of complete accuracy?

*The Commissioner:* The difference is this: We have assumed that the ship went to the corner, and then, instead of turning the corner, continued on the same course. You have assumed that the ship never went to the corner at all, but got to the Northward of it.

*Sir Robert Finlay:* I think, my Lord, the evidence bears that out.

*The Commissioner:* Which?

*Sir Robert Finlay:* Our view.

*The Commissioner:* I thought there was no evidence about it.

*Sir Robert Finlay:* We have had evidence, my Lord, that the course was South 62 deg. West, true, and that is what we have taken. It deviates a little to the North of the track.

*The Commissioner:* I think we all agree that for the purpose of this case it makes no difference.

*Sir Robert Finlay:* Yes. What he did was this: he ran that further to the South - he ran on some 10 miles to the inner South-Westerly direction beyond the track, crossing it, and then he made his corner where he turned in a Westerly direction 10 miles further to the South. At 5.50 p.m. the "Titanic" made her corner. Till he turned the corner his course had been S. 62 W. true. Then, on turning the corner his course was from 5.50 onwards, S. 86 W. true. Now that took him on a course which was to the South of the course of the ordinary track, varying in distance. Its greater distance is to the East.

*The Commissioner:* That would be a difference of nearly 10 miles.

*Sir Robert Finlay:* Nearly 10 miles.

*The Commissioner:* And then you are gradually getting nearer to the marked course.

*Sir Robert Finlay:* I think your Lordship is right.

*The Commissioner:* Or is it eight miles?

*Sir Robert Finlay:* It is more like eight miles, I think.

*The Commissioner:* Let us get it right. I am told it is only 4 miles.

*Sir Robert Finlay:* 4 miles, I am told, is quite right. Then it diminishes at the other end to something between 1 and 2, I think, at the time of the disaster - that she was less than 2 miles South of the track.

*The Commissioner:* That is important, because hitherto I have thought that at the time of the disaster she was about 4 miles South of the indicated ice. I see now what it is. She was about, possibly, 2 miles South of the course, but she was about 4 miles South of the indicated ice.

*Sir Robert Finlay:* Yes, of the position; that is so my Lord. That is to say, she had passed 4 miles to the South of the position indicated for the "Baltic" ice; and a good deal more, of course, to the South of the position indicated for the "Caronia" ice, which was up on 42.

*The Commissioner:* The "Caronia" and the "Californian."

*Sir Robert Finlay:* The "Caronia" and the "Californian." If the Captain of the "Californian" is right in saying that his position was 42.5 N. Lat.; by the time the "Titanic" had reached the spot of the collision, she was far to the Westward of the situation of either the "Californian" ice or the "Baltic" ice.

*The Commissioner:* The "Californian" ice was a good deal further off; more like 30 miles.

*Sir Robert Finlay:* Quite that, I think rather more. If my memory serves me rightly she was 17 miles to the West of the "Baltic" ice, and it would be still more in the case of the "Californian."

*The Commissioner:* Then she was 40 miles to the West of the "Californian" ice. *Sir Robert Finlay:* I had guessed it roughly at about 30 miles; I may have underestimated it, but still it is a very long way. I am told it is 50 miles. Mr. Raeburn has taken it off, and he says 50 miles is correct. Your Lordship appreciates the importance of that fact because it demonstrates that as far as the "Californian" ice is concerned, and so far as the "Baltic" ice is concerned, the "Titanic" had avoided it. For what is absolutely certain is that, under the conditions that existed at this spot, neither the "Baltic" ice nor the "Californian" ice could have drifted in a Westerly direction. The drift of the ice would vary according to the depth it went below the water. In the case of field ice or bergs which were not so bulky as to reach down through the 50 fathoms or a little more of the Gulf Stream which runs in a North-East direction, in the case of ice which did not reach down through that stream to that cold Labrador Current below, which is running Southward, the drift would be Easterly, or, to put it exact, E.N.E.

*The Commissioner:* That seems to show that she had succeeded in avoiding both the "Baltic's" ice and the "Californian's" ice.

*Sir Robert Finlay:* Yes.

*The Commissioner:* She passed out of the danger of it.

*Sir Robert Finlay:* It proves it, my Lord; it was neither of those that struck the "Titanic." Now, with regard to the "Caronia" ice, I say it is clear that she had also escaped the "Caronia" ice, and that these bergs belonged to other ice altogether, which had never been reported. For this reason: The "Caronia" ice would consist partly of icebergs, according to the message.

*The Commissioner:* Will you repeat the "Caronia" message.

*Sir Robert Finlay:* If your Lordship pleases; I will have the exact terms looked up. *The Commissioner:* Just tell me, Sir Robert, so far as you remember it.

*Sir Robert Finlay:* It was: "Ice reported, icebergs, pack ice and field ice in lat. N. 42 to long. 49 to 41." That is the effect of it. I will give the exact terms in a moment. *The Commissioner:* That is sufficient; go on with your observations.

*Sir Robert Finlay:* But there is this very important circumstance to be added - that that report from Westbound steamers was of ice on the 12th, and that makes all the difference;

so that from the time when that ice was in that locality according to these reports, to the time of the collision, there was an interval of certainly not less than 48 hours, and probably something more, because these vessels had reported to the "Caronia" ice in the locality I have mentioned on the 12<sup>th</sup> April. That may have been any time between the early morning of the 12<sup>th</sup> April, which would be the Friday, and midnight on the Friday. So that you have got a minimum period of 48 hours down to the time of the disaster and very probably a good many hours more. Now what we have to consider is what the effect of the evidence as to the movement of ice is on the position that the "Caronia" ice would have reached by the time of the disaster at 11.50 on Sunday, the 14<sup>th</sup>. The ice reported was partly field ice and partly icebergs. So far as the field ice is concerned, so far as the icebergs are concerned that were not of great bulk so as to reach down through the Gulf Stream, the same observation holds good that I made a few minutes ago with regard to the other reports of ice.

*The Commissioner:* That reached down to the Labrador Stream?

*Sir Robert Finlay:* Exactly, my Lord. So far as the ice was field ice or comparatively small bergs, it would be under the influence only of the Gulf Stream, and it would go in an Easterly direction. It would not go where the "Titanic" was at all. So far as the ice reported by the "Caronia" consisted of bergs going through the Gulf Stream into the Labrador Current below, it would take a Southerly or South-Easterly direction under the combined influence of the Gulf Stream on the upper part of the submerged berg and the influence of the Labrador Current on the lower part of the berg. It would go in a SouthEasterly direction. Your Lordship has it from the passages which I read from the "United States Pilot" very recently - I am afraid it was the day before yesterday - which will be in your Lordship's recollection, that the strength of the Gulf Stream varies. It is less at the margin and more in the middle. I speak subject to correction by the experienced gentlemen by whom your Lordship is assisted, but two or three knots may be put as the strength of the Gulf Stream. The Labrador Current varies considerably. The "United States Pilot" puts one knot as a common strength for the Labrador Current. Your Lordship sees that by altering his course to the Southward, going further South than the track, Captain Smith increased the interval between himself and any field ice or bergs which did not reach down to the Labrador Current, and which would be drifting Eastward. He was further to the South and he gave them a wider berth. On the other hand, he did not go further to the South for this reason. He would know that the bergs that got down through the Gulf Stream into the Labrador Current would be drifting in a SouthEasterly direction; and if he had gone further South during the 48 or 60 hours that the "Caronia" ice had had to drift before midnight on Sunday, the 14<sup>th</sup>, he would have impinged in all probability upon that "Caronia" ice. And here comes in the importance of the observation which Mr. Rostron made very concisely. An iceberg is a moving object. You treat an iceberg - I am amplifying what he said - as you treat another vessel which you come across in a course which crosses yours. You do not, because you are heading for a vessel some distance off at 6 p.m., change your course, because you know that while you are heading on for the spot where she is, when you see her she will have passed on further. Or if you had a vessel which was crossing your bows or from starboard to port in that direction, if you starboarded to that vessel you would, by the time you reached the line on which she was, come into collision with her. You hold on and go under her stern,

because you know that while you are approaching the spot where you saw her she will have shifted her position further to the South-East. Of course, we speak in ignorance, necessary ignorance, of what passed through Captain Smith's mind; but I submit it is an eminently reasonable consideration that may have influenced him in choosing this track, that by going so far to the South as he did he gave the field ice and the small bergs, which could only drift Eastward, a wider berth, and by not going further to the South, he avoided impinging upon the big bergs which would have drifted South-East under the influence of the Labrador Current.

*The Commissioner:* That is to say, he went, as you may express it, under the stern of those icebergs?

## **Page 859**

*Sir Robert Finlay:* Exactly. Take the drift of the icebergs - the field ice and the small bergs are out of the question altogether. It is clear that it could not have been the field ice or the small bergs of the "Caronia" ice that caused the disaster; that is beyond all question, because they would go away Eastward. Now, as regards the big bergs, I say they would have gone to the Southward of the course which he chose, because he avoided going so far to the South as possible to impinge upon them at the rate at which they would have travelled.

*The Commissioner:* Then the effect of your arguments is this, that he had either designedly or by a lucky chance so arranged his course as to avoid all the ice of which he had received notice, if he had received only those three Marconigrams.

*Sir Robert Finlay:* Yes.

*The Commissioner:* Now, can you tell me this: can you indicate to me which was probably the ice that he did encounter? Was it the "Mesaba" ice? *Sir Robert*

*Finlay:* It may have been.

*The Commissioner:* It is perhaps not of any significance to enquire, but still I should like to know. Was there any ice in any of the telegrams which this might have been? Perhaps you have not thought of that.

*Sir Robert Finlay:* I think it might have been the "Mesaba's" ice, because your Lordship will recollect that the message from the "Mesaba" which did not reach the bridge, was at about 11 o'clock at night, I think.

*The Commissioner:* What I mean is this. We have had a coloured parallelogram placed upon a chart based upon the different Marconigrams, including the "Mesaba's"; and if that parallelogram is accurately depicted upon the chart the vessel at the time of the striking was within the ice region mentioned.

*Sir Robert Finlay:* Yes, and your Lordship sees that the "Mesaba" ice was reported as being within that parallelogram - reported to the Marconi room on the "Titanic" as late as 11 o'clock, I think, on the Sunday.

*The Commissioner:* 9.40 p.m., I am told. *Sir*

*Robert Finlay:* Yes, 9.40 p.m.

*The Commissioner:* He was right in the middle of the "Mesaba" ice.

*Sir Robert Finlay:* He was right in the middle of the “Mesaba” ice. If the “Mesaba” message had reached the bridge this disaster would never have happened. Here is the “Mesaba” message: “In latitude 42 N. to 41.25; longitude 49 W. to longitude 50.30 W., saw much heavy pack ice and great number of icebergs.”

*The Commissioner:* Can you tell me in what way the “Mesaba” would gather this information which is contained in her Marconigram?

*Sir Robert Finlay:* The expression in the Marconigram is “saw.” *The Commissioner:* It seems over a very large field.

*Sir Robert Finlay:* Your Lordship will recollect that the Marconi operator from the “Mesaba” said he had combined in this Marconigram two messages from the Captain. They had passed through this region; the Captain had made two communications to him of what they had seen, and he fused these two together in this message which states that they had seen “much heavy pack ice and great number large icebergs, also field ice, weather good, clear.” Your Lordship will recollect how Mr. Lightoller, when this matter was brought forward by the Solicitor-General at a latish stage of Mr. Lightoller’s evidence, said, “We never could have got that.”

*The Commissioner:* Speaking for myself I think it would be absolutely wrong to impute to the Captain a knowledge of the “Mesaba” message. If they did get that message they were grossly careless - very, very grossly careless.

*Sir Robert Finlay:* But they did not get it, and why they did not get it is perfectly apparent.

*The Commissioner:* Why they did not get it, I should think, is this, that Phillips was too busy to bother about it, he did not appreciate its significance. *Sir Robert Finlay:* He was very busy indeed, I am not blaming him.

*The Commissioner:* I am not disposed to impute any great blame to Phillips. I daresay he thought that it was a matter of no consequence, and I daresay he had not the ability to distinguish the consequence of it. I do not know whether he had or had not. I suppose it would require him to have a chart before him and the ability to find out where upon the chart this message stated the ice to be. At the same time he had the directions, which we know, that all telegrams affecting the navigation of the ship are to take precedence of any others.

*Sir Robert Finlay:* Yes.

*The Commissioner:* He had that, and he must have neglected that because he must have seen that this was a Marconigram that did affect the navigation of the ship. *Sir Robert*

*Finlay:* Your Lordship recollects the evidence. I will give you the references, if you desire it - showing that there was a mass of business to be done with Cape Race.

*The Commissioner:* I shall want you to give me those references before you finish.

*Sir Robert Finlay:* I will do it now, if your Lordship pleases.

*The Commissioner:* It is suggested that the track may not have been safe from field ice - the track, that is to say, that he was following; the field ice was a good deal further South, according to these Marconigrams, than was usual.

*Sir Robert Finlay:* I quite recognise that, my Lord, but it does not at all affect the observation your Lordship made. As a matter of fact, the “Titanic” did not encounter any field ice.

*The Commissioner:* I was thinking of that observation, but the question is, were not the Marconigrams of such a nature as to give the Captain warning that he might encounter field ice?

*Sir Robert Finlay:* I submit not, for this reason. The field ice in the "Caronia's" message was in latitude 42 North. That field ice could not come in a Southerly direction. The current that would influence it would be the Gulf Stream, which goes to the NorthEast.

*The Commissioner:* That is the difficulty. It is said that it does not at all follow that it could not come South.

*Sir Robert Finlay:* It would be very extraordinary if it did.

*The Commissioner:* It is suggested that the field ice behind it might be forced through.

*Sir Robert Finlay:* But the Gulf Stream is a pretty broad thing, and where you get icebergs to the South of the Gulf Stream they are icebergs which have been forced through the Gulf Stream by the Labrador Current operating on the lower part of the icebergs; but with the field ice there is no such influence.

*The Commissioner:* And I am reminded that the evidence is that the water at 10 o'clock that night was intensely cold. That looks as if they were not in the water of the Gulf Stream at that time.

*Sir Robert Finlay:* I will refer presently to the evidence with regard to the temperature. There may be a local difference in the temperature in the Gulf Stream. With reference to what your Lordship said just now, I observe this Note on the small chart towards the lefthand side: "The Gulf Stream Eastward of 65 deg. W. longitude is usually in streaks of warm water with colder water between."

*The Commissioner:* And "Its rate diminishes as the Westerly longitude decreases." *Sir Robert Finlay:* That is to say, as it is going Eastward its rate is falling until it becomes very slight when it gets to the West coast of Scotland. So that I submit to your Lordship that it is impossible to deduce from the coldness of the water - which I will deal with more in detail by-and-by - that they were in the Labrador Current. That would be an extraordinary phenomenon, because it would mean this: that the Labrador Current

## **Page 860**

was running on the surface at a spot where all the charts show the Gulf Stream. *The*

*Commissioner:* I see there is also on the chart: "Average Northern limit of the Gulf Stream."

*Sir Robert Finlay:* Yes. Your Lordship will observe with reference to what your Lordship said just now as to the average Northern limit that at the Southern side you have got a Note which seems to import that the arrows there mark the limit in that direction, for the Note is: "South of this line the currents are variable."

*The Commissioner:* "South of this line the currents are variable, but North of the line they are not."

*Sir Robert Finlay:* Yes. I can only say how much I deplore the fact that Captain Smith is not here. With his enormous experience of the Atlantic he would have been able to tell us what passed through his mind, and to deal with every suggestion that may be made.

*The Commissioner:* Unfortunately we have to do our best without him.

*Sir Robert Finlay:* I can only deal with all these suggestions to the best of my ability, and by the light of the evidence.

*The Commissioner:* I think all that was meant was that your observations were not conclusive, and that they leave some matters in doubt.

*Sir Robert Finlay:* I could not aspire, my Lord, to put the case with regard to the considerations that influenced Captain Smith in the course that he took on a basis of certainty. I can only offer what I submit is a very probable explanation, and I can only lament most deeply the fact that we have not got the means of knowing what this very experienced officer thought of the situation, and what were the elements which he took into account in making this diversion from his course. Your Lordship asked that I should give at this point the references with regard to the messages not delivered. I was about to do that.

*The Commissioner:* I am not sure that I am asking you a question the answer to which will be material, but I should like to know - I had better know it, I think - what was the ice that he did encounter, if it is to be identified at all with the ice in the Marconigram.

*Sir Robert Finlay:* It is not to be identified; it is impossible to identify it. What I say is this. It must have been a berg which at the time the "Caronia" ice was seen on the 12th was to the Northward of that ice, and which had come down under the influence of the Labrador Stream affecting the big bergs - had come down to the Southward and got to that spot. He avoided the "Caronia" ice because the "Caronia" ice would have passed further to the South than his track. He did not avoid this because this was in the rear of the "Caronia" ice and unfortunately caught the "Titanic." But he had no warning of it, and it is absolutely impossible to identify this ice as belonging to any ice which had been seen in a Northerly position. It may in all probability be part of the ice reported in the "Mesaba's" message.

*The Commissioner:* It occurs to me that it was the ice reported by the "Mesaba" message, because the actual striking took place in a region which the "Mesaba" message referred to.

*Sir Robert Finlay:* I quite agree, my Lord, and for that reason I was about to give your Lordship the reference to the Marconigrams not delivered. There are two other references in the same connection which relate to other messages which I had better give, and then I will read the passages relating to the "Mesaba" message. The first "Californian" message, your Lordship will recollect Bride said - and we do not dispute it - was delivered by him to some officer on the bridge. That officer must be lost.

*The Commissioner:* Bride, I think, said that he never heard of any message except the "Californian's."

*Sir Robert Finlay:* That is so, my Lord. In the first column on page 391, at Question 16663, your Lordship will find what he says about the first message: "I think you stated it was about 3 o'clock in the afternoon on this Sunday when you heard the "Californian" message? - (A.) I said five. (Q.) Five, you said? - (A.) Yes. (Q.) I thought you said three, but you say it was 5 o'clock by ship's time? - (A.) Yes, between 5 and half-past. (Q.) You knew it was an ice message? - (A.) Yes. (Q.) I think you stated to the Attorney-General that you were engaged in adding up your accounts? - (A.) Yes. (Q.) And then you went on adding up your accounts, and paid no attention to this message? - (A.) No. (Q.) Then

some time afterwards, I forget whether you gave us the time, you happened to hear it repeated? - (A.) Yes, that is correct. (Q.) Then you had not written it down when you heard it the first time? - (A.) No. (Q.) You knew it was a message to the "Titanic"? - (A.) Yes. (Q.) Reporting ice? - (A.) Yes. (Q.) You did not write it down? - (A.) No. (Q.) You took no notice of it at all, but went on adding up your accounts? - (A.) Yes. (Q.) Then, if you had not happened to hear that message repeated to another ship, nothing would ever have been heard of that message? - (A.) Yes, it would. (Q.) Well, forgive me. It gave the latitude and longitude. You had written nothing down when the message first came? - (A.) No. (Q.) Do you suggest that without writing anything down, and being busy with accounts, you can trust yourself to carry in your head the latitude and longitude which had been given in the message? - (A.) No, I had read the text of the message, which mentioned three large bergs. I had not got the latitude and longitude, and I should have called the "Californian" if she had not transmitted it at a very short period afterwards and asked her for the latitude and longitude. (Q.) The latitude and longitude you could not have carried in your head? - (A.) No. (Q.) The only way of getting that message would have been to call the "Californian" afterwards to get the latitude and longitude? - (A.) Yes. (Q.) You happened to hear it repeated, did you say, a quarter of an hour or twenty minutes afterwards? - (A.) Yes. (Q.) Are you sure about the time? - (A.) Yes. (Q.) Had you finished your accounts by that time? - (A.) No. (Q.) Were you still on your accounts? - (A.) Yes. (*The Commissioner.*) What are those accounts? (*Sir Robert Finlay.*) What were you doing? - (A.) I was writing up an abstract of all the telegrams sent the day before. (*The Solicitor-General.*) That is the *procès-verbal*. (*Sir Robert Finlay - To the Witness.*) Is that what has been called the *procès-verbal*? - (A.) No; the telegrams. It gives the place where the telegram originated from and where it is going to, the station it is sent to, and the cost of the telegram and the costs of the coast station; our charge, and everybody else's charge, one by one."

*The Commissioner:* That is referring to private telegrams.

*Sir Robert Finlay:* Yes. "16686: Then when you heard it repeated you recognised it as being the message which had been sent to your ship? - (A.) Yes. (Q.) And wrote it down, and took it on to the bridge? - (A.) Yes."

*The Commissioner:* That is a very slack way of doing business. He ought, according to the Regulations, to have taken that telegram on to the bridge at once, and not waited for the chance of it being repeated.

*Sir Robert Finlay:* Yes, my Lord. Then, my Lord, with regard to the second "Californian" message, your Lordship will find that in the evidence of Mr. Evans, at page 202, Question 8988, Evans was the Marconi operator on the "Californian," and this is the message that was sent after the "Californian" was stopped and surrounded by ice: "8988. What did the Captain say when you said that? - (A.) He said, 'You had better advise the 'Titanic' we are stopped and surrounded by ice.' (Q.) Did you get an answer from the 'Titanic'? - (A.) Yes. (Q.) Can you give me the time? - (A.) It was 9.5 p.m. (Q.) New York time? - (A.) Yes; 11 o'clock ship's time. (Q.) What did you say? - (A.) I said, 'We are stopped and surrounded by ice.' (Q.) Did you get an answer from the 'Titanic'? - (A.) They said 'Keep out.' (Q.) Just explain to us, will you, what that means? - (A.) Well, Sir,

he was working to Cape Race at the time. Cape Race was sending messages to him, and when I started to send he could not hear what Cape Race was sending. (Q.) Does that mean that you would send louder than Cape Race to him? - (A.) Yes; and he did not want me to interfere. (Q.) That would interrupt his conversation with Cape Race? - (A.) Yes. (Q.) So that he asked you to "Keep out"? - (A.) Yes. (Q.) In ordinary Marconi practice is that a common thing to be asked? - (A.) Yes. (Q.) And you do not take it as an insult or anything like that? (*The Commissioner.*) What did you say? (*The Solicitor-General.*) "You do not take it as an insult or anything like that." (*To the Witness.*) Do I understand rightly then that a Marconi operator, like other people, can only clearly hear one thing at a time? - (A.) Yes. (Q.) Have you any means of knowing - do you judge that he had heard your message about ice? When you say you sent this message and he said "keep out," did he say that after he had got your message? - (A.) The very minute I stopped sending. (*The Commissioner.*) You cannot tell, I suppose, whether he heard what you said? - (A.) He must have heard it, my Lord, but I do not know whether he took it down. (Q.) Would he hear what you said, or would he merely hear that you were speaking? You see, as I understand, he was getting messages from two points - from Cape Race and from you. He could not hear both, I suppose, at the same time? - (A.) No, my Lord. (Q.) And he may not have heard what you said, though he may have known that you were trying to speak to him. I do not know, you know; I am only asking? - (A.) Well, my Lord, my signal would be much stronger than Cape Race's. (Q.) You think that he would have heard you, and you would, as it were, obliterate Cape Race? - (A.) Certainly, my Lord." "9013: You say who you are? - (A.) First of all you give his call signal, and then yours afterwards. (Q.) And then you gave him this message, spelt it out, that you were stopped in ice, and then he replies to you, 'Keep out.' How do you know he was talking to Cape Race? - (A.) I heard him beforehand. (Q.) You could hear him? - (A.) Beforehand, and directly after that. (*The Commissioner.*) What was it you heard? - (A.) Before that, my Lord? (Q.) No. What was it that you heard which conveyed to you that he was in communication with Cape Race? - (A.) Directly afterwards he called up Cape Race - a few seconds after. (Q.) After he had said to you, 'Keep out'? - (A.) Yes, my Lord. (*The Solicitor-General.*) Could you overhear what he was saying to Cape Race? - (A.) Yes. (Q.) What was it he said? - (A.) He said, "Sorry, please repeat, jammed." (Q.) That means that somebody else had interrupted? - (A.) Yes. (Q.) After that did you hear him continuing to send messages? - (A.) Right up till I turned in."

*The Commissioner:* That was about 11 o'clock, was it not?

*Sir Robert Finlay:* 11.30, I think. "9023. It was not your business, and I have no doubt you did not listen in detail to what they were, but could you tell, as a matter of fact, whether they were private messages? - (A.) Yes, all private messages you can tell by the prefix. (*The Commissioner.*) That means messages from passengers? (*The Solicitor-General.*) Yes, business and private messages for the passengers. (*To the Witness.*) You can tell that by what you call the prefix, the sound that is sent first of all? - (A.) Yes. (Q.) And that continued, you say, till you turned in? - (A.) Yes. (Q.) When was it that you turned in? - (A.) 11.30 p.m. ship's time." Then, at page 391, Bride says something in confirmation of that. It begins at the very top of the second column. "16690. What I said was, trade and private messages sent on to Cape Race would be paid for

extra? - (A.) Yes. (Q.) They would not be included in the service messages? - (A.) No. (Q.) I think you used the expression - I am not sure whether his Lordship caught it - there was a very large accumulation of those messages? - (A.) Yes. (*The Commissioner.*) That is the accumulation of those messages cleared off while the witness was asleep? (*Sir Robert Finlay.*) How long was Phillips occupied in clearing off those arrears of messages for Cape Race? He began at 8.30? - (A.) Yes. (Q.) When did he finish? - (A.) I should estimate he could not have finished before 9 anyhow from the batch he had," that is the messages to be sent from the "Titanic" I infer. "But I could not give you any idea as to when he did actually finish. (Q.) I think you saw Phillips about 10 minutes before the collision, did you not? - (A.) No, after the collision. (Q.) I want to ask you about what you said in America before the Committee of the Senate on this point. Were you asked this question, and did you give this answer: "Were you working with Cape Race, or was Phillips, to your knowledge, just before the collision with the iceberg? - (A.) As far as I recollect, Phillips had finished working with Cape Race ten minutes before the collision with the iceberg. He made mention of the fact when I turned out. (Q.) Did you say that, and is that true? - (A.) I said that, but I could not remember what he said now. (Q.) But did you say that? - (A.) I said that to Senator Smith, but I could not recollect now what Phillips told me after I had turned out."

*The Commissioner:* His recollection was probably better when he was talking to Senator Smith than it was some weeks afterwards when he was talking to you.

*Sir Robert Finlay:* Yes. The next question was this: "16698. Was what you said to Senator Smith true? - (A.) Well, I was on oath at the time."

*The Commissioner:* What does he mean by that. Does he mean it was true or it was not true?

*Sir Robert Finlay:* I think he means that it must have been true.

*The Commissioner:* The next question answered it: "I presume what you said was true? - (A.) Yes."

*Sir Robert Finlay:* "16700. (*The Commissioner.*) Then what you stated just now must be a mistake? - (A.) What was that? (Q.) That this man had finished his work about 9 o'clock. - (A.) I said he could not have finished sending the batch of telegrams before 9. At the same time Cape Race would have a number of telegrams to transmit to him, as was proved by the "Californian." The "Californian" said she heard Cape Race sending him telegrams. (*Sir Robert Finlay.*) You know Phillips was engaged in communicating with Cape Race right on from half-past 8 to 10 minutes before the collision."

*The Commissioner:* That is what I want.

*Sir Robert Finlay:* "(A.) Apparently so, yes. (Q.) Well, have you any doubt about it? - (A.) No, I do not think so. I am judging by the amount of work that was got through. (Q.) He was engaged during these hours from half-past 8 to 10 minutes before the collision in communicating with Cape Race these trade and private messages? - (A.) Yes." With regard to the evidence as to the "Mesaba" message, we have got simply the proof of the sending of the acknowledgment by the operator.

*The Commissioner:* Can you tell me this: How, if at all, was the "Californian's" message acknowledged?

*Sir Robert Finlay:* The first message, my Lord, was acknowledged by the operator.

*The Commissioner:* And in any other way?

*Sir Robert Finlay:* In no other way. The second message was recognised by saying: "Keep out." He may or may not have recognised what the message was, but what he said was "Keep out." That means, my Lord, "You are interrupting me in my communication with Cape Race." And then he said to Cape Race: "Very sorry, jammed. I have been interrupted by somebody else"; and he goes on with his communications with Cape Race till ten minutes before the collision.

*The Commissioner:* The "Baltic's" telegram and the "Caronia's" telegram were both acknowledged in the name of Captain Smith were not they.

*Sir Robert Finlay:* Yes, my Lord, and "thanks." I think there was a message of "kind regards," or something of that kind.

*The Commissioner:* But the word "Smith" was included.

*Sir Robert Finlay:* Yes, that is so. The first "Californian" message was not acknowledged in that

## **Page 862**

way, but your Lordship's observation was that it related only to the "Baltic" and the "Caronia."

*The Commissioner:* The observations I have just made related to the "Baltic" and the "Caronia," that is to say that both messages were acknowledged in the name of Captain Smith.

*Sir Robert Finlay:* That is so.

*The Commissioner:* But the "Californian" message was never acknowledged in that way.

*Sir Robert Finlay:* That is so, that is what I ventured to put to you.

### ***(After a short adjournment.)***

*The Commissioner:* As Sir Robert is not here at the moment I am going to ask you, Mr. Laing, if you can tell me how long you are going to be?

*Mr. Laing:* I thought I should say all I want to say certainly within an hour.

*The Commissioner:* Now, you were going to say something rude; you were going to add, "but if I am interrupted."

*Mr. Laing:* No, my Lord; but I thought if your Lordship wanted further information that I have got at hand it might take longer, but with the material I have prepared I certainly think it will not take more than an hour.

*The Commissioner:* And how long is Mr. Dunlop to take?

*Mr. Laing:* I could not answer for that.

*The Commissioner:* But you know him.

*Mr. Laing:* Yes, I know him.

*The Commissioner:* How long do you think he will take?

*Mr. Laing:* My Lord, I think he will be more than an hour.

*The Commissioner:* That is very indefinite.

*Mr. Laing:* I could not answer for him.

*Sir Robert Finlay:* I was dealing with the question of the course that the Captain took, and I pointed out as regards the field ice and shallow and small bergs reported by the "Caronia" he had given them, by deflection to the South, a wider berth than he would have had if he had kept to the ordinary track.

As regards the deep bigger bergs which would be influenced by the Labrador Current, the Labrador Current is stated in the "United States Pilot" in the passages I have already read, to be of variable force, but one knot is suggested as a not unusual force. It is not so rapid as the Gulf Stream. If it were one knot the "Caronia" ice in 48 hours would have been taken 48 miles to the South of the spot at which it was reported, which is a long way to the South of the course which the "Titanic" took. If it went only half a knot an hour it would have gone 24 miles, which would be several miles to the South of the course which the "Titanic" took. I therefore suggest for your Lordship's consideration that although it is impossible to know what passed through the Commander's mind in all probability his calculation was: "I will give the field ice and the smaller bergs a clear berth and I will pass under the stern of the bigger bergs which must have gone further South than the track I am going." That is why he went just so far South and no further. My Lord, there is only one fact I recall to your Lordship's recollection; the time at which the "Mesaba" message was sent was according to "Titanic" time 9.40; it was 7.50 according to New York time which the "Mesaba" was keeping, and 9.40 "Titanic" time. So your Lordship sees the point of time at which it arrived at the "Titanic."

I think those are all the considerations which I have to submit to your Lordship bearing directly on the question of the navigation of the vessel. In the result, I respectfully submit that Captain Smith and his coadjutors on this ship are vindicated from all blame. The result was unfortunate, but it was an accident that might have happened, as it did happen, to the most careful and experienced navigator, owing to the emergence of new conditions which may profoundly affect the future of the navigation of the North Atlantic. Now, in connection with this subject and what took place on board the vessel, I have said only a very few words in regard to Mr. Ismay. I am prepared to deal at length with Mr. Ismay's evidence, but I do not know how far it is necessary for me to go. I do not know whether the Attorney-General can give me any indication on that point. I am prepared to go through Mr. Ismay's evidence, and I hope to satisfy your Lordship beyond all doubt that Mr. Ismay never interfered by giving any directions with regard to the navigation of the vessel; that it would have been most improper for him so to do; and that the Marconigram from the "Baltic" was certainly not shown to him by Captain Smith by way of inviting advice or directions from Mr. Ismay.

*The Commissioner:* There is no evidence that Mr. Ismay interfered in any way with the navigation of the ship.

*Sir Robert Finlay:* No.

*The Commissioner:* There is at the best or at the worst only surmise.

*Sir Robert Finlay:* Yes.

*The Commissioner:* One naturally asks why did the Captain show the telegram.

*The Attorney-General:* That is the whole point.

*The Commissioner:* And one also asks why did Mr. Ismay before the voyage commenced, take upon himself to go into the engine room and have a conversation with the Chief Engineer.

*Sir Robert Finlay:* If your Lordship pleases. Then I think it would probably be better that I should refer to Mr. Ismay's evidence.

*The Commissioner:* I was pointing out to you that in my view it is all surmise.

*The Attorney-General:* I think it must be.

*The Commissioner:* No one can suppose for a moment that the Captain did not know quite well that the whole responsibility of the navigation of the ship was upon him, and that he had no business to take any orders from anybody else.

*Sir Robert Finlay:* And that he never would. Captain Smith never would. *The*

*Commissioner:* At the same time you know there is a feeling that if there is a person in the position of Mr. Ismay on board, the Captain may think it wise to speak to him on questions of navigation when he would not speak to another person at all. But that is surmise again.

*Sir Robert Finlay:* Mere surmise.

*The Commissioner:* Will you tell us, Mr. Attorney-General, what your view is? *The*

*Attorney-General:* Yes, I think it right I should, so that my friend Sir Robert should know exactly the position I am going to take up. Substantially what your Lordship has said is my view of the evidence. I do not think that there is any evidence that Mr. Ismay interfered. The evidence that we have got all tends the other way. We have his own evidence that he did not interfere in any way, and there is no evidence to contradict it. As the matter stands, it is established that he did not interfere in the navigation. But, as your Lordship has pointed out, and it must be pretty obvious, the showing of the telegram to him was not such an act as would have been performed by the Captain to an ordinary passenger.

*The Commissioner:* Certainly not.

*The Attorney-General:* Whether it was merely to tell him what had happened and the news that he had got, and simply to give him information, is the one view; on the other hand, it is open to surmise that it was shown to Mr. Ismay for him to make any observation upon it if he thought fit. But he certainly did not on the evidence as it stands.

*The Commissioner:* On the evidence he did not.

*The Attorney-General:* I say on the evidence he did not; and upon the evidence as it stands I am not able to take it any further than that. I do intend to submit to the Court that Mr. Ismay cannot be treated as an ordinary passenger. I do not think that the view taken by him at one time - I doubt whether it is persisted in in consequence of

## **Page 863**

some answers - that he was merely an ordinary passenger, could be substantiated. But, my Lord, it takes us no further in the case, and I do not think it assists your Lordship, so far as I know, in answering any of the questions that are put to you, because we still have to get to what happened; and if Mr. Ismay took no part in the directions as to navigation

and offered no advice to the Captain, which is the evidence as we have it before us, I am not able to carry it any further than that.

*The Commissioner:* Then, Sir Robert, I do not think you need trouble yourself to go in detail through Mr. Ismay's evidence; you may strike that out.

*Sir Robert Finlay:* If your Lordship pleases. Then another suggestion was made, I am not sure that it was made by the Attorney-General, but by some of the gentlemen who addressed your Lordship, that Mr. Ismay ought to have said to the Captain, "Go slow."

*The Commissioner:* Well, you may certainly strike that out.

*The Attorney-General:* I certainly never made that suggestion.

*The Commissioner:* That is an absurdity.

*Sir Robert Finlay:* Sometimes it seems he was to blame for interfering, and at others to blame for not interfering. May I recall to your Lordship's memory the evidence there is that Mr. Ismay repeatedly travelled by the boats. He travelled as an ordinary passenger. Of course, it was known to everyone that he occupied a very influential position in the Company, but that did not affect his relations with those in command of the vessel one whit. Your Lordship will recollect that one of the many Captains who have been called in this case said that Mr. Ismay had gone with him repeatedly, and that he never had in the slightest degree occupied, so far as the management of the ship was concerned, any position except that of an ordinary passenger. Of course, that he was Chairman of the Company is a fact that in a sense marked him out from other passengers. My friend the Attorney-General is quite right in saying that in that respect he was not an ordinary passenger, but it did not one whit affect his relations with the navigation of the vessel, and a man of Captain Smith's standing was the last man in the world to have permitted anything of the sort; in fact, nothing could be further from Mr. Ismay's habits, as proved in this case. I therefore, after what your Lordship has said, hope that I may dismiss all the attacks which have been made upon Mr. Ismay in this respect as unfounded, and having really no relation to the facts of the case.

Your Lordship will recollect what I said about the idea that was put forward, not by the Attorney-General, that there was an intention to make a record passage.

*The Commissioner:* You need not dwell upon that. I am satisfied that no record passage was being made.

*The Attorney-General:* That was disproved.

*Sir Robert Finlay:* Yes, and if it were worth going into, your Lordship would find that the White Star Company have never gone in for very great speed. Their speed compared with other vessels built at the same date is rather lower. I have a table here which shows that in detail.

*The Commissioner:* I do not think you need trouble about it.

*Sir Robert Finlay:* Very well, my Lord, that concludes what I have to say with reference to the first head of the case, and I trust I may be very much briefer in the second. I am extremely sorry to have been so long, but your Lordship realises the importance of having the evidence grouped under the different heads, and I have endeavoured to do that as shortly as I could.

*The Commissioner:* Please do not regret it, for what you have said has been the greatest assistance to me, and I know quite well that if you have been long, I have probably been the cause of it.

*Sir Robert Finlay:* The real cause of it is the bulkiness of this record.

*The Attorney-General:* I think really it has assisted because if my friend had not read the evidence which he has I should have had to call your Lordship's attention to a great part of it, which I do not propose to do now because your Lordship has the relevant passages.

*The Commissioner:* We have it on the Note, so that it is like an index book now to me.

*The Attorney-General:* There are some other passages to which I shall call attention, but of course it will only be necessary to direct your mind to a few.

*Sir Robert Finlay:* My Lord, now I pass to the question of the boats and what happened after the collision had taken place. Attacks of several kinds have been suggested, and here I am speaking, not so much of my friend the Attorney-General as of other gentlemen who have appeared in the case for various parties. Attacks of various kinds have been made upon the Company. It has been said that the Company are to blame for not having provided more boats than they did on the "Titanic"; and secondly, that there was a want of discipline and proper training with reference to the use to be made of these boats, and that that resulted in a smaller number of people being taken away than otherwise might have been taken. I propose to deal with these points.

I trust that it is not necessary for me to say very much upon the first point, as to whether more boats ought to have been carried. When a disaster of this kind takes place there is very naturally a public cry as to why there were not boats capable of taking every person on board, and Mr. Scanlan, who dealt particularly with this part of the case, suggested that the Board of Trade were very much to blame, and that the Company were very much to blame for not having had boats adequate to carry every person on board. The truth is that, as regards the question of boats, you must adopt what may be called a reasonable compromise. The whole direction of the energy of shipowners has been towards securing that the ship itself is so thoroughly well built and equipped that there is very little likelihood of loss. At the same time you do not dispense with boats altogether, because the unexpected may happen, and you may want boats for a variety of purposes - communication with other vessels and so on. The result is the Recommendations which the Board of Trade have made and which are embodied in their regulations which have been considered so amply. It is enough for me, I think, to point out that what we carried was very considerably in excess of what was required by the Board of Trade, and very considerably in excess of what we should have been obliged to carry even if the Recommendations of the Advisory Committee had been carried into effect, because there is in those recommendations a provision that where there are watertight compartments a certain reduction may be obtained.

If Mr. Scanlan's point is right, he really blames not only the White Star Line, but he blames the whole world. He begins, of course, with the Board of Trade, and says that we ought to have seen that their requirements were grossly inadequate, and that although we largely exceeded them we did not exceed them sufficiently. Then he involves in the same condemnation all other British shipowners and all foreign shipowners because no shipowner with vessels of this class carries boats up to the capacity of the ship for passengers.

There was immediately after the disaster an extra provision of boats made under circumstances which Mr. Sanderson very frankly explained. He said there was a great public outcry. Of course, a commercial company is dependent upon the public for support, and we endeavoured to meet that cry by putting on board a great number of boats. We began by putting on board boats enough to carry all that the steamer had capacity to carry. We found that was absurd and so inconvenient that we dropped it, and we have been carrying, taking lifeboats and collapsibles together, enough to carry all that were on board on any particular passage. But the question is whether as things stood at the time the "Titanic" went to sea there was anything blameworthy in not providing more boats.

Now, my Lord, may I very shortly - because I do not think I ought very much to elaborate this point - indicate the considerations which go to show

### **Page 864**

that the Company did all that could be required of them, and more than all that could be required of them. The Board of Trade requirements were exceeded. That has been so often pointed out that I need not go through the evidence. The question whether in the future more boats should be carried is, as I think your Lordship has indicated in the course of the case more than once, one of some difficulty. It involves many considerations, and, like many other questions, involves the balancing of considerations more or less conflicting, namely the efficient conduct of the vessel with a certain number of boats on board and the desirability of making, as far as reasonably can be done, provision in the case of disaster. But where the question is of that nature it cannot possibly be charged as negligence against the White Star Company that all that they did was very considerably to exceed the requirements of the Board of Trade. The "Titanic," in fact, had boats for 53 percent, of the persons who were actually carried, and this is in excess of any recommendation that had ever been made to the Board of Trade by any of its advisers. I need not go through the evidence with regard to that; your Lordship is familiar with it.

Then your Lordship has the Departmental Paper No. 249, giving a list of passenger steamships, with the tonnage, the capacity for passengers, and the boat equipment. It is a printed paper.

*The Commissioner:* Yes, I have it.

*Sir Robert Finlay:* One need not go through the whole of it; take a few cases. The "Baltic," I see, is one of them. The number of passengers and crew for which a passenger certificate is granted in the case of the "Baltic" is 2,041 passengers, 370 crew; total, 2,411; the boat equipment would accommodate 1,054 persons. That is one of the White Star Line vessels. That would be 43 percent of the carrying capacity. Then go down a few lines and you come to the "Carmania," one of the Cunard vessels. The carrying capacity by way of passengers and crew of the "Carmania" is 3,520. The boat equipment was for 1,034 persons; that is 29.3 percent. The "Caronia," another of the Cunard vessels, carrying capacity, passengers and crew, 3,483 persons; the persons who could be accommodated in the boats, 1,388.

*The Attorney-General:* Has your Lordship that paper?

*The Commissioner:* Yes.

*The Attorney-General:* It is printed by the Board of Trade.

*The Commissioner:* This was prepared for this case, was it not? *The*

*Attorney-General:* Yes.

*Sir Robert Finlay:* Yes; the heading explains what it is. The "Caronia" had 39 percent of the carrying capacity. Of course the 53 percent I gave in the case of the "Titanic" was of the persons actually carried. The figure for the "Titanic," if you take it, as it is taken in this table, with regard to the carrying capacity of passengers and crew, would be 33 percent, and a fraction. So that while it is 53 percent of the passengers on board, it was 33 percent of the carrying capacity of the "Titanic."

Then the "Carpathia" could carry 2,864 passengers and crew and had boats for 1,072. That is equal to 37 percent of the carrying capacity. Then the "Franconia," a Cunarder, carrying capacity, passengers and crew, 3,145; boat accommodation, 960; that is, 30.8 percent, as against the 33 percent of the "Titanic." Then the "Ivernia" is a little higher; 2,589 passengers and crew carrying capacity; 1,018 persons boat accommodation; that would make it 39 percent. On the "Laconia," another Cunarder, 3,109 passengers and crew could be carried; boat equipment for 960 persons; that would be 30 percent. The "Lusitania," 2,889 carrying capacity passengers and crew; boat accommodation, 978 persons; that is 34 percent - a fraction over the percentage in the case of the "Titanic." The "Mauretania," carrying capacity 2,972; accommodation for 976 persons in the boats; 32.8 percent, which is a fraction less than the accommodation on board the "Titanic" was. I submit that a glance at those instances which I have taken from this table which, as it is expressed in the title, is a list of all passenger steamships of 10,000 tons and upwards for which passenger certificates were granted between the 1st January, 1911, and the 30<sup>th</sup> April, 1912. A glance at this table shows that the blame imputed to the White Star is blame that would be imputed to all other Companies engaged in such traffic.

Then I would invite your Lordship's attention to another table, which appears in the Shorthand Notes at page 538, with regard to two big German vessels; two vessels built by Harland and Wolff for a German company, the "President Lincoln" and the "President Grant." The "President Lincoln" had lifeboats for 1,465 persons. Then, as against the 1,465 persons for whom lifeboat accommodation is provided, the total number of souls on board is 4,108. "Total number of souls on board" means all that could be on board. That works out at 35.5. The "President Grant" had boat accommodation for 1,516 persons; total number of souls on board, 3,991; 37.9 percent.

There is also a table which has been handed in with reference to German vessels headed: "Boat accommodation on German passenger steamers," other than the two, the "President Lincoln" and the "President Grant," which I have given.

*The Commissioner:* Where shall I find that?

*Sir Robert Finlay:* I do not think it is printed in the Notes.

*The Attorney-General:* No, it is a loose table. I commented upon it, and called your Lordship's attention to the accommodation.

*Sir Robert Finlay:* Here is the list giving the percentage. The maximum number of passengers allowed is in the second column, varying from 2,857 in the case of the "Amerika," down to 1,412 in the case of the "Kron Prinzesse Cecilie"; then the crew

carried, and then the total number of persons on board is the sum of those two; that is to say, it is not the persons actually carried, of course - that would vary on every voyage - it is the number that might be carried. Then in the next division, headed "31st March, 1912," you find the percentages. I will take only the percentages without stopping to read the numbers in cubic feet: 74, 65, 55, 48, 74, and 72. *The Commissioner*: All of those are in excess.

*Sir Robert Finlay*: Yes, they are considerably in excess of the "President Lincoln" and the "President Grant," and they are in excess, of course, of English vessels, but they do not, of course, come up to the standard of providing for all that could be carried.

*The Commissioner*: Oh, no.

*Sir Robert Finlay*: And nothing like it.

*The Commissioner*: They vary between 48 and 74 percent.

*Sir Robert Finlay*: I do not desire in the slightest degree to enter into the question of what recommendation should be made, but I think your Lordship has expressed an opinion that there are a great many conflicting considerations that have to be taken into account, and it is a matter requiring the most serious consideration what increase should be made.

Pushing it to its logical conclusion on the lines adopted by Mr. Scanlan it would come to this, that no vessel is to take the sea unless she has got boats adequate to carry every soul on board; and further it would require, as your Lordship pointed out, owing to the difficulty when a disaster occurs of getting everyone into them, that there should be a considerable excess of boats over what would hold that number when tightly packed. After all, business considerations must to some extent govern, because ships will not be sent to sea unless they are properly workable, and perfect safety is really only to be attained by stopping on shore.

Mr. Scanlan said, if I rightly followed him, that shipowners had done their best to realise the vision of the "oarless sea" by reducing the number of boats to a minimum. They have done nothing of the kind. They have acted in excess of the Board of Trade requirements and they are ready to go to

## **Page 865**

any extent in the way of boat accommodation that may be indicated as being right and prudent in view of the various conflicting considerations which have to be taken into account.

A good deal was said by Mr. Scanlan at one part of the case with regard to Mr. Carlisle's evidence as to a submission to the White Star Company of a plan for a great many more lifeboats. That is specifically contradicted by Mr. Ismay on page 446 and by Mr. Sanderson at page 483. I think Mr. Carlisle's evidence with regard to what he says took place at the Committee very much attenuates the importance of anything he said as to what took place elsewhere, because he is most specifically contradicted by Sir Norman Hill, and the contradiction was supported by the shorthand notes to which Sir Norman Hill referred. I, therefore, submit no importance whatever can be attached to Mr. Carlisle's evidence on this point, and that it is ridiculous to make a charge against the

White Star Company for refusing the recommendations which Mr. Carlisle suggests he made, but which in fact, on his own evidence he did not make. It was the question of the davits - how many boats should be under davits and how the davits should be constructed.

My Lord, I pass from that and I proceed to deal with the question of what was done when the disaster had taken place.

The first point that I wish to deal with is the order in which the boats left, because I think your Lordship will find it has a material bearing upon the question of why it was that some boats had considerably less than their full complement while others were filled up. I think the result of an examination of the evidence in this: It shows that the earlier boats, the boats that left earlier, had considerably less than their complement: they had something like on the average 38 persons per boat, while those which left later were packed up. My friend, Mr. Asquith, has prepared a most useful list of the boats in a printed form which has been handed to the Court. There is one correction to be made on that table, and I understand that my friend, Mr. Asquith, has been in communication with Mr. Maurice Hill on the subject, and he agrees in the correction which I proposed. Will your Lordship take the two last pages. The penultimate page gives the order in which the boats were launched on the starboard side. We agree with Mr. Asquith's statement on that point as to the starboard side. The last page gives the order in which the boats were launched on the port side. There is an error there of this kind. I will read the first item in the Table: "No. 14, No. 16 and No. 12 were the first to get away, all about the same time, probably in the order given." That is wrong. These boats all left at about the same time, or at short intervals, but they left after Nos. 6, 8 and 10 had left, and left in the order in which I have given them. So that the first boat to go off was No. 6, the second boat to go off from the port side was No. 8, the third was No. 10, and then, and not till then, Nos. 12, 14 and 16 left with no great interval. No. 12 was fourth, No. 14 fifth, and No. 16 sixth. That is the true order of leaving from the port side. Then the seventh boat was No. 2, the eighth boat was No. 4, and the port collapsible was the ninth.

*The Commissioner:* I have not got those quite right. The first was No. 6, the second No. 8, the third No. 10, the fourth No. 12, the fifth No. 14, and the sixth was No. 16.

*Sir Robert Finlay:* Yes.

*The Commissioner:* Which was the seventh?

*Sir Robert Finlay:* No. 2.

*The Commissioner:* And No. 4 the eighth.

*Sir Robert Finlay:* Yes, and then the port collapsible ninth.

That being the admitted order, as I understand it, in which these boats left, I would ask your Lordship to look as to the orders given for the earlier boats. These orders were in substance - we have not got the orders in every case, but in a great many cases - that they were to stand by, and it was obviously expected that these earlier boats should keep near the ship, or in the case of some of the boats should return to the ship for the purpose of getting more passengers. Your Lordship recollects the evidence as to the order to open the gangway door. That order for some reason appears to have been countermanded, for that gangway door was not opened, and probably for some good reason. I apprehend that the reason for the change of purpose was that there was ground for supposing that the ship might go down rather earlier, and then, of course, the effect would have been

disastrous on any boats that were engaged in taking passengers in at the gangway door. Anyhow, I would ask your Lordship to look at the evidence with regard to the orders that were given to the earlier boats.

Take first the starboard boats and then the port boats. With regard to the order of launching, on the starboard side there was first No. 7. That is shown on the Table which is agreed. If your Lordship will look at the evidence as to the order given by Mr. Murdoch your Lordship will find that it was to stand by the gangway, or to that effect. That is at page 18.

*The Commissioner:* Which boat are you on?

*Sir Robert Finlay:* No. 7, the first on the starboard side. It is in the evidence of Jewell at page 18, Question 131: "You say Mr. Murdoch was giving orders about lowering the boat; did he give orders to launch her down to the water? - (A.) To lower her right down to the water. (Q.) And what were the orders about - what was she to do? - (A.) He told us to stand by the gangway." Those two questions relate to No. 7. Question 102 shows this is No. 7. "(Q.) [132] And what were the orders about - what was she to do? - (A.) He told us to stand by the gangway. (Q.) I do not quite know what you mean by that. What is the gangway you are referring to? - (A.) The doors that open in the ship's side. Just about here (*Pointing to the model.*) - the door is open continually. (Q.) Amidships? - (A.) Yes." It is abaft of amidships, I think.

*The Attorney-General:* Yes, it is.

*Sir Robert Finlay:* "Where the gangway would be if she were in port, I suppose? - (A.) Yes, that is right." That is the gangway by which we all entered into the "Olympic."

*The Commissioner:* Yes.

*Sir Robert Finlay:* Then he points out the spot on the model with some other gangways. Then Question 139: "(Q.) Now where was this gangway you speak of," and then he points. That would be abaft amidships. Then "(Q.) And you were told to remain in the water below that gangway? - (A.) Yes. (*The Solicitor-General.*) Those were your orders. How far off from the ship did you keep? - (A.) We kept right alongside. (Q.) Was the sea smooth? - (A.) Yes, very smooth." So much for No 7.

Then with regard to No. 5, which is the second boat on the starboard side, your Lordship will find the evidence about that - it was given by Mr. Pitman - at page 347, Question 15015: "(Q.) In view of the number that you had got into the boat at this time, did you think that that was as many as this boat would safely carry before she was lowered to the water? - (A.) No, I did not decide how many she should take. (Q.) Who decided that? - (A.) Mr. Murdoch, he came along just then. (Q.) What did he say? - (A.) Well, I jumped out of the boat then, ready to lower away, and he said, "You go in charge in this boat, and also look after the others, and stand by to come along the after gangway when hailed." (Q.) Did you go in charge of this boat? - (A.) I did." Then on page 115, Shiers, who was in the boat, give corroborative evidence on the point. Question 4819 is "Did the officer who told you to lower away No. 5 tell you what to do when you got to the water? - (A.) He did not tell me; he told the other officer." That would be Mr. Pitman. "(Q.) What did he tell him? - (A.) When he got down into the water, to take charge of that line of boats as they came down and stand off at 200 yards." Your Lordship sees that goes to the other boats as well. "(Q.) Stand off the ship 200 yards? - (A.) Yes. (Q.) And Pitman, I think, was your officer that went in the boat? - (A.) Yes."

Then Mr. Lowe speaks of the order on page 368. Will your Lordship look first at page 367, Question 15818? He is stating the boats that he went to.

## Page 866

“(Q.) Did you then go to No. 3? - (A.) I then went to No. 3.” That is one of the boats he went to. Then, over the page, page 368, Questions 15906 to 15912; I think I might almost take 15912 as summarising the matter with regard to the orders given. “(Q.) With reference to these boats that were lowered on your side at which you assisted, did you, after they had been lowered, take any means of communicating with those on board in order to have them filled up through the gangways? - (A.) Yes. I told them to haul off from the ship’s side, but to remain within hail. That is what I told each of them with the exception of the boat that Mr. Pitman went in.” Mr. Pitman got that order.

Then with regard to No. 1, Mr. Murdoch was in charge of that. The order to that was to stand off a little and come back when called. Lowe was also there. No. 1 is the fourth in order from the starboard side according to Mr. Asquith’s Table. Question 11488 on page 257 in Symons’ evidence is: “Do you remember getting an order from Mr. Murdoch to stand off a little way when the boat was lowered? - (A.) Yes, my orders were to pull away from the ship, not too far, and to stand by if I was called back. (Q.) That we have not had from you yet. That is what I wanted. That is quite right. Your Lordship will see the importance of it all. You have it in mind. Question 5011 is what Hendrickson said about this. He was cross-examined about it. That substantially agrees, I think, with what Hendrickson says. I will read you what he says: “We were told to stand off a little way and come back when called.” That is right? - (A.) That is what Mr. Murdoch gave me.” With regard to the other boats on the starboard side, Nos. 9, 11, 13, 15, and the collapsible, there is no evidence of any such order; there is no evidence of any such order at all being given. But with the earlier boats it was obviously contemplated that they should stand by and come to the gangway. Mr. Murdoch was there at the launching of boats Nos. 9, 11, possibly of No. 13, though that is not certain; he was there certainly at No. 15 and at the launching of the collapsible. But there is no actual evidence of the order which Mr. Murdoch gave - as to whether he gave the same order which he had given to the earlier boats or not. Very likely he did not. Then if your Lordship will take the next, the boats on the port side in the corrected order, No. 6 is the first to get away. There is some conflict of evidence about this boat. Hichens says that Mr. Lightoller gave the order to pull for that light (*Pointing to the light on the port bow.*) Mr. Lightoller says that he gave no such order; and it is not very probable that he should have given such an order. At this time he was ordering the boatswain to open the gangway doors. I will just give the references which verify that. Page 44 is Hichens’ evidence. Question 1159 is “When the boat was lowered did you have any order as to what you were to do? - (A.) Yes, sir. (Q.) Who gave it to you? - (A.) Mr. Lightoller, the Second Officer. (Q.) What was the order? - (A.) To pull for that light - to steer for that light. (Q.) What light? - (A.) There was a light about two points on the port bow, about five miles away I should judge.” Mr. Lightoller contradicts that on page 316, and says in answer to Question 13978: “(Q.) Did you or did you not give any directions to these boats which might be taken to mean that they were to row to the light? - (A.) No. (Q.) Were they to go away or were they to stay by the ship? -

(A.) No, I cannot remember giving the boats any directions at all.”

There is also an answer 13891 which perhaps I should refer to which may a little qualify what he said. “(Q.) Did you give any further order to that boat No. 6” - that is the first boat to get away on the port side - “as to what it was to do or where it was to go? - (A.) Not that I remember. I knew there was, if I may mention it, this light on the port bow about two points: I had already been calling many of the passengers’ attention to it, pointing it out to them and saying there was a ship over there, that probably it was a sailing ship as she did not appear to come any closer, and that at daylight, very likely a breeze would spring up and she would come in and pick us up out of the boats, and generally reassuring them by pointing out the light; but whether I told them to pull towards the light, I really could not say. I might have done it and I might not.” Then on the same page, 314, your Lordship will find in answer to Question 13896, and following questions, you have some evidence as to the gangway doors. “(Q.) Did you give any orders with the object of getting more people into it when it was in the water? - (A.) Yes; I see what you are alluding to now, the gangway doors. I had already sent the boatswain and 6 men or told the boatswain to go down below and take some men with him and open the gangway doors with the intention of sending the boats to the gangway doors to be filled up. So with these considerations in mind I certainly should not have sent the boats away. (Q.) That is what I meant. Did you give any order or direction to the man in charge of boat No. 6 that he was to keep near or was to go to the gangway doors? - (A.) Not that I remember. The boats would naturally remain within hail. (Q.) You do not recollect whether you gave any actual order to the man in charge? - (A.) No. (Q.) It is just as well to read this question and answer. This man Poingdestre was asked, “Did Mr. Lightoller give you any orders as to what to do with the boat”; and the answer was, “He gave me orders before the boat was lowered what to do. (Q.) What orders did he give you? - (A.) To lay off and stand by close to the ship? - (A.) Perhaps I did; I daresay. (Q.) Now let us pursue the two things you have mentioned. You say you gave those orders to the boatswain to go down with some men and open the gangway doors? - (A.) Yes. (Q.) Will you point out on the starboard side where they are” - then he explains the doors. Then Question 13905, “Did the boatswain go off after receiving the orders? - (A.) As far as I know he went down.” It was not done; it must have been countermanded. *The Attorney-General*: There is no evidence that it was done.

*Sir Robert Finlay*: There is no evidence of any kind. It certainly was not done. I suggest it was not done for the reason I have mentioned, that they might have been apprehensive of the ship sinking.

*The Attorney-General*: It might be because they were expecting the “*Carpathia*.” They knew she was coming and they did not want them to stray where they might not be picked up.

*Sir Robert Finlay*: And also they may have thought that the light on the port bow belonged to a vessel which would come to them, and that would entirely account for the order which the Captain is said to have given to row for that vessel with that light, put the passengers on board, and come back. That would have been an almost impossible order if that light had been many miles off, but if the Captain assumed that the vessel was coming it was a very natural order.

*The Commissioner:* It is said it would have taken them about two hours to row to that light.

*The Attorney-General:* It was about five miles.

*Sir Robert Finlay:* That would be if the light remained stationary. If, on the other hand, the vessel with that light came towards them, the order becomes perfectly intelligible.

The ship would be there in half an hour.

Then with regard to Number 8 you have the order to which I have referred. It is the second boat on the port side. Crawford, at page 426, Question 17817: "(Q.) And before you left the ship's side did Captain Smith give you any directions with regard to a light? - (A.) Yes, he pointed to a light on the port side, the two masthead lights of a vessel, and told us to pull for there, and land the people and return to the ship. (Q.) Did you see those lights yourself? - (A.) I did. (Q.) And what did you think they were? - (A.) I thought they were a vessel with two masthead lights? (Q.) A steamer's masthead lights? - (A.) Yes." I have made my observation with regard to that, that they thought the vessel was coming. Then with regard to No. 10, there is no evidence of any order. Mr. Wilde was there: he was the Chief Officer. He was there as appears at page

## **Page 867**

141, Question 5999. This is in the evidence of Joughin "(Q.) Why was it that you did not get in. - (A.) Well I was standing waiting for orders by the officer to jump in, and he then ordered two sailors in and a steward - a steward named Burke. I was waiting for orders to get into the boat, but they evidently thought it was full enough and I did not go in it." At the top of page 140 is a reference I ought to have given to your Lordship. (Q.) (5943) "What did you find was the situation then? - (A.) Everything orderly." That is with reference to No. 10 as appears in the immediately preceding question. "The Chief Officer was there. (Q.) Is that Mr. Wilde? - (A.) Yes, Mr. Wilde." Then "(Q.) What was happening; how far had things got? - (A.) They were getting the boat ready for getting the passengers in, and Mr. Wilde shouted out for the stewards to keep the people back, to keep the men back, but there was no necessity for it. The men kept back themselves, and we made a line and passed the ladies and children through. (Q.) Who made the line? - (A.) The stewards mostly - stewards and seamen; they were all together. (Q.) I think I caught you to say that though Mr. Wilde gave the order to keep the men back, there was really no necessity; they kept back themselves? - (A.) Yes. (Q.) Was the order good - the discipline good? - (A.) Splendid."

Then with regard to Number 12. Mr. Lightoller was there. That is at page 82, Questions 2914 and 2962. Question 2914 is, "(Q.) Was there anybody there looking after it? - (A.) Yes. (Q.) Who? - (A.) Mr. Lightoller. (Q.) Is he an officer? - (A.) Second Officer. (Q.) Was there anybody else with him? - (A.) No, only myself." That is Poingdestre speaking. Then Question 2961 is, "Now having lowered her down to the water, did Mr. Lightoller give you any orders as to what to do with the boat? - (A.) He gave me orders before the boat was lowered what to do. (Q.) What orders did he give you? - (A.) To lay off and stand by close to the ship."

So that your Lordship sees that with regard to the starboard boats there is specific evidence in every case of that order to remain at hand. With regard to the boats on the

port side there is that order in some cases; at least in one case it is specifically proved, and in another case there is no evidence of the order at all; we do not know what it was.

With regard to Number 8 the Captain said, "Pull for that light, land the passengers, and return," which comes to very much the same thing. And with regard to Number 6, Mr. Lightoller's evidence at page 314 certainly points to his having expected this boat to remain at hand because he was giving the order at the same time to open the gangway doors, and there are other answers which I have just read which indicate that that is what he meant the boat to do.

With regard to the other boats on the port side, 14, 16, 2, 4, and the collapsible, there is no evidence of an order at all. There may have been or may not have been.

Now, my Lord, my suggestion is this, that there is no ground for the charge put forward that there was want of discipline on the part of the officers and crew. Your Lordship will find that charge formulated at pages 760 and 761 of the Notes.

*The Commissioner:* The evidence of the witnesses is that good order was kept throughout.

*Sir Robert Finlay:* Yes, every witness.

*The Attorney-General:* Not quite as far as that; it is not every witness.

*The Commissioner:* Is there any evidence that there was confusion and disorder? *The*

*Attorney-General:* Yes, there is some. There certainly is some evidence of a rush by second and third class passengers for the boats.

*The Commissioner:* I am not talking about the passengers; I am talking about the crew, the people handling the boats.

*The Attorney-General:* Any evidence of a rush by the crew?

*The Commissioner:* No, any evidence of disorder or want of organisation among the crew. There was a rush of passengers, but I thought the suggestion made by the gentleman in that part of the Court was that by reason of the want of drill these boats had not been handled in an expeditious and orderly way.

*The Attorney-General:* I shall also make that comment, my Lord.

*The Commissioner:* Well, I say that so far as the oral evidence goes there is nothing to support that, if it is to be believed you know. I do not recall anything. *The Attorney-*

*General:* I do not quite understand what your Lordship means. *The Commissioner:* The facts may point to disorder, but the oral evidence, as far as I remember it, always is that good order was kept.

*The Attorney-General:* Yes. There is no statement to the effect that there was disorder, I agree. What I am relying upon is the facts and the explanations of what happened. *Sir*

*Robert Finlay:* I think, my Lord, that I am correct in saying that the only evidence of any misconduct on the part even of passengers was that some two or three foreigners tried to rush into a boat as it was being lowered, and Mr. Lowe, the officer -

*The Commissioner:* Took out a pistol.

*Sir Robert Finlay:* Yes, a revolver, and fired one or two shots into the water by way of showing what any man who tried to transgress the Rules of order might expect.

*The Commissioner:* I remember it.

*Sir Robert Finlay:* And that was quite effective because there was nothing more of the kind.

*The Commissioner:* I am reminded of the cowardly attack that was made upon Phillips when he was busy, but that of course had nothing to do with the boats, and that I think was by a fireman.

*Sir Robert Finlay:* Yes, that incident is quite unexplained.

*The Attorney-General:* The criticism which I shall make upon the discipline and organisation is directed to the preparations that were made before the disaster and actually up to the time of the disaster. Of course it does involve Southampton principally because the time had not arrived apparently for the boat muster as they call it which was to take place. What I propose to say in reference to it is that if there had been better organisation and better preparation for such an event a number of people would have been saved in the boats who were lost. That is the criticism I am going to make. I am certainly not going to say that there was anything in the nature of a panic, or the kind of disorder amongst the crew which would have fostered or promoted panic. Quite the contrary. The submission which I shall make to the Court upon the evidence is that the crew, speaking generally, behaved extremely well on the deck.

*The Commissioner:* I am very glad to hear you say that because I think so too. *The Attorney-General:* And so far from there being any panic in the circumstances order was maintained to an extraordinary degree. That is the view I have formed from reading the evidence, and I would add also that with one or two solitary exceptions the passengers seem to have behaved with extraordinary calmness, not to say heroism. I do not think myself that the evidence, except as to these one or two isolated cases which are said to relate to foreigners, would bear any criticism which would reflect either upon the passengers or the crew in that emergency, in which they suddenly found themselves. The kind of argument which I shall address to the Court is more with a view to the future, and also some criticism on the actual state of preparations in the "Titanic," not for the purpose of throwing blame upon them, because I can quite see that there are many circumstances to be taken into account; nor do I think that throwing blame on them in this particular matter would affect the Court's judgment. What I do want to say is that if greater care had been taken before the ship started that all the crew should know what particular boat they had to go to, and what part they were to play, and also with regard to manning the boats, there would have been a different state of things. I agree there are some balancing considerations to be set against that, but I am only indicating it for the purpose of showing my friend the

## **Page 868**

nature of the criticism which I am going to make upon it. But apart from that my view is that discipline was very well maintained.

*Sir Robert Finlay:* I am much obliged to my friend, the Attorney-General, for what he has indicated as to the line he is going to take. I have listened with very great pleasure to what he said with regard to the behaviour of the officers and crew, and of the passengers. I must say, speaking for myself, it rather raised my ideas of human nature to find that such extraordinary order and such extraordinary courage prevailed among such a large body of people brought together in the miscellaneous fashion as the passengers on a

vessel of this kind must be. There is one expression that occurs to my memory of how the passengers stood keeping back - the passengers stood at attention, I think one of the A.B.'s said, against the side of the saloon waiting for their turn.

May I refer to one other little incident which struck my mind at the time? One boat was putting off with two vacant places and two men got in. At the last moment two women came running up and those men at once got out and made room for the women, and themselves went down with the ship.

I was going to refer to the way Mr. Scanlan put it. I shall deal with the case substantially with reference to what the Attorney-General has said but it is right. I should also call attention to what was said by Mr. Scanlan. Your Lordship says to him at page 760: "*(The Commissioner.)* Is it your contention that if there had been more lifeboats on board this vessel more lives would have been saved, although the lifeboats that were there were not used more than to the extent of two-thirds of their capacity? *(Mr. Scanlan.)* I do say, my Lord, that if there had been discipline - *(The Commissioner.)* Yes, that may be. *(Mr. Scanlan.)* And if there had been a training of the officers and crews in the manning and handling and navigation of the lifeboats, it would have been possible to have launched and lowered lifeboats sufficient to have rescued everyone on that ship. We are all glad to think that there was nothing in the nature of a panic on the "Titanic," but I think it would be blinding one's eyes to the real facts of the case if one were to accept the view that discipline, in any proper sense of the term, was observed after the accident in the filling and sending off of these boats. *(The Commissioner.)* Now I think what you must say you will probably agree with me - is that the facts speak for themselves, and that the evidence of the witnesses, who nearly all say that there was no panic and plenty of discipline, cannot be accepted in face of the facts."

*The Commissioner:* That is what I meant in speaking a minute or two ago. *Sir Robert Finlay:* "*(Mr. Scanlan.)* That is my contention, my Lord. Of course, you might have panic in one sense if there had been a rush of the passengers past the officers to get into the boats; and the witnesses from the crew, and from amongst the officers, are quite justified probably in saying that there was no panic whatever in that sense, and that discipline was maintained in that way, and that the officers were respected by the members of the crew and by the passengers. But in the sense of the officers and the members of the crew realising the duty thrown upon them and the work they had to do in the circumstances of the disaster, I think I am justified in saying in that broad sense that there was a lamentable want of knowledge and want of discipline amongst the officers. *(The Commissioner.)* I want to follow you, and I want to have it clear. All the boats, except possibly one collapsible boat, were launched? *(Mr. Scanlan.)* Yes. *(The Commissioner.)* Let us leave out the one collapsible boat. And they were launched well before the ship foundered? *(Mr. Scanlan.)* Yes, my Lord. *(The Commissioner.)* So that, discipline or no discipline, the boats were got into the water? *(Mr. Scanlan.)* Yes, my Lord. *(The Commissioner.)* All of them, except the one collapsible. *(Mr. Scanlan.)* Yes. *(The Commissioner.)* The only fault, therefore, which was of any consequence, if it was a fault, was that they did not get the people into the boats? *(Mr. Scanlan.)* That is it, my Lord. *(The Commissioner.)* They managed, discipline or no discipline, to get all the boats into the water. *(Mr. Scanlan.)* Yes. *(The Commissioner.)* I leave out the one collapsible boat. What they did not do, for some reason, was to get the people into the boats. *(Mr.*

*Scanlan.*) Yes, my Lord. (*The Commissioner.*) Now, have you thought about that? (*Mr. Scanlan.*) I have, my Lord. I have given a good deal of consideration to the suggestion that people would not go into the boats, and I daresay that at the beginning that was true; but I do think if, when the terrible seriousness of what had happened was recognised by those in charge of the ship, they had told the people plainly that the ship was doomed, and was sinking, and would sink in a very short time, I think there would have been no indisposition to get into the boats.”

With regard to that last suggestion, I submit that Mr. Scanlan in making it did not realise what the probable effects of a communication of that kind would have been. Every step, as we know from the evidence, and as I shall show your Lordship in detail if necessary, was taken to get the passengers together on deck. But to raise a cry of *sauve qui peut* and say the ship was sinking with the women and children on board, besides the vast number of men on board, however well they behaved when they knew there was danger, if a cry of that kind had been started, there almost certainly would have been a rush for the boats, and the very object of those who wanted such information to be communicated to the passengers would have been defeated. I think the officers acted wisely and well in not adopting any such alarmist policy.

*The Commissioner:* In the case of a fire at a theatre, if a man came on the stage and shouted “The theatre is on fire, get out,” I should think that would be about the best way to kill every person in the place.

*Sir Robert Finlay:* The danger at a fire, and the danger at a shipwreck is very much, if an alarm is started, the rush. More people are killed by the crowding to get out at a fire than by the fire in very many cases; and on board ship, if there is a rush for the boats, the object of those who wish to save life is defeated.

Then, my Lord, with regard to not getting more people into the boats, not filling every boat to its full capacity, I submit with regard to the earlier boats that is abundantly accounted for by the fact that the intention was that they should stand by and fill up, coming to the gangway, and in the exercise of their discretion, the best of their judgment, the officers had those boats lowered - it was the earlier boats which had the smaller complement - intending and expecting that they would be able to come back and fill up from the vessel.

With regard to the later boats they were filled up and they carried their full complement, I think, in almost every case.

*The Attorney-General:* Not every case.

*Sir Robert Finlay:* I will not say every case, but I think speaking roughly it is true. I think the deficiency in the filling up of the boats related broadly speaking to the earlier boats.

Now why was it, my Lord, that there was a difficulty in getting the people to come? The women would not; they would not leave their husbands. Many of them could not realise that the vessel was going to sink. That was the second reason. When you are on board a vessel like the “Titanic” you feel that it is like the globe on which we stand. The globe, I suppose, will go to pieces some day, but one does not very much realise it, and when you are on board a vessel like the “Titanic” you have a sense of safety; and these people, to borrow an expression of one of the witnesses, said among themselves: “We do not like to trust ourselves in these little cockleshells; we prefer to stick by the ship.”

*The Commissioner:* Rather than drop down 90 feet.

*Sir Robert Finlay:* Yes, it is an appalling prospect, and it quite accounts for the reluctance to go. I do not think that in the criticism suggested - I am not now speaking of the Attorney-General at all;

**Page 869**

I will deal with what he said about the propriety in future of having training beforehand - but in the criticism suggested by Mr. Scanlan, I do not think sufficient allowance is made for the extraordinary difficulty of the situation. Indiscipline among officers and crew there was none; the passengers themselves behaved splendidly, and one has to look about for another reason altogether for there not being more going off in the first boats. It is simply the reason that I have stated, that the people were most reluctant, particularly the women, to go; and that it was contemplated that these first boats should return to the ship - should stand off, should come to the gangway and should fill up.

*The Attorney-General:* Before my friend passes from the boats I think there is some criticism to be directed - I propose to address some observations to your Lordship upon it - as to the time taken in uncovering and launching these boats. I only wanted my friend to understand that I was going to say something about it so that he might deal with it, if he thought proper.

*Sir Robert Finlay:* I will not forget that. I am obliged to my friend. I think that the result, speaking generally, of the evidence is that the earlier boats must have had rather under 38 persons in each on an average; the later boats were filled up. The loading was superintended on the starboard side by Mr. Murdoch, the First Officer, and Mr. Lowe the Fifth Officer, at Nos. 7, 5, 3 and 1, and by Mr. Moody, the Sixth Officer at No. 9; on the port side Mr. Wilde, the Chief Officer, Mr. Lightoller, the Second Officer, Mr. Moody at No. 16 and by Mr. Lowe at No. 14. That is as far as we can trace. It is not possible to be perfectly accurate about it, but that is as far as we can trace it.

Something was said about the officers thinking that the boat was full enough - not when she should be water borne, but full enough for the purpose of transport through the air.

*The Commissioner:* From the davits?

*Sir Robert Finlay:* Yes. That, of course, raises a question of some nicety. As your Lordship said, it is a most nervous operation, being lowered down from that height. The boats were new, in perfect condition; the davits and the falls were everything that could be desired. No attack has been made upon them, or could be made. But at the same time the officer might, in addition to what was in his mind about the propriety of the boat standing by and returning, think it was just as well not to fill up too full while the boat was being lowered down. It is a very ticklish situation.

With regard to the later boats they did it; but it is a very ticklish situation lowering a boat for seventy feet through the air. If anything went wrong you might have a catastrophe of the most hideous kind; and if a panic seized the women in the boat and there was a rush from one side to the other you might have the boat turned over. I say it is perfectly impossible, with any reason, to censure officers who under those circumstances decided that the earlier boats should go away with, on the average, rather under 38 persons in each boat. Later, more passengers had come up ready to go into the boats, and the officers took the risk of filling up the boats and lowering them. The idea of opening the

gangway had had to be abandoned; and there was nothing for it but to fill up the boats, and it says a very great deal, not only for the tackle and equipment, but for the manner in which the operation was carried out, that all these boats with these full complements of passengers in the later boats, were lowered without any accident whatever. I submit that it reflects very great credit upon the training and discipline of the men who were working, and upon the way in which they were directed by their officers. I put it to the Court, and your Lordship has the highest assistance on this point, that it was an operation carried out in a manner that reflected very great credit upon all who were concerned in it, officers and men alike.

Now, my Lord, I propose to show your Lordship the steps that were taken, as soon as the collision occurred, in the way of warning passengers, and that everything was done to get them up on deck. A good deal was said at one period of the case about the impossibility of third class passengers getting up to the boat deck. I think that has all disappeared. It is one of those points upon which an inspection of the sister ship, the "Olympic," was of the greatest possible advantage. There was no difficulty about their getting up, and I am now going to show your Lordship what steps were taken by the stewards for the purpose of marshalling these people up. I forget who it was suggested in the course of one of the speeches to which the Court has listened that the stewards ought to have dragged the women up. I think your Lordship said that that would have been a very alarming spectacle. It may be suitable at a public meeting under certain circumstances, but it certainly would have been very undesirable in this case, and it might have led really to disastrous results. It is not a practical or businesslike proposal. Now I propose to follow, taking it as shortly as possible, the sequence of events after the collision. The first thing that was done was naturally to close the watertight doors. I need not refer to the evidence about the watertight doors which were operated from the bridge, being closed by pulling over the lever and then touching the spring. That is clearly established. That was done at once. That applies to the lower watertight doors. Then as regards the watertight doors in the alleyways, they are closed. May I just refer very shortly to the evidence that shows that. At page 147 there is the evidence with regard to E deck, Question 6335. This is in the evidence of Joughin: "(Q.) The only other thing is this. You say you saw men coming to close watertight doors; that is to say, those doors do not shut automatically? - (A.) That is right. (Q.) Was that on E deck? - (A.) Yes, immediately outside my room. (Q.) Watertight doors? - (A.) Yes. (Q.) On E deck? - (A.) Yes. (Q.) Was one aft of your room? - (A.) Immediately forward. (Q.) Immediately forward of your room? - (A.) Yes. (Q.) Then was it that watertight door, which you see on the plan is in the alleyway, which is in front of your room? - (A.) I am not sure, but I think it is No. 23 door." I need not follow that further. Then on page 231, Question 10338, Pearcey, who was a pantryman on the "Titanic," is asked this question: "What was it that first indicated to you that there had been a collision with the iceberg? - (A.) There was just a small motion, but nothing to speak of. (Q.) What happened immediately after this motion? - (A.) The order was, "All watertight doors to be closed." (Q.) Are you referring to the watertight doors of this F deck? - (A.) Yes. (Q.) Were they closed? - (A.) Yes. (Q.) Did you help to close them? - (A.) Yes. (Q.) Did several other men help with you? - (A.) Yes. (Q.) Where did you close them? - (A.) I closed them on towards aft. I closed the pantry doors of my pantry on the starboard and port sides," and so on. Then on page 236, in the evidence of Brown,

Question 10669, he is examined by myself: “(Q.) Only one question. Did you hear an order given in the alleyway about the watertight doors? - (A.) That was the first order I heard after I was woke by the shock. (Q.) Just tell us what you heard? - (A.) Who gave it I do not know, but I heard an order in the alleyway outside our quarters to close all watertight doors. (Q.) There are watertight doors in the alleyway? - (A.) Yes, lower down, further aft than our quarters are. (Q.) And you heard that order given? - (A.) Yes. Then on the same page Question 10691: “(Q.) What did you do next? - (A.) The first order I heard was from the Second Steward to close all watertight doors on F deck. (Q.) To close the watertight doors on F deck? - (A.) That was the first order I heard given. (Q.) How long after the accident was it you heard that order? - (A.) A matter of about a quarter of an hour. (Q.) And did you go to F deck to obey that order? - (A.) No. The Third class Chief Steward was sent for, for his men to do that order. (Q.) Was that Mr. Kieran? - (A.) Yes. (Q.) Did you see the Captain about this time? - (A.) No. I saw the Captain a matter of about 20 minutes after that.” Then comes the order about the passengers going upstairs.

## **Page 870**

There are only two other questions on this point. They are in the evidence of Joseph Thomas Wheat on page 240, Question 10922. “(Q.) Then what did you do? Where did you go? - (A.) I went upstairs to E deck again and went down to F deck to close the bulkhead doors on F deck by the Turkish baths. There are two bulkhead doors there. (Q.) And did you close those? - (A.) Yes. (Q.) Did you do that alone, or did somebody help you? - (A.) I closed the inside one myself and then to close the other we had to go on top and turn that one with a key.” Then Question 10937 on the next page: “(Q.) Could you give us some idea, how long after that was should you say, that you closed those watertight doors by the Turkish baths? - (A.) I do not suppose it would be more than five or six minutes. (Q.) Then you were a few minutes down looking at the water? - (A.) Yes.”

Then, of course, the nature of the damage had to be ascertained. Mr. Boxhall speaks to that on pages 355 and 356. I do not propose to follow this in detail, but if your Lordship would look at page 355 and the following page, your Lordship will see that, beginning with Question 15358, he gives a description of what was done looking for the damage. It is a longish description and I am not going to occupy time by reading it. It runs over to page 356 down to Question 15377.

Then the carpenter, on the same page, 355, Question 15368, is referred to: “(Q.) Did the Captain then tell you to find the carpenter? - (A.) Yes, I think we stayed on the bridge just for a moment or two, probably a couple of minutes, and then he told me to find the carpenter and tell him to sound the ship forward. (Q.) Did you find the carpenter? - (A.) I met the carpenter, I think it would be on the ladder leading from the bridge down to A deck, and he wanted to know where the Captain was? I told him he was on the bridge. (Q.) Did the carpenter tell you anything about there being water? - (A.) Yes, he did; he said the ship was making water fast, and he passed it on to the bridge.” Then the Witness

continued on with the intention of finding out what the nature of the damage was and where the water was visible.

Then Mr. Andrews followed by the Captain goes to the engine room (your Lordship will find that on page 89) to see what had happened there. And then the Captain and the purser and Mr. Andrews all go to the main room. That is described three times, I think, on pages 89, 90 and 299. I am not going to stop to read it in detail. Mr. Andrews at that time thought (page 422), as the boatswain told Hemming, that the ship had half an hour to live. According to Mr. Boxhall at page 361, Question 15610, it was one to one and a half hours. That is what the Captain told Mr. Boxhall.

Now I propose to take up the very important subject of the instructions given about getting the deckhands up to the boat deck and getting the passengers up there.

*(Adjourned to tomorrow, at 10.30 o'clock.)*

WRECK COMMISSIONER'S COURT,  
SCOTTISH HALL,  
BUCKINGHAM GATE,  
*Friday, 28th June, 1912.*

PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

LOSS OF THE S. S. "TITANIC."

**THIRTY-THIRD DAY.**

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. w. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

## Page 872

*Sir Robert Finlay:* My Lord, I was dealing with what happened after the disaster in the way of preparing for launching and filling the boats. I do not propose to go through the evidence in detail with regard to the various steps taken by the boatswain in getting the deckhands ready and getting them on deck. All that is really a matter not in dispute. Then with regard to the uncovering of the boats, having the falls made ready and having them swung out under the superintendence of the officers, there is a great body of evidence; but that again speaks for itself and I do not think it is necessary to go through it again. If desired I can give the references, but I really think it is almost common ground. I hope that I am not putting forward any contentious proposition when I say that that part of the work was excellently done. While this was going on, the stewards had orders to attend to the passengers and to get them on deck. The stewards did that work, then went to the passengers and warned them to come on deck, got them up on deck, and any delay that there was was due to the reluctance of some passengers, particularly of the women, to come up and afterwards to get into the boats. That is a point of some importance and I propose to offer to the Court some references to the evidence on that point because it really is the great cause of the boats going off in the first instance not filled up to their full complement. The discipline, so far as the officers and crew were concerned, was perfect. Any difficulty was in getting the women to realise that they must come up, that they must leave the ship and trust themselves to the boats under the circumstances. Now before giving a few references - I have picked out with great care, with the assistance of my learned friend, the most important only - may I read what was said by Captain Rostron of the result of his conversation with the survivors which summarises the situation very fairly. It is on page 716, Question 25563, and the three following questions. Your Lordship says: - "It is said by, at all events, one of the witnesses that one reason why the lifeboats did not carry more than they in fact carried, was that all the people in the lifeboats were wearing lifebelts, and you cannot stow them so closely as you could stow people without lifebelts. I suppose there is some truth in it? - (A.) There is some truth in that. (Q.) You saw the passengers that you landed at New York, and must have conversed a good deal with them? - (A.) No. (Q.) Did you not? - (A.) No, I did not speak to half-a-dozen passengers the whole time. (Q.) Did you hear no explanation at all as to why these boats were not better filled? - (A.) No. The only explanation I got was when

the boats first left the 'Titanic' the people really would not be put in the boats; they did not want to go in, and I understand that some of the boats that left first had fewer people in. That is all I know about it. (Q.) That is what I wanted to know. You heard that explanation given yourself? - (A.) Yes."

Although Captain Rostron speaks of that as not being very much, it really summarises the whole situation. They would not go in, they did not want to go, and the result was that the boats that left first had fewer than their full complement. And then, of course, there was also the intention of having them filled up from the gangway doors, an intention which afterwards had to be abandoned.

Now, by way of merely illustrating a little that general proposition which results from Captain Rostron's conversation with the passengers, may I invite your Lordship's attention to what was said by Lucas at page 50 and the following pages? I will pick out a few questions and answers there. Question 1478 is: "Was any order given about filling up? - (A.) Yes, but there was not anybody there handy, no women. I was singing out for women myself. (Q.) Had you received the order that women were to be put in the boats? - (A.) Yes. (Q.) Whom did you receive that from? - (A.) Moody, the Sixth Officer." That, I think, relates to boat No. 16, which, as a matter of fact, was somewhat later. Then Question 1501: "How many boats did you see filled? How many boats did you take notice of as they were being filled? - (A.) About nine. (Q.) Could you see whether they were all filled to the full capacity? - (A.) They were not all filled. (Q.) Why was that? - (A.) Because there were no women knocking about."

Then on page 51, Question 1730: "But of the eight which you saw leaving, is it true that they were incompletely filled? - (A.) Some had more passengers in than others. (Q.) How many more do you think could have been accommodated in these? - (A.) In some of them they could have taken another 15 or 20. (*The Commissioner.*) Now, what I want to know is this: Why were they not filled up? - (A.) There were not any females on the deck to put in the boats? - (Q.) Or if they were they would not go? - (A.) Some would go in and some would not; they wanted to stay behind with their husbands."

My Lord, the deficiency was not in drill on the part of the officers and crew. All their work was admirably done with regard to the boats. If any drill were wanted, it was drill of the passengers, but it is clear you cannot have a rehearsal of a shipwreck from day to day while a liner is going across the Atlantic. Nervous people would find it very trying, and it is one of those things -

*The Commissioner:* I never heard it suggested yet that there was to be a shipwreck rehearsal on board a steamer.

*Sir Robert Finlay:* But it is what it really comes to, my Lord. I was dealing with the suggestion that there was a want of proper training. In the result, I say, the work could not have been done better than it was done by the officers and crew, and any training of the passengers for an emergency of this kind is, of course, out of the question.

*The Commissioner:* There was not in my present view of the matter proper drill of these men at any time. Whether that contributed to the loss of life I do not know, but I do not think the drill at Southampton was a drill which was of any real use.

*Sir Robert Finlay:* That is the drill when the Board of Trade inspection takes place? *The Commissioner:* Yes, when they lowered the boats. There were six men employed about it.

*Sir Robert Finlay:* I appreciate entirely what your Lordship says in regard to that.

*The Commissioner:* I draw a distinction between a drill and a muster.

*Sir Robert Finlay:* Of course a great deal more might be done if the service were more continuous from voyage to voyage with vessels of this kind, and certainly the White Star Company, and I believe other companies as well, are most anxious to encourage as far as possible the permanence of employment.

*The Commissioner:* I think there is a great deal of force in that. It would be a very desirable thing to continue the employment of these men. Whether it is under the provisions of the Merchant Shipping Act or whether it is merely practice I do not know, but it appears to be the case that when these ships arrive in port, the men are all paid off, and they do not sign on again until the eve of another voyage.

*Sir Robert Finlay:* The White Star Company, as your Lordship has heard, have been very anxious indeed to secure continuity of employment more than it has existed. It has existed to a very great extent because I think some 60 or 70 percent of the men on board the "Titanic" had been in one of the White Star Company's vessels before. I certainly feel very strongly that the increase of such continuity of employment is evidently desirable and the more you can have the same men serving under the same officers in the same boat the better it is for all concerned. But the men do not always look at it in that way. It is very difficult to get them to stop, and it is a result that can be achieved really, as I hope it will be achieved to a great extent by the cooperation of the companies and of the unions of

### **Page 873**

the men. It is a most desirable object. One can see in how many ways it would conduce to the greater excellence of the navigation of such liners; and the White Star Company have spared no effort so far as they are concerned to achieve it. I think that all the A.B.'s with regard to whom we have any evidence had been in the service of the White Star Company before and stopped on. I think I am right in saying some 60 or 70 percent of the crew. I think it was Mr. Sanderson who said that and gave the figure. With regard to the absence of the drill, of course, if there were this greater continuity that as well as other good results would follow. But so far as the actual doing of the work is concerned, no bad results ensued after this collision from any defect or any insufficiency in the amount of drill given. The lowering of the boats could not have been better done, and the fact that not more passengers were put in them was due, not to any fault, not to any want of drill on the part of the officers and crew; it was due to the reluctance of the passengers, particularly the women, first to come on deck, and secondly, to get into the boats. I think that the evidence justifies that observation, and I would ask your Lordship to look further on this point at what was said by Johnson at page 90, Question 3429: "Were there plenty of people on the boat deck? - (A.) Yes, plenty, but they would not go into our boat." Then on the next page, Question 3458, "Was there any call for women and children at that boat? - (A.) All the women and children that were there could have got in. We could have put more in; in fact, we had not a full complement. (Q.) Can you tell us at all what classes were represented? - (A.) I could not. (Q.) When all the women that wanted to go in were in was the boat lowered? - (A.) No, it was put down perhaps 3 or 4 feet. They were told

to go down to A deck to see if anybody else wanted to come in. There was nobody came down to A deck. It stopped opposite A deck.” Then Question 3470 on the same page, “Was she full, in your judgment? - (A.) She would not be full, but she would have been full in a heavy sea. She was not full according to how we were.” That is, in the state of the sea. “(Q.) Was anybody that wanted to get on that boat kept back? - (A.) Not at all, certainly not.”

Then on page 95 the same witness, at Question 3583 is asked: “Just one question. Have you any notion as to which class the majority of passengers in your boat belonged? - (A.) I think they belonged mostly to the third or second. I could not recognise them when I saw them in the first class, and I should have known them if there were any prominent people. (Q.) Most of them were in the boat when you came along? - (A.) No. (Q.) You put them in? - (A.) No. Mr. Ismay tried to walk round and get a lot of women to come to our boat. He took them across to the starboard side then - our boat was standing - I stood by my boat a good ten minutes or a quarter of an hour. (Q.) At that time did the women display a disinclination to enter the boat? - (A.) Yes.” Then the same witness, at Question 3634, on page 96, is asked by Mr. Cotter: “Did any bugle go that night? - (A.) No. (Q.) If a bugle had gone, the men would have gone to their boat stations. I take it? - (A.) Some of them would have gone, and some would not, because they never thought about looking to their boat stations. (Q.) Not the stewards’ department? - (A.) Some of them did not. (Q.) I am asking for your opinion. Supposing they had done so, was not there time to turn the spare men out of the boat, and say, ‘Go down and show the women, second and third class, and also the first class, up here’? - (A.) If you had got them up - but you could not drive the women. (Q.) How do you know that? - (A.) Because I tried it. (Q.) Where did you try? - (A.) For our boat. (Q.) I mean down in the third class, in the rooms; that is what we want to get at - if the stewards had been told to go down and bring them up? - (A.) They were told, but they did not think she would go down, and they were laughing when the passengers were carrying their baggage about. (Q.) Your contention is that they were told, and that the women would not come up on deck? - (A.) I am certain of it. (Q.) How are you certain of it. It is a very serious answer you are giving now? - (A.) Well, I am certain by our boys” - that means the stewards, I think - “because some of our boys would have been saved if they had come to the boat stations. (Q.) You have had conversations since? - (A.) I have never spoken to the boys. (Q.) How do you know? - (A.) Because I know all the old ones were lost. (Q.) That is not the point. You make a statement that a man was there and that the women would not come up, and then you said, ‘some of our boys have been saved’? - (A.) I did not say they were saved; I said all the best of the boys went down. (Q.) How do you know the women and children would not come up? - (A.) Well, I could tell by the bedroom stewards. I saw them, driving, and I saw Mr. Ismay try to drive a few, and he had a pair of slippers on and his dust coat, and he was trying to get the women, and they would not go in for him into our boat. (Q.) That was on the boat deck. I am talking about down below - the third class quarters? - (A.) I was not down there, and I could not tell you. (*The Commissioner.*) This witness was not down below in the third class quarters. (*Mr. Cotter.*) He states there was a steward sent down there, and he also states that the women would not come up. (*The Commissioner.*) I suppose he only says that because he only saw some women come up. Some certainly did

come up and got into his boat. (*Mr. Cotter.*) You are not sure what was going on down below? - (A.) No.”

Then, on page 100, Dillon gives two answers bearing on this question, at Question 3838, “Can you point out what was the situation on the ship of the boat that you saw leave, the last boat? - (A.) No. (*The Commissioner.*) It was on the port side, I understand. The boat that you saw leave, the last boat, was on the port side? - (A.) They sung out it was the last boat. (Q.) Whichever it was, was it on the port side of the “Titanic”? - (A.) Yes, my Lord. (Q.) And was it in the forward part or aft? - (A.) I do not know, my Lord. (Q.) Were you on the after well deck when you saw it? - (A.) Yes, my Lord, I heard an order - the last boat was leaving the ship - ‘Any more women there?’ and we chased them up the ladder. (Q.) After that boat left did you see a number of passengers standing about still? - (A.) Yes. (Q.) Any women? - (A.) No (Q.) I did not quite hear the answer you gave just now. You said something about chasing women up the ladder? - (A.) There were two women on the well deck when we got up from below, and we heard the order - the last boat was leaving the ship - ‘Are there any more women there?’ and we chased them up the ladder. (Q.) Up to the boat deck? - (A.) Yes, I suppose they went up there. (Q.) And those were the women you saw there on the well deck? - (A.) Two women.” Then he went up himself on the boat deck and describes what took place.

On page 140, Joughin, at Question 5951, is asked, “Now tell us about No. 10, in order. What happened? - (A.) It was swung out; the stewards, firemen, and sailors all got in a line. We passed the ladies and children through. (Q.) Into No. 10? - (A.) Into No. 10. Then we got it about half-full, and then we had difficulty in finding ladies for it. They ran away from the boat, and said they were safer where they were. (Q.) You heard ladies saying that? - (A.) I am sure of that. (*The Commissioner.*) When the boat was half-full we had difficulty in finding more ladies? - (A.) Right, Sir. (Q.) ‘They ran away, saying they were safer where they were’? - (A.) Yes. (*The Solicitor-General.*) Up to this time, could you tell me, had you seen any third class passengers - women from the third class? - (A.) Yes, Sir, plenty. (Q.) So far as you saw, was any distinction made between the different classes - first class ladies or second class ladies or third class ladies? - (A.) None at all. (Q.) Of course, at ordinary times this boat deck is a first class deck, a promenade, is it not? - (A.) Yes. (Q.) And the third class people would not get on to it? - (A.) It

## **Page 874**

is railed off just from the boats, and the saloon passengers use it as a sunning deck. (Q.) But at this time were there any barriers up? - (A.) No.” The barriers were all taken down. Then the same witness, at Question 5981: “(Q.) Now, just let us go back to boat No. 10 and finish it. You said that when it was about half-full with women you could not find more women to pass along the line and put into the boat? - (A.) We had difficulty in finding them. (Q.) What was done; what happened? - (A.) I myself and three or four other chaps went on the next deck and forcibly brought up women and children. (Q.) You went down to the A deck? - (A.) Yes, to the A deck. (Q.) And you mean you brought them up to the boat deck? - (A.) Brought them up to the boat deck - there are only about ten stairs to go up. (Q.) Did not they want to go? - (A.) No, sir. They were all sitting - squatting down on the deck. (Q.) And you and three or four others brought them up? - (A.) Yes.

(Q.) Did you put them into the boat? - (A.) We threw them in. The boat was standing off about a yard and a half from the ship's side, with a slight list. We could not put them in; we could either hand them in or just drop them in."

Then Hart is a witness who gives some evidence of some importance beginning at page 222, Question 9882: "Can you tell us so far as your third class passengers are concerned, did you go to each third class compartment and rouse up your people? - (A.) I went to each third class room and roused them. (*The Commissioner.*) Were most of them up, or were they asleep? - (A.) The majority were up. They had been aroused before I got there. (*The Solicitor-General.*) They are not single cabins, these third class compartments, are they; not single berths? - (A.) They consisted of four-berthrooms and two-berthrooms, and two six-berthrooms. (Q.) And what did you do about the lifebelts? - (A.) I saw the lifebelts placed on them that were willing to have them put on them. (*The Commissioner.*) Some would not put them on? - (A.) Some refused to put them on. (*The Solicitor-General.*) Did they say why? - (A.) Yes, they said they saw no occasion for putting them on; they did not believe the ship was hurt in any way."

Then at page 223, Question 9915, and onwards: "(Q.) You would have colleagues, other third class stewards, of course; do you know whether they were doing what you were doing - that is, getting the people up? - (A.) All the men that had rooms were. (Q.) All the third class stewards who had got rooms? - (A.) The third class stewards do not all have rooms. The third class stewards that had rooms went round to their respective sections and were doing the same as I was doing. (*The Commissioner.*) You mean those who had charge of rooms? - (A.) Yes. (Q.) You mean to say they roused the passengers and tried to get them to put on lifebelts? - (A.) Yes. (*The Solicitor-General.*) How many third class stewards would there be who would have charge of rooms in the afterend of the ship? - (A.) Eight. (Q.) As far as you know, they were each engaged in doing this? - (A.) Yes. (Q.) Now, just tell us about the next thing? - (A.) I was standing by waiting for further instructions. After some little while the word came down, 'Pass your women up on the boat deck.' This was done. (Q.) That means the third class? - (A.) Yes, the third class. (Q.) Anything about children? - (A.) Yes. 'Pass the women and children.' (Q.) 'Pass the women and children up to the boat deck'? - (A.) Yes, those that were willing to go to the boat deck were shown the way. Some were not willing to go to the boat deck, and stayed behind. Some of them went to the boat deck, and found it rather cold, and saw the boats being lowered away, and thought themselves more secure on the ship, and consequently returned to their cabin. (Q.) You say they thought themselves more secure on the ship. Did you hear any of them say so? - (A.) Yes, I heard two or three say they preferred to remain on the ship than be tossed about on the water like a cockle-shell." The same witness, on page 225, Question 10045, is asked, "Then it comes to this, that as far as you can tell us, it was either first or second class people who were in that boat before you got there. Then your people got in and some more people got in from A deck, and those people, you think, were third class people? - (A.) Yes. (Q.) When you left the third class part of the ship the second time, the last time, were there still some third class passengers down there? - (A.) Yes, there were some that would not come to the deck. (Q.) They would not come? - (A.) They would not leave their apartments. (Q.) Of course, by that time you at any rate had realised that this was a very serious accident? - (A.) Yes, but they would not be convinced. (Q.) Did you do your best to convince them? - (A.) Everybody did their

best. (Q.) Did you hear other people trying to persuade them? - (A.) Yes. (Q.) On this second journey of yours, the last journey, did you see other stewards, or not, engaged in getting people? - (A.) Yes, I met several on the deck, directing them the way to the boat deck. There was one man at the foot of the companion leading from the sleeping accommodation to the after well deck; there was one man at the end of the companion leading from the well deck to the E deck, and there were others along the saloon and second cabin deck, showing them the way to the boat deck. So that there was no difficulty for anybody who wanted to get to the boats to find their way there. (Q.) There is a third class interpreter is there not? - (A.) Yes. (Q.) Did you see him about? - (A.) Yes. (Q.) Some of your third class passengers are foreigners? - (A.) Yes. (Q.) What was he doing? - (A.) He was trying to keep some of the foreigners quiet.”

At Question 10076, at the bottom of the same page, the Solicitor-General says this: “Lord Mersey has just pointed out that you told us, on the boat deck where the boat left there were some women and their husbands. How was it they did not get into the boats? - (A.) Because the cry was for the women and children, and the boat at that time was practically full of women and children, and these women would not leave their husbands. (Q.) That is what I wanted, that was the impression you got, was it? - (A.) Yes. (Q.) Did you hear any of them say so on the boat deck? - (A.) Yes. (Q.) You did? - (A.) Yes. (Q.) You have told us that you were one of a number of some 60 third class stewards? - (A.) Yes.” Then he is asked how many were saved.

Hart’s evidence ranges over the greater part of the boats because his first lot of passengers was taken to No. 8, the second on the port side to leave. This second lot was taken to No. 15, which was the last lifeboat to leave on the starboard side. So that his evidence covers a very wide range.

The last witness I am going to cite on this point, by way of supplementing Captain Rostron’s general statement and the effect of what he heard, is Mr. Lowe, one of the officers at page 369. Mr. Harbinson is examining (Question 15931): “Did it take half an hour to launch these boats? - (A.) I do not know. It was not the launching of the boats that took the time. We got the whole boat out and in the water in less than 10 minutes. It was getting the people together that took the time. (Q.) Did you hear any orders given to the people brought up to the boat deck? - (A.) Yes, I forget now who I heard, but I heard the order given, anyhow: ‘Everybody on the boat deck.’ (Q.) Do you think there were sufficient seamen on board the “Titanic” adequately to carry out the operation of launching the boats? - (A.) Certainly, they did so. (Q.) Did they do it? - (A.) Yes. (Q.) Did they take what you consider a normal time or an abnormal time to do it? - (A.) It depends upon what you mean by an ‘abnormal time,’ less time or more time? (Q.) Do you think it would have been done quicker if there had been more men? - (A.) No. The thing was done as I do not suppose any other ship could do it. (Q.) In the same time? - (A.) No ship could have done it in better

## **Page 875**

time, and better in all respects - in every respect.” All the evidence is the same way, and, therefore, I do not propose further to elaborate this point.

I therefore submit that all the work that the officers and crew had to do was excellently done, and could not have been done better. I quite agree that more frequent boat drills than have been usual on any vessel of this type may be desirable, but the absence of such boat drill had nothing to do with any of the loss of life that took place on this occasion. The boat drills might have come in as being of importance if the sea had been rough, and you wanted to have a full complement of A.B.'s on board the boat in order to keep her in safety in a rough sea. But that was not the condition, and my submission is that, however desirable it may be that in the future there should be more frequent boat drills, which, of course, is closely connected with that continuity of service of which your Lordship was speaking just now, however desirable that may be, the absence of such drill had nothing to do with the loss of life which took place on this occasion.

With regard to the boat lists, your Lordship will recollect how it was proved by Mr. Sanderson that all the boat lists were stuck up - each department had them posted. I am speaking now of the information given to the men. On page 496, Question 19716, Mr. Sanderson was asked: "Now, with regard to another matter as to the boat drill. Are these the lists which you have - three of them, I think; one for the sailing department, one for the engine department, and one for the victualling department - the stewards, I suppose, with reference to the boats? - (A.) Those are what are put up in the different departments. (Q.) These are documents? - (A.) Yes, they are." Those documents were handed to the Witness and your Lordship has them. "(Q.) Perhaps you will keep them for one moment. In addition to those, is there the general boat list? - (A.) There is a general boat list subdivided into these. (Q.) Are these put up or framed, or stuck up anywhere? - (A.) They are put up in the different departments. I am not sure where the general one goes; I think it goes in the chart room. These go in the departments. (Q.) Are those emergency lists in addition (*handing same to Witness.*)? - (A.) Yes, there are. *That* is an emergency boat list. (*The Commissioner.*) I see on this list that an officer is assigned to each boat, and then there are spaces for the names of four other men. That is so, is it not? - (A.) I think in practice they would have to put more names in than that, my Lord. The term 'Officer,' I think, is used for the purpose of a man who would go in command of the boat. It does not necessarily mean that he would be a ship's officer. He might be a petty officer. (Q.) It begins 'Commander, Chief Officer, First Officer, Second Officer, Carpenters, Boatswains, Quartermaster,' and so on; and then a space is left for four additional names, and they are bracketed together and described as 'Seamen.' What does that mean? - (A.) I suppose, technically, that every man who goes to sea is a seaman. They would distinguish between the sailors and the firemen. (Q.) It does not necessarily mean a deckhand? - (A.) I do not think so. (*Mr. Roche.*) The next page talks about the firemen. (*The AttorneyGeneral.*) There is a special one for the firemen. (*Sir Robert Finlay.*) There are three departments. The first is the sailing department; the second the engineers' department; and the third is the victualling department. (*The Commissioner.*) I beg pardon, Sir Robert. That is quite so. So that there are a great many more than five men allocated to each boat.

(*The Witness.*) I should think in the case of the 'Titanic' that there must have been between 30 and 40 to each boat."

Then Question 19724: "With regard to the question of boat drill and getting firemen to take part in it, had you moved in that matter long before the loss of the 'Titanic'? - (A.)

We have always attempted to do it. (Q.) Of how old standing are the difficulties about getting firemen to take part in the boat drill? - (A.) I think our real difficulties have only been of recent years - in the last two years. I do not recall that we had any real difficulty before that. (Q.) Since this disaster you have been continuing your efforts to ensure proper drill? - (A.) We have increased them. (Q.) Can you tell us what is being done now? - (A.) Yes, we have asked the Board of Trade to make their inspection a more thorough one in so far as, instead of turning out two boats, to turn out a good many. We have turned out as many as 13 or 14, and we have had a large number of those boats manned and sent out, rowing some distance and back again. As I say, the stewards and deckhands have done that work. They do not seem to have had much success with the firemen." And then he reads a longish telegram which shows what they were doing and endeavouring to do.

Now, my Lord, it is very unfortunate that there should be this feeling amongst the firemen against taking part in a boat drill. It is a feeling which I hope will be overcome, and I trust the leaders of the men will co-operate with the Company in removing the feeling against taking part in the boat drill. One can quite understand a fireman saying, "My work is down below; what have I to do with the boats?" At the same time, in case of emergency, it may be very important that they should have had an adequate training as to boat drill, and they used to get it. It is only within the last two or three years, as Mr. Sanderson says, that the difficulty has emerged; and I trust that those who have influence with the men will assist in getting it removed, and that in the future there will be that more complete drill which your Lordship said was to be desired.

I am not going through the evidence as to the crew's knowledge of their boat stations; every step had been taken to apprise them and the majority of the witnesses called knew their boats perfectly well. Some had not looked, and if they did not know what their boat was, it certainly was not the fault of the Company, for every pains had been taken to post up the notices in every department. I think every A.B. and every steward who was called did know their boat - every one who was asked about it.

There was one point to which your Lordship called attention while the case was going on, and that is that the numbers given by the witnesses of those who were in the boats do not agree with the actual numbers; they are too large. That is a thing that one would almost expect to occur. The estimate of the number is not very accurate. Witnesses, unconsciously and quite innocently, have a tendency rather to exaggerate the number, and the result is that when you come to sum them all up you find the total is an impossible total.

*The Attorney-General:* The more significant fact, if I may interpose for a moment, with regard to that, is that the proportions of the men and crew and women saved differ so materially. It is difficult to get at the exact figure, of course. The point that strikes me with regard to it is that whereas we know 711 was the total number saved, of which it is said 642, perhaps 645, were women and children, 71 were male passengers and 123 were male crew; in fact, it turns out that there were 189 male crew, 126 male passengers, and only 388 women saved instead of 642. That is the striking feature of it. According to the evidence, I agree with my friend there would naturally be some exaggeration or possibly some exaggeration of numbers, but it is certainly rather remarkable that in every case, so far as I can see from the evidence, the number of women and children given as saved in

the boats is in excess of the fact; the number of the crew given is less than that saved, and the number of male passengers given is less than were in fact saved. That is the point. *Sir Robert Finlay*: Of course, there were a good many picked up from the water. They would be, of course, men.

**Page 876**

*The Commissioner*: Not very many, about 35.

*The Attorney-General*: Not more.

*Sir Robert Finlay*: I do not know exactly how many, but still all that were picked up from the water I think were men, I am told, except one, but I did not know there was even one exception.

I think I have now concluded my review of the evidence. On the whole, I respectfully submit to the Court that the true conclusion is this: The White Star Company is a company which until this disaster happened had a splendid record. They carried millions of passengers, and there had been only a loss of two lives during 11 years. Then comes this crushing disaster, which, of course, strikes the imagination of everyone. It is due to the emergence of new conditions in the North Atlantic and to very special circumstances to which I have called the attention of the Court in detail.

I submit that the result of the examination of the evidence as a whole is that that disaster was not due to any want of care or diligence on the part of those in control of the ship; that it was an accident which was not occasioned by any negligence or any want of due care on the part of the Captain or his officers, or anyone else on board. It was not due to any want of care with regard to the equipment of the ship. The ship was a splendid vessel and had been built regardless of expense, the commission given being to have the ship made in the best possible way, charging cost plus a percentage for the work of the builders. So that no pains and no money had been spared to make the ship as perfect as, humanly, a ship could be. And that result was achieved.

But, of course, owing to an extraordinary concatenation of circumstances it has proved, when some exceptional natural conditions arise, how vain are the efforts of human skill and science against the forces of nature. But for what happened, I submit, there is no fault whatever on the part of the Company, or those for whom they are responsible.

With regard to what happened after the collision I submit that not a life was lost owing to any fault on the part of the Company, or those for whom they are responsible. A good deal was said about the boats not putting back when the poor people who remained on the ship were in the water. I think your Lordship will realise, and I am sure that the Assessors will be able to inform your Lordship on that point, that for a boat to put into a crowd of drowning people is absolutely fatal, the only result would be that the boat would be swamped, and those in it would be added to the number of victims. The only way in which some work of saving life could be done on such an occasion was that which was taken by Mr. Lowe, the officer who was called before your Lordship. He waited, an operation of the most painful character, requiring great nerve and great coolness, he waited until the sea had done its work with the great majority of people, and then put back and picked up a few of the survivors. But to suggest, as some questions which were put suggested, that there was inhumanity in not pushing into that crowd of drowning

people in the hope of saving them, is, I submit, a course based upon ignorance of the fundamental conditions that attend on the endeavour to save people who are struggling in the water when, if you push your boat among them, the only result will be that those in the boat are added to the roll of victims.

On the whole, my Lord, I submit that the discipline on board the ship was perfect. The Company, of course, are not concerned with the passengers' behaviour. But the passengers behaved, taking them, as a whole, most admirably, and this tremendous catastrophe is one of those things that must happen every now and then, and do happen without any fault on the part of those concerned.

I respectfully ask the Court that the White Star Company and their officers should be acquitted of all blame in connection with this appalling calamity.

*The Attorney-General:* I was calling the attention of my friend to another wireless message, to which I shall direct attention when I come to address you, which has not yet formed the subject of discussion. It has been mentioned. In virtue of what your Lordship said at an earlier stage, it has not been thought necessary to go into it in detail. I think, in consequence of my friend's observations yesterday, it is of some importance now - the one I am referring to - I have called my friend's attention to it, so that, if he desires to say anything, it may be said. It is the message from the "Norrdam." *The Commissioner:* Will you remind me what it was?

*The Attorney-General:* "Congratulations on new command. Had moderate Westerly winds, fair weather, no fog, large ice reported in latitude 42 deg. 24 min. to 42 deg. 45 min., and longitude 49 deg. 50 min. to 50 deg. 20 min." That is acknowledged by the Captain on page 5 of the telegrams received and sent.

*The Commissioner:* What is the date?

*The Attorney-General:* It is the 14th.

*The Commissioner:* What time?

*The Attorney-General:* Sent at 2.31, but any question as to the date is, I think, satisfactorily solved by seeing that the answer is received from the "Titanic" 3.29 p.m.

*The Commissioner:* That is the "Titanic's" time.

*The Attorney-General:* That is the "Titanic's" time.

*The Commissioner:* And whereabouts on the chart does that telegram indicate it?

*The Attorney-General:* It is to the Northward of the "Caronia" indication. Has your Lordship the chart that I handed up of the Marconi Company? It is the enlarged North Atlantic chart. Will your Lordship look at mine. (*Handing same.*)

*The Commissioner:* How many miles to the North of the spot of the "Titanic" disaster is this ice indicated.

*Sir Robert Finlay:* It is a good many miles North, my Lord; I am having it taken out exactly.

*The Commissioner:* Then I want to know whether it is E. or W.?

*Sir Robert Finlay:* I think, my Lord, it will be found - I am having it measured exactly - to be 38 miles -

*The Attorney-General:* That is what I make it.

*Sir Robert Finlay:* The most Southerly point, to the North of the scene of the disaster.

This was reported on the afternoon of the Sunday, so that it could not possibly have got -  
*The Commissioner:* Is it this, that one may say that deductions ought to have been drawn from the telegram.

*The Attorney-General:* That is the point.

*The Commissioner:* But it cannot be said that the actual ice recorded was of any significance.

*Sir Robert Finlay:* No.

*The Commissioner:* It may be said against Captain Smith that it was a warning that he was within reach of the ice, and therefore he ought to have known, but as far as the particular ice itself goes it is quite without the reach of the "Titanic." *Sir Robert Finlay:* Nothing has hitherto been said about it.

*The Commissioner:* I have always supposed that that telegram was immaterial.

*Sir Robert Finlay:* I so treated it, my Lord.

*The Attorney-General:* Of course, that is my objection. That is why I am calling attention to it. I do not think it is immaterial by reason of what was said yesterday. At any rate, my object in calling attention to it is that I am going to found some observations upon it, and call your Lordship's attention to the fact that there were telegrams, and that there was this telegram showing ice to the Northward.

*The Commissioner:* Everyone knew there was ice to the Northward.

*The Attorney-General:* Yes, but I mean that he had had an ice report. I have already indicated the point that I am going to submit with regard to those responsible for the navigation, that, having

## **Page 877**

got four telegrams of ice reports, it was not sufficient, even if the Captain was justified in coming to the conclusion that the ice was to the Southward of him after he had turned the corner.

*The Commissioner:* At present, Mr. Attorney, I do not see that the "Norddam's" telegram carries it much further, because there was the "Baltic," the "Caronia," and the "Californian," all indicating ice to the North and much nearer than the "Norddam." *The*

*Attorney-General:* Yes. I quite agree, my Lord, that is why, at an earlier stage, when your Lordship said you did not think it was worth dwelling upon the "Norddam." I agreed, and the only reason I want it in now is because I am going to found some observations upon it, which I have indicated to my friend.

*The Commissioner:* The telegram is in evidence.

*The Attorney-General:* Yes, but I do not want it to be passed over, because originally we had said that three were the only ones that were material. I agree entirely when your Lordship said it has not anything like the direct materiality, but I think it has some.

*Sir Robert Finlay:* I will say a word upon it as my friend has called attention to it. Your Lordship will see that the "Norddam" ice is to the North of the normal limit marked on the chart for field ice between March and July.

*The Attorney-General:* Yes.

*The Commissioner:* Yes.

*Sir Robert Finlay:* And sensibly to the North of that limit. That ice cannot possibly have been the ice which caused the disaster.

*The Commissioner:* Oh, no; that is not suggested. What is suggested is that it was another warning of ice.

*The Attorney-General:* Yes, that is the point.

*The Commissioner:* And it goes on, as it were, accumulating with the others.

*The Attorney-General:* Yes.

*Sir Robert Finlay:* The reply that I make to that suggestion that my friend, the Attorney-General, has called my attention to, is this; that the intimations that they had of ice which might be dangerous to them were the "Californian," the "Baltic," and the "Caronia." I have submitted that Captain Smith took a reasonable course with regard to that. I am not going to repeat that.

*The Commissioner:* And a fortiori he did with regard to the other?

*Sir Robert Finlay:* The "Norddam" was absolutely negligible. So far from impugning Captain Smith's judgment in the matter, I submit that it rather confirms it, because, having taken reasonable steps with regard to the "Caronia," the "Baltic," and the "Californian" ice, he is entitled to say to himself, "All the ice that I have warnings of are these three and the 'Norddam,' which is utterly beyond my range," and the fact that there is no warning of anything between the "Norddam" and the "Caronia" which might complicate the situation is -

*The Commissioner:* I think I appreciate what you say upon that. Have you finished?

*Sir Robert Finlay:* Yes.

*The Commissioner:* Thank you very much for your assistance. It has been of great use to me - very great use.

*Sir Robert Finlay:* I feel any assistance I have been able to render is almost entirely due to my friends, Mr. Laing, Mr. Maurice Hill and Mr. Raeburn, who have been good enough to help me.

*The Commissioner:* I know their industry from experience.

*Sir Robert Finlay:* And their ability.

*The Commissioner:* Now, Mr. Attorney, I am thinking about how we are to go on with this work. I know you are engaged in many things, and some of them are engagements that cannot be neglected. I have some reason to believe that you must be away on Tuesday.

*The Attorney-General:* Yes.

*The Commissioner:* And possibly for further days.

*The Attorney-General:* Yes, my Lord, quite so.

*The Commissioner:* It is very undesirable that this case should be adjourned at all.

*The Attorney-General:* Quite.

*The Commissioner:* I remember what you said a few days ago, that you proposed to wait until the end of all the speeches before you addressed the Court. If that course is pursued it may land us in the difficulty of having to adjourn for a considerable period. *The*

*Attorney-General:* I have been considering it, and I am much obliged to your Lordship for the suggestion. I do not think there is any danger of it. Your Lordship now has to hear my friend, Mr. Laing, who I know will be very short, and then there is only Mr. Dunlop,

and I shall certainly be able to compress my observations within the limits of tomorrow and Monday, if your Lordship will sit tomorrow.

*The Commissioner:* Yes, certainly I will.

*Mr. Laing:* I do not wish to add anything to the words of Sir Robert Finlay on the description of this vessel, as built for her owners, the White Star Line. I only want to deal with a few technical matters that have been raised in this case by the cross-examination of Mr. Edwards, and to answer a question which your Lordship put to me a day or two ago.

The design of this vessel was that she was to be built and so spaced as to float with any two compartments open to the sea. That was the design that the builders had before them and it is the highest standard of any shipbuilding firm, certainly in this country, and also in Germany, as the evidence shows. The two other great vessels which one naturally thinks of in this connection, the "Lusitania" and the "Mauretania," are built on the same plan, too. Mr. Peskett, when he was in the box, said she was designed and built to float with two compartments open to the sea, and he thought that she could float with three. So with the "Titanic" - Mr. Wilding has proved that she undoubtedly could have floated with any two compartments open to the sea, and that on his flooding plans she certainly would have floated with three, provided they were forward ones, as they were in this case. Not only could she float, on her design, so flooded, but so flooded she would float with the tops of her bulkheads above the waterline by double the amount of the margin required by the Board of Trade. I think their margin is something like 18 inches and she would float from 2 feet 6 inches, I think, is the figure, to 3 feet. So she very fully complied certainly with the design which the builders set themselves to carry out when they started to build this vessel.

I should have been almost content to read one answer from Mr. Carruthers as to the supervision by the Board of Trade of the building of this vessel and the assurance from Mr. Carruthers that she in fact fulfilled every requirement and regulation of the Board of Trade. He says so in specific terms and I should have been content to leave it there had it not been for the points suggested over and over again by Mr. Edwards and repeated in his speech to your Lordship on the close of this case. On that account I feel that I must touch, by simply giving your Lordship the references on the several points which he raised and which were answered in the evidence which was given.

The first point that he raised was that there was no testing of the bulkheads, no actual testing by water test of the bulkheads, of this vessel, with the exception of the forepeak, and, I think, the tanks, while the vessel was under construction. The answer to that was given that it never is done, and that neither Lloyd's nor the Board of Trade require any testing by water pressure of bulkheads, and that the practice is not to do so. I will not trouble to read the evidence, but I will give your Lordship the reference, because your Lordship might like to have it. It is page 525, Questions 20597 to 20600.

*The Commissioner:* I am told it is done in the Navy.

*Mr. Laing:* Yes. I was dealing entirely with the Merchant Service. I know it was said it was done in the Navy.

The next point Mr. Edwards made was this. His cross-examination was directed to show that the bulkhead plating of this vessel was insufficient in strength according to Lloyd's Standard, and your Lordship remembers that putting the questions to Mr. Wilding, Mr. Edwards reached a conclusion which he did not expect, that instead of demonstrating that they were short of Lloyd's requirements, he demonstrated that they exceeded Lloyd's requirements.

*The Commissioner:* I think Mr. Edwards was a little confused with the arithmetic. *Mr. Laing:* My Lord, I think he was. At all events he escaped with great agility from the situation. But the fact remains that what he did establish was that the bulkhead plating was in excess of Lloyd's requirements, and not below them; and the passage in the evidence which refers to that is at page 528, Question 20661. Again, a point which he made and which he also escaped from, was that the stiffeners in this vessel were not sufficiently spaced or properly spaced according to the requirements of Lloyd's Rules. There, again, he demonstrated in the course of his cross-examination, that, so far from being short of the requirements, they exceeded the requirements; and the passage which refers to that is at page 527, Question 20640.

My Lord, in fact, it was proved on these two heads that the ship, as built, was 50 percent over the requirements of Lloyd's, and in excess of the Board of Trade requirements, and the passages which show that are page 539, Questions 20907-8. The next point that Mr. Edwards made was this. He suggested not once, but certainly more than once, that the bulkhead between No. 5 and 6 boiler sections broke down and gave way, and more than once during the course of this Enquiry the evidence as to that has been summarised and the conclusion arrived at was that it had not broken down. But Mr. Edwards reiterated the charge in his address to your Lordship, and my submission upon it is that there is absolutely no evidence at all that the bulkhead broke down, but that the evidence is the other way, that it did not break down. The evidence about it is all summarised on page 527, where the matter was gone into at some little length, and also at page 673.

*The Commissioner:* Will you give me the numbers?

*Mr. Laing:* I do not think there are any numbers; it is a discussion I think below 26625. It starts after that and the matter is threshed out again.

*The Commissioner:* It starts on page 526, does it?

*Mr. Laing:* Yes, my Lord.

*The Commissioner:* How far does it extend?

*Mr. Laing:* It extends right up to page 527, Question 26629.

*The Commissioner:* And there it stops, does it?

*Mr. Laing:* And there it stops. It breaks out again at page 673.

*The Commissioner:* It is a sort of intermittent fever apparently.

*Mr. Laing:* It frequently crops up, my Lord. On page 673 it commences at Question 23974 and goes down to 23975.

*The Commissioner:* Mr. Edwards says, "I think there is some evidence. (*The Commissioner.*) Well, will you tell me what it is? (*Mr. Clement Edwards.*) There is the evidence of Barrett, my Lord. (*The Commissioner.*) What is that, that he saw some water coming in. (*Mr. Clement Edwards.*) No, the evidence of Barrett is this, that in Section 6 he saw water coming in, and in Section 5 he saw it trickling in, and that afterwards, when

he skipped up out of Section 5, he did it because there was a great rush of water as if something had given way.”

*Mr. Laing:* The result of the evidence, which I think I can summarise quite shortly, was that Barrett saw that the plating of this vessel was fractured abaft the bulkhead which separated No. 5 from No. 6, and that some water trickling, or variously described, ran into an empty bunker which adjoined this fracture; thereupon Barrett lowered the door of the bunker, which was not a watertight door, and the water then accumulated in the bunker until it forced the light plating of the bunker door, and came in with what was described as a rush. On the rush Barrett escaped up a ladder. That is how it stood, and I am quite satisfied that your Lordship came to the conclusion, at least so it appears from the various discussions we have had, that the bulkhead did not in fact carry away, but that the bunker door carried away, and so it came in with a rush.

Mr. Edwards' next point was a more serious one, because he in terms said that Messrs. Harland and Wolff had either defied the Board of Trade, and had refused to carry out their regulations, or that the Board of Trade, in face of Messrs. Harland and Wolff had given way and had refused to carry out their own regulations or had been persuaded not to carry out their own regulations. The point which Mr. Edwards raises on this is of a very elaborate character, and it is very difficult to disentangle; but it all turns upon the correspondence which he so often referred to between Messrs. Harland and Wolff and the Board of Trade Surveyors, and between the Board of Trade Surveyors and their Department in London.

The two points so far as I follow it which evolve from this correspondence, according to Mr. Edwards, are these. The first one is that the intermediate bulkheads in the “Titanic” were all carried up a deck too low, that instead of stopping at E deck they ought to have gone up to D deck. That is his first point. His second point was that, as he described it, the watertighting of the fore part of the ship had not been done according to the requirements which the Board of Trade themselves had put forward. Now, I think on the correspondence Mr. Edwards discovered a mare's nest of exceptional dimensions, because there is absolutely nothing in it which supports the two charges which he makes; in fact, it disposes of them. In order to arrive at the height to which the bulkheads ought to be carried. You have, first of all, to arrive at what the freeboard of this vessel is according to her deep-load draught. Mr. Edwards was perfectly right in this: If the freeboard assigned to this vessel does not exceed the requirements of Table C of the Regulations, the whole of those bulkheads ought to have been carried up to D deck. I accept that without any qualification. The whole question is whether they did equal or exceed the regulations of Table C. Mr. Edwards says they did not, and I submit with some confidence that they undoubtedly did. And if they did then these bulkheads were rightly carried up to E and not to D, that is the point.

The point emerges in this way. Mr. Edwards has given us some figures - where he got them from I do not know - but in his argument he gives us the following figures: He says Table C requires a freeboard of 11 feet 1 inch for this vessel, that she had in fact a freeboard assigned to her of 10 feet 11 1/2 inches, and that she was therefore 1 1/2 inches short of the requirements of Table C. But the true figures are that Table C requires a freeboard of 10 feet 11 1/2 inches.

*The Commissioner:* Will you show me that?

*Mr. Laing:* Yes, my Lord; I will show it you as far as I can, because these figures were never put in cross-examination at all. This matter has been evolved at a very late period. 10 feet 11 1/2 inches is what Table C requires.

*The Commissioner:* No witness was examined on this subject at all.

*Mr. Pringle:* May I explain, on behalf of Mr. Edwards, that this correspondence was only produced when the Board of Trade Surveyor was in the box, and it was only possible to cross-examine after that.

*The Commissioner:* I am quite aware of that; it was either a great point, or, as Mr. Laing says, a mare's nest, which you discovered at the last moment.

*Mr. Pringle:* Mr. Laing says he has a difficulty in discovering where the figures were got. The figures are in the correspondence.

*Mr. Laing:* I will show your Lordship the correspondence.

*The Commissioner:* The first thing I want to find out is where the freeboard which this vessel ought to have had is indicated in Table C.

## **Page 879**

*Mr. Laing:* I will show your Lordship the figures. They have never been given in evidence, but the actual measurements exist, and I have no doubt the Board of Trade have them. In fact, we have had them supplied. If I may just complete, just to show the fallacy of this argument, Table C requires a freeboard of 10 feet 11 1/2 inches.

*The Commissioner:* Where do you get that from?

*Mr. Laing:* I will show you the figures; it is a most elaborate calculation. The actual freeboard assigned to this vessel was 11 feet 2 1/2 inches; therefore, instead of being 1 1/2 inches short of the requirements of Table C, she is 3 inches in excess of the requirements of Table C.

*The Commissioner:* According to you, she was better instead of worse.

*Mr. Laing:* Certainly; and the result is, if she is 3 inches better than Table C, then undoubtedly these decks were rightly taken up to E, and not to D, and the whole thing comes to an end.

*Mr. Pringle:* It may save a little time if I say a word or two.

*The Commissioner:* I will tell you why I think you may not at present. Mr. Laing is putting something to me at present which I do not understand, and if you get up to explain it I am afraid you will make me understand it less. You may interrupt afterwards, after Mr. Laing has made me understand what he is saying.

*Mr. Laing:* My point is that on the figures - and I will show you how they are arrived at - this ship was 3 inches in excess of the requirements of Table C, and I think Mr. Edwards would agree, if he were here, that if that were so these bulkheads were properly carried up to E and not to D.

*The Commissioner:* I am not sure about that. Perhaps he ought to agree, but I am not at all sure that he would.

*Mr. Laing:* So far as the evidence goes, if your Lordship will look at page 672, Question 23945, Mr. Carruthers says that in fact this vessel was 3 inches in excess of the requirements of Table C.

*The Commissioner:* Is that where he says, "I think the margin was 3 inches; at all events it was almost 3 inches"?

*Mr. Laing:* Yes, it is Question 23945.

*The Commissioner:* "And when it is placed as low as is required by Table C of the freeboard tables for awning deck vessels the remaining bulkheads may terminate at the deck next below the upper deck." Is that what you are referring to?

*Mr. Laing:* Yes, that is E deck; that is where they did in fact terminate. Now, keeping away from the figures for a moment, because they are terribly complicated, there is evidence to show that in the opinion of Mr. Carruthers, the gentleman in charge of these operations, the vessel did in fact exceed the requirements of Table C by 3 inches. Let me see if I can carry that a little further. The load draught at that freeboard is 34 feet 7 inches. That is at page 499, Question 19796. That is for the deep water loadline. That shows her load draught is 34 feet 7. That is one of the factors in this complicated calculation. Before I go again to the figures, in order to satisfy your Lordship on the evidence, Mr. Archer said that he was satisfied that these bulkheads were carried to the required height, and he, of course, had the whole problem before him and all the figures. He said that at page 692, Question 24433. Perhaps I had better read that question, because it covers the whole ground: "Were you yourself satisfied when the question of the bulkheads was referred to you, that Messrs. Harland and Wolff in the building of the 'Titanic' were taking the bulkheads to as high a deck as you thought was required by your regulations in Circular 1401? - (A.) Yes. (Q.) You were satisfied? - (A.) Yes. (Q.) Mr. Carruthers was not satisfied? - (A.) I do not understand that at all." That is quite a misleading question, because Mr. Carruthers was perfectly satisfied.

*The Commissioner:* The Attorney-General adds: "No, I did not understand that." *Mr. Laing:* I have given your Lordship the reference to Mr. Carruthers, that all the Rules and Regulations were fully satisfied, so that must be some error.

Then Mr. Archer, at page 693, Questions 24511 to 24513, said that the "Titanic," when she left, fully complied with all the Regulations and Rules of the Board of Trade, and, as far as he knew, with Lloyd's Rules too.

The root error of Mr. Edwards' calculation, I think is - it is difficult quite to put one's hand on it - that he has taken the moulded depth of the "Titanic" as 45 feet, whereas in truth and in fact it was 45 feet 1 1/2 inches, and it looks uncommonly like one of his 1 1/2 inches. The reason why I think my friend has gone wrong in his calculation is this. I will show your Lordship a series of figures which were submitted for the purpose of obtaining a freeboard, the approximate figures arrived at by calculation before the ship was finished. When the ship was in fact finished, and the actual calculations were applied to the actual measurements of the ship, the differences, which were worked out to a few inches - this 1 1/2 inches is one of them - resulted in the figure which I have given you, and I think Mr. Edwards must have based his calculation on the assumed figures and not upon the actual figures at all.

Now, if I may turn to these which refer to the correspondence - there are two volumes of it - one is called "Collision Bulkhead," which I daresay your Lordship has - *The Commissioner:* Yes.

*Mr. Laing:* On page 2 of that document you will find a very complicated calculation which I think Mr. Edwards has taken as a basis for his own calculation. Your Lordship will see that they are assumed figures and work out at a result different from the result arrived at on the actual measurements of the vessel which I believe the Board of Trade have.

Now, if I may refer to some at all events of the figures which differ to a small extent. It is headed, "The Olympic," there being a note on page 1 of this volume to this effect, "The steamship 'Titanic' and the steamship 'Olympic' were sister ships, and the points raised in connection with the construction of the latter applied equally to the 'Titanic.'" On page 2 Mr. Archer is sending a letter to the assistant-secretary of the Marine Department, and he is giving a series of calculations for the purpose of arriving at the upper deck of this vessel, and he starts by saying, "Draught 34 feet 9 inches." The loadline of this vessel was 34 feet 7 inches, so there is a variation at once. The freeboard to upper deck is given as 10 feet 9 inches, making 45 feet 6 inches. Then the moulded depth is taken as 45 feet, whereas in truth and in fact the moulded depth was 45 feet 1 1/2 inches, which again would, I should imagine, disturb this calculation.

*The Commissioner:* This letter was written long before the vessel was completed.

*Mr. Laing:* This is on the 30th April, 1910.

*The Commissioner:* And she was not completed until 1912.

*Mr. Laing:* No, and I am told - of course, no evidence has really been directed upon this point, because it has not been raised - that when you make these calculations on assumed or designed measurements, they are very apt to, and do, vary from the actual measurements taken of the ship when completed - by small figures, but they do vary, and vary sufficiently to upset this very nice calculation. My friend, Mr. Edwards, calculating with all the errors which I am pointing out on these figures, has only made a difference of 1.06, I think he said.

*The Commissioner:* That is right.

*Mr. Laing:* 1.06 inches.

*The Commissioner:* He said 1.06 was quite sufficient to bring it over the line. *Mr.*

*Laing:* Yes, that is what his point is, that she was 1 inch or something below the requirements of Table C.

*The Commissioner:* And therefore the deck ought to have gone up?

*Mr. Laing:* Yes. It is all very well for Mr. Edwards to say so, calculating the best he can, but when your Lordship has Mr. Archer, the Senior Surveyor, and Mr. Carruthers, the gentleman at Belfast, all saying that is not true, and that in fact she exceeded the requirements of Table C instead of

## **Page 880**

being under them, there is only one possible conclusion on the evidence as it stands, that Mr. Edwards is wrong, and I am pointing out how he is wrong.

I have had supplied to me, which I believe came from the Board of Trade, the corrected figures in red of these black calculations, and if one works them out you arrive at the

actual freeboard assigned to this vessel and the actual figures required under Table C, of 10 feet 11 1/2 inches.

*The Commissioner:* Is the 10 feet 11 1/2 inches in lieu of the 11 feet?

*Mr. Laing:* Eleven feet 1 inch.

*The Commissioner:* There is no 11 feet 1 inch.

*Mr. Laing:* Mr. Edwards' figures are that Table C requires a freeboard of 11 feet 1 inch. I say that is wrong. In truth, Table C requires a freeboard of 10 feet 11 1/2 inches.

*The Commissioner:* And the 10 feet 11 1/2 inches, what figure is that represented by in the letter of 30th April, 1910?

*Mr. Laing:* That is represented by a figure of 10 feet 9 inches, I think - minus 5. Your Lordship will see it is a most elaborate calculation.

*The Commissioner:* What do you say that ought to be?

*Mr. Laing:* It ought to be, in truth, 10 feet 11 1/2 inches, the requirements of Table C.

*The Commissioner:* Then, if 10 feet 11 1/2 inches is right, instead of requiring the deck to go up above E, it might conceivably have been taken some very short space below deck E, or deck E might be lowered.

*Mr. Laing:* Yes, your Lordship will observe an error in Mr. Edwards' theory. He says the actual freeboard assigned was 10 feet 11 1/2 inches. If you take that 10 feet 11 1/2 inches it is simply equal to the requirements of Table C, but the real freeboard assigned was 11 feet 2 1/2 inches. Therefore she exceeded the requirements of Table C by 3 inches.

Everybody is agreed that that is true.

*The Commissioner:* The actual freeboard is what?

*Mr. Laing:* 11 feet 2 1/2 inches.

*The Commissioner:* Where do you get that from?

*Mr. Laing:* I prove that by showing, as I just have done, that Mr. Carruthers said that she was 3 inches in excess of Table C Regulations.

*The Commissioner:* But some calculation was put before me which I never understood and do not understand now.

*Mr. Laing:* I can prove it in a sort of way, but it is very difficult.

*The Commissioner:* I suppose Mr. Edwards' contention involves saying that the freeboard certificate is wrong.

*Mr. Laing:* Yes, it must do.

*The Attorney-General:* The point I am going to take with regard to that is this: I am not going to repeat one word my friend, Mr. Laing, has said. I have sufficient confidence in Mr. Laing from experience, and I am quite certain when he has done with it he has said all there is to be said on the technical aspect of it; but the point to which I shall direct attention is this. As I understand my friend, Mr. Edwards' contention, this is not a charge of negligence against the Department of the Board of Trade. It is a charge, if it means anything, against one particular official of the Board of Trade. I am drawing the distinction, which your Lordship will appreciate, between saying the Board of Trade is negligent in not framing regulations for certain purposes, and saying that the Board of Trade has framed regulations and proper regulations, but a particular official has not in this case carried out those regulations. Of course, there is all the difference in the world between the two charges. The second is the charge which is to be gathered from what my

friend, Mr. Edwards, has said, that is to say his whole contention is that “these regulations are quite right and proper. I make no attack upon them - indeed, I rely upon them.”

*The Commissioner:* That is Table C.

*The Attorney-General:* Yes, he says they ought to have been carried out, and in this particular case they were not carried out, and he says there was no discretion to be exercised by the Surveyor. Your Lordship will remember there was a little discussion as to what was the meaning of these Regulations and suggestions, and obviously the answer was that if there was any discretion left to the Surveyor no attack could be made upon the exercise of that discretion. If there was - and it seems to me really that is all that results from it so far as I have been able to follow this point which really was made for the first time when my friend, Mr. Edwards, came to address your Lordship -

*The Commissioner:* I doubt whether it was Mr. Edwards' point.

*The Attorney-General:* I doubt it, because he did not succeed in making it clear, and I am not quite sure that he fully grasped the meaning of the point and the calculations which would have to be made. But I certainly would admit this, that he indicated the point when both Mr. Archer and Mr. Carruthers were in the box, and then he asked for correspondence about it. Your Lordship will remember I said the correspondence should be produced, and it was produced, and it is that correspondence to which my friend is referring. The point I want to make is this: From the moment that my friend had the correspondence he has never put a single question, or asked to put a question, to either of the witnesses, whichever it may be, against whom he is making this charge of negligence.

*The Commissioner:* It is said they did not get the correspondence in time to examine it and to put the questions.

*The Attorney-General:* I quite agree that my friend had not it at the time; but when he asked for it it was produced, and I do think it is a matter for comment that if he meant to charge either of the two gentlemen who spoke upon this matter with dereliction of duty founded upon the correspondence, at least the point ought to have been put to him.

*Mr. Laing:* While Mr. Wilding was recalled.

*The Attorney-General:* Yes. It is very difficult, of course, to see exactly at all times what was in my friend's mind on this point.

*The Commissioner:* Whom do you call your friend now?

*The Attorney-General:* Mr. Edwards.

*The Commissioner:* Oh!

*The Attorney-General:* My impression, from what took place, is that when the correspondence was produced there was an end of the point. I had no notion that when my friend came to address your Lordship he was going to say that Mr. Carruthers had made some miscalculation, which had never been put to him. That is the difficulty I have; it is all based upon an argument and upon calculations which have not been put to the witness who is involved.

*The Commissioner:* Mr. Laing is demonstrating - I cannot say in such a way that I can understand - that Mr. Edwards' calculations were wrong. I know that Mr. Edwards' calculations have been wrong in other respects, and that may be some evidence that they are wrong in this, but I do not profess at present to understand them.

*The Attorney-General:* Neither do I.

*The Commissioner:* Do you understand them, Mr. Laing?

*Mr. Laing:* Very indifferently, my Lord. There is very little information to be gleaned out of this book about these matters.

*The Commissioner:* I shall not be at all offended if you give me a candid answer, but do you think you are ever going to make me understand them?

*Mr. Laing:* On the material before your Lordship, so far as the figures and calculations are concerned, I certainly do not, because I have not the means of putting the calculation before you; it is not on the evidence, but I have the results of the calculations in evidence. I pointed out that the freeboard exceeded by 3 inches the requirements of Table C, and all these gentlemen from the Board of Trade have been called, and say that every regulation was complied with. Your Lordship has the certificate which was handed in at a very early stage of this case - the certificate of the freeboard of this vessel; and it is astounding, it is monstrous to think that this vessel should have been allowed to go

## **Page 881**

away with her bulkheads a deck below where they ought to be. That cannot be conceived.

*The Commissioner:* Have the underwriters paid on the policy?

*Mr. Laing:* I believe they have.

*The Commissioner:* I do not think they can get their money back.

*Mr. Laing:* Your Lordship is asked to find this vessel unseaworthy on no evidence at all except on a calculation the factors of which I have showed are not correct. I have a method which has been shown to me of demonstrating how my 11 feet 2 1/2 inches is correct.

*The Commissioner:* Do you question 11 feet 2 1/2 inches, Mr. Pringle?

*Mr. Pringle:* If you had permitted me earlier, my Lord, I was going to explain that it was not really now in dispute - at least, so far as I am concerned.

*The Commissioner:* Then I am sorry I did not ask you earlier. Does that correction disturb Mr. Edwards' calculation?

*Mr. Pringle:* I think it does. Mr. Edwards was not quite sure himself, I think. *The*

*Commissioner:* That is a very candid and a very fair admission, and I really do not think, after that, we need go any further on this point.

*Mr. Pringle:* If your Lordship will allow me to make an explanation - *The*  
*Commissioner:* Certainly.

*Mr. Pringle:* The only figures before these were the figures in the correspondence.

*The Commissioner:* That is, the black figures in this letter.

*Mr. Pringle:* Yes, and we thought it only right to test those figures to see exactly on what basis a new freeboard had been assigned to this vessel, because undoubtedly the new assignment of freeboard was a matter of considerable consequence, as it was going to make a difference in respect of the decks or deck to which the bulkheads should be carried, as those were the bulkheads which were the vital bulkheads in connection with the vessel, and we thought it right that the matter should be tested.

On the figures given there, a moulded depth of 45 feet and a load draught of 34 feet 9 inches, we found there was a deficiency which has been already mentioned. Then it was stated in evidence - I think it was by Mr. Archer - or it is stated in the correspondence, that a difference was made on the freeboard, and on testing this difference with the figures in the correspondence we found that that was not sufficient to bring it below Table C; and undoubtedly, I think it will be admitted that it was not sufficient on the figures which were used in the calculations.

*The Commissioner:* Let us assume for a moment that it was not.

*Mr. Pringle:* If it were not sufficient, then these bulkheads should have been carried to deck D instead of to deck E, and it was with a view to testing that that this matter was gone into, and I think it was perfectly fair.

*The Commissioner:* I am not complaining of that at all. I only wanted to know about the accuracy now of the contention having regard to the corrected figures.

*Mr. Pringle:* At the time we tested the calculation we had not the loadline forms in our possession.

*The Commissioner:* But now you have them.

*Mr. Pringle:* I have seen the loadline forms.

*The Commissioner:* Having procured them, are you now satisfied that the requirements only necessitated carrying the bulkhead up to deck E?

*Mr. Pringle:* Yes, my Lord.

*The Commissioner:* Then that disposes of that point.

*Mr. Pringle:* Yes, I think it does.

*The Commissioner:* Then you need not trouble any more about that, Mr. Laing.

*Mr. Laing:* If your Lordship pleases. Then I pass on to the next point that was made by Mr. Edwards, which was this. He says the correspondence shows that the Board of Trade objected to the cranking forward, I think it has been called, of the collision bulkhead. They said that the cranking forward between the D and the E decks infringed one of their Rules about the length it ought to be abaft the stem. There was considerable discussion over this matter, and finally the builders, Messrs. Harland and Wolff, said: To get rid of all these troubles we will carry up the next bulkhead abaft it to D deck, instead of stopping it at E deck. The Board of Trade thought that was a reasonable and proper suggestion, and they finally confirmed it and accepted it, and stepped it aft; and arranged it as it is now arranged. There can be no complaint about that.

*The Commissioner:* I am advised that that was quite a reasonable and proper thing to do.

*Mr. Laing:* If your Lordship pleases. Then I pass away from that. The next point was, that having raised this second bulkhead abaft the stem up to D deck the Board of Trade raised difficulties, or rather suggested difficulties, that the spiral stairway in the No. 1 hatchway ought to be trunked up. There was some considerable correspondence and discussion about that, and finally Messrs. Harland and Wolff said to the Board of Trade: We will send you a calculation which will satisfy you that if these two matters are not done which you are pressing for and which will inconvenience us - we will satisfy you that the ship cannot possibly hurt in consequence; in other words, that the result will be negligible. They sent their calculations; the Board of Trade considered them and accepted them; and said: "We are satisfied that our previous point was negligible and we abandon our objection." In consequence, the firemen's stairway was not trunked up and the hatch

was not trunked up with the full approval of the Board of Trade. How does the matter stand with regard to this? Mr. Edwards pressed Mr. Archer with a view of establishing that if his suggestions to trunk up these two places had been carried out the ship would never have sunk.

The evidence about that is absolutely conclusive. Mr. Archer, at page 693, Question 24452, said the non-trunking had absolutely no effect at all upon the loss of this vessel, and he said the same thing at 24454, two questions lower down. Mr. Wilding's evidence at page 518, Question 20384, is to the same effect. At page 806 of Mr. Edwards' argument he says that Mr. Archer, in answer to him, had said that if this trunkway had been fitted it would have had a very different effect, the suggestion being that the sinking of this vessel might have been saved. You will find that about the middle of the righthand column on page 806: "You remember, perhaps, my Lord, that Mr. Archer, who had made this recommendation, gave certain evidence, and he stated in reply to a question of mine, that he thought, in the light of the 'Titanic' disaster, it would have been very much better if these requirements at that time had been insisted upon." That is a complete misconception of the answer of Mr. Archer, as one can see if you refer to it on page 693, Question 24457 - your Lordship had better, perhaps, in order to appreciate my point, read again the answer at the top of page 693 too. He is asked what bearing the trunking had on the sinking, and he says: "Not the very slightest effect. (Q.) You do not think so? - (A.) Not the very slightest." Then at 24457 Mr. Edwards presses Mr. Archer, and the witness told him why he did not insist on this trunking being done; and at the bottom of that answer, 24457, Mr. Archer says this: "And when I had ascertained myself that the top of *this* bulkhead would then be 15 1/2 feet above the water, I felt I had insufficient ground for insisting that that should be done, and withholding the declaration." Then follows the question about which I consider there is a great misconception. Mr. Edwards says: "24458. Now, in the light of what has happened to the 'Titanic,' do you think that your view was the best one, or the builders' view was the best one? - (A.) I think that my view was the only right one within our powers under the Merchant Shipping Act." What Mr. Archer obviously means is that in his view he should give way, having had this calculation put forward - that having studied it, he was bound to give way under his powers under the Merchant Shipping Act. But Mr. Edwards has misconceived that answer, and

## **Page 882**

has considered that it means that Mr. Archer on reflection thinks that he was wrong in giving way. That cannot be so in the light of the question which I have just read, 24452, where he says it had not the slightest possible effect on the sinking. I think there is a misconception there.

My Lord, I think I have dealt with the points raised by Mr. Edwards in his argument, with the exception of one, and I will deal with that very shortly, because your Lordship has sent, as I understand, to the other Committee the question of whether bulkheads should be led up to a watertight deck. Your Lordship remembers the argument about that. Some passage was quoted from the Memorandum of the Board of Trade to the Bulkhead Committee and the Report of the Bulkhead Committee of 1891, in which the expression

is used: "The bulkhead shall be carried to the bulkhead or watertight deck." Mr. Archer says: I need not trouble your Lordship with the references about this - that the wording of that Memorandum has always appeared to him to be inaccurate, and that in point of practice these vessels, in the mercantile marine at all events, never have a watertight deck; and that they do not apply that part of the recommendations of the Bulkhead Committee which says the bulkheads ought to be taken up to a watertight deck. They do not do that in practice, and have never done it; and, therefore, as the recommendation of the Bulkhead Committee is only a recommendation and not statutory at all, the Board of Trade are perfectly within their powers in not enforcing this so-called watertight deck, which they do not believe was intended to mean what it apparently does mean. Mr. Archer thought it meant watertight from above; Mr. Edwards thought it meant watertight from below; and having engaged in a discussion over the matter for some hours your Lordship determined to send the matter to the other Committee in order that it might be discussed and perhaps decided there. So that I do not think I need say anything more about the watertight decks.

Now, the last point I have to deal with is the question which your Lordship asked me to look up, whether if the bulkhead between No. 4 and 5 boiler sections had been carried to C deck the "Titanic" would have remained longer afloat, unless it is true that the No. 4 section was holed to such an extent that the pumps could have kept the water down. My Lord, I have looked carefully into the evidence upon this point, and so far as I can see there is no direct evidence except perhaps an answer by the Attorney-General, when the question was being asked, that he thought probably the vessel might have floated.

*The Attorney-General:* I do not think I did say it. It says so, I know, but I did not say it.

*The Commissioner:* Was the Attorney-General giving evidence?

*Mr. Laing:* I think he was, my Lord, on this occasion.

*The Attorney-General:* I do not think I can have said it, because I certainly would not know it.

*Mr. Laing:* It is on page 518, Question 20372: "(*The Commissioner.*) If it had been carried up to C deck the ship would have been saved, or might have been saved? - (*The Attorney-General.*) Yes, I think it would."

*The Attorney-General:* It must be wrong.

*Mr. Laing:* I hope I have now justified the charge which I brought against the Attorney-General.

*The Attorney-General:* I think the last thing on which I would venture to give an opinion is as to flotability. That is wrong.

*Mr. Laing:* Mr. Wilding has put in, as your Lordship knows, what has been called the flooding plan, which is a very elaborate and most ingenious plan, showing the flooding of the various compartments; and as the Attorney-General disowns this answer, which he has given, I took the opportunity of getting Mr. Wilding to answer it. It is not in the evidence, but it is on the plan, and Mr. Wilding's answer is that had the bulkhead in question been carried up to C, as your Lordship's question suggests, the ship might have floated six to twelve hours longer. That is the answer.

But I should like to point out in that connection that there is no reason I can see, nor has any reason been suggested during the course of this case, why that particular bulkhead should have been carried up to deck C, because it is in violation of the whole scheme of

the design of the ship. And if you carry up the watertight bulkheads to deck C, as Mr. Wilding has pointed out, the ship as a commercial object becomes of very little use, because they want to have deck C free. Your Lordship will remember - I need not trouble you with the reference - that Mr. Wilding said that they would not be able to supply the exits which were required by the Board of Trade for emigrant vessels and so forth if these bulkheads were carried up to deck C. I have answered that question so far as I can; it is one of the questions upon which there is no evidence, but a plan and the answer which I have read, and that is the only answer I can give, namely, what Mr. Wilding has told me. I do not want to go into the matter because it has been gone into more than once. The evidence shows that No. 4 boiler section was holed, and that water was rising into it from the skin of the ship. That is the result, I submit, of the evidence which I read to your Lordship of Dillon and Cavell, who both were in that particular compartment and who spoke of the water rising. My Lord, I do not think there is anything further I have to say.

*The Commissioner:* The Witness said nothing about the locality from which the water came.

*Mr. Laing:* I think that all came out. I did not say anything about it because Mr. Wilding went into it fully when he was in the box. There was no cross-examination in my remembrance of anything he said about it. I can give your Lordship the reference to the passage.

*The Commissioner:* Do so, please.

*The Attorney-General:* Is your Lordship's question directed to No. 4 or generally? *The Commissioner:* No. 4, I think.

*Mr. Laing:* I thought your Lordship meant generally.

*The Commissioner:* No. 4.

*Mr. Laing:* I will give your Lordship the passage about that. You will find it on page 517, and from Questions 20346 to 20350 you will find Mr. Wilding's view as to whether this compartment was holed or not from his knowledge of the evidence as it had been delivered.

*The Commissioner:* Just read it, Mr. Laing. "20346: Have you got any theory as to the extent to which the outside of the ship was damaged in No. 4? - (A.) There is a space between the stokehold plate on which the men stand and the tank top, and the inference that I drew from the evidence that was given by Dillon was that an attempt was being made to pump out this water which the engineers found coming in, and that that was the reason why they sent aft. They had only one pump in No. 4 boiler room, and the reason they sent aft for those additional pumps was to get additional pumping power on to No. 4 boiler room, with a view to keeping it down. That would, in general terms, agree with the evidence given by Mr. Ismay as to his conversation with the Chief Engineer, that he hoped to keep it under by pumping. I admit the evidence is circumstantial." Will you go on reading that, please?

*Mr. Laing:* I will read the next Question: "20347: What I wanted to ask you is this. A difficulty is felt as to how No. 4 could have been injured in the skin of the ship if the wound terminated, as from Barrett's evidence apparently it did terminate, just above the watertight compartment forward of No. 5? - (A.) From a calculation which I will refer to in a moment, I cannot believe that the wound was absolutely continuous the whole way. I

believe that it was in a series of steps, and that from what we heard Barrett say in his evidence it was the end of one of the series of wounds which flooded the different spaces; that before the ship finally cleared the iceberg as the helm was put over she would be tending to swing her side into the iceberg, and that a very light contact was made in No. 4. It seemed very probable, quite apart from actual direct evidence of the fact; that is, that after the ship had finished tearing herself at the

**Page 883**

forward end of No. 5, she would tend to push herself against the iceberg a little, or push herself up the iceberg, and there would be a certain tendency, as the stern came round to aft under the helm, to bang against the iceberg again further aft. (Q.) Is the ship broadening at all as far aft as that (*Pointing to the model.*)? - (A.) Practically parallel." Then your Lordship asks him about Cavell's evidence at 20349: "If this evidence of Cavell's is correct, do you draw the inference that in some way or other there was an injury to the skin of the ship as far aft as the No. 4 boiler section? - (A.) I believe that to be correct the whole body of evidence tends that way, Barrett's in particular. (Q.) If the double skin had been carried up higher" - and then it passes off to another point. Your Lordship remembers the evidence quite generally, that they were pumping in No. 4, and that they brought a section of some pipe from aft in order to couple up, as Mr. Wilding thought from the evidence, and pump from No. 3 section, so as to increase the pumping power on that particular division, and that they were pumping up there until practically the last, because, as Dillon and Cavell say, the water was rising as they left. Would your Lordship like me to read Dillon's and Cavell's evidence again?

*The Commissioner:* No, I think not. Now, Mr. Dunlop, how long do you think you will take to convince us that the "Californian" did not see the "Titanic's" lights? *Mr.*

*Dunlop:* I think, my Lord, I will take about two hours.

May it please your Lordship, I am instructed by the Leyland Line, the owners of the "Californian," to appear on their behalf and on behalf of the Master, and I desire at the outset to express on their behalf their profound regret that the "Californian" was unable to, or did not render any assistance to the "Titanic." If, when they heard of the loss of the "Titanic," they had also learned that the "Californian" had either been the means of saving some of those whose lives were unfortunately lost, or had been the means of relieving the sufferings of those who by a merciful providence, were saved, it would, my Lord, have been a great source of consolation to them. I do not desire for one moment, nor is it their intention that I should, in any way minimise the importance of the duty which, in accordance with the best traditions of the sea, rests upon the masters of all ships, to render, if they can, assistance to others who may be in distress. My Lord, I think I might be allowed to read a telegram, which I find in "Lloyd's Weekly Shipping Index," which the Leyland Line sent to the 'Californian' as soon as they heard of this disaster, because it shows what their attitude was towards the "Titanic": "The Leyland Company" - the telegram reads - "have instructed the Captain of the 'Californian' by wireless telegraphy to remain near the scene of the wreck and render whatever aid is possible until he is relieved or until his coal supply runs low." My Lord, this shows their desire and

their anxiety that the "Californian" should render whatever assistance was at that time possible. If the "Californian" had rendered any assistance to the "Titanic," not only would she have been rendering a service to humanity, but she would also have been rendering a service to the owners themselves, because the "Californian" and the "Titanic" both belonged to the same great International Mercantile Marine Company. So much, my Lord, for the owners.

Now, I wish to say a word on behalf of myself, because although I have been present very rarely during the course of this Enquiry some of my friends who have been present have told me that my position as an advocate for the "Californian" is not altogether an enviable one, and I appreciate that in addressing your Lordship now, I am to some extent appealing from your Lordship to your Lordship, because I have seen from time to time the observations that have been made with reference to what has been compendiously called the "Californian" incident. My Lord, all I desire is, if I may be allowed, with your Lordship's permission, to put before you a number of considerations which I ask your Lordship to entertain, and to give them whatever weight your Lordship may, on reflection, think they deserve. And the first submission which I have to make to your Lordship is that the vessel whose lights or whose rockets were seen by those on board the "Californian" was not the "Titanic," and the vessel whose lights were seen by those on board the "Titanic" was not the Californian," and I hope to satisfy your Lordship that the evidence, in whatever way the evidence is tested, leads to no other conclusion. My Lord, may I first deal with the position of the "Californian" herself, and invite your Lordship's attention to the logbook. According to the logbook, the "Californian" was lying stopped in latitude 42 degrees 5 minutes North, which is admitted to be about 20 miles North by East of the place where the "Titanic" had struck the iceberg. This position was given by the Master at Question 6704, and while the Master was in the witness-box no one challenged the accuracy of that position. It was fixed by dead reckoning, and verified from time to time by observations. In the first place, there was the observation at noon. I have a chart here, my Lord, in which I have traced the course of the "Californian" back from the position at which she was lying stopped, and I should like to hand that up to your Lordship in order that your Lordship may compare it with the corresponding track of the "Titanic" at the various times. (*The chart was handed to his Lordship.*) That is the chart I have prepared for my own guidance I have not another copy, but I have a rough copy here which will enable me to explain. Your Lordship will see the noon position, 42.5 North and 47.25 West.

*The Commissioner:* Is this document that we have had handed in the log or a copy of the log?

*Mr. Dunlop:* My Lord, it was the original log that was produced by the witnesses. If it is the same log it would be the original.

*The Commissioner:* It appears to be all in the handwriting of the mate.

*Mr. Dunlop:* The Chief Officer. He was the man who said he wrote up the log.

*The Attorney-General:* He wrote it up from the scrap.

*Mr. Dunlop:* He wrote it up from the scrap log, in which was entered at the time the various entries which were subsequently copied into the log before your Lordship. The first observation that day appears to have been taken at 9.40 a.m., latitude 42 North, longitude 47 West. Your Lordship will see that at that time is also recorded a reading of

the patent log. The log showed 47 1/2 miles. It does not appear on this day when the log was set. At 9.55 the course is altered, and at noon observations are taken by the officers on the bridge, verified by the Master, and her position fixed at 42.5 and 47.25, as recorded in the log. From there a course of South 89 true is set, practically true West.

*The Commissioner:* Where do you get that from?

*Mr. Dunlop:* That is from the evidence of the officer as to the deviation on the steering compass North 59. 9.55, altered course at noon North 61 degrees West, equivalent to South 89 degrees true, practically true West.

*The Commissioner:* Where is the variation?

*Mr. Dunlop:* The variation you will find in the log, 24 3/4 West.

*The Commissioner:* Where is the deviation?

*Mr. Dunlop:* That is given in the evidence of the officer on page 158.

*The Commissioner:* Read it.

*Mr. Dunlop:* It is Question 6782. “(The Attorney-General.) What variation? - (A.) The variation that day at noon was 24 3/4. She was about 24 when we were stopped.”

*The Commissioner:* Where is the deviation?

*Mr. Dunlop:* The deviation would be about 2 E., making an error of 22 W.”

*The Commissioner:* Is there no book in which the deviation would be recorded?

*Mr. Dunlop:* Yes, I think there would be.

## **Page 884**

*The Commissioner:* Where is it?

*Mr. Dunlop:* I have not got it. I believe it is kept on board the ship. I can get it, no doubt. This point was not challenged.

*The Commissioner:* I daresay it was not. It is only that I want the gentlemen who advise me to follow what you are saying.

*Mr. Dunlop:* The Master has translated his compass course into the true course, enabling me to lay it down upon that chart. North 61 degrees West by compass corresponds to South 89 degrees true. No doubt he had the information before him which enabled him to translate it. And that is the course which you would expect it to be. It is about the course the “Titanic” herself was on - a course of about true West. That was the course in fact made good. Whatever the course steered was is made clear by the observation taken at 7.30 that evening. According to the evidence of the Chief Officer, at Question 8798, he took, at 7.30 in the evening, an observation of the Pole Star, which gave him his latitude. That latitude is shown on the chart before your Lordship, and it was as a result of the observation which he then got that he corrected in his logbook the 6.30 position, which he had already communicated to the “Antillian” and to the “Titanic.” At 6.30, if your Lordship will be good enough to look at the log, it is recorded that they passed two large icebergs in latitude 40.5 North and longitude 49.9 West. I have to give the deviation on a South-South-East heading because it is to that heading that the question of the Attorney-General is directed. The deviation would probably be entirely different upon a westerly course. I am on the question of the course now.

*The Attorney-General:* It is for the purpose of distance.

*Mr. Dunlop:* I must get both.

*The Commissioner:* You have not at present satisfied the gentlemen who are with me that the course that you have marked on this plan is the course that you were making. *The*

*Attorney-General:* May I see that plan? I have not had a look at it yet - because we have some evidence from the Captain himself who drew this course. (*The plan was handed to the Attorney-General.*)

*The Commissioner:* You will see what it leads to. There is a straight red line, and if you take the straight red line along to your left you will see it is just over the spot where the "Titanic" is supposed to have sunk, and it is said that is a distance of 20 miles.

*Mr. Dunlop:* At least 20 miles.

*The Commissioner:* But then, you know, the Admiral, who sits on my right, tells me that the information to be obtained from the log does not enable anyone to lay down that track.

*Mr. Dunlop:* That is quite obvious.

*The Commissioner:* And the deviation does not give the course.

*Mr. Dunlop:* The reason for that is that the course which was mentioned in the log is the course by compass, and until your Lordship has the deviation book you cannot obtain the magnetic course.

*The Commissioner:* I am told that there ought not to be a log of this kind without the error of deviation being put down.

*Mr. Dunlop:* There is no column in it, that I can see, for entering the deviation, I think. There is a column for the variation, which is recorded.

*The Commissioner:* Is it not as a Rule put in the remarks column?

*Mr. Dunlop:* Sometimes it is, my Lord. I do not know whether it is done on board the "Californian." The logbook will show that.

*The Commissioner:* Apparently it is not done on board the "Californian." *Mr.*

*Dunlop:* Apparently not.

*The Commissioner:* It was not done on this occasion.

*Mr. Dunlop:* Your Lordship has the logbook, is it recorded on any other occasion? *The*

*Commissioner:* I am sure I do not know. This logbook, I presume, only refers to this voyage; that is so, is it not?

*Mr. Dunlop:* My Lord, I have not seen the original. I think if any question was to be raised about the course -

*The Commissioner:* I am sorry I have to interrupt you again for a moment, but are you going to say that you saw the signals or did not see them?

*Mr. Dunlop:* We saw certain signals.

*The Commissioner:* Are you going to say that they were or were not distress signals?

*Mr. Dunlop:* I am going to say that they were not distress signals; if they were distress signals they were not signals from a vessel herself in distress; or if they were distress signals from a vessel in distress that vessel was not the "Titanic."

*The Commissioner:* That may be. Were they, according to you, distress signals?

*Mr. Dunlop:* No, my Lord.

*The Commissioner:* What were they?

*Mr. Dunlop:* They were supposed to be private night signals.

*The Attorney-General:* The evidence is all against that.

*Mr. Dunlop:* I will deal with the evidence.

*The Commissioner:* You will have a great deal of difficulty in persuading me of that. If they were distress signals, whether they came from the "Titanic" or not, you ought to have made for them.

*Mr. Dunlop:* It does not concern me whether they were distress signals or whether they were not, for the moment. What concerns me is, were they the signals of the "Titanic"? If they were not the signals of the "Titanic," we do not know what signals they were, or why they were fired, until we have the vessel which fired them.

*The Commissioner:* I know that; if they were distress signals - you say they were not, but that they were some sort of ship's signals, whatever that means - if they were distress signals, you know, you ought to have made for the lights.

*Mr. Dunlop:* I will deal later, my Lord, with the circumstances under which these lights were seen, and I hope to satisfy your Lordship, when the time comes, that assuming the signals were what these men believe them to be, they did nothing wrong in remaining where they were until daylight.

*The Commissioner:* Where is the deviation table?

*Mr. Dunlop:* It ought to be on board the ship.

*The Commissioner:* I know where it ought to be - but I am asking where it is. Have you not thought it worthwhile to ask for it?

*Mr. Dunlop:* No, my Lord, because I asked the Master -

*The Commissioner:* Because I am told that you cannot get the course accurately unless you have it.

*Mr. Dunlop:* I asked the Master to translate his compass course into his true course. He did so, and I have no reason to doubt that he did so accurately. If there is any doubt about it, we will send for the deviation book and ascertain.

*The Commissioner:* But you know it is as necessary it seems to me, to have that table, as it is to have the log.

*Mr. Dunlop:* Yes, my Lord, but the log was put in and the deviation book was not.

*The Commissioner:* Why did not he come provided with the other book? *Mr.*

*Dunlop:* My Lord, I will deal with that later. He did not come provided with anything. He did not even come with his logbook - the logbook had to be sent for - he came as a witness to give evidence on other matters, entirely.

*The Commissioner:* Where is this table at present?

*Mr. Dunlop:* My Lord, we will communicate with Liverpool and ascertain where the table is.

*The Commissioner:* You had better telegraph for it.

*Mr. Dunlop:* We will telegraph for it, my Lord.

*The Commissioner:* So that we may have it here tomorrow morning.

*Mr. Dunlop:* If it can be got, my Lord, it will be got. If I may continue, your Lordship has the noon position, your Lordship also has the latitude communicated to the "Antillian" and the "Titanic" by wireless telegraphy at 6.30 in the evening. Your Lordship also has the observation, taken by the Chief Officer, of the Pole Star, at 7.30, all agreeing in the latitude 42.5 North,

which is only consistent with a course of about West true; and the vessel at that time is steaming full speed, making something between 11 and 12 knots, and from the 7.30 position she runs until 10.21, when she stops owing to the ice.

There is no record in the log of any alteration of course between 7.30 and the time when she stopped, nor is there any suggestion that she did alter her course, between these times. My Lord, these were recorded at the time in the scrap log according to the evidence and copied into the log from the scrap log. They appeared in the scrap log long before the "Titanic" was lost - several hours before the "Titanic" was lost and, therefore, before there was any inducement whatever to those on board the "Californian" to make their log appear as if their vessel was further North than she in fact was. It was not suggested to the Master or the officers of the "Californian," nor are there any grounds for the suggestion, that the log before your Lordship has been "cooked." The log on the face of it appears to be a perfectly genuine log.

*The Attorney-General:* I think you are putting that too high - you say there is no suggestion.

*Mr. Dunlop:* No question was put, my Lord, to the Master.

*The Commissioner:* Just a moment, please. The scrap log is gone.

*Mr. Dunlop:* The scrap log is gone, and the explanation of that was given by the witnesses when they were asked about it.

*The Commissioner:* And as far as I remember it was given in a way that satisfied me that it had gone.

*Mr. Dunlop:* Yes, your Lordship was satisfied at the time.

*The Commissioner:* Yes, I thought so. The log places the latitude when the bergs were passed two miles further North, and therefore two miles further away from the "Titanic" than the message places them.

*Mr. Dunlop:* That is so, and the explanation of that is this -

*The Commissioner:* Why should you make your log show a position two miles further North?

*Mr. Dunlop:* The explanation, my Lord, of that is this, that the bergs were passed at 6.30. At 7.30 the observation was taken which enabled them to check their latitude. At 7.30 they found their latitude to be 42.5 North.

*The Commissioner:* That was the Pole Star observation.

*Mr. Dunlop:* That was the Pole Star observation at 7.30. 6.30, an hour before, was the time when they passed the icebergs and when they communicated the position of these icebergs to the "Titanic" and the "Antillian" they communicated 42.3 North. *The*

*Commissioner:* They did.

*Mr. Dunlop:* The explanation of the Chief Officer was that his 7.30 observation enabled him to ascertain that the 6.30 position was wrong by two miles.

*The Commissioner:* So that you say he entered up the log later on and entered it up as he thought correctly.

*Mr. Dunlop:* Yes, he entered it up correctly. From the 7.30 position, running as they say they were running at nearly full speed takes them at 10.21 to the place where they stopped - into the position which is recorded in the log as 42.5 North and 50.7 West. My Lord, I submit that the Master of the "Californian," if he is to be judged at all, must get the benefit of his logbook, which, after all, is not his log. It is the log kept by the Chief Officer, a person whose conduct is not in any way the object of this Enquiry and who is not concerned in the result of what your Lordship's views may be. We are dealing now with the Master, and I submit the Master is entitled to have his conduct judged, amongst other things, in the light of what is recorded in the Chief Officer's log. But that is further confirmed by what appears in the entries on the following morning. If you test it, my Lord, by the distance which he ran from 6 o'clock in the morning, when he heard of the "Titanic's" loss, until 8.30, when he came up to the "Titanic's" position, your Lordship will see that he must have run a distance very considerably over 20 miles.

*The Commissioner:* Can you tell us what course he was making?

*Mr. Dunlop:* He told us, my Lord, in his evidence. He steered various courses to the South-West, and then he carried down along the edge of the ice-field, turned round and steered West.

*The Commissioner:* But the number of miles that he made in a bee-line towards the "Titanic" cannot be ascertained from that.

*Mr. Dunlop:* My Lord, he steamed, in fact, something over 30 miles the next morning, making allowance for the fact that he did not go by the direct route.

*The Commissioner:* Where is the evidence of that?

*Mr. Dunlop:* That is the evidence of the Master, Captain Lord.

*The Commissioner:* Yes, I daresay; he said so, but I would like you to refer me to it, and then tell me why it is not to be found in the log. *Mr. Dunlop:* Because you would not expect to find it there.

*The Commissioner:* Would not you expect to find the course that he was making, and would not you expect to find the speed?

*Mr. Dunlop:* My Lord, he tells us what he was doing; he tells us in the log what he is doing. He is proceeding slowly to a position given, latitude 41.46 North, "proceeding slow, pushing through thick field ice, cleared the thickest ice, proceeding full speed, pushing ice." He is steering various courses.

*The Commissioner:* I daresay he is, but would not you expect to find in the log some information as to the courses that he was steering, and some information as to the speed at which he was going?

*Mr. Dunlop:* I would not expect to find any record of his speed. If he was going various courses I would expect to find that recorded, and we do find that, because we find under the column "Course" - "Course various," which is in accordance with the evidence which he gave, and it is not until 11.20, when he proceeds on his real course, that he states what that course was. My Lord, according to the log, he is running for 30 minutes slow through ice, and for 2 hours at full speed, which he said was about 13 knots, his engineer reported to him that it was 13 1/2 knots. Making allowance for the fact that he was not able to proceed direct to the "Titanic's" position, but had to go round the edge of the icefield, it confirms the statement in my submission that he was at least 20 miles to the northward of the "Titanic's" position. Your Lordship asked me if he had stated in his

evidence the distance which he ran the next morning. I see that is at Question 7378: "How many miles had you, in fact, to steam to get to the place where the wreckage was found? - (A.) I should think 30 miles at the least." But apart altogether from the question of speed, judging it from the record of the interval of time that there was between his position and that of the "Titanic," that is 2 1/2 hours' steaming from the "Titanic's" position - if there is one point on which all the evidence agrees it is this, that as soon as they did hear of the "Titanic's" loss they with all speed went to her assistance. They went in the direction reported by the "Carpathia," and did so at full speed. If you allow for 2 hours at full speed and 30 minutes at slow, and her full speed is something like 13 knots or 13 1/2 knots, I submit, my Lord, it follows that the position recorded in the log as the place where the "Californian" was stopped must be approximately accurate. *The Commissioner:* That is about 20 miles North of the place of the disaster.

*Mr. Dunlop:* North by east of the place where the "Titanic" struck. I invite those who assist your Lordship to check the logbook. We will send for and get if we can the deviation-book, and I submit that the logbook will bear that investigation and will establish that the "Californian" was, in fact, in the position which her log records. That

## **Page 886**

also, my Lord, is corroborated by the distance which you would ordinarily expect to find between vessels bound respectively to New York, as the "Titanic" was, and to Boston, as the "Californian" was, at the 50th Meridian of longitude. You would expect to find them at about 20 to 30 miles apart, if they were both steering the course to the port to which each was respectively bound. If the log is approximately right, it follows that neither vessel could possibly have been at any time in sight of the other. They were separated by so great a distance and so great an interval of time that the "Californian" could not possibly have been of any assistance had she steamed to the "Titanic" as soon as the "Titanic" struck the iceberg. So much, my Lord, for the log.

I further submit to your Lordship that the fact the vessel seen was not the "Titanic" is borne out by what the witnesses from the "Californian" have themselves described as what they saw. And in this connection I think it is important to remember that the witnesses from the "Californian," when they were watching this steamer, had in their minds the "Titanic," because they had shortly before been in wireless communication with the "Titanic." Now, my Lord, what did the witnesses see? First, with regard to the class of vessel which they saw, the Master had her under observation for at least an hour. He said in his evidence that he remarked to the Third Officer, who was standing beside him at the time: "She is not the 'Titanic'; she is not even a passenger steamer." It was impossible to mistake the "Titanic" for the steamer he was seeing. My Lord, that is his evidence at Questions 6724, 6755, and 8197. Stone, the Second Officer, and Gibson, the Apprentice, were the two who were on watch from midnight till 4 a.m. Those were the two witnesses who had this steamer longest under observation, and the better opportunity of judging what she was. They both said in their evidence, and both agreed at the time, when they were watching this steamer, that she had no appearance at all of being a passenger boat. They both agreed to this, my Lord, when they were discussing her, that

she was a tramp, and they were looking at her through glasses. My Lord, that is not only their evidence, the views they expressed here, but it is what both say that they expressed to each other at the time they were looking at her, and when, as I say, they had the "Titanic" present to their minds. Stone's evidence you will find at Questions 7863 and 8088; and Gibson's, the Apprentice, at 7545, 7706, 7728, and 7792. Gill, the donkeyman, who your Lordship may remember went forward at the end of his watch to call his mate at about midnight, had a momentary and passing glimpse of a steamer which he associated with the "Titanic," of whose loss he heard next morning. But even Gill, the donkeyman, with his imagination stimulated by what had taken place in New York, could not and did not say that she was the "Titanic." He judged her to be a passenger steamer because of the glare of lights - her saloon lights and her port lights.

*The Commissioner:* What did Gill say about the vessel that he saw being a tramp?

*Mr. Dunlop:* Gill did not say so, my Lord.

*The Commissioner:* What did he say?

*Mr. Dunlop:* Gill thought she was a passenger steamer.

*The Commissioner:* What did Groves say?

*Mr. Dunlop:* I am coming to Groves, the Third Officer. He thought she was a passenger steamer too. I will deal with that in a moment. I have dealt with Stone, the Second Officer; I am now dealing with Gill; Gill thought she was a passenger steamer. He thought so because of her row of deck lights and port lights. And it is important, my Lord, to remember that he says he saw her shortly after 12 o'clock, which was the end of his watch, as he was going forward to call his mate. According to Groves, the Third Officer, whose evidence was the more dramatic of the two, he said he saw the deck lights and this glare of lights go out at 11.40. That is when they disappeared, according to him. Groves, my Lord, at Question 8203, says the lights disappeared at 11.40. Gill, nevertheless, sees them all ablaze, at Question 18136, a few minutes after 12. If Groves is right Gill must be wrong, and if Gill is right Groves cannot be right. So much, my Lord, for Gill. Groves, the Third Officer, was the gentleman who was on watch from 8 till midnight. When he was pressed at the end of his evidence - I will not say by whom - to say he thought it was the "Titanic," my Lord, he answered this. *The Commissioner:* Did I press him?

*Mr. Dunlop:* Your Lordship asked the question.

*The Commissioner:* I thought so.

*Mr. Dunlop:* Up to that moment, my Lord, he had not the courage to say that she was the "Titanic," but, thus stimulated, he said this: "From what I have heard subsequently I do, but I do not put myself forward as an experienced man." That was the best answer, my Lord, he was able to give. Question 8442. My Lord, it is perfectly clear, I submit, that Groves did not think so at the time, because at the end of his watch he went to have his usual chat with the Marconi operator, who was a kind of "Evening News" to him. He went there to find what vessels there were and what news there was, and, according to the operator's version of the conversation which took place at the end of Groves' watch, not a word was said about the steamer which Groves described in the witness-box. He did not mention her - nothing about seeing a large passenger steamer and her lights going out at 11.40. He did not ask: "Is this vessel the 'Titanic'?" or anything of the kind. My Lord, that appears in the Marconi operator's evidence at Questions 9034 to 9050, where the Marconi operator told your Lordship that there was no reference at all by Groves to the

steamer which he had seen, and both went off to bed. Groves attached no importance at the time to the vessel which he had seen, and he attached no importance at all to any of the incidents which he described when here in the witness-box; and I submit that his evidence was largely the result of imagination stimulated by vanity. So much with regard to the class of vessels seen.

*(After a short adjournment.)*

*Mr. Dunlop:* My Lord, the next point I wanted to deal with was what navigation lights the witnesses from the "Californian" saw. They only saw one masthead light; the "Titanic" had two. The evidence on that point is the Master's evidence, Q. 6805; the Second Officer, Q. 8079; Gibson, Q. 7791; Gill did not notice any masthead lights; the Third Officer said he thought he saw two, no doubt, because he thought that the vessel he was seeing was a passenger steamer; but the Second Officer, Gibson, and the Master were all very emphatic that the vessel which they saw was only exhibiting one masthead light, and they said that if she in fact had been carrying two masthead lights they could not have failed to pick up the second light.

That it was not the "Titanic" is, I submit, also clear from the description which the witnesses gave and the direction in which the steamer they saw was moving. Before 11.40 that night the "Titanic" was steering about due west, and to every vessel to the northward of her she would be showing her green light. The sidelight which the witnesses from the "Californian" in fact saw, or said they saw, was the red light. That is the Third Officer, Question 8228; the Second Officer, 7814; and Gibson, 7425. It may be said that the "Titanic" may have opened her red light after 11.40, when she struck the iceberg, but that is not borne out by the evidence. According to the evidence, she starboarded about two points before she struck the berg, and after her engines were stopped, according to the evidence of her officers, her head did not alter its position at all. The effect of starboarding would not be to open the red

**Page 887**

light to any vessel to the northward of the "Titanic's" position. Therefore, both before the "Titanic" struck the berg and after, if she had been within sight of the "Californian," it is the green light and not the red light which the witnesses from the "Californian" would have seen.

*The Commissioner:* Have you this in your mind. Question 6759: "By this time had you been able to detect her sidelights at all? - (A.) I could see her green light then." *Mr.*

*Dunlop:* Yes; that is the evidence of the Master.

*The Commissioner:* Yes, Captain Lord.

*Mr. Dunlop:* Yes, Captain Lord; but the Third Officer who saw her up till 12; the Second Officer, and Gibson, who saw her from 12 till about 2, described the red light; they never saw a green light.

*The Commissioner:* Then one or other must be mistaken?

*Mr. Dunlop:* One or other must be mistaken, but the weight of the evidence is that it was the red light or different vessels.

*The Commissioner:* Or the "Titanic" swinging?

*Mr. Dunlop:* No, it could not be the "Titanic" swinging, because Captain Lord is referring to a period before the "Titanic" struck the iceberg. *The Commissioner:*

He said about half-past 11, did he not?

*Mr. Dunlop:* He says here at 11 o'clock; he keeps her in view until she stops, about 11.30. During the time she is approaching him she is showing a green light; that is his evidence. The evidence of the others is that she was not showing her green light, but was showing her red light.

*The Commissioner:* She would show her green light, I suppose, before the collision?

*Mr. Dunlop:* Yes.

*The Commissioner:* But after the collision we cannot tell what she showed.

*Mr. Dunlop:* Yes, my Lord, according to the evidence; the evidence is she starboarded two points for the iceberg.

*The Commissioner:* Yes, but you do not know what happened to her after that?

*Mr. Dunlop:* According to the evidence of Boxhall the Fourth Officer, Question 15419: "She did not swing at all after the engines were stopped." He was asked that question whether her head did fall off either to starboard or port, and the answer was no; her helm was starboarded, and after the engines were stopped, her heading did not alter.

*The Attorney-General:* There is some evidence about it which I think your Lordship has in mind. That is Rowe's evidence on page 419.

*Mr. Dunlop:* As far as I can see there is no reliable evidence from any witnesses - *The*

*Commissioner:* I do not know what that means.

*Mr. Dunlop:* There is no evidence from anyone on the bridge. The Fourth Officer was the man who after the collision happened ascertained the "Titanic's" position with a view to communicating by wireless telegraphy with other vessels. He was the person who, if the vessel did alter her heading, would be the person most likely to know, and he was asked specifically the question. He said: no, she did not alter her heading after the engines were stopped. After that time the alteration of heading was to port, under a starboard helm, an alteration which could not possibly open the red light to any vessel to the northward of her. But I am not so much concerned with the sidelight seen after the "Titanic" struck the iceberg as the sidelight which was seen before 11.40, while the vessel which they describe came up and stopped in the ice; because that is the time when we know that the "Titanic" was steering West and would, if she was in sight, be showing to the "Californian" her green light. At that time the body of the evidence is that she was showing her red light.

*The Commissioner:* Of course, if that was before the collision the steamer that the Captain of the "Californian" saw would be in the same position that the "Titanic" would be in, showing her green light.

*Mr. Dunlop:* She would be a vessel to the Southward.

*The Commissioner:* Showing the green light.

*Mr. Dunlop:* Yes, any vessel to the Southward of him, bound West, would be showing the green light.

*The Commissioner:* And, therefore, so far as it goes, she was showing the light that the "Titanic" would be showing.

*Mr. Dunlop:* Showing that light to him at the time he had it under observation between 11 and 11.30.

*The Commissioner:* Yes.

*Mr. Dunlop:* But the Third Officer - and it was the Third Officer on whose evidence your Lordship seemed to be placing most reliance at the time - *The Commissioner:* What is his name?

*Mr. Dunlop:* Groves. Groves, at Question 8228, is very emphatic about it; she was never showing her green light, but she was showing her red light, and he was the gentleman who went off duty at twelve o'clock. He had her under observation from eleven to twelve; and on that point his evidence was supported by that of the Second Officer and Gibson, who were watching her between 12 and 2, and the sidelight these three saw was the red light and not the green.

*The Commissioner:* What Groves says at Question 8228 is this: "Did you see any navigation lights?" He has just said, you know, that he saw two masthead lights. "Did you see any navigation lights - sidelights? - (A.) I saw the red port lights. (*The Commissioner.*) When did you see that? - (A.) As soon as her deck light disappeared from my view." That would be possible, I should say probable, when her helm was being starboarded.

*Mr. Dunlop:* But, my Lord, she could not open her red light.

*The Commissioner:* But you do not know. Her deck lights would disappear very likely, she might be pointing stern on towards the "Californian."

*Mr. Dunlop:* Not as the result of starboarding her helm, if she starboards two points from W. to W. S. W.

*The Commissioner:* No, that is true.

*Mr. Dunlop:* To every vessel to the northward of her she would be showing her green light. The effect of starboarding might be to show her stern lights, but it could not bring her bow round so as to show the port light. That is carried out by the bearings which the Third Officer gave. He said the steamer, when he first saw her, was about 12 miles off, bearing South. It does not matter, for this purpose, what the heading of the "Californian" was. Half an hour later he sees her about six miles distant, bearing S.S.E. That indicates a vessel steering somewhere about N. E., not a vessel during that time going to the westward as the "Titanic" was. The movements which the witnesses from the "Californian" described as to what the vessel which they saw did, were not what the "Titanic" did. They saw a steamer navigating, apparently slowly, through field ice; they give the bearings, and they give the time between these bearings. The "Titanic" was, in fact, going 22 knots in clear water; according to her evidence, she was not in the neighbourhood of field ice at all. She continued going at this speed until shortly before she struck the iceberg. What the witnesses from the "Californian" saw was a vessel coming up from the field ice and then stopping, and apparently they see a vessel which is bound, not to America, as the "Titanic" was, but bound to some European port, and, therefore, showing to them her red light, and, apparently, to the Third Officer, steering about N. E. And that is also what Gill, the donkeyman, described, because, although his

glimpse was only a momentary one, what he saw of the vessel was a vessel apparently heading in the same way as the "Californian" was, and the evidence from the "Californian" is that at that time she was heading about N. N. E. by the compass, which would be about N. E. true. The vessel, therefore, which Gill saw would not be the "Titanic," but heading in the opposite direction. There is no evidence that the "Titanic" turned round before she sank and headed in the direction of Europe.

*The Commissioner:* Gill appears to have thought that the steamer that was visible was out of the field ice. That is so, is it not? He says he looked

## **Page 888**

and he could see the edge of the field ice, in which they were, about five miles away.

*Mr. Dunlop:* Yes.

*The Commissioner:* And the steamer that he saw was five miles further away and, therefore, would be in open water.

*Mr. Dunlop:* My Lord, I should have thought that evidence was extremely unreliable; the evidence of a donkeyman going forward to call his mate at midnight. He would not in the ordinary course of things notice how far the ice extended and whether the vessel that he saw was navigating in clear water or not.

*The Commissioner:* Gill did not give me the impression of a man who wanted to make a case against his ship.

*Mr. Dunlop:* My Lord, he may not have given your Lordship that impression, but - *The Commissioner:* Do you suggest he came here with a desire, I will not say with an intention to deceive, but with a desire to make out that it was the "Titanic" they did see?

*Mr. Dunlop:* Yes, my Lord, I think he did, and I think he did for this reason. This donkeyman hearing of the loss of the "Titanic" the next morning, a few days later arrived in New York, interviewed by New York reporters, giving evidence at the American Inquiry, his imagination got fired by all this excitement and he began to imagine that the steamer of which he had a momentary glimpse was in fact the "Titanic." I submit that from whatever point of view you test the evidence of the "Californian," either as regards the class of vessels seen, the lights seen, the movements which they describe as having seen, they all point to the same conclusion that the vessel which they saw was not and could not have been the "Titanic."

That is further corroborated by the evidence of the Master of the "Carpathia," whose evidence your Lordship will probably be inclined to accept. In his depositions, which your Lordship will find at page 746, Question 25551, he says: "I approached the position of the "Titanic," 41.46 N.L. 50.14 W.L. on a course substantially N. 52 W. (true), reaching the first boat shortly after 4 a.m. It was daylight at about 4.20 a.m." That is of importance. "At five o'clock it was light enough to see all round the horizon. We then saw two steamships to the northwards, perhaps 7 or 8 miles distant. Neither of them was the 'Californian.' One of them was a four-masted steamer with one funnel, and the other a two-masted steamer with one funnel. I never saw the "Mount Temple" to identify her. The first time that I saw the "Californian" was about 8 o'clock on the morning of 15th April. She was then about 5 to 6 six miles distant, bearing W.S.W. (true), and steaming

towards the 'Carpathia.'" It is not until 8 o'clock in the morning that the "Californian" comes within sight of the "Carpathia"; at that time she was about 6 miles distant. She is about half an hour's steaming away from the "Californian" at that time. Put the "Californian" back an hour and a half steaming, one hour at full speed and thirty minutes at slow, and it follows in my submission that the "Californian," before she came in sight of the "Carpathia," must have come from a position some 20 miles north of the "Titanic's" position. If the vessel which was seen was the "Titanic," if the "Titanic" was in sight of the "Californian," it is impossible that the Master of the "Carpathia" could have missed seeing the "Californian" as soon as he came up to the "Titanic's" position at about 4 o'clock in the morning. Instead of that, there were four hours during which the "Californian" was not in sight at all.

The evidence from the "Titanic" also shows that the "Californian" was not in sight at any time. Before 11.40 your Lordship has the evidence of the look-out men who were in the crow's-nest, Lee and Fleet. Neither of those men at any time between 10 and 12, when they were in the crow's-nest, saw the lights of any steamer, and if the "Californian" had then been 10 or 5 miles, or whatever distance, the witnesses from the "Californian" have stated the vessel which they saw was, they could not have helped seeing the lights of the "Californian." But neither of them saw anything of the kind. Hogg relieved Fleet and Lee at midnight, and went into the crow's-nest, and was there until he was called out of the crow's-nest and went away in one of the boats. During the time he was in the crow's-nest, and no doubt anxiously looking for lights, he did not see any lights; he did not see the "Californian's" lights, nor did he see the Morse signals of the "Californian," which would, of course, show a greater distance than the ordinary navigation lights. So that up to the time when the "Titanic" struck the berg, the "Californian" was not in sight of the "Titanic." But a number of witnesses from the "Titanic" have described the lights which they either saw from the "Titanic" after the vessel struck or which they saw when they were in the boats. Most of the witnesses from the "Titanic" who saw any lights at all saw the light or lights of a fishing vessel, that is the light which most of them speak of - that is the Second Officer at Questions 13984 and 14137; the Third Officer of the "Titanic" at Question 15061; the two Quartermasters at Questions 1338 and 17660; the three look-out men at Questions 2566 and 11478 and 17363, and also Mr. Ismay at Question 18584. The only lights which these witnesses saw, representing as I say two officers, two quartermasters, three look-out men, and Mr. Ismay, were the lights of a fishing boat or fishing boats. Others, like Scott, the greaser, saw a light on another of the "Titanic's" own lifeboats. Scott, at Question 5663; Beauchamp, the fireman, and I think some others saw lights which afterwards proved to be the lights of the "Carpathia," but no other lights. That is Question 810. But Boxhall, the Fourth Officer; Lucas, an A.B.; and Hart, a Steward, saw some time between 1 and 2 a steamer which approached, and to which they signalled by Morse signals; they saw her approach, and later on they saw her steam away. They are the only witnesses who mentioned seeing a steamer at all, and that was not until some time between 1 and 2. They saw a steamer which approached at that time between 1 and 2, obviously not the "Californian," because the "Californian" at that time was lying stopped in the ice. She unfortunately was stopped until 6 o'clock in the morning. The steamer which they saw approached, and then steamed away. The "Californian" when she began to approach the scene of the disaster continued to approach

until she actually got there; she never steamed away. The steamer which Boxhall said he saw was never seen or heard of again. The "Californian" came up to the "Carpathia" about 8.30. The steamer which they saw was not using Morse signals; the "Californian" was.

*The Commissioner:* My attention is drawn here to Boxhall's evidence at page 357, Question 15409: "What distance do you suppose her to be away? - (A.) I judged her to be between 5 and 6 miles when I Morsed to her, and then she turned round. She was turning very, very slowly, until at last I only saw her stern light, and that was just before I went away in the boat." And I think there is evidence from the "Californian" that the "Californian" turned slowly.

*The Attorney-General:* Certainly.

*Mr. Dunlop:* She turned slowly at 10.21 or half-past 10.

*The Commissioner:* She went on turning, I think?

*Mr. Dunlop:* Until her head came about N.N.E. Her head went round because the Master, when he stopped his engines for the ice, at the same time put his helm hard over and turned his vessel's head round. But there is no evidence that her head went round to such a position as to show to a vessel to the Southward of her stern light. Boxhall, Lucas, and Hart, when describing a vessel which appeared to steam towards them and then go away again, and that is not the "Californian." That is the whole of the evidence which seems to bear upon this question.

*The Commissioner:* Is there any evidence to show that the "Californian" saw this steamer or the vessel or the lights that the witnesses from the "Titanic" say they saw.

## **Page 889**

*Mr. Dunlop:* I do not know whether this steamer which Boxhall is referring to is or is not the steamer which the Chief Officer of the "Californian" saw at four o'clock, a vessel which had been steaming to the S.W. and afterwards was seen steaming to the N.E. or steaming in a Northerly and Easterly direction. That is the only evidence which seems to connect the vessel which Boxhall saw with any vessel which the "Californian" saw. But I will deal later with the vessels which were in this vicinity at about this time. That is the whole of the evidence which seems to bear upon this question whether the "Californian" and the "Titanic" were ever in sight of each other, and I submit to your Lordship that the conclusion of the whole evidence, the "Titanic's" evidence, the "Carpathia's" evidence, and the "Californian's" evidence, all point to the same conclusion that they were never in sight of each other. If that is so, then the whole foundation of the charge against Captain Lord disappears. The whole significance of what is described as the "Californian" incident at once vanishes if the vessels were never in fact in sight of each other. In that case the rockets seen could not possibly have been the rockets of the "Titanic," but must have been the rockets of another vessel which we have not, unfortunately, got before the Court.

The next question to which I desire to address myself is what steamer was it which the

“Californian” saw and the Fourth Officer of the “Titanic” saw and signalled to. Probably they were different steamers. If it was not the “Titanic” it does not concern me what the steamer was.

*The Commissioner:* Have you made any attempt to find out what the steamers were? *Mr.*

*Dunlop:* Personally, my Lord, I have from the only source available to me, namely, Lloyd’s weekly index.

*The Commissioner:* And have you found out?

*Mr. Dunlop:* Yes, my Lord, I have found out some vessels which I have put on your Lordship’s chart; but, of course, it would ill become the Leyland Line to endeavour to ascertain the name of a steamer which may have seen the “Titanic’s” rockets and did not in fact go to her assistance; it is no part of my purpose. It would ill become the Leyland Line to make enquiries from the Masters or owners of other vessels with a view to showing that there was a vessel nearer to the “Titanic” than the “Californian” herself was, and, therefore, we have made no effort.

*The Commissioner:* Why would it ill become them?

*Mr. Dunlop:* I submit that for them to bring evidence with a view to showing that there was a vessel nearer to the “Titanic” than the “Californian” was, which we know did not in fact go to the “Titanic’s” assistance, or did not in fact render any effective assistance, would only be to involve some other vessel in the criticisms which have been made in the course of this Enquiry.

*The Commissioner:* I think it would be your duty to do it.

*Mr. Dunlop:* Well, my Lord, the view which my clients have taken, and I respectfully agree with them, is that for one shipowner to endeavour to throw blame upon a steamer belonging to some other owner is not what I should have thought would be the loyalty owed by one shipowner to another. It is no part of my purpose and certainly no part of theirs to attempt to throw blame upon any other vessel.

*The Commissioner:* This is a very high sense of duty; I do not appreciate it at all. *Mr.*

*Dunlop:* My Lord, they have not, in fact, done so, but I have had sent to me Lloyd’s Shipping Index, which records the reports of vessels which were in the ice at about this time, and from that index I have been able to locate the position of certain vessels which may or may not have been the vessels which were in sight of the “Californian” or in sight of the “Titanic.” The reason why we cannot put the name to this steamer which we saw is that the evidence before your Lordship is wholly incomplete on this part of the case. When this Enquiry was instituted this question was not formulated. No evidence was directed to ascertaining what vessels were in the vicinity. The only evidence before the Court is the evidence of vessels which were provided with and were, in fact, using the Marconi apparatus. We know the names of a number of vessels that were somewhere in this neighbourhood because we have heard the names in connection with these Marconi messages and some of the Masters of those steamers have as a result been called as witnesses. But there are a great many - there must have been other steamers navigating in this busy highway - which were not provided with Marconi apparatus, and which were not, in fact, if they were provided with it, using the Marconi apparatus, just as the “Californian” was not during the midnight hours; and unless they had Marconi apparatus we are not able to ascertain their names.

No attempt has apparently been made by the Board of Trade to obtain a list of the vessels which were somewhere in this neighbourhood on the night in question; information which no doubt it would be difficult to obtain; but if it had been obtained your Lordship might have been able to get the name of the vessel which I can do no more than describe, a vessel which was apparently bound to Europe, which appeared to be a tramp steamer, which was not provided with Marconi apparatus, and apparently did not use or did not understand Morse signalling. We can only describe the vessel we saw; we cannot put a name to her, and we have not got this vessel before the Court. There is no reason why this vessel should have come before this Court. The circumstances of the "Californian" are such as I think would rather induce Masters to keep away from the Court; they have excellent reasons for keeping away rather than for coming here to say that they were in the vicinity and had an opportunity of rendering assistance, but for some reason or another they were not, in fact, able to do so. The steamers seen by the "Californian" or the "Titanic" may have been either of the two which are mentioned in the deposition of the Master of the "Carpathia."

Now, may I refer your Lordship again to the deposition of the Master of the "Carpathia," on page 746, when he speaks of two vessels other than the "Mount Temple," which he saw at or about five o'clock in the morning - one a four-masted steamer with one funnel and the other a two-masted steamer with one funnel. We do not know the names of either of those two steamers; we do not know to whom they belonged, where they were bound, or where they came from; but clearly these two vessels were at this time near the neighbourhood of the scene of the "Titanic's" loss. It may well have been that the vessel which was seen from the "Californian" was one or other of these two vessels, and it may have been that the vessel which the Fourth Officer of the "Titanic" saw was one or other of these two vessels.

Further, the evidence from the "Californian" shows that there were three, or possibly four, other steamers in this neighbourhood whose names we do not know. The Master described at Question 7400 a vessel which he saw - a two-masted steamer with a pink funnel and a black top, apparently steering to the North-West. Stone, the Chief Officer, at Question 8017, saw, just after 4 o'clock, a steamer with two masthead lights heading to the Eastward or North-East; and at Question 8095 saw three other steamers next morning. Groves, at Question 650, saw a four-masted steamer which he thought afterwards was the "Carpathia," but he must be wrong about that because, according to the "Carpathia" the "Carpathia" and the "Californian" were not in sight of each other until 8 o'clock in the morning. Therefore the steamer that he saw was probably not the "Carpathia." At Question 8339 he says he saw two other vessels. That is Groves, my Lord.

The Chief Officer, Stewart, says at 4 a.m. he saw two masthead lights at Question 8598, and at 8905 he says that at daylight he saw that she had a yellow funnel, and was not the "Carpathia." It is impossible for your Lordship to say, that the vessel which the "Californian" saw was not one or other

of the two vessels mentioned by the Master of the "Carpathia" or one or other of the three or four vessels which were seen next morning by those on board the "Californian." As I say, we do not know their names, because they were not mentioned in the Marconi messages. They either had not themselves or were not using the wireless telegraphy.

I have looked through Lloyd's Weekly Shipping Index for the months of April and May. They mostly contain the reports of vessels that were bound to America. The reports of vessels bound to Europe would not be received at Lloyd's till probably a good deal later. I have only seen those five numbers of Lloyd's Weekly Shipping Index, but the Index, so far as it goes, does mention certain vessels and states the position in which they were, and if I may just refer to one or two of these vessels and describe what their movements were as recorded by themselves, then your Lordship will see that there were vessels in this neighbourhood between the "Californian" and the "Titanic." Has your Lordship the chart before you.

*The Commissioner:* Yes.

*Mr. Dunlop:* When I read through this Shipping Index, I did so with that chart, and I plotted at the time on that chart the positions in order that I might follow the significance of what I was reading. I first take the "Trautenfels." *The Commissioner:* What is the "Trautenfels"?

*Mr. Dunlop:* She is a two-masted black funnel steamer with red stripes, belonging to the Hansa Line at Bremen, and she is mentioned in Lloyd's Weekly Shipping Index of Thursday, the 2nd May, 1912.

*The Commissioner:* Has she any Marconi apparatus?

*Mr. Dunlop:* No, my Lord, she has not. *The*

*Commissioner:* What is her size?

*Mr. Dunlop:* My Lord, I do not know that; she is not in Lloyd's book. *The*

*Commissioner:* Is she a passenger ship?

*Mr. Dunlop:* I do not think so, my Lord; she carries petroleum, I think.

*The Commissioner:* Then I should think she is not a passenger ship.

*Mr. Dunlop:* I am told she is not the petroleum one; she belongs to the Hansa Line. She may or may not be a passenger steamer. It does not say in the Shipping Index. *The*

*Commissioner:* What is her size, and where is she registered?

*Mr. Dunlop:* Two thousand nine hundred and thirty-two tons is her tonnage.

*The Commissioner:* She is a big ship.

*Mr. Dunlop:* She was from Hamburg bound to New York.

*The Commissioner:* What was she carrying; she was not carrying petroleum then you know.

*Mr. Dunlop:* I am told she is not the petroleum steamer; that is the next one.

*The Commissioner:* Well what is she?

*Mr. Dunlop:* I do not know what she is. I only know what I am told here, and I will tell your Lordship what I am told here: "Trautenfels," Hansa, tonnage 2,932, left Hamburg 31st March, bound for New York, spoken on the 7th of April, and then she sends a report which I am going to read to your Lordship.

*The Commissioner:* How do you find out she was at this particular spot?

*Mr. Dunlop:* May I come to that now?

*The Commissioner:* Yes.

*Mr. Dunlop:* I will hand up to your Lordship the Index. Will your Lordship look at page 8 of Lloyd's Weekly Shipping Index under date 2nd May, 1912.

*The Commissioner:* Now let us see that (*The same was handed to the Commissioner.*)

*Mr. Dunlop:* The F is a mistake for T, because in the same number she is described as the "Frautenfels." There is no such vessel as the "Frautenfels"; there is one "Trautenfels." "Reports April 14th in latitude 42.1, longitude 49.53; sighted two icebergs fully 200 feet long and 50 feet high; soon after heavy field ice was encountered which extended for a distance of 30 miles and made it necessary for the steamer to run in a S.W. direction for 25 miles to clear it. In the field ice 30 bergs were counted, some very large. In the Northward no clear water was seen, so that the Captain estimated that the ice in that direction must have extended fully 30 miles long."

*The Attorney-General:* What is it you are reading from?

*Mr. Dunlop:* From Lloyd's Weekly Shipping Index under date 2nd May, 1912. *The Commissioner:* What time?

*Mr. Dunlop:* We have not got that.

*The Commissioner:* Then why have you marked her down on this chart?

*Mr. Dunlop:* That is the latitude in which she is reported on the 14th April. I have not got the time. I can only mark there the latitude which she has given. It may have been any time. It may not have been the vessel which we saw. I cannot put it as high as that, because we do not know at what time she was in this latitude. All we do know is she was there at some time on the 14th April, and she did what the witnesses from the "Californian" described the vessel which they saw did. They saw a vessel encounter ice and then run in a S.W. direction until she went out of sight.

*The Commissioner:* What light of this vessel did you see, a green light, or a red light?

*Mr. Dunlop:* She would be showing her green light.

*The Commissioner:* Yes, but what is your evidence of the light that you saw? One of the witnesses said the green light.

*Mr. Dunlop:* The Master saw a green light.

*The Commissioner:* Two of the witnesses saw a red light.

*Mr. Dunlop:* Three. The others all saw a red light.

*The Commissioner:* Then you know this cannot be the ship if the red light is the right thing - this cannot be the one you saw.

*Mr. Dunlop:* I am quite content if it is not. If your Lordship takes it as the red light we saw of a steamer, then it is clearly not the "Titanic." That throws the "Titanic" out. *The Commissioner:* I quite appreciate that.

*Mr. Dunlop:* I am assuming for this purpose a vessel showing a green light, and the only significance of this is the extraordinary coincidence that what this vessel describes as having done on the 14th April is what the witnesses from the "Californian" say the steamer which they saw did.

*Mr. Dunlop:* I am assuming for this purpose a vessel showing a green light, and the only significance of this is the extraordinary coincidence that what this vessel describes as having done on the 14th April is what the witnesses from the "Californian" say the steamer which they saw did.

*The Commissioner:* Where did you first come across the "Lloyd's Weekly Shipping Index" of the 2nd of May?

*Mr. Dunlop:* Well, I asked for it, my Lord, because I knew that reports were received, and I asked Messrs. Cooper, who instruct me, to get for me some copies of "Lloyd's Weekly Index" for about this period.

*The Commissioner:* It is very nearly two months ago. Where is the "Trautenfels" now?

*Mr. Dunlop:* I do not know, my Lord.

*The Commissioner:* Have you found out her owners?

*Mr. Dunlop:* She appears to belong to the Hansa Line.

*The Commissioner:* Have you communicated with the Hansa Line?

*Mr. Dunlop:* No.

*The Commissioner:* Was that because you did not want to know what they would say?

*Mr. Dunlop:* No, my Lord.

*The Commissioner:* Then, why did you not communicate with them?

*Mr. Dunlop:* Because it is no part of our purpose; it is no part of the object with which we are here to say the "Trautenfels" did anything wrong, and I do not want to suggest that "Trautenfels" failed to render assistance or had any opportunity of rendering assistance.

*The Commissioner:* She would not be likely, I agree, to assist you if that was your object.

*Mr. Dunlop:* No, and it would be unfair to approach them.

*The Commissioner:* I do not agree with you about being unfair at all, but I do agree to this, that if she knew what you were about she would not be likely to help you.

## **Page 891**

*Mr. Dunlop:* No, my Lord, and we could not have asked them without telling them what our object was.

*The Commissioner:* At all events you have not attempted to get any information from her.

*Mr. Dunlop:* No, my Lord, because I have found from the "Index" this information, and when I found it from reading this through one evening with that chart before me, I put the marks on the chart which your Lordship has before you now. So much for the "Trautenfels."

*The Attorney-General:* I think I ought to tell your Lordship - I did not know it till this moment - that we have been making some inquiries with reference to it. There is a reference to the "Trautenfels" in consequence of the funnels - the colour of the funnels and description - we traced that it might be one of the Hansa line, and we have been in communication about it to see if we could ascertain. The letter that I have is from the Treasury Department of the United States Customs Service at the Port of Boston, to which the "Trautenfels" was bound, a letter of the 23rd May. I will read it so that your Lordship may have such information as we have got.

*The Commissioner:* Would you like to have it read?

*Mr. Dunlop:* Oh, yes.

*The Commissioner:* I think perhaps it had better be read.

*The Attorney-General:* We have made a great number of enquiries for the purpose of ascertaining if we can find out what the vessels were.

*The Commissioner:* What question is expressly directed to the conduct of the

“Californian”?

*The Attorney-General:* Well, I think it is 24.

*Mr. Dunlop:* It is wide enough to cover the “Trautenfels.” *The*

*Commissioner:* That is not the one.

*The Attorney-General:* It is the one that covers the “Californian”; that is, if your Lordship has the amended question.

*The Commissioner:* I am afraid I have not.

*The Attorney-General:* I amended it so as to include the “Californian.” *The*

*Commissioner:* What was the amendment?

*The Attorney-General:* “What vessels had an opportunity of rendering assistance to the ‘Titanic,’ and, if any, how was it that assistance did not reach the ‘Titanic’ before the ‘Carpathia’ arrived?” It is the second of those two questions that really is the material one. I do not think the first is material at all. *The Commissioner:* What is the second?

*The Attorney-General:* The second of those two questions I just read, “How was it that assistance did not reach the ‘Titanic’ before the ‘Carpathia’ arrived?” It was framed for the purpose of meeting this point and putting a question to cover it.

The letter is from the Treasury Department, United States Customs Service Boston, to the Commissioner of Navigation at Washington, dated 23rd May, 1912. “In reply to Bureau letter (62052), dated 21st instant, I beg to report that the only steamships known to this office which have a funnel resembling the one described in Bureau letter are those of the Hansa Line. There is an illustration in Part VI. of the list of merchant vessels for 1911. The ‘Trautenfels’ of that line arrived at this port early in the morning on 18th April, and the ‘Lindenfels’ on 20th April. As I am informed that the voyage from the locality mentioned by the Bureau to this port is from three to five days, according to the speed of the steamer, the ‘Trautenfels’ would probably not have been in that locality on 15th April. The steamers of this line do not clear foreign from this port, but proceed to New York with residue of cargo. The s.s. “Inverclyde,” sailing on the American and Oriental Line arrived 22nd April. I have been unable to obtain a description of her funnel. I presume that it can be obtained from the agents in New York. No vessel having a funnel like that described by the Bureau cleared foreign from this port within a period of two weeks prior to 15th April.”

*Mr. Dunlop:* That does not seem to carry the matter much further. What we are dealing with here is a vessel which has given us her position on the 14th of April.

*The Commissioner:* At some time.

*Mr. Dunlop:* Yes, at some time. I cannot put it higher than that, and do not wish to - at some time on the 14th April, and the funnel bears a remarkable resemblance to the funnel of one of the steamers which the witnesses described, black with a red top.

*The Attorney-General:* It is the 15th of April, is it not?

*Mr. Dunlop:* The report is the 14th. She reports that on that date.

*The Commissioner:* Will you refer me to the evidence as to the colour of the funnel.

*Mr. Dunlop:* Yes. It is Question 7400.

*The Commissioner:* Read it to me.

*Mr. Dunlop:* "Was there another vessel near the 'Mount Temple'? - (A.) There was a two-masted steamer, pink funnel, black top, steering North down to the North-West."

*The Commissioner:* Will you tell me when that was?

*Mr. Dunlop:* That was on the morning of the 15th.

*The Commissioner:* What time?

*Mr. Dunlop:* Between 6.30 and 7.30.

*The Commissioner:* Could that possibly be this vessel?

*Mr. Dunlop:* Yes, my Lord, it could. It depends entirely at what time this vessel was in the position which I have marked on your Lordship's chart. We do not know what that time was.

*The Commissioner:* That was on the 14th.

*Mr. Dunlop:* If that was on the night of the 14th, then the position at which this vessel was seen -

*The Commissioner:* Supposing it was on the night of the 14th.

*Mr. Dunlop:* If it was the night of the 14th she would be in the position - *The*

*Commissioner:* She then began to steer a South-Westerly course.

*Mr. Dunlop:* Yes, to try to get out of the ice, apparently.

*The Commissioner:* How many knots does she make? *Mr.*

*Dunlop:* I do not know.

*The Commissioner:* You could not tell where she had got to by 6 o'clock in the morning?

*Mr. Dunlop:* No, it depends upon what speed she was going, and we do not know that; and that depends upon what ice she was encountering which she describes in the report. She apparently steamed 25 miles through ice, through an ice-field which he describes as heavy field ice containing some 30 bergs. I cannot put this higher than that with the information contained in Lloyd's Index it is possible that was the vessel which those on board the "Californian" saw.

Then, my Lord, there is the steamship "Paula." She is the petroleum steamer. *The*

*Commissioner:* Is she also in this same newspaper?

*Mr. Dunlop:* On page 11 of the 9th of May number.

*The Commissioner:* Have you given us the best one?

*Mr. Dunlop:* Yes, the "Trautenfels" is the best, because she steams to the S.W.

*The Commissioner:* The "Trautenfels" is the best you have got, you say?

*Mr. Dunlop:* Yes; the "Paula" is very good.

*The Commissioner:* Are they all very good?

*Mr. Dunlop:* These are the two best, my Lord, because these are the only two which gave us their position on the 14th April.

*The Attorney-General:* Have you a description of the "Paula"?

*Mr. Dunlop:* Yes. The "Paula" is a three masted oil tank steamer of 2,748 tons gross with a black funnel and a red R. I have got her funnel here. It is a black funnel with yellow and a red R on the yellow, and she belongs to the Deutscher-Americana Petroleum Company of Hamburg.

*The Commissioner:* What size was she?

*Mr. Dunlop:* She is 2,748 tons. She gives her position.

*The Commissioner:* She is a petroleum ship.

*Mr. Dunlop:* Yes.

*The Commissioner:* She is not likely to look like a passenger boat?

*Mr. Dunlop:* No, she would look more like what the Master and Second Officer and Gibson say, a medium-sized vessel, apparently a tramp, not having the appearance of a passenger steamer.

*The Commissioner:* Would she have her funnel aft?

*Mr. Dunlop:* That I do not know, my Lord; I think not.

*The Commissioner:* I am told a tank steamer always has its machinery and funnel aft?

*Mr. Dunlop:* Well, your Lordship is informed about that. It may not have been. I do not wish to take up time going through the position she gives, but your Lordship will see on the number of the Index that I have handed up.

*The Commissioner:* I see where you have marked her on the chart.

*Mr. Dunlop:* That is transferring to the chart the latitude and longitude which she gives. Again, my Lord, we are not told the times; we only know those were the positions which she reported as having been in at some time on the 14th of April. There, again, your Lordship will see a steamer going to the Westward and then apparently steaming a SouthWesterly direction in order to avoid the ice-field. In addition to these vessels there are some others, the "Memphian," the "Campanillo," and the "President Lincoln." I have put their positions on the chart.

*The Commissioner:* Is the "Memphian" on the chart.

*Mr. Dunlop:* Yes, I think so. I do not know anything about the "Memphian." She is not in Lloyd's Register. I am told the "Paula," and the "Trautenfels," are both in Lloyd's Register, but the "Memphian" is not. I ought to say that the "Campanillo" and the "President Lincoln" both had Marconi apparatus.

*The Attorney-General:* I have some information about the "Paula," if it is of any use. Enquiries have been made of a very extensive character for the purpose of dealing with this point. This has gone through the Board of Trade to the Foreign Office to America to make enquiries. This is the answer on May 27th, from the Treasury Department of the United States Customs Service, Port of Arthur, Texas: "I have the honour to reply to your letter 62052-N of May 21st, 1912, relative to a vessel in the vicinity of the "Titanic" disaster, and to say that I am unable to find any vessel with a black funnel and white band that has entered here since the disaster that would have been in the vicinity at or about the time of the disaster. The German steamer "Paula" (oil tank), Rieke, Master, and owned by the Deutscher-Americana Petroleum Gesellschaft, of Hamburg, W. T. Worden, 26, Broadway, New York, American agent, arrived at the Port of Sabine, this district, on April 29th, and the Master stated that he passed through the ice-field on Sunday a few hours before the "Titanic," and that, finding the ice getting worse, he changed course directly to the South for 25 or more miles. It may be possible that Captain Rieke may have seen the vessel of which you request information. The "Paula" cleared hence for Ozelosund, Sweden," I do not think it helps very much.

*Mr. Dunlop:* What I submit is that the evidence before your Lordship on this part of the case is so imperfect, so incomplete, that it would be wrong to infer that the vessel which was seen was the "Californian," because your Lordship is not able to put a name to the other vessels which the witnesses have described. That is the reason why I have mentioned these other vessels.

Then there is the question: Why did the steamer which the "Californian" saw exhibit rockets? The answer to that question is that we do not know, because nobody has been called from that steamer, whatever she was. All we can do is to speculate.

*The Commissioner:* You may be wrong about that. A number of people were called from the "Titanic."

*Mr. Dunlop:* Yes, but if it was not the "Titanic"?

*The Commissioner:* I agree that if it was not the "Titanic," nobody has been called from this steamer.

*Mr. Dunlop:* Nobody has been called from the steamer and therefore we can only speculate as to why it was that this steamer which the "Californian" witnesses describe was seen exhibiting rockets. They have given their explanation and put forward their theories, and I want to mention the theories which have been put forward to your Lordship, because I submit that the theories of the men who were on the spot, who not only saw the rockets, but also saw the movements and the class of vessel that was exhibiting the rockets, is very much more likely to be right than the opinion of people who like ourselves were not there. The explanation of these rockets in the first place may be that they were answering rockets, that they were rockets fired by a vessel which was between the "Californian" and the "Titanic," fired in answer to some other vessel which may have been in distress; or, it may be that the vessel which fired the rockets had sustained the kind of damage which a vessel is likely to sustain in field ice; she may have broken a blade or two of her propeller or damaged her rudder and wanted a tow in daylight. She may have been signaling to the "Californian" to stand by till daylight with a view to towing her if she required towage in the morning.

*The Commissioner:* I do not know; do people signal by means of rockets in such a way as to indicate a request to stand by? *Mr. Dunlop:* It is the only means.

*The Commissioner:* I thought the signals were "Come to our assistance," not to stand by.

*Mr. Dunlop:* My Lord, there is no other signal to the eye, if you exclude Morse signalling, than rockets.

*The Commissioner:* Would rockets mean, or may they mean, "We are foundering"? *Mr. Dunlop:* It may mean that and it may mean a great deal less than that.

*The Commissioner:* You do not stand by at a distance of 10 miles for that.

*Mr. Dunlop:* The evidence is 6 miles.

*The Commissioner:* You go to the vessel, at least, I should think so. What is the use of standing by 6 miles away when a vessel is going down to the bottom? I do not know.

*Mr. Dunlop:* No, my Lord, but supposing this vessel was not going down to the bottom?

*The Commissioner:* We do not know whether she was or was not.

*Mr. Dunlop:* No.

*The Commissioner:* Are you going to stand off 6 miles away and trust to chance and say to yourselves “She may be going down to the bottom or she may not, so we will stay here”?

*Mr. Dunlop:* What these witnesses saw was this: they saw a vessel steaming through field ice and then stopping, and they had this vessel under observation. It may well have been that this steamer stopped because owing to moving in field ice she had damaged her propeller or her rudder, stops for the purpose of making an examination, discovers on examination that she has damaged her rudder or propeller, sees a vessel some five or six miles away which she may want to tow her when towage is possible, and signals to her for that purpose. She has no other means of conveying to that other vessel the request that that other vessel shall stand by her. At least, I know of no other signal. If she has wireless telegraphy she may do it by wireless or she may use Morse signals, but this vessel was not in fact using Morse signals while she was under observation. Eliminating wireless telegraphy and Morse signalling she was using the only means of communication that would be at her disposal.

The first theory, namely, that these signals were not signals of distress in the sense of not being signals from a vessel which was herself in distress,

### **Page 893**

was the theory of the witnesses from the “*Californian*,” the witnesses who saw the rockets. It is the view which they say they formed at the time; it is the view which they stated in the witness-box here. I will give your Lordship a reference to Stone’s evidence on this point, because Stone and Gibson were the two men on duty at the time these rockets were seen. Stone is Questions 7844, 7856, 7866, 7896 to 7898, 7970, 7993, and 7997. Gibson is Question 7696.

Not only is it the view, they say, they formed at the time, and adhere to here, but it is the view which their reports conveyed at the time to the Master, Question 6917, and the view which their reports conveyed to the Chief Officer when they were relieved by the Chief Officer at 4 o’clock in the morning. That appears in the Chief Officer’s evidence at Questions 8582, 8586, 8611, 8862, and 8868.

Ridicule was thrown at the time on this suggestion that a vessel would fire distress rockets as a means of answering some other vessel, but this theory obtained remarkable confirmation a day or two after the “*Californian*” witnesses left the witness-box, when we got the evidence from the “*Carpathia*.” The “*Carpathia*” sent up rockets in order to indicate to those in the “*Titanic*” that the “*Titanic*’s” distress signals had been recognised and that the “*Carpathia*” was going to her assistance. I should have thought it was the only means at night if a vessel sees another sending up distress rockets, and wishes to acknowledge that she has seen them and is going to act upon them.

*The Commissioner:* Then why did not you send up rockets?

*Mr. Dunlop:* We were Morse signalling to her, and we were standing by, so that the theory of the witnesses themselves is supported by what the “*Carpathia*” is said to have done at Question 9570; in other words, to sum it up, those rockets were not signals from a vessel in distress; they were answering signals, signals of reply, and not signals of request for assistance. That is their theory. If the Second Officer, who was the only officer who

saw the rockets, had thought they were signals from a vessel herself in distress, what would his conduct have been?

*The Commissioner:* That is what I wondered.

*Mr. Dunlop:* In the first place, I submit he would have reported to the Master that he saw a ship in distress and signalling for assistance. He made no such report; he stopped and discussed whether they were private night signals, or whether they were signals of distress.

*The Commissioner:* He should not have stopped to discuss anything about it; he should have gone to the Master at once.

*Mr. Dunlop:* He did not do so, my Lord, because he did not think that they were signals from a vessel herself in distress. That is his view. His view may have been wrong or it may have been right, but he was there.

*The Commissioner:* Was he the man who said "I do not suppose that ship is sending up those signals for nothing"?

*Mr. Dunlop:* I think there was some discussion of that kind with Gibson, the Apprentice, or Gibson said so. What I wish to point out is that the conduct of the Second Officer at the time is quite inconsistent with the conduct of a man who has seen rockets which he thinks to be signals from a vessel herself in distress.

*The Commissioner:* I agree with you there - it is.

*Mr. Dunlop:* And therefore one has to look in order to ascertain what it really was they saw, one has to test it by what they did at the time, by their conduct, and their conduct at the time is the best indication in my submission, of what it really was that they saw, what impression was conveyed to their minds by the rocket which they saw, and the movements of the steamer which they saw.

In the second place he would take effective measures to call the Master and get him to come on deck if for no other higher motive than that of shifting the responsibility for inaction from his own shoulders to that of the Master. He was quite content to remain during that watch with the knowledge that the Master was sleeping in the chart room alone, and he made no attempt to bring the Master on to the deck. I say he would certainly have called the Master on deck and communicated with him and taken measures to see that the Master did come on deck if he had for one moment thought there was a vessel in distress and wanting assistance. He would also have called the Marconi operator. It would have been no trouble for him to do so; he would have done that, and not remained content with signalling to her by Morse signals. *The Commissioner:* What was the colour of the rockets that you saw?

*Mr. Dunlop:* I do not know, my Lord; they were said to be white rockets, and there was a discussion as to whether they had any colours in them or not.

*The Commissioner:* They were white rockets.

*Mr. Dunlop:* I think the evidence is they were white rockets.

*The Commissioner:* What was the colour of the rockets from the "Titanic"? *Mr.*

*Dunlop:* Oh, white rockets.

*The Commissioner:* At all events, the rockets you saw were the same colour. *Mr.*

*Dunlop:* Oh, yes, they were the same colour as, I suppose, most of the rockets that exist

in the world are. Most rockets are white rockets. *The Commissioner:* Are there not some green and red?

*Mr. Dunlop:* Yes. Some use what are called private night signals which consist of different coloured balls thrown up, red and green and blue. There are coloured rockets in use, but I think I am right in saying the rocket most generally used is the white rocket.

*The Commissioner:* Distress rockets may, according to the Rules, be anything?

*Mr. Dunlop:* Yes, they may be any colour.

*The Commissioner:* They are generally white.

*Mr. Dunlop:* I expect they are generally white because most rockets are white. My Lord, he did not call the Marconi operator; he was content to go on signalling to this vessel by Morse signals and getting no reply. That I submit he would not have done had he thought this vessel was a vessel in distress and wanted assistance. He would not have been content with the steps he took to get into communication with her. And lastly, if they had been distress rockets, you would have found those signals entered in the scrap log. According to the evidence they were not entered there.

*The Commissioner:* We have never seen the scrap log.

*Mr. Dunlop:* No, my Lord, and the Third Officer, Groves, who had no responsibility in the matter at all because at all material times he was below, was asked if he saw the scrap log on the following morning and he said he did. He was asked was there any entry in the scrap log of those signals.

*The Commissioner:* I have forgotten what your explanation is, or was, of the fact that rockets are not referred to in the log at all. What is the explanation?

*Mr. Dunlop:* The explanation is because they did not think that the rockets were signals of distress. They thought they were what they call private night signals.

*The Attorney-General:* They did the next morning when they knew what had happened to the "Titanic."

*Mr. Dunlop:* Not the officers.

*The Attorney-General:* Oh, yes.

*Mr. Dunlop:* They still in the witness-box denied that they were distress rockets in the sense of being rockets from a vessel in distress. The whole of their evidence is to the effect that they were not. In one sense distress rockets, true, because they are rockets which show a white light, but in the sense of being rockets from a vessel in distress their answer is no, and there is no evidence to the contrary.

*The Commissioner:* How many rockets did you see?

*Mr. Dunlop:* I think, my Lord, the evidence is about eight.

*The Commissioner:* How many rockets did the "Titanic" send up?

*Mr. Dunlop:* We do not know. She said she was sending up rockets for about an hour.

## **Page 894**

*The Attorney-General:* From 12.45.

*Mr. Dunlop:* For about an hour, I think, the Fourth Officer said.

*The Commissioner:* Is not there any evidence as to the number they sent up; does not one witness say about 8.

*Mr. Dunlop:* I think one witness did say about 8.

*The Commissioner:* You saw eight, and the “Titanic,” according to some of her witnesses, sent up eight.

*Mr. Dunlop:* That is so, but I do not suppose that the man who sent them up was counting them. I think, on the whole, we saw more than that, because, after seeing the eight the witness described seeing three more.

*The Commissioner:* One of the “Titanic’s” witnesses said they sent up eight to twelve, I think.

*Mr. Dunlop:* And the witnesses from the “Californian” describe seeing rockets a considerable time after the “Titanic” had ceased to exhibit rockets. They saw rockets till nearly 4 o’clock in the morning.

*The Attorney-General:* It is suggested they came from the boats.

*The Commissioner:* The “Carpathia” was sending up rockets then, was she not?

*Mr. Dunlop:* The “Carpathia” was a long way off, steaming up towards the “Californian” at that time. I do not think it was suggested that the rockets which were seen about 4 in the morning were the “Carpathia’s” rockets.

*The Commissioner:* At all events, does not it come to this, that the “Titanic” was sending out white rockets and you saw white rockets; that the “Titanic” sent up about eight rockets, and you saw about eight rockets?

*Mr. Dunlop:* Yes, it is a coincidence.

*The Commissioner:* Yes, it is a coincidence.

*Mr. Dunlop:* As to the colour, it is not of importance, because that is the colour of rocket you would expect if a rocket was sent up at all. The number, again, my Lord, is purely guesswork on the part of the officer who was firing them, because he was not counting them. What he said was, “I was sending up rockets during the course of an hour.”

*The Commissioner:* And did not you see the rockets just at the same time that the “Titanic” was sending her rockets up?

*Mr. Dunlop:* I have looked through the evidence in order to try to fix the time at which the Fourth Officer of the “Titanic” sent up those rockets, and I have not been able to fix the time.

*The Commissioner:* At all events, we know it was not before the collision with the iceberg.

*Mr. Dunlop:* Oh, no; somewhere between 1 and 2.

*The Commissioner:* Did not you see them somewhere between 1 and 2?

*Mr. Dunlop:* We saw some between 1 and 2 and some between 2 and 3.

*The Commissioner:* Oh, yes, and some between 2 and 3 possibly, but you see the same colour that the “Titanic” sent up; the same number that the “Titanic” sent up, and you see them just about the same time that the “Titanic” is sending them up. *Mr. Dunlop:* Yes.

*The Commissioner:* Those are all coincidences.

*Mr. Dunlop:* Is not that perfectly consistent with the view that the vessel firing rockets was firing answering rockets? If so, the numbers and the colours would coincide. *The Commissioner:* I was on a different point. I was on the question as to whether you saw the “Titanic’s” rockets.

*Mr. Dunlop:* Yes, and I submit not. The fact that we saw eight and saw white rockets does not show they were the “Titanic’s” rockets because that happens to be the number which her witnesses say they sent up, or the colour which they sent up, because if they were answering rockets as is the theory of the witnesses from the “Californian,” you would expect to find precisely the same coincidence; or you might find the same coincidence. For every rocket on the “Californian” sent up there was one sent up in reply from the intermediate steamer.

*The Commissioner:* But you do not signal at night by means of rockets in the same way that you would signal in the daytime by means of flags, do you?

*Mr. Dunlop:* Oh, no.

*The Commissioner:* I mean you do not carry on conversations by means of rockets.

*Mr. Dunlop:* No, but if rockets are sent from a vessel herself in distress and the steamer seeing them wishes to acknowledge them, if she has not got the means of acknowledging them in any other way she will or may very likely fire rockets. At any rate that is the theory of the witnesses from the “Californian.” That is the view they formed at the time. It may be now that we know what, in fact, was happening that their theory was wrong, but we are now dealing with the conduct of the men at the time, and we must judge that conduct, I submit, by the views that they formed at the time. Their theory is, I submit, quite consistent with the colour of the rockets and the number of the rockets, if, as they say, these were rockets fired in answer to rockets from a vessel herself in distress. It may be the vessel which the “Californian” saw firing these rockets, being between the “Californian” and the “Titanic,” was herself seeing the rockets from the “Titanic” and taking that means of acknowledging that she had seen them.

*The Attorney-General:* When I was putting some questions to Gill, the donkeyman, dissented from the suggestions which I have made that nobody who saw the rockets attached any importance to them at the time or thought they were signals calling on the “Californian” to render immediate or any assistance.

*The Commissioner:* That is not in accordance with the conversation that took place - “A ship does not fire up rockets for nothing.” There was a conversation between the two men to that effect. The one says to the other, “A ship is not sending up rockets for nothing.”

*Mr. Dunlop:* Those men have their conversation. Both said to each other, and said when they came here, that they were not signals from a vessel in distress. True, they made that observation that they were not sending them up for fun, and I do not suggest that she was. On their theory, it was far from fun she was indulging in, but this vessel was sending up rockets in answer, as they thought, to some other vessel which may have been in distress. So satisfied were Stone, the Second Officer, and Gibson, the Apprentice, that the vessel whose rockets they were seeing was not in distress that although after five minutes past two they saw two or three more rockets, according to their evidence, they thought there was no need to tell the Master, much less to call him. I submit that is very significant that they should have seen two or three more, knowing that the Master was remaining below, and should not have reported these additional rockets to him. That only shows that what they were seeing did not at the time convey to their minds that the rockets were rockets from a vessel in distress. That appears at Questions 7588 and 7601.

It is easy for critics who were not there, speaking with the knowledge that comes after the event, to say that these men ought to have attached importance to them at the time. It

is very easy to say that, but one must remember that these men were watching the steamer herself. They saw what her movements were, and what she was doing, and the rockets, taken in conjunction with what they saw led them to think that the steamer which they saw was not in distress. And the opinion of men on the spot is generally more reliable and more accurate than the opinion of persons who were not.

The steamer they saw disappearing in the distance as she steamed away to the SouthWest may or may not have been the steamer which the Fourth Officer of the "Titanic" said he saw approaching not answering his Morse signals, and afterwards steaming away. It is significant that the same witnesses who described the firing of these rockets say that as soon as the vessel which they saw began to fire rockets she at the same time began to steam away to the South-West and steamed away until gradually her lights were lost sight of in the distance. That is the evidence, and the reports made

### **Page 895**

at the time by the Second Officer and by Gibson. If that is true the vessel that was firing these rockets cannot have been the "Titanic," because the "Titanic" at this time was lying stopped, and the fact that they saw this vessel steaming away at the same time as they saw the rockets no doubt was the factor which led them to suppose that the vessel that they saw was not herself in distress, but was going off in answer to some other vessel which was away to the Southward of her.

Now, my Lord, I want to deal, if I may quite shortly, with the case on the assumption that the vessel which was seen, and whose rockets were seen was the "Titanic." I am going to ask your Lordship to judge of Captain Lord's conduct by the circumstances as they were present to his mind at the time these events happened. Captain Lord was a young Captain, some 35 years of age, who had worked himself up in the Leyland Line by his care as a navigator. For some six years he had been in command of Leyland Line steamers, and he had shortly before been promoted to command the "Californian," a fairly large passenger steamer of over 6000 tons. As a Captain, his first care and duty was the safety of his own vessel. On the 14th of April he was on duty all day. He had never been in ice before or in the neighbourhood of icebergs. Icebergs had been reported to him by East-bound steamers. He was keeping a sharp look-out for ice, and he passed various icebergs that day, as are recorded in the log. After darkness set in he ran into thick field ice, which obliged him to stop his ship at 10.21. While taking every precaution for the safety of his own vessel and her crew, he was not unmindful of the safety of other vessels. He was in no way callous up to that time, because by means of his wireless apparatus he communicated to vessels in the neighbourhood the position of the icebergs that he had passed earlier in the evening, and when he stopped in the ice he communicated the fact to the "Titanic," which he knew was somewhere in the neighbourhood, showing that he had regard for the safety of other vessels besides his own. Between 10.21 and 12.15 he saw that the field ice extended in all directions. He said it extended as far as the eye could reach. It was thick ice; it was ice that was crunching and grinding against the ship's sides with such a noise that the donkeyman, Gill, was unable to sleep. He was, therefore, in a position in which it was obviously dangerous to move his ship or his rudder or propeller, a danger which he would not have been justified

in running especially in the dark except in the case of clear and unmistakable necessity. At 11 o'clock he sees this mysterious steamer which, rightly or wrongly, he judged at the time and said at the time was a cargo boat and not a passenger boat. He watched her approach. At 11.30 he saw her stop owing to the field ice, as he thought, and the fact that she did stop just as he had stopped would no doubt confirm the wisdom of his resolution not to move his engines till daylight. At 12.10, according to the evidence, the Third Officer was relieved by the Second Officer. The Third Officer goes to bed. So does the Marconi operator; neither of those two are suspicious at all that anything was taking place. At 12.15 the Master goes to his chart room with his clothes and boots on, to lie down after he had been 17 hours on duty. He gives orders to be called at daybreak, because he had decided not to get underway before daybreak; and he told the Second Officer to tell him if the mysterious steamer either came nearer or moved away. If it came nearer he might have to shift his position. If she steamed away, and it was safe for her to do so, that might affect his decision not to proceed on his voyage till daylight; therefore, he gives this direction to be informed as to the steamer's movements, not that he has any idea that the vessel is in danger, but because her movements may affect his.

At about 1 o'clock in the morning the Second Officer, speaking through the speaking tube, reports that he has seen rockets, but the Second Officer did not think and did not report that the steamer which was firing these rockets was in distress. That report did not convey, and was not intended to convey to the mind of the Master, that the vessel was in distress. The Master then told the Second Officer to Morse signal to her and find out why she was firing rockets and to send Gibson to report the result. At five minutes past two in the morning Gibson reports that she would not answer the Morse signals, that she had fired more rockets, and was steaming away to the South-West. At this point there is a conflict of evidence as to whether the Master was asleep, as he says he was, or was awake, as Gibson says he was. The truth probably lies between the two; the man was half asleep, and in that condition the Master repeated the question which he had put earlier in the evening to the Second Officer as to the colour of the rockets.

I am going to submit he put that question because he could not understand how the steamer which he himself had seen and which was then reported to him to be steaming away to the South-West could be wanting assistance, and the description of her movements, therefore, created a doubt in his mind as to whether they were signals of distress or not, and, therefore, he enquired as to the colour of the rockets. He also asked what o'clock it was. I venture to think he asked that question because he wanted to know how long it was before daybreak, in case assistance might be wanted.

The attitude of his mind was this: "If she is steaming away to the South-West, then these are not distress signals and she is not in need of my assistance. If she is lying stopped she may have sustained some damage to her propeller or her rudder. I can do nothing for her until daylight; I am stopped here in the ice and so is she. I will wait till daylight." That appears to have been the attitude of his mind as the result of the communications made to him by the Second Officer and by the Apprentice Gibson. In any case, he was entitled to rely on the watch on deck sending for him if they thought there was any need for him to be on deck. They were the judges of the situation, and he was entitled to rely, and did rely, on their judgment.

I should like to read two answers which he gave to Question 7373 and the following questions, because I submit those answers are the explanation of his inactivity. "(Q.) Did you question your Second Officer as to why you had not been called? - (A.) I did. (Q.) What was his explanation to you? - (A.) He said that he had sent down and called me; he had sent Gibson down, and Gibson had told him I was awake and I had said, 'All right, let me know if anything is wanted.' I was surprised at him not getting me out, considering rockets had been fired. He said if they had been distress rockets he would most certainly have come down and called me himself, but he was not a little bit worried about it at all. (Q.) If they had been distress rockets he would have called you? - (A.) He would have come down and insisted upon my getting up." He was relying upon the Second Officer and Gibson, and if any erroneous impression was drawn by these men who were on watch, it was not Captain Lord's fault. He was entitled to rely upon them, and he was lulled into a state of security and unsuspection by the reports that he got and the way in which those reports were made. He is allowed to continue his sleep and is called at daybreak, in accordance with the orders he had given the night before. Then he hears of the loss of the "Titanic." As soon as he hears of the loss of the "Titanic" he proceeds towards her with all possible speed, and all the witnesses are agreed that as soon as the necessity for taking action was brought home to Captain Lord's mind he at once took action, and extreme action. He steamed at full speed through the field ice which has been described, and successfully did so, and at 8.30 he arrived at the "Carpathia's" position. At 7.30 he passed a vessel blocked in the ice. He thought at the time it was the "Mount Temple." It is quite clear now, from the evidence given by the Master of the "Mount Temple," that the "Mount Temple" was a good deal further to the Southward, and, therefore, the vessel he saw stopped in the ice must have been some vessel other than the "Mount Temple." But that is what he sees at 7.30, a vessel which although comparatively near the scene of the tragedy is herself so involved in

## **Page 896**

ice that she is unable to force a passage through it. Captain Lord, however, does so, and he eventually gets alongside the "Carpathia" at highest speed at 8.30 in the morning. When he gets alongside he is told by the "Carpathia" that she has picked up all the survivors. Captain Lord is not content with this assurance. For two hours after that he searches amongst the wreckage in the hope that he may pick up any of those who may happen to survive. The conduct of Captain Lord that morning was not the conduct of a man who was callous or indifferent to the duties which he owes to humanity. I submit that his inaction was purely the result of ignorance of the conditions that were actually existing some two or three miles away from him on this particular night. He was entirely ignorant of what was going on during the time he was resting in the chart-house. Had he only known, he would have rushed to the "Titanic's" assistance, and no one regrets more than he does that he did not do so, but the remorse for his apparent inactivity during these fatal hours of midnight is relieved by the knowledge that if he had gone to this vessel's assistance when called by Gibson at five minutes past two he could not by any possibility have got to her before the "Carpathia" had herself arrived upon the scene.

As I have already explained to your Lordship the "Californian" was distant two and a half hours steaming from the position of the "Titanic" and if he had gone to her assistance at 5 minutes past 2 it is perfectly obvious that he could not have reached her until after about 4.30 which was half an hour after the "Carpathia" got there. That is assuming that he could have made at night the progress which he was able to make in the daytime, and it is very unlikely if at night he had proceeded in the direction in which the "Titanic" was that with this field of ice in front of him he would ever have got there. But I submit that on this evidence it is abundantly clear that even if he had taken action at 2.5 which is the time it is suggested he ought to have taken action, he could not possibly, by reason of the distance and the time intervening between himself and the "Titanic," have reached the "Titanic" in time to have been of any assistance at all. Even if he had gone at 1 o'clock in the morning, which was the time when first rockets were seen he could not have arrived there until 3.30, more than an hour after the "Titanic" had sunk. So that in no view, as I submit of this case, would the conclusion be a fair one that any life would have been saved or any suffering relieved had the master of the "Californian" not remained inactive between 1 and 6 o'clock in the morning. My Lord, that is his evidence at Question 7406, if I may read one or two answers to your Lordship on this part of the case because they put what his view is. "(*Mr. Dunlop.*) Assuming that she sank somewhere between 2 and 3, could you in fact, if you had known at 1.15 a.m. in the morning that the "Titanic" was in distress to the southward and westward of you, have reached her before, say, 3 a.m.?" - (A.) No, most certainly not. (Q.) Could you have navigated with any degree of safety to your vessel at night through the ice that you had encountered? - (A.) It would have been most dangerous. (*The Commissioner.*) Am I to understand that this is what you mean to say, that if he had known that the vessel was the "Titanic" he would have made no attempt whatever to reach it. (*Mr. Dunlop.*) No, my Lord. I do not suggest that. (*To the Witness.*) What would you have done? No doubt you would have made an attempt? - (A.) Most certainly I would have made every effort to go down to her. (Q.) Would the attempt from what you now know in fact have succeeded? - (A.) I do not think we would have got there before the "Carpathia" did if we would have got there as soon." His attempt would have failed. As I say he laments that he did not make the effort, but I submit also that if he had made the effort it is one which certainly would not have done any good to the "Titanic" and might possibly have only added the "Californian" to the "Titanic" tragedy.

There are reasons why in my submission your Lordship, even although you may take an unfavourable view of Captain Lord's conduct, ought to refrain in your report from censuring him. There are three grounds on which I submit that your Lordship, even although you think that his conduct merits rebuke, ought in your report to refrain from rebuking him. The first ground is, I venture to think, the ground of public policy. I submit it would be a grave mistake to introduce into your report a topic which cannot but affect the prestige of the British Mercantile Marine if the topic is introduced for the purpose of censuring the conduct of Captain Lord. Your Lordship's report will have an international interest and importance. It will be circulated by the press in all foreign countries, or in most foreign countries, and if it contains any censure of the "Californian," it will put into the hands of foreign critics a weapon of attack on the reputation of the British Mercantile Marine, of which we are very justly proud and jealous. I mention this in order that your

Lordship may have present to your mind this aspect of the case, and consider whether it is in the public interest that publicity and advertisement should be given to what has been called the "Californian" incident.

But in the interests of justice the report ought not to pass any censure on Captain Lord. In the first place the Commission was not appointed to enquire into his conduct at all. His conduct had absolutely nothing to do with the objects of this Enquiry as stated by the Attorney-General in his opening speech. There was no jurisdiction to hold any Enquiry into Captain Lord's conduct. Under the Merchant Shipping Act an Enquiry may be held into the conduct of a Master who, after being in collision with another ship unreasonably fails to stand by her or give her his name. But apart from that section there is no power to hold an Enquiry into the conduct of a Master who, after being in unreasonably withheld assistance from a vessel in distress. It is admitted that there is no jurisdiction here to suspend or cancel Captain Lord's certificate. If it has not that jurisdiction, it has no jurisdiction to censure him, because censure is merely ancillary to the jurisdiction which the Court possesses if it has jurisdiction of cancelling or suspending his certificate. Censure is frequently an alternative to the power which the Court has of suspending or cancelling a certificate in a fit case. But if the Court has no jurisdiction to deal with his certificate it cannot have a jurisdiction to express censure on his conduct. Whatever we may think, they are merely opinions which ought not to have the sanction which your Lordship's report would give to the opinions which your Lordship may possibly hold. If the Board of Trade had power to order an Enquiry into Captain Lord's conduct, it did not exercise the power, and it cannot now treat the Enquiry, which was not into his conduct, as if it had been.

Under the Rules which regulate proceedings at these enquiries, if a charge is made against a Master, he must be told what the charge is. That is required by the Merchant Shipping Act, and is also required by the Rules which govern the procedure on these enquiries. The Rules are set out at page 723, and under Rule 3 he must, when an Enquiry is ordered, be served by the Board of Trade with a notice in the form which your Lordship will find on page 729, containing a statement of the questions which, on the information then in possession of the Board of Trade, they intend to raise on the hearing of the investigation, and service of this notice is essential in order to make a Master a party to an Enquiry.

From the little experience I have had of Board of Trade enquiries, the very first step taken in a Board of Trade Enquiry is to formally prove service of these notices upon the men whose conduct may be called in question. No such notice was given to the Master of the "Californian." On the 26th of April, Captain Lord and Gill gave their evidence at the American Court of Enquiry, and a transcript of that evidence was in due course transmitted to the Board of Trade. On the 11th of May, on the arrival of the "Californian" in Liverpool, statements were taken by the officers of the Board of Trade from Captain Lord, the three officers, two Apprentices, an A.B. and some of the engine room staff. On the 14th of May, Captain Lord attended

here and gave his evidence, and his testimony was relevant to some of the questions which have been submitted to your Lordship. I asked on that occasion to be allowed to appear on behalf of the "Californian" and the Master, and my application was very properly resisted by the Attorney-General and objected to by your Lordship. My application was resisted or certainly not assented to by the Attorney-General, who properly explained that although the evidence showed that rockets were seen by the "Californian," and the evidence showed that the "Titanic" was not very far from the "Californian," it was very difficult to say that that evidence had any bearing upon the questions submitted to your Lordship, and, therefore, as the "Californian" was sailing, he proposed to put a few questions to the witnesses. That is, on the 14th of May after the Board of Trade had all the information which they now have bearing on the "Californian" incident. No charge at that time was made against Captain Lord, no intimation was made that any charge would be made, and he was not made a party to the Enquiry. He appeared here in no other capacity than as a witness to give to the Court such assistance as he could in answering questions which had then been submitted by the Board of Trade for your Lordship to answer. And the capacity in which I appeared is properly stated on the front page of the various records of the day's proceedings "as having watched the proceedings on behalf of the owners and officers of the "Californian," as distinct from "appearing on behalf of the 'Californian,'" which are the words I see opposite more distinguished names. It is not until the 14th of June, a month after Captain Lord has left the witnessbox, that an intimation is given that the Board of Trade propose to formulate a question relating to the "Californian," which would give the Court an opportunity of censuring Captain Lord. It is not my province nor my purpose to criticise the procedure which has been adopted with relation to the "Californian," but it is manifest from the statement of facts as I have stated them, that Captain Lord has been treated here in a way which is absolutely contrary to the principles on which justice is usually administered, or on which these enquiries are generally conducted.

I respectfully urge the Attorney-General to consider whether this question ought really to be put at all. The object of it is explained by the Attorney-General on page 649. There it is stated that the object of this question is that the Law Officers of the Crown should get from your Lordship a finding of the facts relating to the "Californian" incident in order to enable them to make up their minds whether, in the public interest, they ought to institute criminal proceedings which may be instituted under Section 6 of the Maritime Convention Act. If that is the object of the question, I submit it is a wholly unfair object. If this man may be prosecuted hereafter, he ought to have had notice of this question before he entered the witness-box; he ought to have known precisely what the charge made against him was, and he ought to have had an opportunity of hearing the evidence given by the other witnesses before he himself had to give his own evidence.

If you deal with this question, my Lord, and find the facts against Captain Lord, what chance would he have of a fair and impartial trial before a jury which had read your Lordship's report? If that is the object, my Lord, of this Question, this invitation to your Lordship to find the facts with regard to the "Californian" incident, if the object is with a view to future proceedings, I respectfully and strongly urge that it is a most unfair object. If that is not the object, then I do not know what the object of the question is. If it is not in the public interest that Captain Lord should be charged with a failure to render assistance,

then the question ought not to be raised so publicly here in the form of the question which has been submitted to you.

Captain Lord has already been sorely and severely punished for his apparent inactivity during these fatal midnight hours. That inactivity, whichever view your Lordship may take of the facts, is, I venture to submit, an inactivity due to mere thoughtlessness or error of judgment and not to any willful disregard of duty. He may have relied too much on his Second Officer and Gibson, the Apprentice; he may have erroneously drawn a wrong inference from the reports which they made to him. Whatever his conduct was it was conduct due to a want of appreciation of what the real circumstances at that time were, and not to any willful disregard of duty.

The ordeal of public criticism and public censure, through which he has already passed, will, without further censure, be a sufficient warning to him and to other Masters of the strict duty that lies upon those who go down to the sea in ships of rendering assistance if they can to other vessels in distress. It requires no further rebuke to impress upon Master Mariners the importance of that duty. That counsel should have to appear here to vindicate his reputation and defend his honour is not the least humiliation that this man has had to undergo.

For all the reasons that I have urged, I do ask your Lordship not to pass any censure upon this man, and I venture to think that if your Lordship does not censure him then truth and justice and mercy will meet together in your Lordship's report.

*(Adjourned to tomorrow at 10.30 o'clock.)*

## WRECK COMMISSIONER'S COURT,

SCOTTISH HALL,

BUCKINGHAM GATE,

*Saturday, 29th June, 1912.*

### PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### THIRTY-FOURTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

#### Page 900

*The Attorney-General:* Before we proceed I understand that your Lordship proposes to sit on Monday in another place?

*The Commissioner:* Well, I believe so; I am told this hall is not available on Monday. If it is, so much the better. I would rather go on and finish here.

*The Attorney-General:* Then, my Lord, today, I think, subject to your Lordship's view, it would be sufficient if we sat till half-past one, and then if I resume on Monday I have very little doubt I should conclude.

*The Commissioner:* If I do that, what I shall do on Monday is to sit until we have finished. You cannot come on Tuesday?

*The Attorney-General:* No, I think there is no doubt we can finish on Monday. The utmost that might happen might be that I should have to conclude on Wednesday; I could not come on Tuesday.

*The Commissioner:* Are you sure you could come on Wednesday?

*The Attorney-General:* I understand so from the House of Lords.

*The Commissioner:* Because I do not want the thing to stand over? *The*

*Attorney-General:* Neither do I; I want to get rid of it. It is quite safe for Wednesday, but I do not anticipate really going into Wednesday.

*The Commissioner:* Rather than risk it I would rather sit later today unless you have some engagement, which I daresay you have?

*The Attorney-General:* It was because I thought we should finish on Monday that I suggested we should rise early today.

*The Commissioner:* I only want to do what is convenient to all.

*The Attorney-General:* I thought by taking this course we should finish quite well on Monday. It will not be necessary for me to refer so much in detail to the evidence. There is one further point I wish to direct attention to so that your Lordship may have the figures before you. If you come to answer the question with regard to the number of passengers and classes of passengers saved by reference to the Table which was put in at page 479*a* there would be a difficulty, because the figures have been a little altered. What I wish to direct attention to is that we have now an agreed statement which I am going to hand in, which is not printed, which will give your Lordship all the information that you would require to answer to the question as to the number of persons saved and the classification of those persons. It might be quite convenient to print the two Tables I am going to hand in at the end of today's Note, so that your Lordship will have them before you.

*The Commissioner:* Yes.

*The Attorney-General:* We may treat this Table which was put in at page 479*a* as cancelled - 703 was the number taken as saved originally; it has now turned out that it is 711, and of course that necessitates some alteration.

*(The Table was handed in. See Appendix.)*

Now before I proceed to address your Lordship in detail upon this case I desire to express my thanks to the White Star Line, and in particular to Mr. Wilding, for the assistance which they have given us during the Enquiry. I think it is only right to say that, although to some extent their conduct is under review and criticism by the Court, every possible assistance has been given by them, and also by my friend Mr. Laing's clients, Messrs. Harland and Wolff, so that all available material has been placed before your Lordship and the Court.

In discussing the evidence and putting before your Lordship certain conclusions which I will ask you to consider, I do not propose to travel in great detail through the evidence upon which comment has already been made at considerable length by my friends who have already addressed you. As your Lordship has appreciated, more particularly with reference to the task which Sir Robert Finlay undertook, he has, so far as it affected the case which he was presenting to you, gathered together all the available evidence on

those points, whether for or against the view for which he was contending, and, therefore, the references which I shall make will be only by way of comment, and, except on very important matters, when I shall refer to the specific answers, I shall pass over the particular answers that are given and summarise what my submission is as the result of the evidence. I cannot think that any useful purpose would be served by my doing again in a different form what has already been done and is before the Court.

Now, my Lord, speaking generally, the Questions which your Lordship has to answer relate to what has happened in the past and what is to happen in the future. And no doubt different considerations must apply when you are forming a judgment as to past events, or making any recommendations as to what shall happen in the future for the guidance of those who have to navigate the North Atlantic. The main questions resolve themselves into two, I think. The first is whether there was any failure to take proper precautions which, if taken, would have avoided or would have materially minimised the loss both of life and property. That, of course, is the question that affects the past. Then the other, and I cannot help saying it appears to me to be the more important question in relation to this Enquiry, is: What precautions shall be taken in the future to guard against any similar calamity.

Your Lordship certainly has not begrudged the time which has been spent upon this Enquiry, although I am fain to admit that I think we have travelled over much ground which it is unnecessary for me now to consider in addressing your Lordship and which it will be unnecessary for you to consider. The very fact that we have gone into these questions at such length, and, I think, with such minuteness, has brought out this, that save as regards a few questions there is really no controversy at all.

The question to which I propose to address myself first and which, together with perhaps the question relating to boat accommodation, is, in my view, the most important, is that relating to the speed of the vessel at the time of the casualty.

*The Commissioner:* I did not quite hear what you said; you said something about boat accommodation.

*The Attorney-General:* I said except for the question relating to boat accommodation, to my mind speed is the most important one. There are two main questions: one is the speed and the other is boat accommodation. That is what I mean speaking quite generally, and I propose to address myself at first to the speed question; that is Question 14, which carries with it a good many other Questions which your Lordship will have to answer. I preface the observations which I am going to make with this proposition, which I submit is really beyond controversy, that had the speed been materially reduced on this night of the 14th April, the "Titanic" would not have been lost, or if she had been lost, no lives would have been lost. I submit in formulating that proposition I am really only putting before the Court what is established beyond all doubt by the evidence in this case. I will deal with it a little more in detail when I come to analyse the evidence, but substantially what I mean is, that supposing this vessel, instead of going at 22 knots per hour had proceeded at a moderate speed, say, of eight to ten knots per hour, although it might have been that she would not have avoided collision with the iceberg, yet she would not have sunk, or if she did sink, she would have been kept afloat for a sufficient time for the "Carpathia" to have reached her and saved all her passengers. That is a view which I submit is plain from the evidence which has been given.

In the observations which I am about to make to you in reference to speed, I want to make it quite clear that although I am going to put before the Court considerations based upon the evidence which, if accepted by the Court, will mean that there was negligent navigation of this vessel on the part of those who were responsible for the navigation. I have no desire, nor is it any part of my duty, to press that except in so far as it is necessary to bring clearly before the Court

**Page 901**

various statements of witnesses which to my mind ought to have a serious bearing on the judgment which the Court should form with regard to the navigation.

*The Commissioner:* Which is the question which invites me to express an opinion upon negligence?

*The Attorney-General:* There is no question which asks you whether there was negligence or not, but there is Question 14, which asks you whether the speed was excessive.

*The Commissioner:* Yes, that appears to me to be quite a different thing.

*The Attorney-General:* It may be, of course. That question can be answered without saying anything further with regard to negligence; I can only say that is a matter for your Lordship to determine. When you come to answer that question, I can conceive that the Court might come to the conclusion that it preferred not to deal with any argument which may have been addressed based upon this proposition that there was negligent navigation, and that the Court might be satisfied in saying that the speed was excessive. Of course, that is a matter which your Lordship must determine.

*The Commissioner:* I do not consider that I am bound by the form of the questions.

*The Attorney-General:* No.

*The Commissioner:* But at the same time I do not want to enter into an Enquiry which is not necessary, and perhaps is one which I ought not to enter upon.

*The Attorney-General:* Of course you have to bear in mind also Question 24: "What was the cause of the loss of the 'Titanic,' and of the loss of life which thereby ensued or occurred?"

*The Commissioner:* Assuming you are right, there is no difficulty, in my opinion, in answering that question. Assuming you are right that the speed was excessive - the cause was the excessive speed - that was the effective cause.

*The Attorney-General:* I quite understand.

*The Commissioner:* Whether the people who permitted that cause to operate were negligent or not appears to me to be quite a different question from the cause of the accident. It may be refining, but it occurs to me that if the speed was excessive, so excessive that an alteration would have avoided the accident, then the cause of the accident was the excessive speed.

*The Attorney-General:* Yes, but that still leaves open the question whether the excessive speed was, in your Lordship's view, negligent navigation.

*The Commissioner:* What, does it matter? If it was excessive it was wrong navigation, but whether it was negligent is another matter. I draw a distinction between a thing which

is wrong and a thing which is negligent. Negligence may cover both, but a thing which is wrong does not necessarily mean a thing that is negligent.

*The Attorney-General:* Of course, there may be two courses open, and the one selected may turn out to be the worse; the wrong course of those two may be selected.

Nevertheless, I quite appreciate that that may have been an error of judgment which is not negligence, because either of the two courses might have been a course which any prudent commander might have taken, and the fact that it turned out badly naturally would not make your Lordship come to the conclusion that there was negligence. I quite appreciate that. But there is the further point, which certainly is involved, covered by the questions, although I quite appreciate that you might not think fit to answer it or may not think it is necessary to answer it, and that is whether the speed should have been reduced; whether the person responsible -

*The Commissioner:* We are quarrelling about words, I think. If I think the speed was excessive it follows that I think it should have been reduced.

*The Attorney-General:* Yes.

*The Commissioner:* But it does not follow that because it was not reduced the man who failed to reduce it was negligent.

*The Attorney-General:* No.

*The Commissioner:* Do you follow what I mean? It sounds a little casuistical, but to my mind it is true.

*The Attorney-General:* I agree.

*The Commissioner:* I am very much disposed at present - I will not commit myself to anything about it, and I do not desire to do that - but I am very much disposed at present to think that the whole of this disaster was due to the excessive speed.

*The Attorney-General:* That is the view I am going to present.

*The Commissioner:* That is the view I am disposed to take at present; I do not commit myself to it, of course.

*The Attorney-General:* I quite understand what is in your Lordship's mind with regard to it, but I want to put certain considerations before you, and then your Lordship will determine whether it is necessary to say anything about it.

*The Commissioner:* Certainly. I only wish to point out what my mind is at present about it.

*The Attorney-General:* What I am particularly anxious is, in dealing with this matter, after the very full and exhaustive Enquiry which we have had into the circumstances, if your Lordship has a very definite view upon the aspect of the question, that is whether there was negligent navigation, that if you think fit, it should be expressed in answering the questions. I mean, whichever judgment you may form, if your Lordship comes to the conclusion that on the whole you think, having reviewed all the circumstances, you will not express any opinion upon it, of course I am equally satisfied, if I may say so, provided that the considerations have been put before you which will enable you to come to the conclusion. That is the course I desire to take.

At the outset of these observations I want to put one further proposition before your Lordship which I think must govern, to a large extent, the view which your Lordship will take of the evidence, which is that the reduction of speed which would certainly have

avoided the very grave character of this disaster was a very small precaution to be taken. I respectfully submit to your Lordship this: What strikes me here upon the whole of this evidence is that for a great number of days we have been discussing the cause and the effect of the disaster of this vessel coming into collision with an iceberg at night at a speed of 22 knots per hour when we know in point of fact, beyond all controversy, that ice reports (which I must analyse very closely later) had been received by the Captain - that he and his officers knew that he was approaching the vicinity of ice, that he was quite aware that at any moment he might expect to meet an iceberg, and notwithstanding that they continued at this speed of 22 knots when, so far as I am able to judge, there was not the faintest reason why they should have continued at that speed on that night. The striking thing about it is that they did not desire to make a record passage; I think the White Star Line have proved that conclusively, and if they had arrived at the time which was intended it would not have been a record passage. What they did intend was to arrive on the Wednesday morning at five o'clock. That is what was planned, and certainly it was not necessary to push this vessel at its extreme speed in order to do that. Your Lordship will remember how the evidence stands. I think I may put it quite shortly when I say this, that 22 knots an hour was the speed at which she was going on this night, that what was necessary to bring her to New York at five o'clock on Wednesday morning was 20 knots an hour from that time and no more. That was given in evidence by one of the witnesses and was accepted. Therefore, if only we had had this reduction of speed for a few hours till daybreak, so far as I can gather from the evidence before us, there would have been still plenty of time for the vessel to arrive at the time intended and all possibility of this disaster would have been avoided.

My object in making these observations to your Lordship is this: Of course I know you would take into account in deciding a question of that character whether it was reasonable in all the circumstances to expect this particular precaution to be taken. That is, no doubt, a very guiding factor

## **Page 902**

in arriving at a conclusion, at any rate as to whether there was any lack of reasonable precautions, which is only another way of expressing whether there was any negligence. If you were being asked to say that the disaster occurred by reason of their having omitted to take some precaution which would have made it impossible for this vessel to travel between the United States and this country because the precaution to be taken would have necessitated such expenditure as would have prevented this "Titanic" being a commercial venture, of course I can quite understand that you would say: "Oh, no; what I am dealing with is a matter of commerce, and there may be some risks which have to be taken, which everybody has to take, and it certainly is not for me to insist upon such a precaution as would destroy the mercantile marine of this country." Of course, I quite appreciate that. What I am pointing out is that it is no precaution of that character which I say was not taken in this case, but it was the simplest precaution which was omitted, and that was the reduction of speed for a few hours. That impresses itself upon my mind very strikingly upon a review of the whole evidence, and more especially when I come to call

your Lordship's attention to the indications that there were, that they were dealing on that night with abnormal and not with normal conditions.

*The Commissioner:* Is it your view that the existence of abnormal conditions is established? I rather gather that it is.

*The Attorney-General:* It depends what you mean by abnormal.

*The Commissioner:* You know it is important, if I have to consider the question of negligence, to consider whether there were abnormal conditions.

*The Attorney-General:* I agree. I have given attention to it and I am going to call your Lordship's attention to particular passages in the evidence which bear upon it. I attribute myself so much importance to this question regarding speed that I have no doubt most of what I have to say will be directed to that point. It has not been gone into exhaustively by the other side, by any of my learned friends who, of course, have dealt with other questions which more particularly affected them, leaving this particular question to me. Observations and arguments have been addressed to your Lordship, and I think of a very pertinent character, but both my friends, Mr. Scanlan and Mr. Clement Edwards, who touched upon this question, indicated that they were not going into it at length because they knew that I was proposing to do it.

The question which I think you would put to yourself at the outset of an Enquiry into the evidence is, What is the standard of care to be taken in navigating a vessel of this kind on this track. I desire to make only one observation with reference to that, and one which I am quite sure will not be controverted and will be acceptable to your Lordship, and then to pass from it. The answer I would make is that it is the highest standard of care which is required in a case of this kind. I do not shrink, of course, from this observation, that I think greater care is required when you are dealing with a passenger and emigrant vessel of this character than when you are dealing with a cargo vessel. I quite understand that the observation might be made: "Well, but it is just as important in a cargo vessel that there should be no risk of loss of life of the crew or of the loss of the vessel as in the case of a passenger and emigrant steamer." I do not think that is quite a correct view to take of it, with submission, and I do not expect it is the view which your Lordship would take. When a vessel is trading with passengers and emigrants there is a greater responsibility upon the Captain who is in charge of and responsible for some 2,201 persons, than if he is merely trading in a tramp steamer dealing with persons and in charge of persons who are used to the sea and who are more able to take care of themselves in times of difficulty than passengers, and particularly emigrants, who, perhaps, have never been to sea before. I do think that I am entitled to say that the highest standard of care has to be applied to passenger and emigrant ships.

*The Commissioner:* I think it has to be applied on both cases; in both cases the highest standard, whatever it is, ought to be applied. I do not see why you should risk the lives of the men on a tramp steamer any more than you should risk the lives of emigrants.

*The Attorney-General:* No.

*The Commissioner:* You risk more lives on the one, of course.

*The Attorney-General:* Yes, and you risk the lives of those who are not used to the sea in the one case; I mean there is more difficulty for the passengers, as indeed is shown, to realise the peril in which they are placed than there would be with the crew. But it is not

necessary, so long as your Lordship accepts the view that it is the highest standard of care that is to be applied, for me to argue it at any length.

*The Commissioner:* I accept it, though I do not understand it. What “the highest standard” means I do not know. It means reasonable care based on experience and skill. That is what it means, I think.

*The Attorney-General:* I think it means that you exact more care and skill in the particular case, and that you are entitled to exact it in this particular case or in similar cases.

*The Commissioner:* You cannot drive it to extremes, otherwise a vessel would never put to sea at all.

*The Attorney-General:* That is what I pointed out. You may say that so many or such precautions would have to be taken that the commercial venture would be destroyed; of course, I quite agree to that, and I am not suggesting that you must take that line.

*The Commissioner:* Some risk must be taken.

*The Attorney-General:* Oh, certainly. Now, my Lord, in this particular case all that it is necessary to say - and I think I am entitled to say this - is that every precaution should have been taken to guard against collision with ice. There can be no doubt about that, and that is the only standard which I am asking the Court to apply in this case. When we come to the concrete proposition that is what it resolves itself into.

*The Commissioner:* It does.

*The Attorney-General:* And that is, no doubt, one upon which there will be no question between your Lordship and myself or between myself and my friends. Now collision with an iceberg is a well known danger of navigation. Your Lordship asked a question which, at the time, we were unable to answer, as to whether there were any reported cases which dealt with collisions with icebergs and you were referred to the “Arizona.” My Lord, there is another - I only mention it in answer to what was put by your Lordship - there was the “Cretic” in 1891, which was the subject of another Enquiry, with regard to a vessel which had come into collision with an iceberg. There was no look-out; that was what was found as the cause.

*The Commissioner:* There is no difficulty about that.

*The Attorney-General:* No, but what your Lordship had in mind was whether there were questions of this kind which had been discussed. Also it is quite clear from the book to which reference has been made, and it is a fact so well known, so well accepted by everybody that I need not labour the point, that on this track, on this North Atlantic track, icebergs at least, without saying ice-fields, are dangerous for which every prudent Commander must also be on the look-out.

Further, in this particular case there were warnings that in this year, 1912, the ice would travel South at an earlier period than usual. That is the true meaning of the ice reports which were sent to the Commander, Captain Smith. They were clear indications to him which any Captain who is used to navigating this track would know meant not only that there were one, or two, or three isolated icebergs which he might meet, but that in fact he must expect ice to be travelling across his track because icebergs and ice-fields had been reported during this month, which was an unusual

month. Although in May and June sometimes on this track, since the track was established, which, I think, was in 1898, they have met icebergs still in April they did not expect it. That is the way in which the evidence stands, and I will give your Lordship the exact references.

*The Commissioner:* April is too early?

*The Attorney-General:* Yes. Substantially it comes to this, as your Lordship says, April is a little too early. In May and June it does happen. I do not mean it happens every year, but since 1898 it had happened, and it was the kind of thing they expected might happen, and which at least had happened three times since 1898. That is how it stands. But in April it was thought very unusual. Now the Commander was aware of these ice reports which he had got, which were four on this particular date (I am leaving out the "Mesaba"), the "Caronia," the "Baltic," the "Californian," and the "Norrdam," which give quite clear indications to him.

Now, my Lord, Sir Robert Finlay has dealt with this by the argument that at any rate as regards the ice reports of the "Caronia" and the "Baltic," the Captain might reasonably have expected that he had passed to the North of the ice reported by them in consequence of the time that had elapsed and the position in which the "Titanic" was when they got the news and the reports of the latitude and longitude in which the ice had been found. Of course, I shall have to deal with that a little more in detail, but the view which I take of the whole of the evidence is this (and this is the answer to the question which your Lordship put to me just now as to whether I formed the opinion and put forward the view to your Lordship that the conditions were abnormal), that I am prepared to accept and think it right to accept on the evidence the description given that it was an exceptional night.

What is exactly meant by saying that the conditions were abnormal, I am not quite sure. If it means they were infrequent, I agree; if it means - that is the position I am taking. I do agree that is the position I am taking. I do not agree with this, that it was a specially calm night on this night of the 14th April undoubtedly. But that there had been such specially calm nights before I think is established by evidence to which I am going to call your Lordship's attention. It was not the first time in the experience of navigators that they had had such a night as this with a flat calm which is the distinctive feature of it so far as it has any bearing upon this case. Other navigators have said, of course, that they have seen this kind of thing before. It is very unusual at this time of year, but it does happen. The submission I make to the Court is that those conditions were unusual in the sense that they were infrequent; but unusual conditions necessitate unusual precautions. And whereas it may be perfectly right to go full speed ahead on an ordinary night when everything can be seen and there is no difficulty whatever in clearing an iceberg when it has been reported, it is a totally different state of things when you are dealing with unusual conditions, such conditions as existed on this night.

It is very much open to question whether it is a right thing in any circumstance to go at full speed, even though you can see perfectly clearly, but no doubt it is right to say this as your Lordship indicated at an early stage, and I ventured to assent then, as I do now, that if you can see an iceberg at sufficient distance to navigate your vessel clear of it within a

sufficient time, well, of course, there is no necessity to reduce speed. If you can depend upon seeing an iceberg five miles distant and that gives you ample time to clear it, I agree there would be no necessity to reduce your speed. But when you have conditions, particularly at night, which cannot make it certain that you will be able to see an iceberg at a great distance, then it becomes a very different question. The evidence establishes this, that according to the experience of those who have been in the habit of navigating on this track, and among ice, you could see an iceberg at night, on a fine clear night, at a distance of from five miles to one and a half miles. That is the closest I think it has been put. Of course I am summarising the whole of the evidence. As your Lordship is aware, there has been a great deal of difference of opinion about this distance. Perhaps the majority put it at something like three miles in fine weather, conditions such as were assumed in the question put to them; but some go so far as to say that you might not see it unless it was a distance of something like one and a half miles.

Then again, one has to bear in mind that when they say that, the view of some of the Commanders is that you would expect among icebergs to find some of a dark blue colour. It does not much matter what the particular colour is; it presents a dark appearance, and that those which present that dark appearance, that is the dark side to you, would naturally be less easy of detection, and would be seen at any rate according to their view, at a less distance than those that present the lighter and whiter appearance. I think this is an important point in view of one argument which has been addressed to you by Sir Robert - that you must expect, when you get among icebergs, to find some of this dark blue colour, or some which present a dark appearance to you, and, therefore, you must expect that there will be some icebergs which will be very difficult to detect at night. I notice one witness went so far as to say that he did not think you would detect an iceberg of that kind at night at a greater distance than a mile; that was Captain Cannons. If you once get to them and you have to bear in mind that amongst the ice through which you are going to travel you may meet a dark-faced iceberg, which you will only see when it is very close to you. I submit that that makes it abundantly clear that it can never be safe to go at full speed at night in a region in which you expect to meet icebergs.

*The Commissioner:* Is it your view of this case that there was a good look-out or a bad look-out?

*The Attorney-General:* I am going to deal with that. The view that I take of it is that the men on the look-out were qualified men, specially engaged as look-out men, and I see no reason for doubting their capabilities as look-out men. Then there were the officers on the bridge.

*The Commissioner:* Only one, Murdoch.

*The Attorney-General:* I say there were officers on the bridge, one of whom was actually on the look-out; one of them might be on the look-out or might not, but it was the duty of one. I think that is the position. That they failed to detect this iceberg, of course, is beyond all controversy. The difficulty one has, and which has confronted the Court from the first, is how is it they failed to detect it until it was so close upon them?

*The Commissioner:* That is my difficulty.

*The Attorney-General:* Of course, and it is a real difficulty in the case and it is one I want to deal with because I quite appreciate it is the difficulty here.

*The Commissioner:* One of your witnesses said a mile. This was, I suppose, a third of a mile or a fourth of a mile.

*The Attorney-General:* A fourth of a mile. The best estimate one can form of it is this. Of course to some extent in the observations I am going to make, we are dealing with seconds, and it is important to bear in mind that it is in consequence of the speed of this vessel that we are dealing with seconds. We never ought to have to consider a question of three or four or ten seconds in determining whether or not there is going to be a collision with an iceberg. The only reason why we have to do it here is because this vessel was travelling at the rate of at least 700 yards a minute. That is the position quite clearly. It was at least that, and in the observations I am going to make I will assume that 700 yards per minute is the pace at which she was proceeding. That is a little less than 22 knots really but it is sufficient for the purpose. According to the evidence, I think the utmost that you can give this vessel in point of time, judging from the events that happened, and also the pace that she was going, is 40 seconds. I do not think that you can from any point of view say that she had more than 40 seconds between the time of the iceberg being seen and the time of the impact.

#### **Page 904**

*The Commissioner:* The difficulty is the one pointed out just now, to reconcile that with a good look-out.

*The Attorney-General:* I know. I am going to deal with that and deal with it also from the view put forward by my friend. Taking into account that she is travelling at this speed of 700 yards and what was done during the time (it is almost impossible to be quite precise about it, but we know what happened), I will take the order of events without referring to the evidence which no doubt is present to your Lordship's mind and those who are assisting you. Fleet, one of the two look-out men in the crow's-nest sees the iceberg, he sees it after being told at half-past nine - or rather the preceding look-out man having been told at half-past nine - to keep this special look-out for icebergs and growlers, which is passed on to him at ten o'clock, when he goes on duty. He has been on duty for an hour and forty minutes with his mate Lee in the crow's-nest, looking out for ice, the ship travelling all the time at this speed of 22 knots. I should think if you have to peer into the darkness with the vessel proceeding at that pace, an hour and forty minutes must be rather a strain, but two hours seems to be accepted as quite a fair time for a man to be acting on the look-out, and I make no comment on that except this, that it might have a tendency to make a man a little slacker during his last half hour. But that is all surmise. We have no evidence to indicate that it was, except the fact of what happened; but at 11.40 he suddenly sees an iceberg. He then goes to the bell. He strikes it with a signal three times, "Something ahead." Your Lordship remembers he then goes immediately to the telephone, he telephones to the bridge - they have one of those loudspeaking telephones there - he reports through the telephone to the bridge, "Iceberg ahead." The answer is, "Thank you," and then the helm is hard-a-starboarded. According to the evidence of Hichens, the Quartermaster, the order is given "Hard-a-starboard," at once when the telephone message comes through. It is so close in point of seconds that it is really very difficult to say whether that did actually happen or whether the order may have been

given by Mr. Murdoch, having seen the iceberg himself - it is so close in point of time that really I do not think anyone can determine that, and if it assists in any way the case of the White Star, I am perfectly ready to assume that Mr. Murdoch saw it quite as quickly as the look-out men, and that the order was given by him "Hard-a-starboard" on his own initiative, and not on the report that was given from the look-out. It really is only a question of two or three seconds, and you cannot do more than to say that the helm was hard-a-starboarded at once. Your Lordship will remember he had just got it over - I think it is 40 degrees to get it hard a-starboard - he had, in fact, just got the helm right over when the vessel struck. She had meanwhile veered two points to port - that is the position. We know according to the evidence of the turning circle how long it would take her. I have not the figures before me, but I think I am right in saying it takes 37 seconds at this pace for her to turn the two points to port. Therefore, she, having turned the two points to port must have taken 37 seconds, and I do not think that I am adding too much or treating them unfairly when I say if you add three seconds for the report of what takes place you get as nearly as you will ever be able to get the time that had elapsed between the report of Fleet and the striking of the iceberg; that is between the sighting of the iceberg and the striking of the iceberg at most 40 seconds must have elapsed. That I think is the position of the discussion on the evidence such as we know it. Now that means this, that the furthest distance at which the iceberg was seen from the vessel was 466 yards - anything from 450 to 500 yards is the extreme distance that you can put it. I say 466 because it is two-thirds of 700 yards which I was assuming she was travelling per minute. Therefore, what we have got established is that this vessel going along at this pace, travelling at this 700 yards a minute, only sees the iceberg at a distance of 466 yards, and that that is not enough. However quickly the men may act at the helm, however swiftly the order is given, and however quickly the officer in charge acts, you cannot navigate that vessel with her 850 feet length out of the way of that iceberg in time. In the statements which I have been making in regard to these matters, I think I am stating facts proved on the evidence which are beyond all question and beyond all controversy. It has been suggested during the course of the case - I only make the reference to get rid of it so far as I am concerned - that if the order had not been given "Hard a-starboard" and the vessel had gone straight on to the iceberg, it was indicated by Mr. Wilding as in his opinion, and, of course, I accept it not only as the opinion of a highly skilled gentleman who has been of the greatest assistance to us in the course of the case, but equally as his honest opinion formed, apart altogether from this case and the consequences of it - that the vessel would have telescoped to the extent of 100 feet or more. That is his view. I only wish to make this one observation with reference to it, speaking with the experience of some of these cases, I do not mean only shipping cases - not nearly so many as your Lordship has had before you - I think the one thing which it is impossible to foretell, even for gentlemen of the highest scientific evidence, is exactly what will happen if you take a different course from that which was taken, a course such as nobody has ever seen put into practice and which is the course which is assumed for the purpose of arriving on this conclusion. I am sure there is every reason for supposing Mr. Wilding would be right in saying she would be telescoped for 100 feet or a little more, and that would have been the extent of the disaster. I can only speak as a person who has not scientific training, but I should have thought if that happened - (I am saying this, of course, more especially to

your Lordship and to those skilled gentlemen who are associated with you) - I should have thought that if a vessel telescoped 100 feet or more it is a very difficult thing to say what would have happened to the ship - whether her plates would not have been so started that the water would have come in, or what damage otherwise would have been caused - and it can only be surmised. I do not dwell upon it, because no one will suggest - certainly I should not suggest - that what Captain Smith ought to have done was to have gone head on, stem on to this iceberg.

*The Commissioner:* I do not think you need trouble yourself about that.

*The Attorney-General:* No; I should never have dreamed of doing so.

*The Commissioner:* I think the gentlemen who are sitting with me are of opinion, and certainly I am, that in starboarding the helm the proper thing was done in face of the iceberg.

*The Attorney-General:* As your Lordship pleases. That is the view I have formed, and I am very glad to hear it is also the view of the Court. Now, what one has to grapple with in this case is, assuming that you have competent men on the look-out, why this iceberg was not detected earlier. That is really the crux of the case.

*The Commissioner:* To my mind it seems a question of the alleged abnormal conditions of the night. It brings one right up against it. If the look-out was good what was it that prevented them from seeing the iceberg at a greater distance?

*The Attorney-General:* Quite. I think one has to bear in mind also when you say: Was the look-out good, that it has to be very good for a vessel travelling at this pace. I do not think you can separate the two. I have tried to do it myself and have found it difficult. I do not think you can say: "Well now, let us look at it from the point of view of the lookout and let us look at it from the point of view of speed." My submission to the Court is that you have to consider whether or not the look-out was sufficient and whether or not speed ought to have been reduced, by the consideration of the actual facts, that is the speed of 700 yards a minute and look-out men in the

## **Page 905**

crow's-nest and on the bridge. It is the combination. I think your Lordship indicated it earlier.

*The Commissioner:* What I understand is this, that the possibility of even a good lookout not detecting the iceberg must be taken into consideration.

*The Attorney-General:* That is so. When you are going at this pace you must take into account that a man may have his eyes or both men might have both their eyes directed to starboard in the crow's-nest, their attention attracted by some light or something which they thought was a light.

*The Commissioner:* Some ship's light.

*The Attorney-General:* Yes, and here is this vessel travelling ahead at 700 yards a minute. I will assume they might have seen it at a distance of a mile and a half, which would mean that if they were looking at the light for only a minute, by the time they got back to looking ahead they would already have been within only 450 yards of that iceberg. That is the difficulty of that situation, and that is why it is I say that you must

take into consideration in considering the look-out the speed at which the vessel was travelling.

Now, I am going to make some observations with regard to that because I am going to suggest that in any event on this night, expecting ice as they were, they ought to have had a look-out on the stem as well as in the crow's-nest. I am going to base that on the evidence which has been given. I am not unmindful of a good deal of evidence which said that that is only done in a haze.

*The Commissioner:* That seems to involve the contention that the look-out was bad.

*The Attorney-General:* Well, not necessarily. I do not think it necessarily does. *The*

*Commissioner:* If it was necessary to supplement the men in the crow's-nest, then it must have been that the men in the crow's-nest did not constitute a sufficient and proper look-out. If they did they would not have to be supplemented.

*The Attorney-General:* When you said the look-out was bad I thought you meant they were negligent, but I see what you mean.

*The Commissioner:* No, I mean that the look-out provided by the officers on the ship was not sufficient.

*The Attorney-General:* Yes, my Lord, I am going to contend that the look-out was not sufficient, taking into consideration the rate of speed and, moreover, the conditions on that night - what I will call the unusual conditions, because I prefer the term, if I may say so respectfully, to the one which has been used during the course of the discussion of "abnormal" conditions, as "abnormal" may imply something more than I mean, but I accept "unusual conditions" - I am going to deal with those. They are as I understand it, two and only two which have been suggested during the course of this Enquiry. I mean the fact that the night was fine, that there was no wind, that the sea was calm, had nothing unusual in it, you might not expect to find it in April-

*The Commissioner:* I should have thought all those circumstances were favourable circumstances, not circumstances that created any difficulty.

*The Attorney-General:* No; but I wanted to deal with what they said were the conditions. I agree, if I may say so, those are not the conditions which I think are relied upon as making the difficulty - I was dealing with the conditions of that night. But the two conditions which are urged in favour of the White Star Line are, first, that the iceberg was dark in colour and, therefore, not easily seen, and second, that there was a flat calm. Those are the only two conditions which I have been able to discover from the evidence as the usual conditions of that night.

*The Commissioner:* I suggest that when the evidence is tested, the only abnormal condition not known to Lightoller and not known to the Captain was the alleged absence of any swell.

*The Attorney-General:* May I say with respect, I know that has been put forward, but I do not think that is the evidence. It has been accepted, I know, during the course of the case and I agree there is a statement to that effect. I am going to call your Lordship's attention to it, because my submission is that from the very first Lightoller was perfectly aware that there was a flat calm. He may not have known the full extent of the flatness of the calm, if I may use that expression, he may not have been aware of this, that when the boats were lowered into the water on that night the sea was so flat that they had actually no lift in the boat at all at any moment so as to free the tackle. That is his explanation.

But, my Lord, that is of comparatively little importance, the circumstance in itself that there was no lift. What is of importance is that there was substantially no swell, and my submission is that Lightoller quite recognised that from the earliest moment.

*The Commissioner:* Is it not the same thing - no lift and no swell? He wants to make out at all events that it is the same thing.

*The Attorney-General:* Yes, the only distinction I draw between them is this, so far as I can judge of the evidence. I will call your Lordship's attention to it because I think it is of the highest importance, and it is almost the only portion of the evidence I am going to call your Lordship's attention to in detail. According to the view which I am going to put before you, if you read Lightoller's evidence it destroys the argument which has been put forward on behalf of the Company by my friend that there were those two unusual conditions, unknown to the officers on board the "Titanic."

*The Commissioner:* What are the two?

*The Attorney-General:* I am giving them full credit; the two are that the iceberg was of a dark colour, and the other was the flat calm.

*The Commissioner:* The absence of swell.

*The Attorney-General:* That is what is meant by the flat calm.

*The Commissioner:* That is what is meant by the flat calm; yes, those are the two.

*The Attorney-General:* Yes.

*The Commissioner:* And the others they had recognised already.

*The Attorney-General:* Yes, I agree. Those are the two that, according to my view, are the ones that are relied upon. Now the flat calm is relied upon for this reason. One has to consider it closely. It is said by Lightoller, or rather by those who are arguing on behalf of the Company, that if it had not been a flat calm there would have been a ripple. That was the expression used - there would have been a swell, a swell which would have caused a ripple or a break of the water at the base of the berg on the waterline, and that would have indicated to anyone who was on the look-out at a considerable distance that there was an iceberg ahead. That is the whole point, the whole substance of the argument based upon the flat calm.

Now, my Lord, the answer which I think must be made to that, or which at any rate I am going to submit for your Lordship's consideration, is that if it is true that you ought and you could as a reasonably prudent man in such circumstances rely upon this ripple or break of the wave as an indication, Lightoller knew about it, that is to say, he knew it was absent on that night. Lightoller knew - and when I say Lightoller, of course, I include the other officers - already at 9 o'clock in the evening that the weather was so unusually calm, that the water was so flat, that it formed the subject of conversation between him and the Captain of the vessel, so struck were they by it. And why was it they would discuss such a question as that? Because, apparently, they both thought it was a pity that there was not a little wind to make a little sea to create a ripple or wave which would break at the base of the iceberg as they were approaching ice and they wanted that extra indication. That is their own view of it. I will go at once to this passage.

*The Commissioner:* I suppose I am obliged to accept Lightoller's statement about that conversation?

*The Attorney-General:* Well, I do not know.

*The Commissioner:* I do not like these precise memories; I doubt their existence. However, there it is.

*The Attorney-General:* There it is, and we have to deal with it on the evidence. The reason why I am dealing with Lightoller's evidence is because

## **Page 906**

Lightoller is the only person who makes this excuse.

*The Commissioner:* Yes, and it sounds to me so like an excuse.

*The Attorney-General:* Well, that is the view I am going to put forward, that it is only an excuse.

*The Commissioner:* Yes, and it sounds to me so like an excuse.

*The Attorney-General:* Well, that is the view I am going to put forward, that it is only an excuse.

*The Commissioner:* Oh no, I do not think it will suit your argument to do that.

*The Attorney-General:* I think it does - at least I do not know what is in your Lordship's mind - if I have got rid for the purpose of this argument of the view put forward that they did not know on board that the calm was a flat calm - then there is an end of the argument with regard to that unusual condition.

*The Commissioner:* You can say if that conversation did take place, the greatest precautions ought to have been taken.

*The Attorney-General:* That is the point I am making.

*The Commissioner:* But what occurs to me is this - did it take place? If you want to dwell upon your argument you must stick to the conversation and say it did take place.

My difficulty is that it is not contradicted in any way.

*The Attorney-General:* I can only deal with it upon the evidence which is before the Court.

*The Commissioner:* Yes, quite right. I have read most carefully Lightoller's evidence, not only that part of it but the whole of it, and I must say that it does not make a completely favourable impression on my mind. I have read it very carefully.

*The Attorney-General:* Of course, it is very difficult, you must deal with the evidence before you.

*The Commissioner:* I am afraid I must deal with it as I find it.

*The Attorney-General:* Yes, if you eliminate altogether from consideration Lightoller's evidence. Suppose you said this conversation did not take place, the result of it would be this, that there would be nothing to indicate that there was anything so exceptional on that night. His is the only evidence of it.

*The Commissioner:* Has it occurred to you that the conversation about what I call the abnormality, the abnormal condition, perhaps came to the mind of Mr. Lightoller by way of enforcing the fact that there was an abnormal condition? Do you follow what I mean? However, perhaps it is not worthwhile discussing it. What I mean is this; I will be quite plain about it. He wants to make out an abnormal condition and it occurs to him that if he speaks of a conversation in which the abnormal conditions were referred to, that is evidence that there were abnormal conditions; and he has not seen that by the very

conversation that he speaks to he shows that they were warned of the abnormal conditions.

*The Attorney-General:* Of course, the dilemma is this. The dilemma is apparent from what your Lordship has said. If there were no abnormal conditions, then all this argument which has been addressed as an excuse falls to the ground; if there were abnormal conditions then the argument which I am putting to your Lordship is that they had full notice of it and that that necessitated unusual precautions.

*The Commissioner:* So far as I am concerned, the White Star Company's case would have been very much better without that conversation.

*The Attorney-General:* It might be, but there it is. If no such conversation took place -

*The Commissioner:* If no such conversation took place and they came here and said, "We discovered afterwards that we were in the middle of abnormal conditions," that would be one thing; but here the case put forward by Lightoller was, "We were in the middle of abnormal conditions and were actually talking about them."

*The Attorney-General:* We must deal with the statement by him which is the only evidence we have got, given in a good deal of detail as your Lordship remembers. Just see what he says about this. The passage is at page 306, Question 13615. The whole of his evidence for five or six pages is of very great importance. I deal with it particularly because by this I am attacking the evidence which bears most against the view for which I am contending at the moment. Your Lordship will remember it begins by a very sharp drop of temperature of something like ten degrees; it gets to freezing point, that you have got in the earlier questions on that page which I do not trouble your Lordship to read because I know you have it in mind. It begins by this - that during a couple of hours that evening the temperature dropped from 43 degrees to 33 degrees, and subsequently dropped again to freezing. That is the position. He is on deck: "(13615.) At five minutes to nine, when the Commander came on the bridge (I will give it to you as near as I remember) he remarked that it was cold, and as far as I remember I said, 'Yes, it is very cold, sir.'"

*The Commissioner:* Read that slowly.

*The Attorney-General:* Yes. "In fact," I said, "it is only one degree above freezing. I have sent word down to the carpenter and rung up the engine room, and told them that it is freezing, or will be during the night." There is no doubt about that, because there was somebody else who took the message.

*The Commissioner:* There is no doubt about that. I am talking of the conversation. *The*

*Attorney-General:* I mean there is no doubt about the message, and I suppose there is no doubt he would have reported it.

*The Commissioner:* I have no doubt about that, but this man purports to remember immaterial little observations that took place on the bridge that night: "It is very cold. Yes, it is freezing." I doubt very much whether he remembers anything of the kind.

*The Attorney-General:* The exact words it may be, but your Lordship sees the temperature is of some importance. It is not to be exaggerated, I agree. *The*

*Commissioner:* I am talking about his memory about this conversation.

*The Attorney-General:* "We then commenced to speak about the weather. He said" - that is the Captain - "There is not much wind." Now look at these words: "I said, 'No.'"

*The Commissioner:* That is one abnormal thing. "There is not much wind" - abnormal in this sense, you know, that there would be an absence of fringe round the base of the berg.

*The Attorney-General:* Yes, but I do not think you can say that that is abnormal.

*The Commissioner:* No, it is not abnormal; but that is one of the things which he relies on subsequently. No wind, no swell, black ice - they did not talk about black ice in this conversation.

*The Attorney-General:* They do talk about black ice; but may I point out - I do not want to be hypercritical about it, but I think it is important to bear it in mind - that there is a difference, as of course your Lordship appreciates, between no wind and no swell.

*The Commissioner:* Oh, yes.

*The Attorney-General:* He does not say that no wind would be an abnormal condition.

*The Commissioner:* No.

*The Attorney-General:* What he says is no swell would be an abnormal condition.

*The Commissioner:* It is one of the points, however, that he relies upon.

*The Attorney-General:* Yes; "It is a flat calm, as a matter of fact." He repeated it. He said "a flat calm."

*The Commissioner:* Yes, there are the two of them making the point.

*The Attorney-General:* Yes. "I said 'Yes,' quite flat; there is no wind." *The*

*Commissioner:* He makes the point the third time.

*Mr. Laing:* I am very unwilling to intervene, my Lord, but - *The*

*Commissioner:* I am doing this in your favour, Mr. Laing.

*Mr. Laing:* I only wanted to point out that the witness is evidently meaning a flat calm to be no wind. He is distinguishing between no swell and no wind.

*The Attorney-General:* I will call attention later to what he has said modifying it. But it seems to me there is all the difference in the world between

## **Page 907**

talking of a flat calm which is the expression that he uses throughout as indicating that not only is it a calm but quite a flat calm in the sense that there is no swell; because he says so directly.

*The Commissioner:* I am advised that a sailor would not use the expression "flat calm" as meaning no swell.

*The Attorney-General:* You will see what he says about it.

*The Commissioner:* He repeated it "He said a flat calm" I said 'Yes, quite flat; there is no wind.'

*The Attorney-General:* I said something about it was rather a pity the breeze had not kept up whilst we were going through the ice region. Of course my reason was obvious; he knew I meant the water ripples breaking on the base of the berg." That is the point. "(Q.) You said it was a pity there was not a breeze? - (A.) Yes, I said, 'It is a pity there is not a breeze,' and we went on to discuss the weather. He was then getting his eyesight, you know, and he said, 'Yes, it seems quite clear, and I said, 'Yes, it is perfectly clear.' It was a beautiful night, there was not a cloud in the sky. The sea was apparently smooth, and there was no wind, but at that time you could see the stars rising and setting with absolute

distinctness.” Then you get to the other point. I will read it - the other abnormal condition of the blue iceberg.

*The Commissioner:* Yes, about the reflection of light.

*The Attorney-General:* “We then discussed the indications of ice. I remember saying, ‘In any case there will be a certain amount of reflected light from the bergs.’ He said, ‘Oh, yes, there will be a certain amount of reflected light.’ I said, or he said - it was said between us - that even though the blue side of the berg was towards us, probably the outline, the white outline would give us sufficient warning, that we should be able to see it at a good distance, and, as far as we could see, we should be able to see it. Of course, it was just with regard to that possibility of the blue side being towards us, and that if it did happen to be turned with the purely blue side towards us, there would still be the white outline.” That is at the top. Your Lordship has said you have read it and you have realised that this is gone into and discussed in question and answer in some detail. *The*

*Commissioner:* Great detail.

*The Attorney-General:* Yes. He explains the natural precautions; “We knew we were in the vicinity of ice,” and he says, at Question 13622, in answer to my friend the SolicitorGeneral, “Then you both realised at the time did you, that since it was a flat calm” - that is the question and answer I wanted particularly to get before you - “it would be more difficult to see the ice? - (A.) As far as the case of the berg was concerned, yes, it would be more difficult; naturally you would not see the water breaking on it if there were no wind; and so you would not have that to look for.”

Now, my Lord, those questions and answers to which I have referred make this, I submit, perfectly clear, that in Mr. Lightoller’s view, when he is speaking of a flat calm and of the ripple round the base, what he means is, without analysing too closely the exact meaning of the words used by him, that he will not that night get the benefit of the ripple which breaks round the base of a berg. That is clear.

*The Commissioner:* No doubt.

*The Attorney-General:* Whether you put it as wind or whether you put it as the result of a swell it comes to the same thing. He knew he would not get that and that is what I rely upon, and I submit that destroys the point; and without going into it in any elaborate detail and without taking up the various pieces of evidence to which my friend referred, those answers of his destroy the case made that those were unusual conditions, because unusual conditions have no value as an excuse unless it means that they were so unusual that they did not know of them at the time.

*The Commissioner:* The way I look at it is this; even if they were unusual conditions, even if they were abnormal, if he knew the fact it removes the value to the officers of the abnormal conditions as an excuse.

*The Attorney-General:* Yes, that is what I mean.

*The Commissioner:* It destroys its value if they knew it.

*The Attorney-General:* It does.

*The Commissioner:* I am disposed to agree with you that whether he meant swell or whether he meant a motion on the sea distinguished from swell, in either case he pointed it out according to his own account (an apocryphal account), in his conversation with the Captain, and, therefore, the excuse was gone.

*The Attorney-General:* It is a little difficult to deal with the view which is in your Lordship's mind about the conversation.

*The Commissioner:* Well, I have got the view and I have had it for a long time. But there it is; there is the evidence.

*The Attorney-General:* It is right to say this is it not - your Lordship is a better judge than I am from every point of view, and I was not here during the whole of the time when Lightoller was giving his evidence - that he did give it very well.

*The Commissioner:* It is to be remembered that he told exactly or practically the same story in America.

*The Attorney-General:* Yes, from the first. I think it is right to say with regard to Lightoller, is it not, that he gave his evidence very well.

*The Commissioner:* He gave it remarkably well.

*The Attorney-General:* Too well your Lordship thinks?

*The Commissioner:* Well, remarkably well.

*The Attorney-General:* The earlier question and answer to which I called your Lordship's attention, 13617, deals with the dark colour of the iceberg. There is a body of evidence besides that with which I am not going to deal in detail, but to which I will give the reference and which I will indicate to you. The result of it all is this, that according to the view which I present to your Lordship, not only did Lightoller (who was not on the bridge at the time, it is said) know that there would be no ripple, to use a more neutral phrase with regard to it, at the base of the berg on the waterline, but he also knew that he might expect to meet an iceberg which would present this dark appearance. Those are the two things which he knew. He says that quite clearly himself. Those are the two things which we have to deal with in this case, and which are suggested as the abnormal conditions.

Now, before I proceed to call your Lordship's attention to a few more passages in the evidence - they will be very few - I want to see what it was that they did know. I have made this point about Lightoller. In order to establish (before we get to the precautions that were taken) what it was they knew, one wants to get at the frame of mind of the officers on this night before the actual collision happened, and, therefore, it is that I have called attention to what they did know. Now, my Lord, what else did they know? They knew of the warnings of those four wireless telegrams to which reference has been made. They knew that the temperature had fallen very considerably during that evening; and although I am not going to contend on the evidence that a mere fall of the temperature is an indication of ice region, I do submit that when you know you are approaching an ice region, a fall within two hours of ten degrees in the month of April is at least some indication that you are getting near to ice. That is all. I do not wish to push it any further than that.

*The Commissioner:* I am not sure there is much in that.

*The Attorney-General:* I do not think it is very important; it emphasises the fact that they knew they were approaching ice, that is all.

*The Commissioner:* I am not sure about that. I am not sure that proximity to an iceberg necessarily means cold air.

*The Attorney-General:* No, my Lord, nor am I, with respect, suggesting it; I am drawing the distinction; I say not necessarily.

**Page 908**

*The Commissioner:* It is not the cold air that proves an iceberg. The iceberg comes down from the North, but I am not at all satisfied that it creates a large atmosphere round itself which becomes cold.

*The Attorney-General:* Oh, no.

*The Commissioner:* It may do.

*The Attorney-General:* I quite understand that view if you are dealing with an isolated iceberg, but that is not what they expected. One has to get rid of the notion that they were expecting they might meet an isolated iceberg or two. That is not what they were expecting. They had had definite notification of icebergs and ice-fields, which is a very different thing.

*The Commissioner:* Yes, but some miles away.

*The Attorney-General:* Yes.

*The Commissioner:* The ice-fields were a considerable distance away, and although it would be, of course, a large field of ice, I doubt whether it would affect the atmosphere miles away so as to make itself obvious.

*The Attorney-General:* As I said just now, I am not attempting to press it any further than this; that knowing they were approaching the vicinity of ice, that they had reason to expect to come upon ice, that that sudden drop of temperature was some indication to them that they might be then just upon it. I do not want to put it any higher than that, and that is the sole use I am making of it. It is only to get at the state of mind they were in had to take the precautions.

Further, they knew that ice was coming South earlier than usual; they knew that, of course, from the reports, not only from the specific reports of the particular position of these icebergs and ice-fields which were signaled to them by wireless telegraphy, but they knew from that very fact that the ice was coming south earlier than they would ordinarily expect. It amounts to this, therefore: that on that particular night in the month of April it behoved them to take extraordinary care, because they must expect, or at any rate they might expect to meet considerable quantities of ice coming down Southward. That is the highest I want to put it.

Then further, although with the change of course which had been made between 5 and 5.50 that evening of proceeding some seven to ten miles to the Southward before they turned the corner, they might have expected to have avoided some of the ice which was reported, they had no reason to expect that they had avoided all the actual ice reported to them; and they had certainly no reason to expect that they had avoided all ice, even though they avoided all ice reported. That depended, of course, upon the argument that I addressed to your Lordship just now, that they must have known the ice was coming to the South, and although they had avoided the particular ice reported to them by those messages, they might still well have anticipated that ice would be drifting South across the track.

*The Commissioner:* Sir Robert Finlay's case, of course, was that the alteration of the course was such as to lead them to the conclusion that they had cleared the ice, that they were passing some bergs under their stern, as it were, and that the others were too far away to be of any consequence. But I am at a loss to reconcile that argument with the fact that Lightoller and Moody were making a calculation which led one of them to the conclusion that they would reach ice, or might expect to reach ice, about 9.30 and the other one about eleven.

*The Attorney-General:* And Murdoch says to Lightoller when Murdoch relieves him at 10 o'clock (page 308, Question 13707): "It is pretty cold.' I said 'Yes, it is freezing.' I said something about we might be up around the ice any time now."

*The Commissioner:* Yes, I did not draw Sir Robert Finlay's attention to that, and I do not think he dealt with it.

*The Attorney-General:* May I finish that answer? I meant to deal with it in another connection, but it just bears out what your Lordship is saying: "I said something about we might be up around the ice any time now, as far as I remember. I cannot remember the exact words, but suggested that we should be naturally round the ice. I passed the word on to him. Of course, I knew we were up to the 49 degrees by, roughly, half-past 9"; but this conversation about what took place in the future was 10 o'clock, and then in this last answer your Lordship intervened and said to him: "You yourself knew the boat was already in the ice region at this time? - (A.) Yes. (Q.) Did you tell Murdoch so? - (A.) Yes, my Lord, as I say, when he came on deck. (Q.) What did you say to him? - (A.) That we were up around the ice, or something to that effect; that we were within the region of where the ice had been reported. The actual words I cannot remember; but I gave him to understand that we were within the region where ice had been reported."

*Mr. Laing:* Your Lordship asked what our view about that was. It was this: that they plot down, or are supposed to plot down, on the chart, these ice messages they get, and that all that was meant by these conversations is, as appears quite clearly here, that at 9 or 9.30 in one case, and at 11 o'clock in the other case, they would be within the region where the ice was reported. That is all it comes to. It says so in terms.

*The Commissioner:* Here, again, Mr. Lightoller's memory is remarkably accurate. I think the impression he wanted to produce on my mind was that they were making calculations which showed them that they were then about the place where the ice existed, not about the place where it had existed, but about the place where it did then exist.

*Mr. Laing:* May I read that answer again?

*The Commissioner:* Certainly, by all means.

*Mr. Laing:* "What did you say to him? - (A.) That we were up around the ice, or something to that effect, that we were within the region of where the ice had been reported. The actual words I cannot remember, but I gave him to understand that we were within the region where ice had been reported." That is what he says.

*The Attorney-General:* I am afraid that will not do. I quite agree with my friend that if you take those words alone they would bear at any rate, or are capable of bearing, the meaning which he desires to attribute to them, but there is a lot which has preceded that.

*The Commissioner:* Let us look at page 309.

*The Attorney-General:* I think your Lordship ought to read a little earlier. The only view which it is possible to take from Mr. Lightoller's evidence - on pages: 307, 308 and 309, not taking isolated passages from them, is that he knew they were approaching ice; and therefore he had a conversation on the point that they were approaching ice, not approaching the region where it was reported, but his view was they were approaching it, and therefore he had this conversation with the Captain and with Mr. Murdoch. Let us see what he says.

*The Commissioner:* I put the question to him (13618): "Then you had both made up your minds at that time that you were about to encounter icebergs? - (A.) No, my Lord, not necessarily. (Q.) It sounds very like it, you know? - (A.) No, not necessarily, my Lord. (Q.) You were both talking about what those icebergs would show to you? - (A.) As a natural precaution. We knew we were in the vicinity of ice, and though you cross the Atlantic for years and have ice reported and never see it, and at other times it is not reported and you do see it, you nevertheless do take necessary precautions, all you can, to make perfectly sure that the weather is clear and that the officers understand the indications of ice and all that sort of thing."

*The Attorney-General:* If my friend is right in the suggestion that all he meant was he was within the reported region, what is the object of his talking about "it is a pity there is no breeze to create a ripple" to show the ice which he was not expecting to encounter, according to my friend?

*The Commissioner:* There, again, comes in the misfortune of that conversation.

## **Page 909**

*The Attorney-General:* Why is it a misfortune, with respect?

*The Commissioner:* Misfortune to them.

*The Attorney-General:* I know it may be. It may be it is a misfortune that he has to state the fact.

*The Commissioner:* The Solicitor-General says to him at Question 13480: "Here was a message shown you which referred to ice in latitude 42 N.? - (A.) Yes. (Q.) Do you recollect, or can you help us at all, did that indication 42 N. indicate to you that it was near where you were likely to go? - (A.) It would, had I taken particular notice of the latitude, though, as a matter of fact, latitude with regard to ice conveys so very little. (Q.) Is that because it tends to set North or South? - (A.) North and South, yes." He means to say it is coming down South, I suppose?

*The Attorney-General:* Yes.

*The Commissioner:* "(The Commissioner.) I do not follow that? - (A.) We take very little notice of the latitude because it conveys very little. You cannot rely on latitude. (Q.) (The Solicitor-General.) For ice? - (A.) Yes. (Q.) (The Solicitor-General.) He answered that 'Because the ice tends to set North and South. (To the Witness) Then do you attach more importance to the longitude? - (A.) Far more.'" *Mr. Laing:* Will your Lordship look at Question 13487?

*The Commissioner:* Yes: "(Q.) That is longitude. Did you form any sort of impression at that time as to what time of day or night you were likely to reach the area indicated? -

(A.) Not at that time.”

*Mr. Laing:* That is all, my Lord. “The area indicated.”

*The Commissioner:* You know there is a singular omission on the part of Mr. Lightoller to tell Murdoch that Moody’s calculation was, according to him, wrong.

*The Attorney-General:* He seems to have acted upon it as if it were right. I think this matter is put at rest so far as Mr. Lightoller is concerned, without reading the three or four pages to which I have referred, if you look at page 328, your Lordship’s own questions, and the answers when Mr. Scanlan was examining him.

*The Commissioner:* Will you read it to me?

*The Attorney-General:* Yes. It is page 328, Question 14352. I was only going to read two questions and answers that are quite material, but one can follow it a little more easily if I read these few questions and answers preceding; it will save me reading the pages to which I have given the reference. If you look at page 327, Question 14346, leading up to what I said just now: “(Q.) Did the course which you followed lead you into the region from which the presence of ice was reported to you? - (A.) The course set at noon? (Q.) Yes? - (A.) No. (Q.) Did the course you were following up to the time you left your watch at ten o’clock lead necessarily to a place where you expected ice? - (A.) Where there was a possibility of seeing ice? (Q.) Not only a possibility of seeing it, but a possibility, and almost a certainty, of running into it? - (A.) Oh, no. (*The Commissioner.*) I do not think he could say that. (*To the Witness.*) Before you left the bridge did you know you were making for a locality in which ice was to be expected? - (A.) Quite so. (*Mr. Scanlan.*) Because you so stated to Mr. Murdoch when you were leaving the watch, according to your evidence here yesterday? - (A.) Yes. Let me explain my point, and we will get it far clearer. You see, we were making for a vicinity where ice had been reported, as you say year after year, and time and again, and I do not think for the last two or three years I have seen an iceberg, although ships ahead of us have reported ice time and time again. There was no absolute certainty that we were running into an ice-field, or running amongst icebergs or anything else, and it might have been as it has been in years before ice reported inside a certain longitude.”

Now come the two questions and answers on which I rely. Your Lordship says: “I can understand that; it does not follow that because ice is reported you are going to have a collision with an iceberg? - (A.) That is what I wish to convey. (Q.) You need not trouble about that at all as far as I am concerned. The point which I understand is being put to you at present is this, that you knew you were steering into what I may call an ice-field, a district in which there were icebergs and growlers and field-ice. That is what you want to put, Mr. Scanlan? (*Mr. Scanlan.*) Yes, it is, my Lord. (*To the Witness.*) You knew you were heading there when you left the watch” - that is 10 o’clock, and he says, ‘Yes.’” Now that is the point.

*Mr. Laing:* Reading the ones you have read surely it only means he was going into a place where ice had been reported.

*The Attorney-General:* Oh, no; it means more than that.

*The Commissioner:* It did not give me that impression at the time, Mr. Laing, at all; it gave me the impression at the time that what he meant to convey to me was that they were running into a place where they might expect to encounter ice; not that they were

running into a place where they had been advised that ice had been previously. *The Attorney-General*: May I remind your Lordship further upon this. That discussion which Mr. Lightoller had with the Captain, which he explained as referable to a possible haze, is now, so far as I am concerned at any rate, out of the case. I mean that I have given the greatest consideration to all that my friend, Mr. Scanlan, said, and if I may say so, I do not think anyone could add anything to what he said about it. No one could add anything to what was said, and said very well, by him, but it does not go quite far enough. It only indicates that there was evidence of it and I agree, if I may say so, with the view your Lordship expressed as your own opinion and that of the gentlemen assisting you, that there was no haze.

Now my reason for referring to that is this. There was a good deal of discussion during this evidence about the haze and Mr. Lightoller was asked about it, and his point is - I am not going into detail about the haze - that there was some doubt. My suggestion on this evidence is that Captain Smith was very uneasy about this; he was certainly not comfortable in his mind. He was doubtful about it and the conversation that he has with Mr. Lightoller indicates it, because the Captain says: "If it becomes at all doubtful, in the least doubtful, let me know at once." Now what did that mean? They knew that they were approaching a region in which they might expect - I do not want to put it any higher than that - and there might possibly be a haze, as sometimes happens, and at any rate there might be difficulties; but if the conditions changed at all, if they were in the slightest degree worse than they were, then he wanted to be called and only wanted to be called because he knew they were approaching a region in which they might expect to find ice; that is the full extent to which I desire to push this evidence; and that, I submit, is the absolute, clear and logical conclusion from what has been stated.

*The Commissioner*: Then you really think that that conversation did take place; I do not want you to answer that question.

*The Attorney-General*: I do, my Lord. It is certainly very difficult to say what the exact words were.

*The Commissioner*: My difficulty is that I cannot reject it.

*The Attorney-General*: No, my Lord, and in one sense my difficulty is that I have got to deal with it. I mean to say all this is the evidence which is relied upon against me. When I say against me, I mean against the view for which I am contending now.

*The Commissioner*: My difficulty is that it seems to me to support your view.

*The Attorney-General*: That is my contention, but that is not why it was introduced. *The*

*Commissioner*: Unless you think it worthwhile, I do not think you need dwell upon this part of the case any more.

*The Attorney-General*: Your Lordship means with regard to Lightoller's evidence? *The Commissioner*: Yes.

## **Page 910**

*The Attorney-General*: I have called attention to those pages.

*The Commissioner*: I have read it very carefully indeed, and have got it all in my mind.

*The Attorney-General*: Very well. Then I do not propose to deal with it any further.

Now, my Lord, there are just one or two references that I would like to give to support

the view which I have presented to you of the state of knowledge of those who were on board the vessel, apart from the questions we have just been discussing, and this I can do very shortly and without troubling your Lordship to read the reference, but just simply getting it on the Note, because it is beyond question that the fact that the ice might be expected in June, but would not be expected in April, is proved definitely by Mr. Sanderson at page 477, at Questions 19294 to 19311.

*The Commissioner:* What is the significance of that in face of the telegrams? *The Attorney-General:* The significance, my Lord, is as explaining that even though - I am dealing with the argument of my learned friend Sir Robert Finlay, that is the way I am using it in answer to him - even though, and contrary to the view I am putting to the Court, the Captain was justified in thinking that he had passed to the Northward of the ice which had been reported to him, he should have expected that further ice would have been coming South. That is the point of it.

*The Commissioner:* That is a perfectly legitimate observation.

*The Attorney-General:* And that is all I want to say with reference to it. *The Commissioner:*

If some bergs were coming down and he managed to go to the North of them, it was not an unreasonable thing to say there may be others coming.

*The Attorney-General:* Quite.

Now, my Lord, there is also this observation to be made about it. Of course the alteration of the course, proceeding below the corner, to the Southward of the corner 7 to 10 miles was before they had got the "Californian" telegram at all; the "Californian" telegram did not come till 7.35 or something like that, by the "Titanic's" time, and the course had been altered and changed afterwards at 5.50, and from 5 to 5.50 they continue.

Now, my Lord, may I just say a word; and it shall not be more in view of what your Lordship has been good enough to indicate, with reference to these telegrams, the wireless messages. They have been referred to so much that it is only necessary for me to call attention to this, that what they do report is bergs, growlers, and field-ice. That is the first one that was received, the one from the "Caronia," and says 42° North" and "49° to 51° West. April 12th." The second one from the "Baltic," which evidently was thought to be of extreme importance (I will indicate why I say that in a moment), is because there the Greek steamer reports passing icebergs - "a large quantity of field ice today," and then it gives the latitude and longitude; and as we know that is very close to the spot at which the "Titanic" did actually strike the iceberg - very close indeed. That is a message which the "Titanic" would have received at about twenty minutes to two. Your Lordship will remember the evidence turns upon this. According to Mr. Ismay, at about twenty minutes to two or a quarter to two, just before he was going in to lunch, Captain Smith came and handed him this Marconigram which he then put in his pocket and retained till somewhere about 7 o'clock in the evening when he was asked for it again, and, my Lord, the only reference I want to make to that, the only one which I think is really relevant to the question which you have to answer now, is that Captain Smith evidently thought (as he must have thought) that that was a most important message, but we are left a great deal to surmise as to what happened. We have had Mr. Ismay's recollection as to what happened - not of the conversation, because there was none - but of the handing of the telegram; and we are left, I must say, in some difficulty in understanding what actually took place between him and Captain Smith in view of what he stated. But all we know

about it, and we must accept the evidence (I accept that in this case as I took Mr. Lightoller's in the other) as it stands; we have no other. And what Mr. Ismay says is, that it was handed to him, and he admits it was handed to him because it was so important. Now, as affecting Mr. Ismay, I am making no comment. The use I am making of this is to show what value Captain Smith attached to that message; that is the point - that he showed it to Mr. Ismay, and of course it is idle, as it seems to me, to suggest that Mr. Ismay was there on board as an ordinary passenger, and it was only because of his statement to that effect that it became necessary to go into so much detail as to what his position was; but I am not suggesting and did not suggest at the time your Lordship asked me the question at an earlier stage in the case, that he interfered in the navigation. That is not the point of it at all. The point of the observation is that he was here on board the vessel and that Captain Smith when he received that Marconigram thought it was of such importance that he took it to him, gave it to him and fetched it away again by 7 o'clock in the evening; and I doubt whether it adds much to what one can see, or in fact anything, when you look at the context of the telegram, because it is so perfectly plain that it is just exactly within the region within which they must pass within the next few hours, so that nobody could afford to look upon that telegram lightly, and certainly I know your Lordship has not from the first moment that it was brought to your attention.

Now, my Lord, when they had got all that knowledge the question that arises upon it is, what ought they to have done?

*The Commissioner:* The only precaution taken, as far as I remember, was to tell the man that he was to keep a sharp look-out for ice.

*The Attorney-General:* Yes. There is just one slight incident, I think, to which I would like to refer in fairness to Mr. Murdoch. He had the fore-scuttle hatch closed because it made a glow, and he wanted to prevent that so that they would get a better view of the ice; I mean he was careful about that. I doubt whether it has been referred to much in the evidence.

*The Commissioner:* I remember the evidence, but it has not been referred to. *The Attorney-General:* I will give the reference to it as it has not been referred to. It certainly shows that he had it in mind and took that precaution. One cannot leave it out in considering what they did. It is at page 421, Questions 17706 to 17709. What it comes to is that he ordered Hemming at a quarter-past 7 on that evening to close the fore-scuttle hatch to shut off the glow, as he wanted it to be all dark before the bridge so that they could see the ice more easily. That is the position, and that is all that was done. Now, my Lord, the two suggestions I am going to make are, first of all that what they ought to have done was to have reduced their speed; and secondly, that they ought to have doubled the look-out and put a look-out in the eyes of the vessel as close to the stem as they could get him. I will deal first with the latter question about the look-out. The evidence is quite short upon it. Your Lordship had your attention called in detail to it by my learned friend, Sir Robert Finlay, who travelled through all the evidence about this; I am not proposing to do that. Your Lordship will understand when I give these references that they are selections which tell in favour of the view for which I am contending. There is a body of evidence which takes the other view. I am not referring to that, and I will show your Lordship why in a minute - it may be difficult to say. Possibly your Lordship may think it right to express your view about it when you come to report, as to whether in such

circumstances there ought to have been a look-out man stationed on the stem. I suggest, that it is well worthy of consideration, that according to the evidence of very experienced men, it is the best way of detecting ice, and I am only going to trouble your Lordship with the evidence of Captain Rostron of the "Carpathia,"

## Page 911

who dealt with this at page 745. If your Lordship would look at Question 25534 on page 745, you will see he was asked: "You would attempt to keep out of the way of ice-fields and alter your course, but for icebergs you would go on your course, and depend upon picking them up with your eye, and then avoiding them when you have picked them up?" - (A.) Yes. (Q.) I think you have already told me, but I should like to make just sure of it, that you would take special precautions with regard to the look-out by putting men in the eyes of the vessel? - (A.) Yes. (Q.) When you had an ice report? - (A.) Yes. (Q.) As well as having a man in the crow's-nest? - (A.) Yes." Then your Lordship says: "Do you put two men in the crow's-nest? - (A.) I only put one." And then I put to him, "And two in the eyes?" And he said, "Yes." And at page 734, my Lord, Captain Fairfull, of the Allan Line, takes the same view at Question 25272: "Is your practice in accordance with theirs?" - (A.) All except that when we get to the ice track in an Allan steamer, besides having a look-out in the crow's-nest, we put a man on the stem head at night." Then your Lordship says: "I do not hear what you are saying," and he says, "Besides having a look-out in the crow's-nest in crossing the ice track, I put a man on the stem head at night. (Q.) Whether it is clear or not? - (A.) Yes." Your Lordship sees that I am only referring you to the passages that show that whether it is clear, or whether it is not clear, the practice of some experienced men is to put them on the stem because it is so important. *The Commissioner:* There is, of course, a good deal of evidence the other way. *The Attorney-General:* Yes. I say so, my Lord. Then comes Sir Ernest Shackleton, who dealt with it at page 721. He took a very definite view. He says that the nearer you get to the waterline the better position you are in to detect ice. That is the substance of what he says. It is at pages 720 and again on 721. The question on page 720 is No. 25043: "What I want you to tell my Lord is: Do you think it is of advantage in clear weather to have a man stationed right ahead at the stem as well as in the crow's-nest?" And he says, "Undoubtedly, if you are in the danger zone; in the ice zone. (Q.) And supposing you were passing through a zone where you had ice reported to you, would you take precautions as to the look-out? Supposing you only had men in the crow's-nest, would you take any other precautions? - (A.) I would take the ordinary precaution of slowing down, whether I was in a ship equipped for ice or any other, compatible with keeping steerage way for the size of the ship." And then he said also that he would put the man in the stem of the vessel. He says the same thing at page 721, Question 25087. And Captain Jones, who, your Lordship may recollect, was asked some questions, says the same at page 675, Questions 23653 to 23658.

*Mr. Laing:* Was he a captain of the Allan Line?

*The Attorney-General:* No, I do not think so; it is the Dominion Line. He says the same thing - one in the crow's-nest and one in the stem head. I need not trouble your Lordship, having given you the references, by reading it all. In one of those questions and answers

to which I referred, he said that it had always been their custom to do that - to put one in the crow's-nest and one in the stem at night. Then Mr. Lightoller, at page 304, says something to which I want to refer upon this. He says this: that in anything but clear weather they put on extra look-outs, and they put them in the stem on the "Titanic," and the only reason apparently -

*The Commissioner:* They actually had a watch on the stem of the "Titanic" during the voyage?

*The Attorney-General:* They had, during the voyage from Southampton. That is quite right. And if that is the case your Lordship has got the evidence clearly before you - it is at Question 13520, at page 304. If that is the case, my Lord, one cannot understand, I submit, why, in these circumstances, with this anxiety, which undoubtedly was operating upon the minds of those who were responsible for the navigation, of approaching a region where ice might be expected - to put it no higher - I say, one cannot understand why the precaution was not taken of putting a man in the stem of the vessel, because the object of it is that clearly the look-out man may be able to see in the stem earlier than the man in the crow's-nest; and that in any event what it does is gives an added security. That is done as soon as the weather is not clear. Even although the weather is clear and you are approaching the region of ice or are in the region of ice, in the vicinity of ice or where you may expect ice at nighttime, travelling at 700 yards a minute, I do submit it is impossible to understand why this precaution of putting men on the look-out in the stem of the vessel was not adopted by them. It is difficult to say (I do not profess to be able to say - of course no one can) whether, if you had them in the stem, that would have prevented this disaster; I do not know. But at least one can say this, that according to the evidence of all those, or of a number of those who are experts in detecting ice, that that would be a precaution which certainly was taken or would be taken by them, and is an advantage. And it was not in this case even necessary to carry further men. All that they had to do was to give the order when they got to this time of night, and were discussing it - all that they had to do was to say that these two men, or one man, should have gone forward into the stem; and when you bear in mind the rate at which they were progressing I do submit that they ought to have done it, and that it was a precaution that they ought to have taken; and then, my Lord, I get further to this, that as regards the speed it is quite clear what it was. According to the evidence of one witness, it was 45 knots for two hours, according to cherub log - it does not matter very much about the exact speed; it is sufficient to say that, according to the evidence of another witness (Mr. Boxhall) he said he was quite satisfied that the speed was 22 knots. And according to the evidence of one further witness, one of the Quartermasters, he said after he took up the log after the vessel had been in the casualty, he found she had made the 260 knots from noon that day, when the log had been set; that he took it up at about 11.45, and that would give a speed of 21 3/4 to 22 knots. And, therefore, it is that I have allowed something lower than that, in the test I have been taking, without doing any injustice to the White Star Line by taking 700 yards a minute, which is less than the evidence so far established.

Then, my Lord, a great deal has been said during the course of the case, particularly at one time, about the lighting up of the two or three boilers at 8 o'clock on Sunday morning. Your Lordship will remember the discussion. Certainly now, having had the advantage of hearing the evidence, or gone into it very carefully, it seems to me that there

is no importance to be attributed to it. I do not suggest upon the evidence, indeed I do not think that one can suggest, that the vessel was travelling at more than 75 revolutions, and 75 revolutions would give us 22 knots, and no doubt they had in mind that they were going to travel at 78 or 80 revolutions either on Monday or Tuesday, wherever they found a favourable moment to test the speed of the vessel for two or three hours, but it had nothing to do with the record passage, as we know now that it was never done before, and I do not think it is necessary to trouble your Lordship with any further observations upon it, for it throws really no light upon what actually did take place.

Now, my Lord, I think the precautions that were taken are sufficiently indicated by what your Lordship has already said, and that you have them present to your mind, and I am not going to dwell upon them. So far as I can make out altogether from the time of the first indication by Marconigram of the presence of ice, there was first the precaution taken by the Captain, which I will assume was taken in consequence of the Marconigrams, of proceeding the seven to ten miles to the Southward before he turned the corner; I will assume that.

## **Page 912**

Then there is the direction given to the look-out men, which they were to pass on, to keep a sharp look-out for ice and growlers, the exact words are "icebergs, small ice, and growlers."

My Lord, there is just one more point upon that to which attention has not been directed, which I think it is worth bearing in mind in connection with this, and that is that Mr. Lightoller says that his recollection of it was that he said that that order was to be passed on till daylight. That is at Question 13658 at page 307. Its value, of course, is obvious to your Lordship, that during the night there was this anxiety about going through this region of ice, and that this sharp look-out was to be kept - this precaution - right through until they got to daylight and could see better.

Now, my Lord, I think that really brings me very near the end of what I want to say about the speed. My Lord, I will not trouble you with passages as to the speed, because there is really no controversy, it is so well established by the evidence that I think the short statement I have made and the reference to the evidence is sufficient up it.

*The Commissioner:* You are entitled to assume that the speed was from 21 to 22 knots.

*The Attorney-General:* Yes, and, as I say, I have assumed a little less than that. Now, my Lord, what are the answers that are made? Upon that state of facts to which I have been referring - no doubting of the look-out, no reduction of speed, and substantially, except for telling the look-out to keep a sharp look-out, no precaution taken - I say advisedly no precaution taken - to spot the ice which they might expect to meet during the night. What is the answer that is made to the Court? Well, my Lord, really it is only this: it always gets back to the two points, that the conditions were so extraordinary that night, and so unknown to them, as they must say to make it of any value, that they did not know that they would be upon an iceberg so soon. *The Commissioner:* It was, as Sir Robert Finlay says, an accident.

*The Attorney-General:* Yes, an accident; and I think my learned friend added, the kind of thing that must occur. Now, my Lord, I join issue most emphatically with that. I think this is just the kind of thing that must not occur, which need never occur. There are accidents no doubt against which you cannot possibly provide, but this is not one of them. If they had had no knowledge of ice, if they did not know that they were approaching a region of ice, if they had not had the Marconigrams and this had been suddenly, quite unexpectedly, an iceberg which had come down upon them, there is more reason for the excuse. But in view of what had happened, and what they knew about the region through which they were travelling, I do submit that it is idle for my learned friend to suggest that this is "just the kind of accident that must occur."

*The Commissioner:* I do not think, Mr. Attorney, Sir Robert said it must occur; I do not think he meant it in that sense.

*The Attorney-General:* It was the phrase he used; I think what he meant was that it was the kind of thing against which you cannot provide.

*The Commissioner:* Yes; it is a kind of thing which you cannot foresee.

*The Attorney-General:* Yes. That is what I am objecting so strongly to. That is exactly what I mean. I did not mean more than that. This is just exactly the kind of thing that you can foresee, which ought to have been foreseen, and that in the circumstances we are dealing with in this case, should have been foreseen, and all that you have to do in order to take precautions about it was what I ventured to point out was this very simple and slight precaution, but having very great effect upon the reduction of speed. Now, my Lord, it has been said, I know, during the course of the case, and much reliance has been placed upon it by my learned friend Sir Robert Finlay and by the witnesses who were called - a great body of evidence has been called before you to establish that it is the practice of Captains of liners to proceed at this or any other great rate of speed; in other words, not to reduce their speed, although they may expect to meet icebergs, and at night, provided that the weather is clear and think one must add also this, that in all probability what these masters of vessels meant was that, provided they could see the iceberg at a sufficient distance to avoid it, they would not reduce speed; I doubt whether it comes really, when you analyse it, to more than that. If it does, my Lord, then I do beg respectfully to protest emphatically against it being accepted as the practice.

*The Commissioner:* I do not think it was - I do not know. You must not assume that what I say is final, but it appears to me that what they mean is this: We always do go full speed though we have notice that there is ice in the vicinity, because we believe that it will always be possible for us to avoid the ice when we see it.

*The Attorney-General:* Yes.

*The Commissioner:* As you said some time ago, if that is all that is meant it is quite right.

*The Attorney-General:* Yes; of course, I have nothing to say against it. But of course, there is another possible view; it has been indicated by some of them, and I will only say a word about it. I do not want to take up time with it. It is said that one of the reasons why they do it is in order to get away from the possibility of fog.

*The Commissioner:* Yes, I know.

*The Attorney-General:* That is one of the things they say, and certainly Mr. Ismay was very emphatic about it, and why I am referring to it, and dwelling upon it a little, is because some of the witnesses (I will not trouble to give your Lordship the reference to

them) certainly take the view that that would be right now, notwithstanding what had happened with reference to the "Titanic." *The Commissioner*: One witness did.

*The Attorney-General*: Yes. I think it was Mr. Passow, and certainly Mr. Ismay did as I understood him, and his evidence establishes it, and Mr. Sanderson was taking the same view, and really what they are saying and the way they are looking at it (and that is the reason why I am dwelling upon it) does strike one as rather strange, because I think it is a little appalling that they should take the view that that would be right now notwithstanding what has happened and notwithstanding the lesson that they have learned, for we now know that not only on board one vessel, the "Titanic," did they not see this iceberg, but they got into all this difficulty through the speed that they were going. And yet, notwithstanding all that, this is to be treated, apparently, as one of those very rare and exceptional things which one cannot be expected to foresee, and which would not alter their practice. The only reason why I am dwelling upon it is that I do ask your Lordship in any event and with all respect, at any rate to condemn the continuance of such a practice, so that not only may you make it possible to foresee, but that we may foresee. If that is not done we may have another similar catastrophe; and therefore it is that I am asking your Lordship to state emphatically what your view, if you agree with it, and the view of those assisting you, would be upon this.

My Lord, one other distinction has been drawn by these witnesses, and it is not unimportant; I have no doubt it is present to your Lordship's mind. Witnesses were asked questions: Supposing you had a report of an iceberg or icebergs, would you reduce your speed? and then they have said, with the qualifications and assumptions to which I have just referred, that they would not, but they made this qualification, some of them at any rate, that that would not apply to an ice-field. Your Lordship will remember the broad distinction that was drawn between the ice-field and the icebergs. Of course, I am not an expert in these matters, but, so far as I am able to gather from the evidence, the reason is this, that you may be meeting an iceberg, or two icebergs, or three icebergs, without the proximity of an ice-field; but if you know that there are icebergs and ice-fields in the vicinity, then you do know that you are in the region in which there must be a considerable amount of ice. And there is the further difficulty which has been explained by some of those who were on the Canadian Lines, that if you get into an ice-field

### **Page 913**

and are surrounded by it there may be trouble to your propeller if you continue along your way; you may get into a lane and find it closed, and you may not be able to get in, or you may not be able to get out, and you have got ice close up against the propeller of your vessel which may affect the vessel, and which at any rate it is very advisable to avoid.

Now, my Lord, in this case the reports that the Captain had got were of both ice-fields and icebergs, and therefore all those precautions which ought to have been taken and which would have been taken by those who thought icebergs or ice-fields were to be avoided, should have been taken in this particular case. I am not going to make any comment upon the instructions that were issued. Your Lordship will remember that we have had a good deal of evidence about them. Apparently both with the Oceanic Steam

Navigation Company and other Canadian lines, where they would presumably expect to meet more field ice, there is a specific direction with regard to field ice. With the lines trading with the United States they have merely a general one - I say general because it has no specific reference to ice. I am not inclined myself to quarrel with that view, at any rate, so far as to suggest that there is anything wrong or blameworthy in their not having given specific instructions as to ice. No doubt these vessels would encounter, and do encounter ice, and the Commanders have to exercise their judgment it is left to them, and, if necessary, they have to deviate their course in order to avoid the ice. Your Lordship will remember we were told that that is what they do, and there were some reports produced with regard to it. I am not going into that matter save to say this: that it certainly would be desirable in any event, whatever view your Lordship may take of this case and of the conduct of those who were responsible for the navigation, that some instructions should be given, if you think fit to make the recommendation to the Masters of vessels, that when they have reports of this character they should go at a moderate speed during the night. I know the difficulty, and I am fully aware that your Lordship appreciates it, of saying at what speed; none can say that. The reason why I use the term "moderate" is because it was found in the International Regulations which were made for preventing collisions at sea, and in the Article - I think it is Article 16 - which refers to what a vessel must do in mist, or fog, or falling snow, the order given by the Rule is to go at moderate speed, and then it is left to the Courts to interpret what that should be in the particular conditions of day. I do not think one can be more precise about it than that, and I called your Lordship's attention to it as I thought you might like to have it.

*The Commissioner:* I am much obliged to you. Have you got a copy of it?

*The Attorney-General:* Yes, it shall be handed up to you, my Lord. It is Article 16: "Every vessel shall in a fog, falling snow, or heavy rainstorms go at a moderate speed, having careful regard to the existing circumstances and conditions." *The*

*Commissioner:* Has every Captain a copy of this in his cabin?

*The Attorney-General:* Oh, yes, my Lord, I think so. Of course, it is a thing he is bound to know.

*The Commissioner:* Then I do not see what the advantage is of putting it into the Sailing Directions. It is issued, as I understand, by the Company.

*The Attorney-General:* The point of it is - I am only referring to it for this reason - that it does not relate to ice - that is the point of it.

*The Commissioner:* Oh, yes; I beg your pardon.

*The Attorney-General:* The only reason I am referring to it is to show what is done when you are dealing with fog. I thought it would give some sort of guidance to the Court when you are dealing with these things, bearing in mind that those Rules are the result of International conference.

*The Commissioner:* How did they come to omit ice?

*The Attorney-General:* I did not know, my Lord. They do not seem to have considered it at all. And of course you have got to bear in mind that it is only for preventing collisions at sea; under the Merchant Shipping Act those regulations have to be made only for preventing collisions between vessels at sea. They have no application except that.

*The Commissioner:* It is a sort of sailing article, Article 29.

*The Attorney-General:* Yes, that is seamanship, really. That means, of course, that there might be such exceptional circumstances (which I have no doubt your Lordship has had to consider when you were President of the Admiralty Court) which relieve a man when he did not obey a particular Rule.

*The Commissioner:* It is not quite that I mean. What I mean is this. Article 29 says: "Nothing in this Rule shall exonerate any person from the neglect of any precaution which may be required by the ordinary practice of the sea or by the special circumstances of the case."

*The Attorney-General:* Yes, my Lord, but still that would not apply to this case. It has no application to the impact of a vessel with an iceberg.

*The Commissioner:* No.

*The Attorney-General:* My Lord, I will just remind you of what was done for the purpose of meeting the serious and grave difficulties raised by the foundering of the "Titanic" subsequently, as something which also has to be borne in mind, and which your Lordship will have to consider with regard to one of the questions (it comes in its proper order now), and I will be very brief about it, because there is no controversy, and that is with regard to tracks. There is a specific question directed to it, and of course your Lordship will have to consider it. Your Lordship will remember that the way it stands is this, that subsequently, after the "Titanic" disaster was reported, there was an alteration made which lengthened the voyage about 220 miles. That is at page 602 of the Note, Question 23588. A chart was handed up which showed your Lordship what had been done. The consequence of that alteration is that they proceed much more to the Southward, and it has the effect of lengthening this voyage some 220 miles, and apparently, as I gather from reference to the chart, that was arrived at on the 19th of April by the Hydrographic Office in the United States - according to their chart.

*The Commissioner:* Can you give me the reference to the question?

*The Attorney-General:* It is Question 23588, page 602, my Lord, and page 603 too. My Lord, the way that matter stands, if I may state it to your Lordship quite shortly, is that in 1908 there was the agreement arrived at by which what I may call a main highway was made out to the United States, and another main highway for vessels home from the States by agreement - that is 1898; and from that time and at that time there was an alternative Southern route taken which would be resorted to when they expected much ice during these months. That has, in fact, been resorted to three times since 1898, and that your Lordship will find at page 477, Questions 19293 and 19311.

*The Commissioner:* By whom?

*The Attorney-General:* By these lines who were parties.

*The Commissioner:* By one or other of the lines, do you mean?

*The Attorney-General:* No, by all. As I understand it, what had happened was that reports came in of ice along the track, what I may call the normal Southern track, and in consequence of that the lines agreed to an alternative Southern track for the time being, and then what they did was to deviate. And I was going to make this observation about it, that it does look as if that kind of thing is only done when they do agree, and one can see the difficulties that there are - competition between the lines in the one lengthening the voyage if the other does not; just in the same way if one reduced his speed and the other

did not; and one can understand therefore very well why it is that many of these Captains (many of the

## Page 914

Captains of competing steamers) say, "Oh, we do not reduce our speed; we go full speed ahead at night." There is keen competition no doubt to make a short voyage. It may be said that the public wishes it; but I think, as your Lordship said earlier, that cannot excuse or justify anybody in going at an excessive speed when he knows there is danger ahead. But that is the position - it applies both to the track and to the speed.

Then, my Lord, at page 663 there is a discussion that shows what I have just referred to - that on the 19th April, 1912, the new track, making 220 miles more voyage, was resorted to. It is only to give your Lordship the reference. It is after the event, of course, to show what actually happened.

*The Commissioner:* That would lengthen, as I understand, the passage to New York by about 12 hours, by the quicker boats?

*The Attorney-General:* Yes, it makes it to that extent safer.

Now, my Lord, I think the only other thing to which I want to direct your attention in this connection, and that I can do very shortly, is what the evidence is as to the colour of the particular iceberg seen. Of course if you come to the conclusion that whether it was a black or a dark iceberg or not is immaterial for this purpose, then it is unnecessary for me to refer to this evidence; but if you think that which is relied upon as an abnormal condition - that is the dark colour of the iceberg - is of any importance, then it will be necessary to consider what the evidence is about, and I will state it really in a sentence, and give the reference to it, so that they may appear upon the Note so as not to take up time unnecessarily with it. The effect of it is this, that there are only two witnesses who state positively that they saw it, they are Fleet and Lee and they are the only ones. Mr. Boxhall says he fancies he saw it after the event, after he came up, but it is very difficult to place much reliance upon that. He saw it, he says, about two minutes after he came up on deck, or he thinks he saw it. But I think that really exhausts the evidence upon it. It is very curious that there is so very little evidence. That is all the evidence you have got in this case as to the colour of that iceberg, except perhaps one fact which I do not think adds anything to it, but I will mention it in case my learned friend thinks it does, and that is that Lucas, one of the witnesses, says he saw ice on the well deck where it fell, and that it was of a darkish white. I do not know that it adds anything to it, because what a piece of ice that had fallen from the berg on to the deck would show as a colour is not necessarily a key as to what you would see in the mass, and I do not think it adds anything. Lee is at page 83, Question 2441 to 2444, and Fleet is at page 410; he is the one who first saw it, Question 17277. The passage I referred to in Mr. Boxhall's evidence is at page 359, Questions 15496 to 15501. And really that is all the evidence you have got about it and what I am going to submit to you, if your Lordship pleases, is that really you have not apparently reliable evidence to find as a fact, if it were necessary to determine it, that this was one of those icebergs which capsized, or which was presenting its dark face. I think the only explanation of why it is said that it was that kind of iceberg, was that there was not any phosphorescent light about this iceberg. There was certainly no

iceblink according to the evidence, and I do not suppose there would be on any iceberg of this character, and I do not think there has been any suggestion that there was - but there was none; there was no ripple around the base of the berg at the waterline. That is independent of the colour of the berg, but it is one of the things relied upon; and there was no white outline at the top of the berg above the water, and that I think is the whole of the evidence about it.

Now, my Lord, when you are dealing with it on a night of this kind, I think that all you can say about it is, when you bear in mind that this was a low-lying berg, 60 to 80 feet high.

*The Commissioner:* Who was the witness who saw it vanishing on the starboard side of the ship?

*The Attorney-General:* That is Shiers, my Lord, but I did not think that that came to anything.

*The Commissioner:* I think he describes it as something of a grey colour.

*The Attorney-General:* Yes, I did not think his evidence was of any value.

*The Commissioner:* Perhaps he did not. I am sorry to disturb you, but it struck me he did say that he had seen it when it was vanishing.

*The Attorney-General:* He did say it, my Lord. It is at page 111. It is quite plain that he is speaking about it there. It is the colour I wanted, and I do not fancy he says anything about that. I do not think he said anything about colour. He did say: "I saw the berg that was going away." You are quite right in that, my Lord. *The Commissioner:* Yes.

*The Attorney-General:* But I do not think it threw any light upon it. This is the nearest I think we shall ever get to it - that is why I did not pay any attention to it - Question 4544, at page 111: "About how far off? - (A.) I could not say; it was very dim then; I could just see it."

*The Commissioner:* Yes, that is what I had in my mind. "It was very dim; I could just see it." You need not trouble any further about it.

*The Attorney-General:* Very well, my Lord. Now, my Lord, there is a little evidence and of value upon this question of icebergs, which your Lordship no doubt has in mind, of Captain Rostron, of the "Carpathia," and Sir Ernest Shackleton. I mean upon the point, the specific point, which was also deposed to by some other witnesses, of the dark iceberg; and showing that it was the kind of thing that you ought to expect; and there was also the evidence of Mr. Lightoller, to which I have referred. Now, my Lord, I only want to call your attention to the passages there again, because I have summarised it. I have stated what the effect of it is, and I have no doubt it is present to your Lordship's mind. The effect of it really is this, that it is the kind of thing that every reasonable man must expect when he gets amongst ice, that some of the icebergs, or one of the icebergs, may present this dark appearance and will be difficult to detect. That is all that is necessary for the point that I am upon.

*The Commissioner:* This dark colour is seen, is it not, after the berg has turned turtle?

*The Attorney-General:* Yes, it is; but I am not sure that it is confined to that. Certainly that is the evidence that that is what happened. One witness, Captain Cannons, I think, told us that he was watching and he saw it happen to one; he saw it turn turtle, and when he saw a projection above the water it was a much darker colour; and Lightoller refers to it in the same way. The natural consequence of all that is that you must expect icebergs to

turn turtle as they are travelling South, and that it is just one of the things against which you must guard. That is all that it is necessary for me to say. Captain Rostron did refer to it at page 743, Question 25461 to 25465. They are very short; perhaps I might just read them. I had been dealing with icebergs which present a dark appearance, and I said: "That is what you would ordinarily expect when you are looking out for icebergs, is it?" - (A.) Yes. (Q.) You cannot tell from which side you are going to see it? - (A.) No. (Q.) Nor how it is going to present itself to you in appearance? - (A.) No. (Q.) So that if I follow what you have said, you would always have to be prepared for an iceberg which presented a dark appearance to those who were looking out for it," and he says, "Yes." Now, my Lord, I submit that that is conclusive upon the point, and quite clear.

Sir Ernest Shackleton, at page 719, was quite definite and emphatic about it, too, in the light of his very great experience, and he gave two instances, your Lordship may recollect. They were rather slightly referred to by my learned friend, Sir Robert Finlay - no doubt, a little pressed by them - but they were instances by Sir Ernest Shackleton of what had happened to him when he was an ordinary passenger on a vessel, not on the "Nimrod," but when he was an ordinary passenger on a vessel going across the Atlantic,

## **Page 915**

and he says this at page 719, that in April, 1897, he saw a blue-black berg, a low-lying berg, he calls it, when he was crossing on this very track; and he says that in 1903 he saw the same thing again, and he says he saw several bergs in the track. The first one I referred to was in the month of April, 1897; the other was in the month of May, 1903, and there the difference was that he saw several bergs, and amongst them a black berg - that is the position. And in the light more especially of the passage to which I have called attention of Mr. Lightoller's evidence, also showing that he was well aware of the same object, of the existence of this kind of iceberg - I think it is page 307 - I do not propose to trouble your Lordship with any detail with regard to it.

Now, my Lord, my submission upon this part of the case, upon which I have concluded what I desire to say now is this, that in view of all those facts and circumstances to which I have called your attention that preceded the sighting of the berg, a reasonably prudent navigator ought to have reduced his speed, and I say further that he ought to have doubled his look-out, and that the reasonable precautions to have taken would have been both; but certainly he ought not to have neglected either the one or the other. My Lord, then I say further, that in assuming your Lordship hesitates to come to that conclusion, and you think, if the direction of your mind was that way, that you would not express any view upon it because you were not called upon to do so.

*The Commissioner:* That is what occurs to me just as it occurs to me in the case of the Captain of the "Californian."

*The Attorney-General:* Yes, my Lord. Well, I have put the consideration before your Lordship and of course I leave it there, and your Lordship will decide of course as you think fit.

*The Commissioner:* It does not prevent me finding that the cause of the accident was what you suggest it was.

*The Attorney-General:* No. Still, your Lordship, of course will answer the questions as you think fit, but having taken over 30 days in the case, and having gone into all the facts, it did seem to me right that I should put it before you so that if you come to the conclusion - and I know you would not come to a conclusion unless you were driven to it, because you are dealing with the case of a man who is dead -

*The Commissioner:* I said a long time ago that I doubted whether I ought to find a dead man, or a man who is not represented, guilty of negligence.

*The Attorney-General:* Your Lordship will decide upon that when you come to your judgment.

*The Commissioner:* Taking the "Californian," that man is not represented. He came here merely as a witness.

*The Attorney-General:* Who?

*The Commissioner:* Captain Lord.

*The Attorney-General:* Oh, yes, my Lord, he was represented.

*The Commissioner:* Yes, he is here in the sense that somebody sent by his owners did speak for him.

*The Attorney-General:* Then, my Lord, I would sooner deal with that separate, if I may; I know what your Lordship has in your mind.

*The Commissioner:* What I mean is that he has not been cited here to defend himself against the charge made against him of negligence.

*The Attorney-General:* Your Lordship is speaking now of the Captain of the "Californian"?

*The Commissioner:* Yes, Captain Lord.

*The Attorney-General:* But that is quite a different thing.

*The Commissioner:* I am not sure. You are talking at present about Captain Smith. What I am pointing out is this, that Captain Smith could not be here; he is dead; he could not have been cited. But the Captain of the "Californian" is here really merely as a witness. He has not been cited to answer a charge of negligence, and I have great reluctance to find people guilty of negligence when they are not cited and charged with it, and have not had a proper opportunity of answering the charge.

*The Attorney-General:* I will deal with Captain Lord's case, my Lord.

*The Commissioner:* Later on. I am only suggesting that there is an analogy between the two cases; I may be wrong, you know, but that is what I am suggesting.

*The Attorney-General:* Well, so long as your Lordship has present to your mind what the position is with regard to the case and you have all the considerations, at any rate, which have occurred to me to present to you, that the speed was excessive, I should submit that it is beyond all question in this case upon the evidence as it stands; but naturally that does not dispose of the other points. It is quite possible, as your Lordship says, to treat that simply for the purpose of this case as a fact, and to leave it there.

Now, my Lord, that is really all I need trouble you about with regard to that. The result of it in any event is that the question as to the cause of the disaster, and Question 14 as to the speed are, I submit, plain apart from all these considerations that I have put to you, and, my Lord, having placed all the facts before you I am content to leave it. It certainly is no part of my duty, and it is the last thing I should desire to press your Lordship to find

negligence against Captain Smith, and I quite appreciate what your Lordship says, that he is not represented. At the same time as I leave it, I do think it necessary to put before you this, that having enquired into all these facts and circumstances, we have gone into all that has happened with regard to the navigation of this vessel, and if you do come to the conclusion that it was negligent navigation I submit there is nothing to prevent the Court from saying it. That is the point I want to make clear.

Now, my Lord, I am going to other matters, and probably your Lordship would think it right to adjourn.

*The Commissioner:* Do you intend to come back this afternoon?

*The Attorney-General:* No, my Lord.

*Mr. Laing:* May I correct a statement of the Attorney-General (I did not want to interrupt him) which arose about Mr. Ismay's opinion. My Lord, my friend the Attorney-General said in the course of his argument that Mr. Ismay's view had been expressed that the question of speed in future was one which he had formed an opinion about. That is incorrect. May I read what Mr. Ismay said, because I wish to correct it. He was asked: "Is it still your view that your Captains and officers are discharging their duty in crossing the Atlantic, when ice is reported to them, in going ahead at full speed and taking no extra precautions? - (A.) So long as they can see the object far enough ahead to be able to avoid it." That is all that Mr. Ismay said.

*The Attorney-General:* I agree that that is what he said, and I am not putting it any higher than that.

*Mr. Laing:* I thought you did.

*The Attorney-General:* No; that is exactly what I was saying.

***(Adjourned to Monday next at 10.30 o'clock at Caxton Hall.)***

**Page 916**

The following document was put in by the Board of Trade, and agreed to by the White Star Line:-

1. When the "Titanic" left Queenstown on or about 11<sup>th</sup> April last -

(a) The total number of persons employed in any capacity on board the "Titanic" was	...	885
The respective ratings of these persons were as follows:-		
Deck Department	... ..	68
Engine Department	... ..	325
Victualling Department	... ..	494
	----	885

N. B.-The eight bandsmen are not included in this number as their names appear in the 2<sup>nd</sup> Class Passenger List.

(b) The total number of passengers was 1316  
Of these :-

	Male	Female	
1st Class	180	145 =	325
2nd Class	179	106 =	285
3rdClass	510	196 =	706
		----	1316

Of the above six children were in the 1<sup>st</sup> Class, 24 2<sup>nd</sup> Class, and 79 3<sup>rd</sup> Class. Total, 109.

### S.S. "TITANIC."

711 lives were saved }  
1,490 lives were lost } 2,201 total on board.

#### PASSENGERS SAVED.

##### *1st Class.*

Adult Males	57	Out of 144, or 97.22 per cent.	Adult
Females	147	Out of 175, or 32.57 per cent.	
Male Children	5	All saved.	
Female Children	1	All saved.	
	-----		
	203		

##### *2nd Class.*

Adult Males	11	Out of 168, or 8.33 per cent.
Adult Females ...	80	Out of 93, Or 86.02 per cent.
Male Children ...	11	All saved.
Female Children ...	13	All saved.
	-----	
	118	

##### *3rd Class*

Adult Males	... 75	Out of 464, or 16.16 per cent.
Adult Females	... 76	Out of 163, or 46.62 per cent.
Male Children	... 13	Out of 48, or 27.08 per cent.
Female Children	... 14	Out of 31, or 45.16 per cent.
	-----	
	178	

-----

The number of the Crew that were saved was 212. Of these:--  
43 belonging to the Deck Department. 72 to the  
Engine Room Department, and 97 to the Victualling  
Department.

-

----  
212

Of the 97 belonging to the Victualling Department 20 were  
women. Out of the total number of 66 belonging to the Deck  
Department on board immediately before the Casualty, 43, *i.e.*, 65.15 per cent  
were saved.

Out of the total number of 253 belonging to Engine Room Department,  
72, *i.e.*, 28.45 per cent were saved

Out of the total number of 397 belonging to Victualling Department, 97,  
*i.e.*, 24.43 per cent was saved.

Out of 23 women belonging to the Victualling Department, 20, *i.e.*, 86.95 per cent  
was saved.

The passengers who embarked at Queenstown were presumably all Irish and  
amounted in numbers to ... .. 113

Of these: --

#### SUMMARY

CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

## LOSS OF THE S. S. "TITANIC."

### **THIRTY-FIFTH DAY.**

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

*The Commissioner:* Sir Robert, I was asking Mr. Laing in your absence on Saturday about Lightoller's evidence; it presents, if it is to be accepted, in my opinion, considerable difficulties with regard to your theory. First of all there was clearly in my mind the discussion about every so-called abnormality which is relied upon before the Commission, except the swell, and the swell does not appear to me to make any difficulty, because they were not anticipating seeing any fringe round the bergs. That is the effect of the conversation. They did not anticipate any fringe round the bergs, and it was one of the difficulties they discussed. Therefore, it seems to me the absence of swell is not of any importance. The other difficulty that I had with reference to your theory is this. Lightoller made a calculation and came to the conclusion that they would reach ice at half-past 9. Now Mr. Laing suggested that that was not the true effect of this evidence; that all that he meant was that they would reach the region in which ice had been notified. That does not seem to me to be the effect of his evidence. I think his evidence means that in his opinion they would come where they might expect to see ice, and if he did make a calculation of that kind, and it was properly made, it is inconsistent with your theory that all the notified ice had, by the time of the collision, passed away.

*Sir Robert Finlay:* May I deal with both those points?

*The Commissioner:* If you please.

*Sir Robert Finlay:* I will take the second first, because I submit it admits of a short answer. Will your Lordship kindly look at the large chart which I handed up where the time is marked at which the "Titanic" reached 49 degrees and also the time when she reached 11 o'clock when she would be further on her course. Your Lordship will see soon after 9 o'clock the "Titanic" gets just beyond 49 degrees. Your Lordship sees the line down there does not mean any meridian; it is a line dividing the chart into 20 mile squares. At the top your Lordship will see longitude 49, and then if your Lordship goes down to the track which the "Titanic" took your Lordship will see that at 9 she was short of 49 degrees.

*The Commissioner:* I do not follow you.

*Sir Robert Finlay:* The track where the "Titanic" was proceeding where you have the legend "'Titanic's' course after 5.50 p.m., S. 50 W. true, speed 22 knots." Your Lordship sees "9 p.m." marked there. That is short of 49 degrees.

*The Commissioner:* It is slightly short of 49 degrees; about 3 miles.

*Sir Robert Finlay:* I think about 3 minutes.

*The Commissioner:* It is three miles in distance.

*Sir Robert Finlay:* Exactly. One calculation by which they would get soon after 9, to the region to which the "Caronia" message referred, is one of those which Lightoller referred to, that is his own calculation. He said: I made a mental note - I remember the expression - of 49 deg., because I considered the longitude of importance. That relates to the "Caronia."

The other, the 11 o'clock, relates to the "Baltic." Your Lordship will see that almost immediately below the position of the iceberg reported by the "Baltic" is "11 p.m.," as the position of the "Titanic"; so that it is quite clear that the explanation as I submit of the discrepancy is what Lightoller himself suggested, that Moody must have been dealing with the "Baltic" ice, while he, Lightoller, was dealing with the "Caronia" ice. *The Commissioner:* Yes. It does not seem to me to matter which they were dealing with. Both

of them came to the conclusion that they would possibly sight ice, and the calculations were based on one or other of the three telegrams.

*Sir Robert Finlay:* Yes.

*The Commissioner:* And that calculation, if it is accurate, seems to me to be inconsistent with your theory that they could not have sighted ice at that time, that none of the ice of the three messages could be sighted, because, as you put it to me, the ice had gone further South, and they were passing round the stern of the bergs.

*Sir Robert Finlay:* I submit there is no inconsistency at all, my Lord. What they apprehended was, although no other ice had been reported, and although the course that they took would avoid, and did avoid, the ice which had been reported, yet they had got to the longitude where this ice had been reported, and it was, of course, always possible that there might be other ice.

*The Commissioner:* Do not you see the danger of that? If they knew that they were in the region where ice might be, where icebergs might be, then they ought to have taken that circumstance into consideration.

*Sir Robert Finlay:* I think they did, my Lord, as I shall show in answering your Lordship's other question; but I hope that I have made clear that the explanation which Lightoller gave of that discrepancy between the two calculations is a correct one. *The Commissioner:* I remember very well what he said, and a very unsatisfactory explanation it was.

*Sir Robert Finlay:* But, my Lord, it exactly fits in with the position of the "Titanic" at 9 o'clock and at 11 o'clock.

*The Commissioner:* It may be, but if you remember he said when Moody told him that he expected to meet ice about 11 o'clock, "I noticed that it was wrong, but I did not say so; he was busy at the time and I did not want to disturb him." It appears to me a most unsatisfactory explanation, but that is what he says. Then he says. "I thought" - he said this subsequently and seems very like an afterthought - "I thought that Moody's calculation was based on some other telegram."

*Sir Robert Finlay:* My Lord, I do not know whether Mr. Lightoller is now in the country. If your Lordship thinks it might conduce to the interests of truth to recall him - *The Commissioner:* I do not want to have Mr. Lightoller back; I am quite satisfied with the evidence as far as it goes.

*Sir Robert Finlay:* If your Lordship pleases.

*The Commissioner:* I should not care for any evidence of Lightoller coming after the discussion.

*Sir Robert Finlay:* If your Lordship pleases.

*The Commissioner:* If you follow what I mean -

*Sir Robert Finlay:* I follow perfectly. My submission is that Lightoller's evidence as it stands is clear and consistent with the facts so far as relates to these two messages, and I submit it does not touch the point which I made that all this ice that was reported - the "Baltic" ice and the "Caronia" ice, as well, of course, as the "Californian" ice which was far to the Eastward - was successfully avoided, and the course taken was one which would avoid it, because, while the field ice and the smaller bergs would be well to the Northward, the big bergs must have gone to the South.

*The Commissioner:* I have been thinking very anxiously about your theory about the Labrador Current taking these big bergs to the South, and I shall give it great consideration. But it seems to me that your admission that there might have been other bergs in the track which they were following, put upon them, if it be true, the obligation to do more than they did.

*Sir Robert Finlay:* My Lord, I submit not for this reason. As soon as you have had a report of ice in a particular longitude, although you have taken a course which avoids the ice which is reported, every prudent navigator will take into account that there may possibly be other bergs; and then it comes back to the question whether, by following the course which is invariably adopted in North Atlantic navigation, of keeping the speed at which the vessel was going, there was anything in the slightest degree blameworthy.

*The Commissioner:* Then you come to the abnormality?

*Sir Robert Finlay:* I do, my Lord. I shall deal with that in answering your Lordship's second question.

## **Page 919**

*The Commissioner:* Let me make it clear as we go along. There is a vast amount of evidence, and very good evidence too, good in quality and a great deal in quantity, to show that it has not been for a quarter of a century or more the practice to alter the speed merely because ice is to be seen, because experience tells them that they can always avoid it. But then there arises the natural question: then why did not you avoid this?

*Sir Robert Finlay:* That brings us to the abnormality.

*The Commissioner:* Yes, then comes the excuse for not avoiding it, the abnormality.

*Sir Robert Finlay:* May I put it as the reason why we were not successful in avoiding it? But before I pass from the practice, might I call attention to the fact that not only is there a vast body of evidence all consistent, but there is no contradiction from anyone engaged in that trade?

*The Commissioner:* It may be that I am quite satisfied that they were following a well known practice which was justified by experience - as you pointed out in your speech, justified by the excellent results in the absence of accidents, in following that course. That may be; but why did not they see it?

*Sir Robert Finlay:* That brings me to answer your Lordship's second question, and that relates to this. The circumstances were abnormal in two respects: in the first place the swell, if it had existed, as everyone believed it did exist, would have shown a distinct ripple at the foot of the berg, not so great, of course, as there would have been if there had been wind, but still perfectly noticeable. May I state one other point - that there would have been a second indication, which was also referred to, between Mr. Lightoller and the Captain, and that is this, that if you have got a berg which turns its black side to you, you get a light over the top, owing to the fact that the other side is white: but here we had that very rare phenomenon, a black berg with no white side.

Now, what I am putting to your Lordship is this - and I submit, when the evidence is looked at, it is clear - that this catastrophe arose from the fact that the "Titanic" was properly pursuing the regular practice in relying on what experience has shown to be the case, that you can see the bergs in time to avoid them. She did not see the berg in time to

avoid it, because you had the extraordinary fact that two things, each rare in itself, a black berg and no swell, coincided; and thereby the ship did not get warning before she was upon it.

May I say one word with regard to the conversation with the Captain. We are now entirely in your Lordship's hands as to what took place upon that occasion, but what I wish to put before your Lordship is that it is clear that conversation related only to the absence of wind. I will show your Lordship - I am not going to make a speech, of course, but to refer to one or two questions and answers - that they never knew until they got to the water that there was no swell, and the combination - the extraordinary combination - was a black berg and not even a swell.

Will your Lordship kindly look at page 305, Question 13569. The Solicitor-General is examining. "Tell us what you were going to say? - (A.) In the event of meeting ice there are many things we look for. In the first place a slight breeze. Of course, the stronger the breeze the more visible will the ice be, or rather the breakers on the ice. Therefore at any time when there is a slight breeze you will always see at nighttime a phosphorescent line round a berg, growler, or whatever it may be; the slight swell which we invariably look for in the North Atlantic causes the same effect, the break on the base of the berg, so showing a phosphorescent glow. All bergs - all ice more or less have a crystallised side. (Q.) Is it white? - (A.) Yes; it has been crystallised through exposure and that in all cases will reflect a certain amount of light, what is termed ice-blink, and that ice-blink from a fairly large berg you will frequently see before the bergs comes above the horizon. (Q.) Now let me follow. Was there any breeze on this night? - (A.) When I left the deck at 10 o'clock there was a slight breeze - Oh, pardon me, no. I take that back. No, it was calm, perfectly calm. (Q.) And there was no breeze. Was there any? - (A.) As far as we could see from the bridge the sea was comparatively smooth. Not that we expected it to be smooth, because looking from the ship's bridge very frequently with quite a swell on the sea will appear just as smooth as a billiard table, perfectly smooth; you cannot detect the swell. The higher you are the more difficult it is to detect a slight swell. (Q.) That means, then, does it not, that if you are on the bridge and you are relying on the fact that there may be a slight swell, you really cannot tell from the bridge whether there is a swell or not - a slight swell? - (A.) We look at it rather the other way - that, though the sea may appear smooth, we pretty well know that there is a swell, though it may not be visible to the eye, nor yet have any effect on the ship. It is a most rare occurrence - (Q.) You mean there nearly always is a swell in the North Atlantic? - (A.) This is the first time in my experience in the Atlantic in 24 years, and I have been going across the Atlantic nearly all the time, of seeing an absolutely flat sea. (Q.) Do you agree from that experience that this was an occasion when it was an absolutely flat sea? - (A.) Absolutely flat. (*The Commissioner.*) Not in fact, but to all appearance? - (A.) In fact, my Lord. (*The SolicitorGeneral.*) He means in fact, my Lord. (*The Commissioner.*) Do you mean there was no swell at all? - (A.) I mean to say that the sea was so absolutely flat that when we lowered the boats down we had to actually overhaul the tackles to unhook them, because there was not the slightest lift on the boat to allow for slacking, unhooked." That the absence of swell they detected afterwards when they got down to the water; they did not know it from the deck. I think your Lordship will recollect that one of the Assessors, I

think it was Captain Clarke, informed your Lordship in the course of the case, as your Lordship stated, that sailors talk of it as calm although there is a swell on.

Then, on page 306, the witness goes on at Question 13615: "At five minutes to 9, when the Commander came on the bridge (I will give it to you as near as I can remember) he remarked that it was cold, and as far as I remember, I said, 'Yes, it is very cold, sir.' In fact, I said, 'it is only 1 deg. above freezing. I have sent word down to the carpenter,'" and so on - "We then commenced to speak about the weather. He said, 'There is not much wind.' I said, 'No, it is a flat calm as a matter of fact.' He repeated it; he said, 'A flat calm.' I said, 'Yes, quite flat, there is no wind.' I said something about it was rather a pity the breeze had not kept up whilst we were going through the ice region. Of course, my reason was obvious; he knew I meant the water ripples breaking on the base of the berg. (Q.) You said it was a pity there was not a breeze? - (A.) Yes, I said, 'It is a pity there is not a breeze,' and we went on to discuss the weather. He was then getting his eyesight, you know, and he said, 'Yes, it seems quite clear,' and I said, 'Yes, it is perfectly clear.' It was a beautiful night, there was not a cloud in the sky. The sea was apparently smooth, and there was no wind, but at that time you could see the stars rising and setting with absolute distinctness. (Q.) On the horizon? - (A.) On the horizon. We then discussed the indications of ice. I remember saying, 'In any case there will be a certain amount of reflected lights from the bergs.' He said, 'Oh yes, there will be a certain amount of reflected light.' I said, or he said; blue was said between us - that even though the blue side of the berg was towards us, probably the outline, the white outline would give us sufficient warning, that we should be able to see it a good distance, and, as far as we could see, we should be able to see it. Of course, it was just with regard to that possibility of the blue side being towards us, and that if it did happen to be turned with the purely blue

## Page 920

side towards us, there would still be the white outline. (*The Commissioner.*) Then you had both made up your minds at that time that you were about to encounter icebergs? - (A.) No, my Lord, not necessarily."

That merely means they were in the region where the possibility must be taken into account.

"(Q.) It sounds very like it, you know? - (A.) No, not necessarily, my Lord. (Q.) You were both talking about what those icebergs would show to you? - (A.) As a natural precaution. We knew we were in the vicinity of ice, and though you cross the Atlantic for years and have ice reported and never see it, and at other times it is not reported and you do see it, you nevertheless do take necessary precautions, all you can, to make perfectly sure that the weather is clear and that the officers understand the indications of ice and all that sort of thing. That is a necessary precaution that is always taken. (*The SolicitorGeneral.*) There are one or two things about that I should like to be clear about. I caught you saying that you, or the Captain, said it was a pity there was not a little breeze because it would have shown the iceberg? - (A.) Yes, it would have assisted. (Q.) Then you both realised at the time, did you, that since it was a flat calm it would be more difficult to see the ice? - (A.) As far as the case of the berg was concerned, yes, it would

be more difficult; naturally you would not see the water breaking on it if there was no wind; and so you would not have that to look for. (Q.) Do you remember when the Captain was on the bridge with you, did you tell him that, as you made it out, you would get to the danger zone - to the ice region - about half-past 9? - (A.) No. (Q.) Was anything said about the time when you would get to it? - (A.) No, not that I remember." And then follows a good deal about Mr. Moody and his calculation.

So that your Lordship sees that that conversation with the Captain referred to the two things, the two indications they would get if they came across an iceberg - the one was the white fringe on the top even though the dark side of the iceberg were turned towards them, they would see the white light over the top from the other side, it being crystalline and white from exposure to the weather. They did not get that because this was a quite black berg. The other indication was the indication from the breaking of the water at the foot of the berg, that they would have if there were wind, and that they would have too, in a less degree, if there were a swell. They knew there was no wind, and they discussed that it was unlucky, because that would have accentuated it.

*The Commissioner:* This conversation reads to me as if they knew there would be no breaking of water on the base of the iceberg.

*Sir Robert Finlay:* That is quite inconsistent with a great deal of the other evidence, my Lord; it is quite inconsistent with what Mr. Lightoller said on the previous page. *The Commissioner:* Naturally you would not see the water breaking if there was no wind.

*Sir Robert Finlay:* Will your Lordship look at what he said on the previous page, at Question 13569: "Of course, the stronger the breeze the more visible will the ice be, or rather the breakers on the ice. Therefore, at any time when there is a slight breeze you will always see at nighttime a phosphorescent line round a berg, growler, or whatever it may be; the slight swell which we invariably look for in the North Atlantic causes the same effect, the break on the base of the berg, so showing a phosphorescent glow."

*The Commissioner:* Then why were they discussing the absence of wind if they believed there was a swell as you say they did at that time; and if the swell would have produced the same effect on the bottom of the berg, why was it material to discuss the question of the absence of wind?

*Sir Robert Finlay:* That brings us back to the consideration which comes up every time. We have not here Captain Smith to give us what was in his mind, but one can, I think, see what Mr. Lightoller meant. If there were wind there would be a much more marked ripple, phosphorescent light at the foot of the berg, than if you had only a swell; but if you had a swell there would be that light, enough to give warning. It would not be nearly so marked as if there was wind. I do most respectfully put it to your Lordship that that is the effect of the evidence.

Now, will your Lordship kindly look at what Sir Ernest Shackleton says at the top of page 721. The earlier part of the answer relates to another matter. I am on Question 25063, the last sentence of which is at the top of page 721. Sir Ernest says, "Of course, that particular night was an abnormal night at sea in being a flat calm; it is a thing that might never occur again. (Q.) That is what Mr. Lightoller says. You say apparently it is very rare to get such a flat calm as there was that night?"

*The Attorney-General:* That means there, a calm without a swell.

*Sir Robert Finlay:* Clearly; that is the whole point. “(A.) I only remember it once or twice in about 20 years’ experience - the sea absolutely calm, without a swell, as it was recorded to have been.”

*The Commissioner:* It is not an unknown thing according to Sir Ernest Shackleton; he says once or twice in 20 years. It appears to me that is a matter that a good sailor would take into consideration.

*Sir Robert Finlay:* But you must also take the other circumstance, that it is a black berg, all black.

*The Commissioner:* They had been discussing something which appears to me to have been very nearly the same as a black berg, that is to say, a berg presenting what they call its blue side.

*Sir Robert Finlay:* But there is this notable difference, that if it is a berg with a blue side, the other side is white.

*The Commissioner:* And they get the fringe?

*Sir Robert Finlay:* And you see the fringe. They were entitled to rely upon the overwhelming probability that they would have one or other of these indications even if the berg were turning its black side. Of course, the enormous probability was that the berg would be white, as it was described by men who have spent their lives in the Atlantic, who told your Lordship over and over again, many of them, that they saw a white berg, a great thing as white as that great white cartoon there. That is what they have seen. That is what in all but the rarest cases they do see. If they do by any chance see the blue side, the dark side of a berg which has been torn off, then they have the glimmer at the top. Here they did not have that, but they had the extraordinary combination of a totally black berg, with not even a swell to show the presence of the berg by the ripple that that would have produced - not nearly so strong as if there had been wind, but still quite strong enough to have given an indication.

I therefore most respectfully submit to your Lordship that it would not be right to find that there was anything blameworthy in following the practice which every man who has sailed the Atlantic for a long period past would have adopted.

That leads me to one other observation. My friend, the Attorney-General, I am told, said Mr. Ismay asserted it would be right to go on at the same speed. Mr. Ismay is most anxious that it should be made clear that he never intended to say anything of the kind, and when his answer is looked at, I submit it is clear he did not. I will not trouble your Lordship with it, because your Lordship said I need not trouble about it; but what Mr. Ismay, of course, means is this. This accident has revealed in the first place the encroachment of ice much further to the South; in the second place, it is brought home to every one that there may be this extraordinary combination of circumstances, and as regards the practice in the future it may very well be that your Lordship will think it right to recommend that that practice should be modified in the view of what has happened. What I do respectfully submit is that

## **Page 921**

it is impossible to say there was anything blameworthy in the course that was taken by Captain Smith.

*The Commissioner:* I am much obliged to you, Sir Robert.

*The Attorney-General:* The questions to which my friend, Sir Robert, has been addressing himself are matters upon which I addressed you at length on Saturday, and the only one observation I desire to make in answer to my friend's remarks this morning is this: If you look at page 73, Question 2442, the evidence of Lee, one of the look-out men, you will see that there was the white fringe on the top, of which my friend was speaking.

*Sir Robert Finlay:* Oh, no, not at all.

*The Attorney-General:* It is really no good saying "not at all." I am going to read the question and answer.

*Sir Robert Finlay:* It is every good; when you have read it, you will see it is not. *The*

*Attorney-General:* I am not speaking of the ripple. This is not the ripple at the base of the berg; this what is at the top. "(Q.) It was a dark mass that appeared, you say? - (A.) Through this haze, and as she moved away from it, there was just a white fringe along the top."

*Sir Robert Finlay:* Yes, but then you must take 2441 with it.

*The Attorney-General:* "Can you give us any idea of the breadth. What did it look like? It was something which was above the fore-castle? - (A.) It was a dark mass that came through that haze and there was no white appearing until it was just close alongside the ship and that was just a fringe at the top. (Q.) It was a dark mass that appeared, you say? - (A.) Through this haze, and as she moved away from it, there was just a white fringe along the top. That was the only white about it, until she passed by, and then you could see she was white; one side of it seemed to be black, and the other side seemed to be white. When I had a look at it going astern it appeared to be white."

*The Commissioner:* You must remember that the iceberg at this time was in the glare of the lights of the "Titanic."

*Sir Robert Finlay:* Yes, my Lord, the next question shows that: "At that time the ship would be throwing some light upon it; there were lights on your own ship? - (A.) It might have been that." I submit that entirely disproves my friend's view.

*The Attorney-General:* I am not dealing with that. With respect, it does not seem to me that what my friend has said this morning has in the slightest degree affected the view that was put before your Lordship, at least the argument that I addressed to you on Saturday, because all that my friend has said this morning, and, if I may say so, has said with all the force that he commands, only adds this, that there were these two abnormal or unusual conditions which I accepted on Saturday, when I argued the case before you, as the two abnormal conditions upon which my friend relied. They were all, however, matters which I dealt with then, and I agree with him that the result of the evidence shows that the excuse put forward must depend upon those two conditions. I analysed them then, and I do not propose to go into them at any further length. The only supplementary reference that I will make to what was said then, and I only make it because in consequence of what your Lordship said on the last occasion, I did not refer to the evidence upon it is this: My friend said to me just now, and said quite rightly - I call your Lordship's particular attention to it - that when Sir Ernest Shackleton is talking of a flat calm he means what I meant by a flat calm on Saturday when I referred to the evidence. I said a flat calm is a calm in which there is no swell. My friend agrees with me certainly,

that when Sir Ernest Shackleton is speaking of it, that when he speaks of a flat calm - *Sir Robert Finlay*: It is used in both senses.

*The Attorney-General*: I know it is, but it is no answer to the point I am making. I quite agree, and my friend is quite entitled to say that it may be when you speak of a flat calm in consequence of certain answers that Lightoller gave, that he is speaking there of a calm, a perfectly smooth sea, apparently presenting a flat surface, and nevertheless with a swell, and it may be he is speaking of it without a swell. It is a little difficult to tell, but he uses the expression "flat calm." Lightoller does in the first instance - it is his expression.

*The Commissioner*: And the Captain's expression.

*The Attorney-General*: Yes; as I said to my friend, Sir Robert Finlay, this morning, you observe that Sir Ernest Shackleton, who, at any rate, is a seaman, when he is speaking of a flat calm means what I suggest it does mean. There is all the difference in the world - at least I suggest it - between speaking of a calm and a flat calm. However, I do not want to lay too much stress upon the meaning of a particular phrase that is used in connection with it; all I want to show is that when he is speaking of a flat calm he must have in his mind that at least there must have been practically no movement although there might have been the slightest swell. That, I think, is the highest it can be put. And if there had been this very slight swell - I will concede in favour of Mr. Lightoller's proposition - that when he is speaking of a flat calm he means only with a slight swell - that would not have given any ripple upon the base of the berg upon which he would be entitled to rely as indicating to him at some distance ahead the presence of an iceberg.

That really exhausts what I desire to add upon that subject, and I will now address myself to the other point to which it is desirable that I should call your Lordship's attention. So far we have been dealing with the vessel up to the time of the report of the iceberg and the striking of the iceberg. It is unnecessary that I should call your Lordship's attention in any detail - so it occurs to me, but, of course, I will take any course your Lordship thinks right - as to what happened from the report by the look-out men of iceberg ahead and the striking of three bells and the telephone message, and then what happens on board the ship with the order to Hichens, the quartermaster; it is unnecessary that I should go into detail upon that, because I am accepting literally the evidence as it was given, and that you may treat the two things - that is, the sighting by the look-out man of the iceberg and by the officer in charge, Mr. Murdoch - as simultaneous. That is the fairest way, at any rate to Mr. Murdoch, to deal with it, that he saw it at the same time, and that immediately an order is given, "Hard-a-starboard," and if your Lordship will remember Mr. Moody's evidence, he said that she was hard-a-starboard, the helm right over, just as the impact took place.

One has to bear in mind, and I will only ask your Lordship to consider what all this means - that it has taken me pretty nearly three times as long to recapitulate this story as to what happened after the sighting of the iceberg as the actual occurrence took, as the actual time that elapsed between the sighting of the iceberg and the striking of the berg, which I say at most is 40 seconds.

What I mentioned just now is the evidence of what Hichens said that Moody had said. I said the evidence of Moody, but I did not mean that Moody had been called.

Now, my Lord, that brings us to consider what the effect of the collision was. Of course we have gone into that with considerable minuteness, having regard to its importance; we

have examined the plans with the model and in particular with that large plan. Now that we have got it indicated as we have, your Lordship can see there on the section where exactly the wounds were inflicted, and I do not propose, unless you think it desirable (I am quite prepared to do it with references in detail to the actual evidence upon it, with the pages) to go into it.

*The Commissioner:* I do not think it will be useful.

*The Attorney-General:* No, my Lord. It did not seem so to me, because when you have located the spot there is very little importance in going through the evidence which tells you where the

## **Page 922**

spot is which is now indicated on the section. Your Lordship will see that this ship, as she is veering to port under the starboard helm during this period of something like 40 seconds - because that is what it must be now; I am dealing with the wounds inflicted strikes at about five places indicated on the section, and it is worth noting that she is considerably torn. I will indicate what they were. I have no doubt your Lordship has them well in mind, and I do not wish to dwell at any length upon the detail because I cannot conceive it will be of any assistance.

*The Commissioner:* No.

*The Attorney-General:* But what I want to do is to point out what the result of the whole evidence is, beyond all question, and therefore it is unnecessary to dilate upon it at any length. In the first place you have a blow struck in the forepeak tank. There is an undoubted puncture of the skin there - penetration. Then you have it further in 1, 2 and 3 holds; you have that clearly proved. Then you have a very serious blow which was struck in the firemen's passage. That I say was very serious for this reason. Your Lordship will remember according to the evidence the blow struck there must have penetrated through the outer skin and through the inner skin of the firemen's passage and the distance between the inner skin and the outer skin at the nearest point was 3 feet 6 inches. So that one can form some conception of the force of the blow, and also of the penetration which must have taken place there if you realise that at least - we do not know the exact spot - 3 feet 6 inches of that ship was penetrated by some spur or something on that iceberg, which was under water; that is plain because otherwise you would not have got the blow struck which went right through the two skins and opened up that part of the firemen's passage through which, as your Lordship remembers, the water was coming in such great gushes.

Later we have the evidence also of the blow struck between No. 6 and No. 5 boiler sections. There again we have evidence which is very plain, at least as to this, that there were external wounds which were proved in the side of the vessel. They must have been struck outside and probably between the bulkheads, or at a distance, which penetrated both, before the after bulkhead of No. 6 section, and also abaft of it, and the consequence of that would be that as the blow struck the bulkhead as the ship struck like that, of course, it would hole both No. 5 and No. 6, and there is no doubt water came through that part in No. 6 and No. 5.

The only element of doubt that is left in the case as to actual penetration of the outer skin of the vessel is in No. 4 boiler section. We do not know really what happened there, and I do not think, as far as I am able to judge, anything in the evidence enables us to say, at any rate with any precision, what happened. What we do know is that water was rising there. That we have got quite clearly proved by the evidence. It is indicated on the plan that the blow was under the stokehold plates, and I think that must be plain also. The water was coming in under the stokehold plates, because your Lordship will remember it was rising there; we have very clear indications of that.

*The Commissioner:* I am reminded that it was something like an hour and three quarters before they were driven out of that stokehold by the water.

*The Attorney-General:* Yes.

*The Commissioner:* It seems to support the suggestion that the water came over the top and then found its way down into the bunker, and then gradually rose from the bunker so as to rise above the plates.

*The Attorney-General:* No doubt that is a possible view, but I think the evidence shows the water was rising above the plates.

*The Commissioner:* Yes, but an hour and three-quarters afterwards; it was that that drove the men away.

*The Attorney-General:* After a time, yes.

*The Commissioner:* It is suggested that it was so long after the collision that the water was found coming up above the plates, that the probability is the water found its way from the top and went down into the bunker and filled the bunker, and then rose.

*The Attorney-General:* That depends on the evidence of Dillon and Cavell.

*The Commissioner:* However, I do not think you need dwell upon it.

*The Attorney-General:* I quite appreciate it may be so; it is well to bear it in mind, because no doubt the result of the evidence shows that eventually, as the water was rising, the firemen were driven out of that particular section, and they had to get up the escape in order to get clear. I do not think that it is of very great importance, because we know certainly from Mr. Wilding's evidence that, supposing you stop at the wound inflicted in No. 5 boiler section, and do not travel further aft than that, it is quite sufficient, apparently, to show that with the wounds that there were, the vessel was irretrievably doomed; that is quite plain. The only question is how long she would float.

*The Commissioner:* What is your theory as to the number of sections filled with water at the time she sank?

*The Attorney-General:* At the time she plunged down?

*The Commissioner:* Yes, at the time of the foundering.

*The Attorney-General:* According to Mr. Wilding's view - I am speaking from his view - I do not profess to be able to say anything, except what is based upon his evidence to your Lordship - according to him the water must by that time have got as far aft as the reciprocating-engine room. That I think is shown by the plan which he handed up to you with the coloured pencil upon it, because the doors are open by that time, your Lordship will remember. *The Commissioner:* Yes.

*The Attorney-General:* The watertight doors are open. It is not as if you could say the watertight doors are all closed and then up to a certain section you get the water coming

in, because your Lordship will remember once the water gets over the bulkheads and begins to flow in, - these watertight doors were open all the way aft.

*Mr. Laing:* They all shut mechanically.

*The Attorney-General:* Only with the float, yes - but that is as the water rises. *The Commissioner:* There is, of course, the automatic effect of the rising waters upon the doors.

*The Attorney-General:* Yes, the float we have heard about; that is quite right. Assuming that operated, and I see no reason to doubt it (there is no evidence to show it failed and I do not see why it should), it certainly would have the effect of closing the door before the water got above the stokehold plates. That I have seen put into operation, and I have no doubt your Lordship did, upon the "Olympic."

*The Commissioner:* That does not answer my question. How many sections do you think were filled at the time she foundered?

*The Attorney-General:* I put it up to No. 4.

*The Commissioner:* Inclusive?

*The Attorney-General:* Yes, because the water is rising there your Lordship sees, and when we have got to No. 4 the water was rising, quite clearly and drove the men up. It got up to their knees and drove them away.

*The Commissioner:* That means to say that this vessel, which was constructed to float with any two compartments filled, did float until four had practically been filled. That is what it comes to?

*The Attorney-General:* Yes. May I add this to it, my Lord, that, according to Mr. Wilding's evidence - your Lordship has those who are more familiar than ever we can hope to be, after a lifelong study of these questions - but as I follow Mr. Wilding's evidence the effect was this, that, loaded as she was at the time she sailed on this voyage, she would have floated with three compartments filled. That is what he said, and I see no reason to doubt it. She was constructed, as

## **Page 923**

your Lordship will remember, to float with any two adjoining compartments flooded - that is not unimportant and when so flooded she would have floated with the waterline 2 1/2 to 3 feet below the height of the bulkheads. That is the position. That is what the design was with the vessel loaded in a certain way; but he pointed out that, loaded as she was at that particular time for that particular voyage, although she was not designed for that purpose, she would actually have floated with three compartments flooded.

*The Commissioner:* That is to say, she was lighter in the water?

*The Attorney-General:* Yes. Your Lordship will remember - I only give the reference in passing - this is all dealt with by Mr. Wilding at page 515. He explains his view and how the water overcame the vessel, and how it was that she sank. It is all dealt with very well, and your Lordship will remember he gave us a very graphic explanation of it. I think the result quite clearly, beyond controversy, of this evidence is this, that no height of bulkheads would have saved that vessel, holed as she was. I think that is established.

*The Commissioner:* It is said that if the bulkhead on the after-side of No. 5 boiler section had been taken higher it would have prevented the flooding of No. 4 boiler section, and the ship would either have floated, or have floated, at all events, longer than she did.

*The Attorney-General:* That, assumes, of course, that there is no injury to No. 4. That assumes that.

*The Commissioner:* Yes, it does.

*The Attorney-General:* Yes, it must.

*The Commissioner:* It really comes to this, that if No. 4 boiler section was holed, no bulkhead would have saved the ship.

*The Attorney-General:* That is it.

*The Commissioner:* But if No. 4 boiler section was not holed, and the bulkhead aft of No. 5 boiler section would have saved the ship or kept her longer afloat if it had been carried higher.

*The Attorney-General:* Yes.

*The Commissioner:* I think that was admitted by Mr. Wilding.

*The Attorney-General:* Yes, I agree; he deals with it at page 518.

*The Commissioner:* If this part of the case is really important - I do not know that it is - it is important to ascertain as nearly as we can whether No. 4 was holed or not. *The*

*Attorney-General:* Yes. That depends upon the evidence of Dillon and Cavell.

Dillon's evidence begins at page 98. He is the trimmer. He gives evidence, first of all, about opening the watertight doors after they had been closed, with which I am not going to trouble you, because that is quite clear in your Lordship's mind. Then at page 100, Question 3817, we get, I think, to the point which is material upon the question we are now examining. Perhaps I had better read a question or two before to introduce it: "Did you see any water before you went up in any of the boiler rooms or the engine room? - (A.) Yes, there was water coming in forward. (Q.) The furthest point forward you reached was No. 4 boiler section? - (A.) Yes. (Q.) Was it coming in there? - (A.) Yes. (Q.) Where was it coming in? - (A.) Coming from underneath. (Q.) From underneath the floor? - (A.) Yes. (Q.) And from what part of the floor, the forward part or the afterpart? - (A.) The forward part. (Q.) Did it come in large quantities or only in small quantities? - (A.) Small quantities. (Q.) Was there any depth of water standing on the floor? - (A.) No. (Q.) Do you mean the floor was just damp? - (A.) That is all. (Q.) And it seemed to be coming through the floor? - (A.) Yes. (Q.) Did you see any coming through the side of the ship at all? - (A.) I never noticed. (Q.) Was there any water anywhere else in any of the other sections? - (A.) No. (Q.) Then you got this order about a quarter-past 1, and you went up on deck."

If you look also at Questions 3810 and 3811, just preceding those, there is evidence of the time which your Lordship commented upon just now: "Can you give us any idea of how long it was after the ship had struck that you got the order to go on deck? - (A.) Yes. (Q.) About how long was it? - (A.) An hour and 40 minutes. (Q.) That would make it about 1 o'clock? - (A.) No. (Q.) After that - a quarter-past one? - (A.) Yes."

Then Cavell is at page 107, Question 4247: "When you came back to No. 4, and you found the lights were on again, did you see any water in No. 4? - (A.) No. (Q.) When you got back to No. 4, do you remember hearing an order being given? - (A.) Yes. (Q.) What

was it? - (A.) Draw fires. (Q.) Is that any part of a trimmer's work, , as a Rule? - (A.) In an emergency. (Q.) In an emergency you would do it, of course? - (A.) Yes. (Q.) And did you lend a hand to draw the fires in No. 4? - (A.) Yes. (Q.) And were they drawn? - (A.) Partly drawn. (Q.) What would there be - 30 furnaces? - (A.) Yes. (Q.) Were the firemen there helping to draw, too? - (A.) Yes. (Q.) You say they were only partly drawn? - (A.) Yes. (Q.) What happened then? - (A.) The water started coming up over her stokehold plates. (Q.) In No. 4? - (A.) Yes. (Q.) Did that happen gradually or did it happen suddenly? - (A.) It came gradually. (Q.) The water - you moved your hand, you raised it; did it seem to come up from below? - (A.) Yes. (Q.) As far as you saw in No. 4, did any water come in from the side of the ship? - (A.) Not so far as I saw. (Q.) When the water came up through the plates what was done then? - (A.) We stopped as long as we could. (Q.) That is right? - (A.) And then I thought to myself it was time I went for the escape ladder. (Q.) They were still drawing the fires, these men, were they? - (A.) Yes. (Q.) How high did the water get above the plates they were standing on? How much water were they standing in before they left? - (A.) About a foot. (Q.) Working up to their knees? - (A.) Yes. (Q.) Scraping the cinders out? - (A.) Yes." I think that is all the evidence there is.

*The Commissioner:* What that comes to, it appears to me, is this, that the water, as far as these two witnesses could tell, was not coming from the side of the ship. *The*

*Attorney-General:* Yes, neither of them certainly saw it coming from there. *The*

*Commissioner:* That looks as if that part of the ship was not holed, and if that part of the ship was not holed then that water that they saw must have come over the bulkhead.

*The Attorney-General:* Of course, there is another possibility which you must take into account, that they are standing on the plates; they would not see whether the water was coming in below the plate; they would not see whether the water was coming in at the side of the ship below the plate.

*The Commissioner:* No, their impression is apparently - that is all I can say - that the water was not coming in from the side of the ship. That seems to me to show if their impression is a well-formed impression that that part of the ship was not holed. I quite agree it is speculation, because that part of the ship might be holed and might have been holed below the plates on which they were standing.

*The Attorney-General:* Yes.

*The Commissioner:* But they do not seem to have thought there was any water coming in from the side of the ship, and if it was not it must have been coming in over the bulkhead.

*The Attorney-General:* I do not think really that is the effect of the evidence, with all respect. Look at what Cavell said. I do not know that it is of any importance, but if it is -

*The Commissioner:* It is only important upon this question whether the ship would have been saved by having a higher bulkhead.

*The Attorney-General:* Yes, but it is a question you will not have to decide.

*The Commissioner:* I do not think it is necessary to decide that.

*The Attorney-General:* I rather understood that you were not going to decide that. *The*

*Commissioner:* But if I am to give a description as well as I can of the circumstances which sent this ship down to the bottom, I should have to consider that, I think.

*The Attorney-General:* All I want to observe with reference to it is this: If your Lordship notices the form of the question which is put to both witnesses, Dillon and Cavell, and the answer, what they are asked is whether they saw water coming in.

*The Commissioner:* And what you say is she may have been holed all the same.

*The Attorney-General:* Quite; the water was coming up the stokehold plates. *The*

*Commissioner:* And the hole might have been beneath the plates from which they saw water coming up.

*The Attorney-General:* Yes.

*The Commissioner:* All I mean is the answer "We saw no water coming in from the side," that probably meant they did not believe the ship was holed in the side at that place. It is pointed out to me, it is of no importance unless it is maintained that putting the bulkhead higher would not have saved the ship or prolonged the life of the ship. *The*

*Attorney-General:* I am going to point out the position we are in with regard to it. I will deal with it at once, because it will be an answer to what your Lordship was putting. That part of the case as to whether it is desirable to carry the bulkheads higher or whether it is desired to have a watertight deck, so far as I understood from what your Lordship said at an early period, is a part of the case which you do not intend to deal with; that is to say, that you do not intend to make any specific recommendation with regard to that. Your Lordship's view, as I follow it, is that there is a Special Committee which has been appointed for the purpose of considering the spacing and construction of the watertight compartments, and as I followed your Lordship's view, it was that you could not and would not go into that matter in this Enquiry; it would take a very long time, and necessitate naturally the examination of a great many witnesses in order to enable you to deal with it; but no doubt, if you thought right, your Lordship would make some general recommendation with regard to that. I presume, of course, I am only stating now what occurs to me with regard to it - that your Lordship would ask the Committee to deal with those two questions into which we have examined, in some little detail, without arriving at some conclusion in consequence of the view your Lordship did take.

*The Commissioner:* I am thinking of the description which I may have to give of the circumstances which brought the ship down to the bottom of the sea, and one of the things I must consider, I think, is whether the water in No. 4 came from the hole in the side of the ship, or whether it came over the bulkhead.

*The Attorney-General:* I quite follow for that purpose it would be necessary. *The*

*Commissioner:* It is for the Committee to say whether it is desirable that the bulkhead should be necessary.

*The Attorney-General:* I quite agree, my Lord, it would be necessary.

*The Commissioner:* As far as I can go, I must make up my mind upon the question whether No. 4 was holed or not. But you will remember this - if the evidence is so vague and uncertain that I cannot form any opinion upon the question which will be of any value, I shall say so.

*The Attorney-General:* I was going to say this, my Lord, and I will leave it with this observation: That so far as I am able to gather from the evidence, there is not sufficient to make it clear - I suggest to your Lordship, and one must be clear about it before coming to a conclusion - whether or not she was holed in No. 4. There is not sufficient to make it

clear. I believe really that is the true effect of the evidence. I certainly cannot say that it is made clear that she was holed, because there is not any evidence of that. But from what we know of the water rising it is quite possible that she was holed below, and therefore that nobody would have seen it, and there is no evidence before you to explain it. I submit that is how the matter stands.

Now, my Lord, I do not propose to dwell any further upon that part of the case. I want to deal at once with the steps that were taken after the collision. We have proceeded by stages, first of all, of the vessel approaching the iceberg, then she struck the iceberg, she has been injured, and now I want to see what steps were taken after that. That involves a consideration in the main of two matters - one is what was done with regard to the watertight doors and the other is with regard to the boats. Substantially those are the two questions. There are minor points, but of no real importance because certainly they had no effect whatever upon the saving of life.

Now, my Lord, in the first instance, as to the closing of the watertight doors. I think the evidence is fairly clear and establishes this, that immediately after the impact the watertight doors were closed from the bridge in a way with which your Lordship has become familiar, and I also have become familiar, on the "Olympic." These watertight doors were closed, and it is equally clear that these watertight doors were opened some time after from No. 4 aft so as to enable a suction pipe to be brought from the aftermost tunnel. Those doors I was just referring to, are those which would no doubt have been closed, so far as one is able to judge, when the water rose sufficiently high by means of the float to liberate the clutch and allow the door to drop down again. I will assume that was done. The only other questions which have arisen as to watertight doors are as to those doors on decks E and F. There has been a good deal of question with regard to that, and, of course, I can give you what happened - the evidence in detail - with reference to that. But so far as I have followed all the criticism that has been directed to what happened afterwards, no complaint was made, if I understand aright, by my friend Mr. Edwards, who specially dealt with the question of bulkheads, and watertight doors, with regard to these two decks after the examination that we have had. And it seems fairly plain that those doors were closed. It is gone into by the witnesses up to a point that the emergency doors were opened and that there was access along the alleyway. As your Lordship is going to deal with the history of what was done, I will just give your Lordship the reference to it. I do not think it is of sufficient importance for me to dwell upon it in detail, but I will state shortly what happened, and give you the pages and questions. At page 236, Brown, in Question 10669 to 10672, says that the first order he got after he was wakened by the shock was to close all the watertight doors. That is what first happens: "Did you hear an order given in the alleyway about the watertight doors? - (A.) That was the first order I heard after I was woke by the shock. (Q.) Just tell us what you heard? - (A.) Who gave it I do not know, but I heard an order in the alleyway outside our quarters, to close all watertight doors. (Q.) There are watertight doors in the alleyway? - (A.) Yes, lower down, further aft than our quarters are. (Q.) And you heard that order given? - (A.) Yes.

Then, Mackay, on page 236, Questions 10691 to 10694 - he was the bath room steward - says: "The first order I heard was from the second steward to close all watertight doors on F deck.

*The Commissioner:* These references were all given to me by Sir Robert Finlay. *The Attorney-General:* All I wanted to do was to show your Lordship what had happened. I do not want to go through them, because I attribute very little importance to this part of the evidence.

*The Commissioner:* I have them all marked.

*The Attorney-General:* Very well, my Lord. I am very glad because it will save me dealing with it. The conclusion of the whole matter is in Wilding's evidence on page 517, and that is the only evidence your Lordship need be troubled with.

*The Commissioner:* I will see whether I have that reference.

*The Attorney-General:* I have no doubt your Lordship has it. It has been referred to several times. At Question 20360 you get the conclusion of the matter and I only call attention to it because it

## **Page 925**

does summarise what had happened. He is asked: "Does it throw any light to your mind upon the question of whether the watertight doors in the bulkheads were or were not shut." That is on the question of the wounds and how long she floated, and he says, "No." The same scale, if I may so use it, of the sinking is not sufficiently definite, because closing the watertight doors between E and F deck would only have made a delay of a few minutes, perhaps five or ten minutes. The evidence is not accurate enough upon that. That is really the substance of the matter.

I would like to make one observation in passing, not so much to bring it to your Lordship's notice, as because I know some comment has been made with regard to it. There is no question in this case but were the pumping arrangements were satisfactory and worked satisfactorily. Your Lordship will remember we began to go into it and it was made quite clear that there was no complaint about it, and therefore your Lordship thought it was unnecessary to go into it, and also that you were satisfied, and those who were assisting you, that the pumping arrangements were satisfactory; so that we need not deal in any detail with that. No question was put to your Lordship with regard to it. But what I do want to address myself to now, in dealing with the steps that were taken immediately after the collision, is how soon after the collision it was realised that the injury or injuries were very serious.

*The Commissioner:* How soon it was realised?

*The Attorney-General:* Yes. My view of the evidence which I submit for your Lordship's consideration, is that it was realised immediately, or almost immediately, by the Captain.

*The Commissioner:* Within 20 minutes.

*The Attorney-General:* Yes, certainly, within 20 minutes, but I think one might even say within a shorter time; but it is sufficient to say within 20 minutes certainly, by the Captain and by the Chief Engineer, by Mr. Andrews, who represented the builders, by those, of course, who spoke to Mr. Andrews who were only taking his view, and by Mr. Ismay himself. The only importance of that is to show that we do get from Mr. Ismay's questions to the Captain and to the Chief Engineer within a short time after the impact, conversations which show what their view was of the injury. I will not trouble your

Lordship with references to it, because I have no doubt it is present to your Lordship's mind. It is stated really in a couple of sentences. The effect of it was that the Captain said, "It is very serious." The effect from the conversations with the Chief Engineer was: "It is very serious; I hope that I may be able to keep it under with the pumps." That is how it stands. And, of course, there is further evidence of the conversations with Mr. Andrews, to which reference has been made, but which indicate, in any event, that he put the life of the vessel at the moment that he was asked as 1 1/2 hours only. I am taking the extreme view. According to one witness he said half an hour, but according to another witness he said an hour-and-a-half, and I will take the longer time.

There are just a few passages upon it to which I wish to direct your Lordship's attention. Mr. Lightoller says that he realised that it was serious when Mr. Boxhall came to him half an hour after the impact and told him that the water was up to F deck. That is at page 310, Questions 13784 to 13791. My friend the Solicitor-General says: "Time is very difficult to calculate, especially when you are trying to go to sleep, but seriously, do you think it was half an hour? - (A.) That I was in my bunk after that? (Q.) Yes? - (A.) Well, I did not think it was half an hour, but we have been talking this matter over a very great deal, and I judge it is half an hour, because it was Mr. Boxhall who came to inform me afterwards we had struck ice, and previous to him coming to inform me, as you will find out in his evidence, he had been a considerable way round the ship on various duties, which must have taken him a good while. It might be less, it might be a quarter of an hour. You will be able to form your judgment. (Q.) He is the Fourth Officer? - (A.) Yes.

(Q.) How would his time of duty run? - (A.) He was on duty till 12 o'clock. (Q.) 10 to 12? - (A.) 8 to 12. (Q.) It was Mr. Boxhall who came to your room and gave you the information? - (A.) Yes. (Q.) What was it he told you? - (A.) He just came in and quietly remarked, 'You know we have struck an iceberg.' I said, 'I know we have struck something.' He then said, 'The water is up to F deck in the mail-room.' (*The Commissioner.*) Well, that was rather alarming, was it not? - (A.) He had no need to say anything further then, sir."

*The Commissioner:* By F deck he meant G deck; is not that so?

*The Attorney-General:* Yes, that is quite right.

*The Solicitor-General:* Yes, it was cleared up afterwards. He said Boxhall did say F deck, but he meant G deck.

*The Attorney-General:* Then at page 316, Mr. Pitman says, at Questions 14931 to 14956: "(Q.) You were aroused, and at first did you think much had happened? - (A.) No, I did not. (Q.) What was it aroused you; was it a noise, or a jar, or what? - (A.) A noise; I thought the ship was coming to anchor. (Q.) Did you lie on in your bunk for some few minutes? - (A.) I did. (Q.) At the end of those few minutes did you do anything? - (A.) Yes, I went on deck. (Q.) Was that curiosity, or what took you there? - (A.) Yes, I suppose it was. (Q.) Getting on deck, what did you see or hear? - (A.) I saw nothing and heard nothing. (Q.) Did you go to the forward part of the navigation bridge? - (A.) No, I only just went outside the quarters." It comes a little later: I will leave out the intervening part. Question 14948 is: "(Q.) While you were dressing did you receive any information? - (A.) Mr. Boxhall came to my room and said the mail room was afloat. (Q.) How long do you think had elapsed between the time you were aroused and Mr. Boxhall coming and

telling you this? - (A.) I should think it must be 20 minutes. (Q.) Did he give you any information as to what had caused the mail-room to be afloat? - (A.) Yes; I asked him what we had struck, and he said an iceberg. (Q.) After that did you quickly proceed with your dressing? - (A.) Yes, I put my coat on and went on deck. (Q.) When you got on deck, did you see anything being done? - (A.) The men were uncovering the boats.”

Then Mr. Boxhall, at page 361, Questions 15607 to 15613.

*The Commissioner:* I have read all you want to read on the subject: “Mr. Andrews tells me he gives her from an hour to an hour and a half” to live.

*The Attorney-General:* Yes, that is the passage I was going to refer to. I do not think it is worth calling your Lordship’s attention to what another witness said because I am taking the longest time. You will remember one witness said Mr. Andrews only gave it half an hour. That was Hemming.

*The Commissioner:* On what page is that?

*The Attorney-General:* It is at the bottom of page 421. The actual passage is on 422, at Questions 17738 to 17741. It starts at the bottom of page 421. “Shortly after that, did you” that is Hemming, the lamp trimmer - “see the boatswain? - (A.) Yes. (Q.) What did he say to you? - (A.) He told us to turn out; that the ship had half an hour to live, from Mr. Andrews; but not to tell anyone, but to keep it to ourselves. (Q.) I did not hear what you said about Mr. Andrews? - (A.) The boatswain told us to turn out; the ship had only half an hour to live, from Mr. Andrews, but not to tell anyone. The boatswain heard it from Mr. Andrews, and he told us. (*The Commissioner.*) When was this; how long after the jar which you heard? - (A.) About 10 minutes, I should say.”

*The Commissioner:* That brings it nearer to what you were saying; I said 20 minutes.

*The Attorney-General:* Yes, I think 10 minutes is the time, on the evidence. One may say within 10 minutes they knew it.

Then there is Mr. Lowe at page 366, Questions 15791 to 15794. This concludes the evidence of the officers upon this point, I think: “(Q.) Just tell us what woke you up? - (A.) I was half awakened by hearing voices in our quarters, because it is an

## **Page 926**

unusual thing, and it woke me up. I suppose I lay down there for a little while until I fully realised, and then I jumped out of bed and opened my door a bit, and looked out, and I saw ladies in our quarters with lifebelts on. (Q.) When you first looked out people had got their lifebelts on? - (A.) They had. (Q.) Do you know the time? - (A.) I do not. I have not the remotest idea of the time right throughout. (Q.) Were the boats being attended to?” - this marks the time - “(A.) As soon as I looked out through the door I jumped back and got dressed and went out on deck, and the boats were being cleared.”

Now, I have exhausted the officers’ evidence upon it, and at page 442 you find the passage I recalled to your Lordship’s recollection in Mr. Ismay’s evidence, Question 18513 - Captain Smith was there - “Did you ask him anything further” - he is dealing there with Captain Smith. Perhaps your Lordship will look at 18509. - “(A.) I went back to my room and I put a coat on, and I went up on to the bridge. (Q.) Was Captain Smith there? - (A.) He was. (Q.) Then did you ask him what had happened? - (A.) I did. (Q.)

And what did he tell you? - (A.) He told me we had struck ice. (Q.) Did you ask him anything further? - (A.) I asked him whether he thought the damage was serious, and he said he thought it was. (Q.) What did you do then? - (A.) I then went downstairs again - down below. (Q.) Did you meet Mr. Bell, the Chief Engineer? - (A.) I met the Chief Engineer at the top of the staircase. (Q.) Did you have some conversation with him? Will you tell us what it was? - (A.) I asked him whether he thought the ship was seriously damaged and he said he thought she was, but, as far as I remember, he thought the pumps would control the water." Then I read to him the question and the answer which he had given in the American evidence: "'(A.) He said he thought the damage was serious, but that he hoped the pumps would be able to control the water? - (A.) I do not know whether he said 'he hoped' or 'he thought'; it is to the best of my recollection. I cannot remember every word he said.'" That is how it stands.

Now, of course, there is some importance to be attributed to that from two aspects. The one is as to what steps were taken by those on board and the time that it took them to get the boats away with the passengers on board; and the other is because of some criticism which has been directed to the omission of the Captain and officers to inform the passengers that the danger was so serious. I mean, there are those aspects upon which this evidence is material.

The first thing that I want to say with reference to it is that the uncovering of the boats, clearing the boats for use, and getting them ready to put into the water does seem to have taken a long time. Your Lordship will remember how the evidence stands upon this. There are other considerations to be taken into account in determining whether or not there was too much time occupied in clearing the boats; but one has to remember this, that the order to lower the boats was given within some 20 minutes of the impact, which would bring us to 12 o'clock. In point of fact, no boat was lowered at the earliest till 12.45. That was boat No. 7.

*Mr. Laing:* The order to uncover, you mean; you said to lower.

*The Attorney-General:* Yes, quite right; my friend is quite right; the order to uncover, and subsequently the order to lower. But the first boat lowered, so far as we are able to gauge from the evidence, is at 12.45; that is boat No. 7. Of course, by that time, as your Lordship observes, more than an hour had elapsed. She struck at 11.40 and the first boat is put into the water at 12.45. No doubt there are those who will assist your Lordship who are more familiar with the time that it ought to take to get a boat ready and to lower into the water in an emergency such as this than I, but it does strike one as a long time.

*The Commissioner:* What is the significance of it?

*The Attorney-General:* In this case?

*The Commissioner:* Yes.

*The Attorney-General:* So far as it affects the loss of life in this case, I do not think it is of any significance.

*The Commissioner:* It had no effect at all. They managed, before the ship went down, to get all of the boats out.

*The Attorney-General:* I am not sure but what I was a little hasty in saying "no effect," because, after all, one has to remember there was a difficulty in getting the last collapsible boat out.

*The Commissioner:* Yes, I remember that very well, and perhaps an exception ought to be made in reference to the last collapsible boat; but why should we trouble ourselves about enquiring into that, unless, indeed, I want to enquire into the boat drills these men had gone through.

*The Attorney-General:* Of course, that does open up a somewhat wide question which I should be prepared to take your Lordship's view about. Although it is quite true that it may be said, or I will assume it may be said, that the fact that it took a long time did not result in any loss of life - I will assume that for the purpose; and I will assume also that the fact that they had no boat drill did not result in any loss of life - I have got something to say about it - but I say I will assume it, the question is whether your Lordship, notwithstanding that, in view of the facts you have had brought before you, would think it necessary to make some recommendation, for example, with regard to boat drill which would affect both the considerations which I am now putting to you. The suggestion I am going to make is that if that had been the effect of boat drill, it never would have taken so long to discover the boats or to lower them.

*The Commissioner:* Whether it would have taken longer or not to lower them there ought to have been boat drill.

*The Attorney-General:* I quite agree, if you arrive at the fact that there ought to be boat drill, which is impressed upon one from the evidence.

*The Commissioner:* I do not think at present it would have made the least difference in the time that they took to get the boats down into the water. It does not affect the question of lowering. There ought to be boat drill.

*The Attorney-General:* Certainly.

*The Commissioner:* There is no doubt about that.

*The Attorney-General:* I do not think it is suggested that there is.

*The Commissioner:* Luckily in this case it did not matter because, subject to the comment about the loss of the collapsible boats, you could get all the boats into the water.

*The Attorney-General:* Yes. I am going to say something to your Lordship about the boat drill before I leave the case, but I pass from it at the moment I only want to call attention to the fact of the time that was taken. I certainly do not want to spend any time upon it if your Lordship has made up your mind that there should be boat drill. That is the only point to which I was going to direct my criticisms upon the time taken. Curiously enough under the Merchant Shipping Act of 1906 there is a provision that there must be an entry in the logbook of the boat drill and a penalty for not entering it; I think it is Section 9, but there is no statutory provision that you must hold a boat drill. That is how the law stands at present upon it. It is Section 9 of the Act of 1906. An entry must be made by the Master in the official logbook of every occasion on which boat drill is practiced on board the ship and on which the life-saving appliances on board the ship have been examined for the purpose of seeing that those appliances are fit and ready for use. The Master shall, if and when required by any officer of the Board of Trade, produce for inspection any record kept by him for the purposes of this Section. If the Master of a ship fails to comply with any requirement of this Section he shall be liable on summary conviction for each offence to a fine not exceeding £10."

*The Commissioner:* What section is that?

*The Attorney-General:* Section 9 of the Merchant Shipping Act of 1906. What it amounts to is that if there is boat drill, it must be entered in

**Page 927**

the logbook and if it is not entered in the log a penalty ensues.

*The Commissioner:* There is no provision that there must be boat drill.

*The Attorney-General:* No, that is a point to which I shall direct attention by and by. Parliament at any rate has only provided a penalty for not entering it in the log, but we do know this with regard to boat muster for boat drill: The Emigration Officer called Clarke in this case at Southampton did make, and is in the habit of making, a requirement that boats shall be put into the water - that is, for the purpose of giving his certificate. My Lord, obviously, I should say, that that is not sufficient, because all that that amounts to is picking out two boats which are manned by seamen and put into the water just for the purpose of seeing, as I should imagine, that the davits and tackle are in order and that the boat can be lowered -

*The Commissioner:* And that the boats were sound.

*The Attorney-General:* Yes; that is all it comes to; but, really, it is not of very great practical value, because you would never get your boats manned as they were on these two occasions and lowered full of seamen. What you have to remember is that when the boats have to be lowered at sea there are the proper number of firemen and trimmers and stewards to man them when they are lowered.

*The Commissioner:* Are you going to suggest that it should have been incumbent on the officers of this ship to have taken part in the boat drill, because, if you did, you would produce a state of things that would be almost impossible.

*The Attorney-General:* Yes.

*The Commissioner:* All you want is eight or nine of the men.

*The Attorney-General:* I do not think there is any great difficulty in it. There is a boat muster which, in the ordinary course, would have been held on board this ship; it would have been held on the Sunday, apparently; it was never held before the vessel started. It is not a boat drill, but it has some of the elements of a boat drill, and that is what took place, apparently.

*The Commissioner:* It enables the men to be mustered ready for action in an emergency, but they get no practice in the lowering of the boats.

*The Attorney-General:* I agree, but it gets them there, and it tells each man what his place is in the boat; that is the object of it. Each man would know his boat, and know where he is to go in the boat, and there it ends, and after all, the ship is travelling at the time, and there is no question of lowering the boats into the water and practicing; they cannot do that, but it has just that element in it which is of itself of some importance.

*The Commissioner:* Must every man of the thousand who constitute the crew take part in lowering the boats, or is it confined to the deckhands?

*The Attorney-General:* Yes, the seamen.

*The Commissioner:* I am told that at a boat muster the boats are swung out.

*The Attorney-General:* Yes, swung out, but not lowered.

*The Commissioner:* I do not think it is suggested that when they get out into the ocean the boats are lowered.

*The Attorney-General:* No, because the vessel is travelling at 22 knots at the time, but they are swung out, certainly; I think we have heard something about that.

*Mr. Cotter:* My experience of 18 years is that the men get a boat badge, and the number of the boat is on the badge; for instance, No. 2 lifeboat would be on the badge, and the man would have to go to No. 2. A bugle goes, and they know by the bugle, and they go to their boat stations, and the order goes, "All hands to the deck." The men stand by the boats, and the officer in charge of the boat has a small book, with the list of names of that boat in that book, and he calls out the names of the men, and each man has to reply what he is, whether he is a fireman, steward, or cook; every man has to answer to his name. The officer who is in charge of the drill gives the order so many men in the boats; there are eight men told off for a boat; each seat in the boat is numbered. No. 1 is a sailor, No. 2 is a fireman, No. 3 is a steward, No. 4 is a fireman, No. 5 is a sailor, No. 6 is a steward, and No. 7 and No. 8 is a sailor and fireman. That makes three stewards, three firemen and two sailors in a boat. The sailors' duty is chiefly to look after the falls and tackles; then order for swinging out the boats comes, and the whole of the men, the spare men, stand by, and launch the boats out. They may lower some right down to the water's edge.

*The Commissioner:* Do you mean out at sea?

*Mr. Cotter:* No; this is only done in port, and that is how the men get knowledge of how to handle the boats. This is done regularly in the Cunard Line, both in New York and in Liverpool.

*The Commissioner:* Do all the stewards take part in that?

*Mr. Cotter:* Every steward, every fireman and every sailor.

*The Commissioner:* Then 900 men take part in it.

*Mr. Cotter:* Yes, 900 men.

*The Commissioner:* Do the 900 men take part in this work in the boats?

*Mr. Cotter:* Not in the boats, but in the handling of the boat drill.

*The Commissioner:* Nine hundred men take part in the handling.

*Mr. Cotter:* Yes.

*The Commissioner:* All the stewards?

*Mr. Cotter:* Yes, the stewards, the sailors and the firemen.

*The Commissioner:* Supposing the firemen will not come on board till just within a few minutes of the boat being launched, what happens then?

*Mr. Cotter:* It is a bad system to have in any case in any company. That has happened in the case of the White Star Line, but in the Cunard Line it does not happen.

*The Commissioner:* I am not sure about that.

*Mr. Cotter:* I am positive.

*The Commissioner:* I doubt whether there is any big difference between the Cunard Line and the White Star Line.

*Mr. Cotter:* There is a big difference, my Lord; I have sailed in both.

*The Commissioner:* Now, Mr. Attorney, will you proceed.

*The Attorney-General:* My Lord, we have gone off the track a little. I was only going to say that I should hesitate a little to say that it is only the seamen who ought to take part in

the boat drill. I should certainly hesitate to say that it is only seamen who ought to take part in the boat drill, but after all those are the men who least require the drill. *The Commissioner:* Is it not the usual thing for those men to go through a course of boat drill?

*The Attorney-General:* No

*The Commissioner:* Does the Captain of the vessel ever go through boat drill?

*The Attorney-General:* I should imagine not, I do not suppose that he requires it.

*The Commissioner:* Does the head steward go through it?

*The Attorney-General:* I do not see why not, my Lord; I do not see why his degree of head steward should prevent him.

*The Commissioner:* But does he?

*The Attorney-General:* That I cannot say.

*Mr. Cotter:* Yes, he does, my Lord.

*The Commissioner:* I am told he does.

*The Attorney-General:* Well, that satisfactorily answers the question.

*The Commissioner:* I will tell you what I am advised about this, and that is, that in long voyages to the East, where you are at sea for several weeks, it can be done, but you cannot get through the whole of the crew, through the stewards and firemen and A. B.'s. you cannot get through them all; but when you are out on an Atlantic voyage which lasts only five days, is it practically impossible, and that you would have to do nothing else but working at the boats. You could scarcely do it in five days, and you would have the people doing other work besides working at the boats.

## **Page 928**

*The Attorney-General:* I suppose what it means is that you would have to do it the day before if you do it at all?

*The Commissioner:* Then you would want more officers and men?

*The Attorney-General:* That is the difficulty that has been pointed out to me. *The*

*Commissioner:* It is quite obvious it is desirable that there should be some sort of drill, and in this case, as far as I can make out, it is admitted there was none.

*The Attorney-General:* Yes.

*The Commissioner:* There was this inspection of the two boats.

*The Attorney-General:* Yes, there was the inspection of the two boats in Southampton. Well, my Lord, that really was the object of the criticism that I was going to direct to the time taken up.

*The Commissioner:* Are you going to say anything to me as to the value of the boats?

*The Attorney-General:* Yes, my Lord.

*The Commissioner:* They were very valuable on this occasion?

*The Attorney-General:* Yes, I am going to say that, but, of course, that comes to the other question which is involved, about the boat accommodation.

*The Commissioner:* But my own impression at present is that the collision happened in such a way that boats were not wanted.

*The Attorney-General:* I agree; and when I deal with that part of the case I shall say that has been the policy, not only of the Board of Trade, but of the Advisory Committee

which has been sitting under the Merchant Shipping Act and giving expert advice to the Board of Trade, but I will come to that in the proper order when I come to deal with the boat accommodation required by the Board of Trade.

Now, my Lord, the point that I was upon just now about the clearing of the boats from the ship, and the time that was taken, proves this, that altogether (I do not think you can be precise) from about a quarter to one to half-past two o'clock was occupied in lowering the boats. There is this submission to be made in connection with that, that according, certainly, to Mr. Lowe's evidence, and some other evidence, the time taken was not because of any difficulty in handling the boats, but because they could not get the passengers to get into them, and no doubt that is a perfectly just observation which one must bear in mind that they seem to have had very great difficulty in getting the passengers to the boats, or, when there, to get them into the boats, but I shall not comment further upon that in view of what your Lordship has said, that you think there ought to be boat drill, as to my mind that is the only value of the evidence in this case, and I therefore will say nothing more about that part of it.

Now, my Lord, the second consideration, having regard to the seriousness of the casualty as realised between 10 minutes or at a very early period from this happening to which I have referred, was that it is said, if the passengers had been told of the extreme danger and that the vessel could not float for more than an hour and a half, or if they had known what Mr. Andrews had said as his opinion, or what the Captain had said as his opinion to Mr. Ismay, or the Chief Engineer, Mr. Bell, equally to Mr. Ismay, if they had known that, that they would have got into the boats, there would have been no difficulty. Of course, what would have happened no doubt would have been that they would have got into the boats; but I think, as your Lordship indicated, there would have been the gravest possible danger of panic at that time, and of a struggle to get into the boats, instead of the very orderly organisation and maneuvering that took place by the stewards getting in front, and asking the passengers and the women and children to get into the boats, carrying out the order of the Captain that women and children should be in the boats first; all that discipline which existed, one cannot help thinking, would have been prevented if they had been told that there was a serious danger, and I also should suggest that no passenger who knows that his vessel - I believe no passenger, however ignorant of the perils of the sea, who knows that his vessel has been in contact with an iceberg, and that an order is given that the boats to be uncovered and lowered, and women and children are to be allowed to get in first, would have failed to realise that there was at least a grave state of things on board that vessel. I only make those observations because of the criticisms which they have been made already upon this - I think in particular by Mr. Harbinson, who said they ought to have been told. My Lord, in this connection, as I am dealing with this, I would like to remind your Lordship of how the matter stands with regard to the third class passengers. It was said, certainly at the outset of this case, that the accessibility of the third class passengers to the boats was extremely difficult, that they could not get to the boats, and a suggestion was made that the greater percentage of the third class passengers drowned was due to the fact that they had not been able to get there and, indeed, at one time it was suggested, if not here, certainly it has been suggested by some statements which appeared in the Press, that they were prevented from getting to the boats - forcibly prevented. Well, my Lord, fortunately, very fortunately I think, all that

suggestion is absolutely disposed of by the evidence that has been given. I am not going to refer to it now; I have collected it, and intended to call attention to it, because I did think it was a matter of very great importance; and the suggestion which was underlying many of the questions that were put, certainly by my friend Mr. Harbinson, was that the third class passengers had been worse treated in this matter than the first and second class passengers, particularly the first, and that that accounted for the greater loss of life among the third class passengers. My Lord, of course when one reflected upon the condition of things that that seemed to indicate, I think it was very distressing to think that that really was the fact. My Lord, we know from what Mr. Harbinson has said himself as the result of this evidence, and after the very zealous vigilance with which he has conducted his case on behalf of the third class passengers, whom he represented, he comes to the conclusion which I would just like to repeat to your Lordship, as disposing of a great mass of the evidence which has been given and as my excuse for not referring to it more in detail. He says, at page 781: "I wish to say distinctly that no evidence has been given in the course of this case that would substantiate a charge that any attempt was made to keep back the third class passengers. There is not an atom or a tittle of evidence upon which any such allegation could be based, and I do not for one moment say the third class passengers were deliberately kept back or were kept back at all in the sense that any effort was made to prevent them reaching the boat deck. *The Commissioner*: What page is that?

*The Attorney-General*: 781. "I desire further, my Lord, to say that there is no evidence that when they did reach the boat deck there was any discrimination practiced either by the officers or the sailors in putting them into the boats. It would be wrong of me to say so, because there is no evidence which would bear me out in saying so, and I think it only fair, in speaking on behalf of the third class passengers, I should make that observation to your Lordship." Now, my Lord, in view of that statement by my learned friend, a statement which he very fairly, and, if I may say so, very properly made, having regard to the suggestions that certainly have been made public with regard to the third class passengers. I do not intend to go in any detail into the evidence. Your Lordship will remember that we went with great care in this case into the plans, and also, with Mr. Wilding's assistance, along the decks, in order to see whether or not the third class passengers had access to the decks, and we have had much discussion about the barricades, or the barriers, that existed on the vessel; at one time it looked as if it was possible that it might be suggested that it was those that prevented the third class passengers from getting on the deck. So far

## **Page 929**

as the evidence goes it is quite plain that nothing of that kind took place. You have still to remember that there was a larger percentage of third class passengers drowned than of second or first class. My Lord, one reason that occurs to me, and that, I suggest, is worthy of consideration, is that these third class passengers were emigrants. They would probably almost, and they would certainly be carrying all they possessed with them. To leave the cabin or to leave the vessel with all their little property on board and to go into the boat would be a thing that they would naturally be loth to do, more loth probably than

a person whose property was not all on the vessel, and who might be inclined to leave such little baggage as he had without any very serious consideration. When you bear in mind here that you have emigrants, and that you are dealing with emigrants, and that they were asked to leave and to get into the boat at a distance, no doubt, of some 65 feet, and to be lowered in these boats into the water, probably many of them never having been on a vessel before, and certainly not of a vessel of this character, I think one can readily understand why it is that the third class passengers refused to leave the ship, and remained on the ship in a larger number proportionately than either first or second class passengers. There is one other reason, not an unimportant one, which is of course that their quarters, according to the construction of the ship, were in a less favourable position undoubtedly for reaching the boats than either the first or second class passengers. That, I think, is quite clear from what we saw.

*The Commissioner:* Their quarters are at the extreme ends.

*The Attorney-General:* Yes, both forward and aft, and that must be borne in mind. Still, according to the evidence, stewards were told off and were sent to fetch them, and according to what you have before you they failed to get them to come on deck for the most part, or to attempt to get into the boats. Your Lordship may remember one particular piece of evidence, I think it was as to boat No. 15, the last boat on the starboard side, of which it was said that stewards were sent to get passengers, and sent down to see whether there were no women and children to come up from the third class to get into this last boat that was leaving on the starboard side, and then came back and apparently they found no one. I am bound to say that the evidence that was given with regard to that was not very satisfactory, and your Lordship will remember with regard to this last boat that as she was being lowered and as the passengers were getting into her it was then found that she could take more, and stewards were sent down to see whether they could find any third class passengers to come up on deck and get into the boat, and the answer was that they found none. I have always found that a little difficult to understand, because there were a very large number of third class passengers still on that vessel, and one does not realise why it was that no one came up on deck. To some extent you must bear in mind also that some of the emigrants were foreigners, but even then with regard to that the evidence is that interpreters were sent along to explain to them what it was that they were required to do. So that viewing the evidence in all its aspects, and bearing in mind what has been said by my learned friend Mr. Harbinson, I think what it resolves itself into eventually is that the third class passengers were more loth to leave their cabins and to get into the boats than the first class passengers seem to have been, or even the second class passengers; and further that they were not so favourably situated, and their cabins were not so favourably placed as either first or second class, but as far as I am able to gather anything from the evidence there is no other explanation of why it is that so many were lost. Your Lordship will remember the proportion is very striking. *The Commissioner:* There were 560 third class, I think, in the vessel.

*The Attorney-General:* Yes, about. And, my Lord, the evidence with regard to it, both as to the access to the boat deck and as to what was done is all collected, but I am not sure whether your Lordship has got it. Some attention was directed to it undoubtedly by my learned friend Sir Robert Finlay, and in some detail, but whether your Lordship has all the information upon that which is available I am not quite certain.

*The Commissioner:* I do not think you need stop to examine it in any closer detail. *The Attorney-General:* If you please, my Lord; then I will pass from it. It will save a good deal of time. Now, my Lord, I propose to deal with what happened with reference to the boats. I am not now upon the accommodation provided - that I propose to deal with when I come to the important part of the case that affects the Board of Trade. My Lord, the boats are dealt with in the boat list, of which your Lordship has the analysis before you, and if I may say so, it is done with such care and so well that I do not think I could usefully spend any time in attempting to amplify it. Your Lordship really has the substance of it there, and it is as well put as it can be.

*The Commissioner:* Mr. Attorney, which is the question to which you are directing my attention now? What is the number of it? Is it a specific question?

*The Attorney-General:* Yes, there is a specific question, of course, as to the capacity of the boating accommodation. I think really it comes into Questions 16, 17 and 19, and 20 is quite specific upon the point.

*The Commissioner:* Read me Question 20, please.

*The Attorney-General:* "What was the number of (a.) passengers, (b.) crew taken away in each boat on leaving the vessel? How was this number made up, having regard to, first, sex; second, class; third, rating? How many were children and how many adults? Did each boat carry it's full load, and, if not, why not?" But there are several questions that deal with the boats.

*The Commissioner:* Am I expected to take each boat separately and set out the circumstances relating to it? There is a question, I think, that asks me to do it.

*The Attorney-General:* You are asked this: How many passengers and crew left in each boat? That is all, I think.

*The Commissioner:* I can do it in a way, but not precisely, I am afraid.

*The Attorney-General:* I do not think anybody with the greatest care, even if we had much more evidence than we have, could be quite precise about it, but I do not think it is intended that you should do more than to give an indication according to the evidence of how many you think were carried in each boat.

*The Commissioner:* According to the evidence a great many more people were carried away in these boats than they were capable of carrying.

*The Attorney-General:* I quite agree, and that is particularly striking when you examine the proportions. I think as far as I have been able to analyse it, according to the evidence, we know in fact there were 711 persons saved in the boats; that is the full number. There were, according to the evidence, 836 carried in the boats, and who ought to have been saved if that number is right, and moreover, it shows quite plainly that the witnesses have been inclined to over-estimate the number of women and children who went away in each boat, and to under-estimate the number of male passengers that went away in the boats, as well as the number of the crew. That is exactly how it stands.

*The Commissioner:* Yes, that is exactly how it stands; there is an exaggeration in the gross number, and there is an exaggeration of the number of women and children. *The Attorney-General:* Yes, the tendency undoubtedly has been for the witnesses who have been called to make out that more women and children were carried in the boats than were in fact carried, and a less number of men and crew. It is striking in particular with

regard to the women and children, because in fact there were 388 saved of women and children; according to

**Page 930**

the evidence there were 642 women and children saved. In fact there were 126 male passengers saved; according to the evidence there were only 71. In fact there were 189 male crew saved; according to the evidence, only 123. So that bears out what your Lordship said as a summary. That is dealing with the total number saved as 703 instead of 711, as we now know it, but the other figure is not of very great importance. Now, my Lord, may I say just a word, and it will not be more, because I have already indicated to you at an earlier stage of the case what my view was in answer to a question from your Lordship with reference to the discipline upon which your Lordship is asked a specific question; I think it is No. 17. My Lord, one cannot peruse the evidence given in this case without, I think, being very much struck by the discipline of the crew, taken as a whole, and of the behaviour of the crew. To take one instance, and I think a very, very striking one, to which I was adverting only a little while ago, when I called your attention to the evidence of Dillon and Cavell, trimmer and fireman, who were in No. 4 boiler room, they had been on deck, and there were others who had been ordered down below in a vessel which they know was in great jeopardy, and who heard the order which had been given from the bridge to uncover the boats and to man them, and to be ready to launch them, and to fill them with women and children. All these men on board knew perfectly well that they were in grave peril, and yet it is one striking fact that they go down, apparently without any question, without any murmur, they go down below to work on board that vessel, and down below in the hold when the water was coming in, as we know, in No. 4 boiler room, till the water was up to their knees, when they were ordered to come up on deck through the escape, and when they found, in fact, that all the boats had gone except the collapsible, and I think one ought to bear in mind the behaviour of these men in the circumstances. These were not even seamen, and on the whole I do not think that one is saying a word too much when we say that the behaviour of those men was heroic. My Lord, one is also struck in reference to the evidence about the engineers. Not a single engineer was saved. As my learned friend Mr. Roche said in the very admirable address he made to your Lordship, it is by no means an uncommon thing; it is a common thing to find that no engineers were saved. There they are right down in the vessel, and during a time of peril they do not come up, and they did not come up in this case until, if at all, all hope of safety had disappeared. There is some evidence of some eight men having been seen, it is not quite clear that it is right that they were engineers, but whether they were or not, when they were seen it is as plain as possible that it was only after all the boats had gone, and when there was no hope of rescuing them. And another striking fact which is worth remembering also, of which my learned friend reminds me very pertinently, I think, is that there were eight ship's boys on board this vessel. We have heard nothing about them; they played no part in their humble capacity on board this vessel as ship's boys; every one of them was drowned. They might very properly, if it had been desired, been treated as juveniles, but they were not; they went down as part of the crew of the ship; and, as I say, we do not hear a single word about them.

My Lord, really, speaking with the rarest exceptions in this case, everybody on board seems to have behaved in this moment of the gravest peril, realising, as they must have done, that they were in imminent danger of losing their lives, with a calmness and with a devotion to duty which I hope will always be remembered to the credit of those who sail on board British vessels. My Lord, in the same connection, I think one ought also to remember the passengers; the accounts which have been given of the women who refused to leave their husbands; took their chance, and must have known perfectly well what it meant; and the accounts that we have had of some, knowing quite well that, by staying on board, they were doomed to destruction, nevertheless preferred it - preferred to remain with their husbands to going on board the boats. It must also not be forgotten, my Lord, that the men, with the exception of, I think, only in one instance of which evidence was given of a rush by the second and third class passengers to one boat, which was checked, as your Lordship will remember, by Mr. Lowe - with that exception, again the passengers seem to have behaved extremely well. My Lord, the men on board made no attempt to leave the vessel. It must have been realised, I suppose, at an early moment on board that vessel, so far as one is able to reconstruct the scene, that there was only accommodation, and that not even sufficient, for the women and children on board that vessel, and no attempt made on behalf of the men to force themselves in, as your Lordship so pertinently observed recently; even in one case where there were two men who got in because they thought there were no more women, when the women were seen the men got out and the women were placed in the boat and were saved. Your Lordship will remember again one other significant fact, that although the stewards and crew were marshaled to keep the line and to prevent the male passengers from getting into the boats, and to take care that only women and children got into the boats, the evidence is that they had nothing to do; that the passengers stood there and made no attempt in any way to get into the boats, but assisted in keeping order with the stewards and with the rest of the crew. All those are factors which it is as well that one should bear in mind, and I know your Lordship will bear them in mind when you come to deal with what happened on this vessel after the casualty.

My Lord, this becomes of greater significance when you present to yourself the picture in that vessel, of the ship sinking by the head, the water always getting further and further mastery over the ship, the boats going away one by one, and the realisation of those who remained on board that ship that, although the water was gaining control over the vessel, there was no boat, and there was no possibility of their leaving the vessel. There is some evidence, the evidence of Mr. Bride, that when the news came through, as he received it, that the "Carpathia" was coming to their assistance (I think I am right in saying that it was at 12.35 that that happened - it is within a minute or two), that that news was taken by him at any rate to some of those who were on board the vessel. It may be that that caused a good many to prefer to remain on board the vessel, but one does not know exactly how much was known of that; one can only surmise that if there was information of that kind given by him, as he says he did give it when he went up amongst the people on board the vessel, it would very soon spread and very soon be known, and no doubt helped to steady those people who were on board, and made them able to wait the arrival of the "Carpathia" with greater fortitude. But still, all the time this vessel is getting nearer

and nearer to foundering, and all the time one sees that the boats are being lowered and the last means of escape are disappearing.

Now, my Lord, I do want to make one comment with regard to this matter, and that is in respect of this No. 1 boat. No. 1 boat was the emergency boat on the starboard side, the boat which has figured somewhat prominently in this case on account of the evidence which was given in the first instance by Hendrickson, and which led, in consequence of some possibly underlying suggestion to the calling of Sir Cosmo and Lady Duff-Gordon. As I said at an earlier part of this case, and I repeat it now, any comment that I have to make with regard to this boat is not directed against either Sir Cosmo or Lady Duff-Gordon. For my own part, I should find it impossible to make any harsh or severe comment upon the conduct of any woman who, in circumstances such as these, found herself suddenly lowered down this great vessel on a dark night into the water in a small boat, and who was afraid to go back because she thought there was a danger of being swamped. At any rate, I shall make

### **Page 931**

no comment whatever upon it. But, my Lord, the evidence, and the reason why I am directing attention to it, is that it is quite plain that for some reason that boat was lowered with 12 persons in it instead of 40, and there is not the faintest explanation, as far as I can see, of why that happened. There were altogether seven of the crew of that vessel; of course, a far larger proportion in comparison with passengers than in any other boat. There were seven crew and five passengers - Sir Cosmo and Lady Duff-Gordon, Miss Francatelli, and the two American passengers. That constituted the whole of the evidence. And also it is apparent from the evidence that they did not get into the boat - that is to say, these passengers - until the boat was being lowered. Your Lordship will remember the evidence in particular with regard to the two American passengers, that they came running along, and were bundled into the boat at the last minute as she was going down. The order which was given is an order with which one has become somewhat familiar in this case - I do not profess to be repeating the exact words, it is not necessary that I should read them - but substantially it was that they were to stand by the vessel and to come back when called upon. My Lord, I am quite sure - in fact, I know it has exercised your Lordship's mind a good deal, as it must those of all who have striven to comprehend that order and see what it meant. The only possible explanation, it seems to me, is that it was intended at one time, as no doubt, it was according to the evidence to fetch passengers from the gangway aft. We have had the evidence about the proposal that they should be put into boats from the gangway aft, but apparently that is all we hear of it, nothing seems to have been done, and so far as I know, of the evidence no order was given as to preparing the gangway or opening the door, and one quite understands, of course, that it might have been a very dangerous thing to do if the vessel is all the time going down further and further by the head; it may have possibly been a thing that could not have been done, but, my Lord, there, I regret to say, the matter must be left as regards this boat. I am quite unable myself to offer any explanation of it. I am puzzled over it. I have read the evidence with care, but I cannot see why this boat was lowered in these circumstances and with that very small number of passengers.

My Lord, the value of it as throwing light upon this Enquiry, is, I think, twofold. First of all, it shows, I think, the importance of boat drill; it shows further that had there been boat drill, you would have had your men presumably at the moment ready, knowing what there was to be done, and I think if there had been better organisation as to what should happen in the case of an emergency such as this, there would have been a better possibility of getting the passengers into the boats. One is a little struck by this - and I make this observation for your Lordship's consideration - that although, as I have said, there was perfect discipline in the sense that there was no panic, the organisation does not seem to have been quite satisfactory with regard to getting the passengers out from their cabins and placing them in the boats. What strikes one in reading the evidence is that nobody seems to have known precisely what his duty was, or how many persons were to be placed in the boat before the boat was lowered. Certainly that is the evidence with regard to a number of the boats. I think I am right in saying (I will deal with it in detail) that there were only four of the boats that left with their full complement of passengers and crew; but all the rest left with a less number than they could have carried, more particularly could have carried on this particular night.

Now, my Lord, one must bear in mind as against that, I think, that this vessel was on her first voyage. I suppose if those who were on board the vessel, particularly the crew, if they are in the habit of being re-engaged after they have been discharged at the end of a voyage, would become more familiar with the vessel, and would better know what should be done at the particular moment, in an emergency, they would certainly know the vessel better, but it is a factor which ought to be borne in mind that during this voyage at this particular moment when this emergency arose, there seems to have been no satisfactory organisation with regard to getting the passengers on deck. What I mean by that is, I should have thought that it might have been possible to have had men told off whose duty it would have been in an emergency of this character to call the passengers and to bring them on deck; but, in any event, what we do know about it is that these boats left, and left without their full complement, which might have carried a larger number, and therefore would have led to a smaller loss of life, and that of these the worst of them is this boat No. 1.

Now, my Lord, the comment I desire to make upon that is more especially with regard to the man who was in charge (and the man who was in charge was Symons), whose duty it was to attempt to save life if there was any possibility of doing that. The man does not seem to have carried out, at any rate, the order that was given to him. He was told to go away and stand by. Instead of that, as far as I understand his evidence, and I have looked at it with great care, he seems to have got away as far as he possibly could; and when he heard the cries, although one can quite realise and quite understand that a man would hesitate, and rightly hesitate, at plunging into a mass of struggling people, yet at the same time there were a great number who might have been saved if the boat had gone back before he had got as far as the people who were huddled together, according to the evidence of one person, as they were in the water after the vessel had gone down, and Symons' evidence, I suggest to your Lordship, was unsatisfactory. He gave no proper account of why he did it. He had got some parrot phrases somewhere in his mind that in the exercise of his discretion he had done it and that he was the master of the situation, but they afforded, as far as I can follow, no justification for what he did, and I do not

think there is one, and, as far as I am able to see from the evidence, there is no explanation of why he went away and made no attempt at all to save life - no explanation at all, except that he says he was afraid that if he had gone back they would have been swamped. My submission to your Lordship with regard to that is that it is not a true explanation of what happened at that time. He was afraid also, I think I am right in saying, of suction. My Lord, none of those things justify a man in his position who is used to the sea -

*The Commissioner:* When was the boat lowered into the water?

*The Attorney-General:* I think it was from ten minutes past one till a quarter-past one.

*The Commissioner:* It was a full hour before the foundering of the "Titanic."

*The Attorney-General:* Quite. The order in which the boats were lowered, I think, was 7, 5, 3, 1, and this boat would be lowered just about ten minutes to a quarter-past one, according to the evidence. As your Lordship says, that was at least an hour before the foundering. But as to that part of the case, as to what happened, why he did not come back, what he did, and why no further passengers were placed in the boat, I confess to me is very difficult to explain. I can see no justification for it, and I can see no explanation for it, but there it stands. My Lord, when I say I see no explanation of it, I think it is right to bear this in mind, and to call your Lordship's attention to it, that Mr. Lowe, the officer, said he took everybody who was on board who was there as far as he could see, and that there were no people left on the starboard deck at the time. I think that must be a mistake, because it is quite clear that after that, the four after boats were lowered on the starboard deck, and that there were a number of passengers and crew who were in those boats. As your Lordship will remember, boat No. 15, which is the one as to which there was a good deal of discussion, was the last one which left. So that he must be mistaken with regard to that. I suppose what it really means is that he did not see any others, but it cannot be that there were no other women and children on the starboard deck at the time this boat

## **Page 932**

was lowered, as we know for an absolute certainty that the other four boats were subsequently lowered, and of course carried with them a number of women and children.

*The Commissioner:* The capacity of this boat was 40?

*The Attorney-General:* Yes.

*The Commissioner:* And it went away with 12?

*The Attorney-General:* Yes, of which seven were crew.

*The Commissioner:* Was there any other boat that went away with so small a proportion of passengers on board?

*The Attorney-General:* No, my Lord, there was no other boat; and there was no other boat which went away with a larger number of crew than passengers either - none. Well, my Lord, I confess I am quite unable to understand why that boat was lowered in that way, and equally I am unable to understand why no attempt was made by Symons subsequently to save the lives of some at least of the people who were in the water. Now, my Lord, dealing generally with the boats, I am not going through it in detail because your Lordship has the list before you, generally dealing with them, the only boats that

took their full complement and even more were four, Nos. 11, 13, 14, and 15, that is the total. Now, my Lord, one has to see why it was, what explanations were given of why these boats were not more fully loaded. In this particular case, of course, it was of supreme importance, because if the boats had been loaded to their full capacity in each case, there would have been so many more lives saved which were lost. Now, my Lord, in the first instance, the one view is that officers superintending the lowering were afraid that the boats would buckle or that the falls would give way. That is one explanation. The second is that there were no more women at hand to get into the boats, or, in any event, no women who were willing to get in. The third is that it was contemplated that more people would be put into the boats when they were in the water from the gangway ladders - that is the explanation I referred to before. Those, I think, are the three explanations of why every boat did not go away at least with its full complement.

Now, my Lord, I do think that in this case it strikes one as very regrettable that the officers should have had doubts in their minds as to the buckling of these boats or as to the falls being incapable of bearing the strain of carrying the full complement down, because there is no doubt that a number of boats were lowered into the water with less than their full complement for that reason. That is quite clear.

*The Commissioner:* Is there any satisfactory evidence that they did fear the buckling of the boats?

*The Attorney-General:* There is a statement with regard to it of the witnesses, my Lord.

*The Commissioner:* I know. I mean, what is the statement to that effect? Are we to be led to suppose that these lifeboats are so constructed that they will bear the strain, when hanging from the davits, of the full complement of passengers?

*The Attorney-General:* I should have thought so, my Lord. I should have thought that clearly they were constructed for that purpose.

*The Commissioner:* Then I do not see, if that is so, why you think that the officers should know that, and then I do not know why, especially in this calm sea, there was any fear of the boats buckling. I can well imagine that the passengers, women and children, had inconceivable fear, but I cannot imagine why the officers should have had any fear of it.

*The Attorney-General:* Of course, there is the evidence your Lordship will remember of Mr. Lightoller about it, who himself says that that was his view; and there is also the evidence of one of the men, Poingdestre, who says that the boat was ordered to be lowered because Mr. Lightoller thought the falls would not stand a heavy load. That is the falls. It has just the same effect, of course, but it is not the boats.

*The Commissioner:* It is the same thing. Of course the officers ought to have known that the boats and the falls would stand the strain. I cannot help thinking that the real reason was that they could not induce any more people to get in at the time. Did Mr. Lowe stop people getting into the boat?

*The Attorney-General:* Certainly his view was that he was taking risks. I do not think that he stopped them.

*The Commissioner:* Is there any evidence that Mr. Lowe actually stopped people from getting into the boat when it was not full?

*The Attorney-General:* I do not think he says that. I do not remember his saying it. *The Commissioner:* Did Mr. Lightoller say it?

*The Attorney-General:* Mr. Lightoller's view certainly was that it was not safe for the boat.

*The Commissioner:* He had no business to have such an idea.

*The Attorney-General:* I think it was deplorable of course for any officer to take that view with regard to the lifeboats, which are there for that very purpose, that the officers should not have known the number of persons to be carried. Each of these lifeboats would have carried 65 persons as lifeboats, and indeed some of the boats went away carrying 70, and those who were in the boats were saved.

*The Commissioner:* One boat, I think, was lowered with something like 70.

*The Attorney-General:* Yes, No. 11, some say 70, and some say 74.

*Mr. Laing:* Seventy may not be accurate. We do not know.

*The Attorney-General:* I agree; of course it is very difficult to say exactly how many there were, and I do not think anyone could say with precision how many were saved and how many were in each boat. But at least we do know this, that 70 to 75 is the effect of the evidence, and this boat, No. 11, seems to have carried the largest number. No. 15 was said to have carried 70; there was a good deal of evidence about that. I have before me just now Mr. Lowe's evidence about it. I do not think he said anybody was stopped. His view was that he was putting people in, and that he thought he was taking risk in doing it; and I did call your Lordship's attention when I was dealing with boat No. 1 to what he had said in dealing with passengers on the starboard side; but in this connection Mr. Lightoller's evidence is at page 314, and at Question 13883 he deals with this question, "Was boat No. 6 filled? - (A.) It was filled with a reasonable regard to safety. I did not count the people going in." That seems to be the extraordinary view or opinion he formed. "But you exercised your judgment about it? - (A.) Yes. (Q.) It was filled as much as you thought was safe in the circumstances? - (A.) Yes. (Q.) In your judgment, is it possible to fill these lifeboats when they are hanging as full as you might fill them when they are water-borne? - (A.) Most certainly not." *The Commissioner:* Then he is wrong about that?

*The Attorney-General:* Absolutely wrong, according to everybody's opinion. Then your Lordship asks, "Is that due to the weak construction of the lifeboats, or to the insufficiency of the falls? - (A.) A brand-new fall, I daresay, would have lowered the boats down and carried the weight, but it would hardly be considered a seamanlike proceeding, as far as the sailor side of it goes, but I certainly should not think that the lifeboats would carry it without some structural damage being done - buckling or something like that. (Q.) And had you those considerations in mind in deciding how many people should go in the boat? - (A.) Yes," and then my learned friend, the SolicitorGeneral, who was examining him referred him to Poingdestre's evidence upon it, to which I called your Lordship's attention just now, but here it is and the convenient thing will be just to refer your Lordship to Poingdestre's evidence. It is at page 83 he is asked,

"Do you know how it comes that there were not more than 42 put into this boat? - (A.) Yes." (That is boat No. 6, that is the boat constructed, of course, to carry 65, he says.)

"Well, the reason is that the falls would not carry any more. (Q.) You mean somebody was frightened of the falls? - (A.) Yes, the Second Officer, Mr.

Lightoller. "Did you say anything aloud about it" -

*The Commissioner:* This evidence comes to no more than this, that Lightoller was afraid.

*The Attorney-General:* That is all, my Lord.

*The Commissioner:* My attention was drawn to Mr. Lowe's evidence.

*The Attorney-General:* Yes, my Lord. There is a little more at page 477.

*The Commissioner:* That has been read already.

*The Attorney-General:* Yes, my Lord, it is a passage that I called attention to. *The Commissioner:* "And that was why you lowered the boats from the boat deck when they were not altogether full? - (A.) I was working on the idea that the gangway doors were going to be opened, and take people from there." Then he says in answer to that last question, "Certainly; we were not going to load the boat with its floating capacity from the davits." (*The Commissioner.*) Do you see any reason why the lifeboats should not have been lowered full of people? - (A.) Yes, I do. (Q.) Did you see any one of them lowered full of people - I mean with about 60 in the boat? - (A.) No, Sir; I could not say that I did. (Q.) What, in your opinion, is the reason why the boat should not be lowered full of people? - (A.) The reason, my Lord, is that the boat is suspended from both ends, and all the weight is in the middle, and that being so the boat is apt to buckle, that is, break in the middle, and both ends buckle up like that (*showing*), and shoot the whole lot out of her." Well, I do not know whether this man was cross-examined or examined about it again. Had he ever seen such a thing?

*The Attorney-General:* I am much obliged to your Lordship for calling my attention to it. Would your Lordship mind reading the next two Questions?

*The Commissioner:* "At all events, you would not think it safe to do it? - (A.) No. (Q.) How many were in your boat when it was lowered? - (A.) I mustered them when I got away from the ship, and there were 58 passengers - that would be 65 altogether. (Q.) That was lowered without buckling? - (A.) Yes, but I said I was taking on risks, Sir." "Do you think the boats were fit to be lowered with their full complement," and Lightoller and this man Lowe seems to have thought that there was some risk. What business they had to think there was some risk, I do not know.

*The Attorney-General:* At page 427 your Lordship will see according to that, Mr. Wilde, the Chief Officer, thought so too. Question 17897, "Can you give any explanation of this boat No. 8 being lowered and launched with only 35 passengers? - (A.) No. The only thing is that Mr. Wilde, the Chief Officer, said there were quite enough in that boat to be safe to lower it."

*The Commissioner:* That is another man.

*The Attorney-General:* Yes. "Was that in reference to the strength of the falls? - (A.) Yes. (Q.) And the tackle for lowering? - (A.) I should say that is what he thought." Then your Lordship says "That is rather a leading question. (*To the Witness.*) This boat was being lowered, like the others, from the davits? - (A.) Yes, my Lord. (Q.) And being lowered a long way? - (A.) Yes. (Q.) From the davits to the water? - (A.) Yes. (Q.) Does it occur to you that Mr. Wilde might have thought that the load in her was quite enough? - (A.) Yes, I think that is about what he thought. He said there was quite enough in it to

lower from the davits.” Then there is a little discussion about it, and your Lordship says: “What occurred to me was that you were putting the blame on the davits and the falls, and I do not think myself, at present, that the davits and falls had anything to do with it, but it was the fear of the boat buckling and throwing the people out.” Then there was some examination about that - “The falls were perfectly new. There was no difficulty experienced in lowering.”

*The Commissioner:* I remember the suggestion made in this examination was that the falls and boats were not strong. This examination was being conducted by Mr. Scanlan. The suggestion, you know, against this ship was that the boat was not strong enough; that was the suggestion thrown out by the examination. It was not well founded, because the boats were strong.

*The Attorney-General:* There is no suggestion that they were not.

*The Commissioner:* According to this man, a boat which would hold about sixty was allowed to be lowered with about forty. *The Attorney-General:* Thirty-eight, my Lord.

*The Commissioner:* I do not see why they should wish to construct a boat for the purpose of carrying sixty people, if it is only to be used for the purpose of carrying forty.

*(After a short adjournment.)*

*The Attorney-General:* My Lord, I have said all that I desire to say about the buckling of the boats, or the suggested weakness of the falls - that they were not of sufficient strength to carry boats with their full complements. I want to call attention now to the evidence and I shall only do so very generally, because I think it has been so very fully explained during the course of this Enquiry. The second reason to which I referred, why there were not more passengers in the boats, was that the order had been given that women and children only were to be placed in the boats, and that there was a difficulty in getting women and children to go into the boats. There are a great many passages in the evidence, but I do not expect that your Lordship would desire me to go through that, as that is a matter upon which there can be no controversy.

*The Commissioner:* I think not.

*The Attorney-General:* If your Lordship pleases. The same observations would apply to the evidence which has been given about the gangway. That is the third suggested reason why there were not more passengers placed in the boats, because it was contemplated that this gangway would be opened and that they would be able to recall the boats to put more passengers in them. It simply remains as a suggestion; nothing was done, as your Lordship knows, with regard to it; and I gather from the evidence also that if it had been necessary to do it, it would have taken a considerable amount of time to open this gangway door and presumably to fit the gangway so as to lower the gangway and let the passengers down by it into the boats.

The next thing that I desire to direct attention to, and that very shortly, is why it was that there were not more passengers picked up by the boats after the vessel had foundered? There are four reasons given for that through the evidence. The first was that the persons in the boats were afraid of being swamped by others attempting to board them; that I have already commented upon. The second was that there was a danger of suction; the third

that the boats were told to pull for a light and were too far away to return (that only applies to some of the boats); and the fourth was that the boats were not well enough manned to make their way back to the ship with any hope of being useful. That was thrown out as an explanation of why some of the boats did not go back. It occurs to me that the last one is a very unsatisfactory explanation, because there does not seem to be any reason why they should not have been able to get back, assuming that they had remained only within a short distance of the "Titanic." The evidence upon that is somewhat voluminous, but I cannot think again that any useful purpose is served by travelling in detail through that, as these four reasons are sufficiently well established by the evidence. It seems to me, to make it unnecessary for me to

### **Page 934**

travel through it in detail, and to call your Lordship's attention to particular questions and answers.

Then, my Lord, I return to the general question which I was considering in dealing with the boats; that is, as to what steps were taken to save life. In the first place, I have called your Lordship's attention to what was done with regard to the boats. Then there were the attempts to summon the passengers to the boat deck with lifebelts and warm clothing. Your Lordship will remember there was a good deal of evidence given in detail with regard to that. The evidence with regard to the third class passengers is, in the main, the evidence of Hart, at pages 221 to 225, and at page 230; and the evidence of Pearcey at page 231, Mackay, 237, and 239, and Wheat, at page 241. Your attention has been called in some detail to this, and I think you have all the references that are material upon it. If your Lordship should require them again I can supply them, but I do not want to do it unnecessarily, as I am very anxious to get to a conclusion. I think your Lordship really has them sufficiently. That deals with the orders that were given with regard to the boats, and with the summoning of the passengers to the deck.

Then there is a third step which was taken, which was to send up distress signals and to use the Morse flashlight. The evidence as to that is in Rowe's evidence on page 419, Questions 17657 to 17684. He says that rockets were sent up. It comes at the end of Question 17657. It gives in detail what happened. The particular question with regard to the evidence of the time they were sent up, is at the end, Question 17684. On the same page, 419, there is the evidence about the Morse signaling, Question 17660; and then at 17684 is the sending up of the rockets from about a quarter to 1; he says he noticed it till about 1.25.

Boxhall's evidence with regard to it is on pages 356 and 357, Questions 15394 to 15420. He is asked about the steamer: "(Q.) Could you see how far off she was? - (A.)

No, I could not see, but I had sent in the meantime for some rockets, and told the Captain I had sent for some rockets, and told him I would send them off, and told him when I saw this light. He said, Yes, carry on with it. I was sending rockets off and watching this steamer. Between the time of sending the rockets off and watching the steamer approach us I was making myself generally useful round the port side of the deck. (Q.) How many rockets did you send up, about? - (A.) I could not say, between half a dozen and a dozen, I should say, as near as I could tell. (Q.) What sort of rockets were they? - (A.) The rocket

distress signal.” Then he describes their effect: “(A.) You see a luminous tail behind them and then they explode in the air and burst into stars. (Q.) Did you send them up at intervals one at a time? - (A.) One at a time, yes. (Q.) At about what kind of intervals? - (A.) Well, probably five minutes; I did not take any times. (Q.) Did you watch the lights of this steamer while you were sending the rockets up? - (A.) Yes.”

I may have to recur to that in connection with the “Californian” incident later. At present all I wanted to do was to call your Lordship’s attention to what steps were taken. Then besides that, there are the wireless messages which were sent which appear in the Marconi *procès-verbal*, of which your Lordship already has the information - I mean the C. Q. D. and the S. O. S. messages, which were sent all round. No doubt everything was done that was possible by wireless telegraphy in order to attract the attention of vessels. I think the first signal sent, from the *procès-verbal*, was 12.15 a.m. to the “La Provence.” If your Lordship has the Marconi records it is only necessary to call attention to the time at which the first message was sent, which was 12.15 a.m.; “‘La Provence’ receives ‘Titanic’ distress signals.” Then also at 12.15 a.m.: “‘Mount Temple: ‘Titanic’ sending C.Q.D., says require assistance, gives position”; and at 12.25 the “Carpathia” receives the message. That is on the same page. The first is “La Provence” receives “Titanic” distress signals at 12.15, then the “Mount Temple” hears the “Titanic” at 12.15 sending the C.Q.D., and then I went on to 12.25, when the “Carpathia” received the signal. I think to that your Lordship must add the evidence of Mr. Cottam, which is at page 405, which shows that the message sent immediately by the Captain of the “Carpathia,” Captain Rostron, was that he was turning round and coming to the assistance of the “Titanic.” It does not appear in the *procès-verbal*, because Mr. Cottam explained he did not write it down. You find that at page 405, Question 17107 - I might begin at 17105 - he says he confirmed the message before reporting it to the bridge: “I asked him if he intended me to go straight away to the bridge and get the ship turned round immediately, and he said, ‘Yes, quick.’ (Q.) Did you go to the bridge? - (A.) Straight away, yes. (Q.) You reported it to your Captain? - (A.) To the officer on watch first, and, from him, to the Captain. (Q.) Then what was done about the ‘Carpathia’? - (A.) She was turned round immediately. (Q.) And made for the position? - (A.) And headed for the position, yes. (Q.) Then you, I suppose, would go back to the Marconi room to your instrument? - (A.) Yes I did; I went right away. (Q.) Up to this time had you sent the ‘Titanic’ any news of where you were? - (A.) No, not up to then. I went straight away back to the cabin and sent our position. (Q.) Who gave you your position? - (A.) The Captain gave me our position. (Q.) Then you were in a position to tell the ‘Titanic’ where you were? - (A.) Yes. (Q.) And did you tell her that you were coming to her assistance? - (A.) I did.”

*The Commissioner:* What time was that?

*The Attorney-General:* That is 12.35 ‘Titanic’ time. We have had it at some time that that was the time it took place. Bride gave us the time and I will give you the reference.

*The Commissioner:* Bride tells us when he received it?

*The Attorney-General:* Yes, it is at page 388, Question 16517: “What was the message from the ‘Carpathia,’ so far as you can recollect it? - (A.) She transmitted her position and told us she had turned round and was coming along as fast as she could. (Q.) To your assistance? - (A.) Yes.” Then at Question 16523 he says he reported that to the Captain and Mr. Phillips remained in the room.

*The Commissioner:* That does not give the time.

*The Attorney-General:* No, my Lord, he has said the time, but for the moment I have not the reference. At Question 16511 you will see: "You have told us you came up at 12 o'clock and that then you heard this conversation." The only importance of that was that, of course, it must be at some period after that that he is on deck, because he comes back there at 12 o'clock. This is very near it on page 393, at the end of his evidence, Question 16795, "Do you remember how long it was after the collision when you learned that the "Carpathia" was coming to your assistance? - (A.) The "Carpathia" was the second boat to answer our call. (Q.) Can you remember how long that was after the collision? - (A.) No, I could not tell you; it was within a very short space of time after we sent out our first distress signal. (Q.) And you took that message to the Captain, you told us? - (A.) Yes. (Q.) Now, do you know if the Captain communicated the substance of your message to any of the officers or to the crew? - (A.) I passed the word myself as I went to find the Captain. (Q.) To whom did you pass it? - (A.) To anybody whom I happened to go close by. (Q.) Did you pass it to any of the officers? - (A.) Not to my knowledge. (Q.) But you gave it out that the "Carpathia" was coming to your assistance? - (A.) Yes. *The Commissioner:* Where do you get the 12.35 from?

*The Attorney-General:* 12.25 is the time given of the message being received by the "Carpathia" from the "Titanic."

*The Commissioner:* I thought 12.35 was the time when the "Titanic" received the message; I thought you said so. It would be the same time, I

## **Page 935**

suppose. I mean to say, when the "Carpathia" sends a message to the "Titanic," the "Titanic" receives it at the same moment.

*The Attorney-General:* Yes, 12.25, you have got quite definitely that call was received from the "Titanic" by the "Carpathia." Then you know what happened is that Cottam goes to the bridge.

*The Commissioner:* He went to the bridge and spoke to the Captain, and the Captain said: "Let them know our position, and tell them we are coming."

*The Attorney-General:* Yes.

*The Commissioner:* That could not have taken more than a few minutes.

*The Attorney-General:* I do not reckon it more than a few minutes. I put it at the very latest at 12.35. That is how I get to the time.

*The Commissioner:* Evidently Bride cannot tell us exactly, but it must have been very shortly after.

*The Attorney-General:* It is within a few minutes, certainly. I do not want to take too close a time; I put it at 10 minutes, so as to make it quite safe.

*The Commissioner:* At about 20 minutes to 1 they would receive the "Carpathia's" message.

*The Attorney-General:* Yes.

*The Commissioner:* It is a good hour after the accident.

*The Attorney-General:* Apparently the first signal by wireless telegraphy, so far as I have been able to get from the evidence, is 12.15. From 11.40 to 12.15 nothing was done by Marconigram, so far as this shows us. But at that time the message is sent out, and your Lordship sees, was received by several vessels at 12.15, by the "Carpathia" at 12.25, and then within a few minutes she sends her message that she is coming to their assistance. Of course, they go on for a considerable time, but I do not think it helps very much. What your Lordship wanted to know was when the "Carpathia" signalled. Now, my Lord, that deals with all the steps that were taken after the vessel had come into collision. It is not very easy to see why they did not send a message earlier by Marconigram, because they knew apparently within a very few minutes, within 10 minutes, that the vessel was seriously injured. They may have waited.

*The Commissioner:* That is what occurred to me. The Captain must have known it was necessary to get assistance as speedily as possible, within a quarter of an hour, and one would have thought he would have gone straight to the Marconi room and summoned assistance. But you say 12.15 is the first.

*The Attorney-General:* Yes, that is the first. That is "Titanic" time.

Well, now, that, I think, disposes of all the evidence that there is, as to steps taken after the collision. What happened subsequently has given rise to some doubt at one time, but I think it is abundantly clear now, particularly after the evidence of the officers, that, although it may have been thought at one moment, and certainly was by some of the crew - some of the earlier witnesses who were called before you - that the vessel had broken in two at one stage, and that the head, the fore part of the vessel, had disappeared, leaving the afterpart floating for a time, which then disappeared, that is disposed of now.

*The Commissioner:* There is no suggestion of that now.

*The Attorney-General:* No. I think the reason why they came to that conclusion was that apparently one of the funnels broke aft, and possibly those looking at it, seeing that happen, may have thought that meant that the afterpart of the vessel was still afloat. That is some explanation of it. But it is quite plain, I think, from the evidence which has been given now that she did not break in two, there can be no question of that, and that she did go down certainly with her stern at an angle of something like 45 degrees. I think that seems to be established pretty clearly by the evidence, especially by the evidence of the officers, and that would be explained also by the plan which Mr. Wilding put in, which showed your Lordship what would happen if those compartments became filled. It is exactly what those who are skilled in the flotability of vessels would naturally expect to happen, and what, according to the evidence, did happen.

That brings me to the two last points, undoubtedly important ones, upon which I have to address you, and one is the very important matter of the boat accommodation provided by the "Titanic," and also as to whether that boat accommodation was sufficient. Well, it is quite plain, and there is nothing to be said to the contrary, that according to the evidence we have got the boat accommodation was not sufficient for the number of passengers who were on board; I mean by that that on this particular occasion, had there been more boats and had the passengers been willing to leave in the boats, a greater number of lives would undoubtedly have been saved. That is quite clear.

In the observations which I want to make to your Lordship now with respect to this matter, I have to deal with the suggestions which are made as to the want of proper

provision by the Board of Trade for an emergency of this character, and I think it substantially amounts, when one has considered all the evidence that has been given, to the suggestion that the Board of Trade ought to have provided a scale of boat accommodation for vessels of over 10,000 tons and in different gradations, so that it would have been necessary according to the Board of Trade requirements.

*The Commissioner:* Over 10,000?

*The Attorney-General:* Yes, I say over 10,000, because it stopped there; over 10,000 and upwards was where it stopped, as your Lordship remembers; and a good deal of criticism has been directed to the fact that the Board of Trade did not make a scale dealing with the different gradations of tonnage over that 10,000 tonnage. I want to call your Lordship's attention to how that matter stands, but before I do so I just want to refer, which I shall do very shortly because of what your Lordship has already said, to the evidence about the bulkheads. It is very difficult to separate entirely the consideration of these two matters, because the policy of the Advisory Committee and the policy also of the Bulkhead Committee, which sat in 1890 and reported upon this matter, was that it was better to make ample provision for the unsinkability of the ship, so far as it was possible, than to provide complete accommodation for all persons on board the vessel. With reference to that what I should submit to the Court is, that both the Board of Trade and the Committee who were dealing with this matter were right to this extent, that it is more important to have efficient provision of watertight compartments and proper subdivision, sufficiently strong bulkheads, so arranged that if there is a collision and penetration of the ship's side the vessel should still float, than it is to have complete accommodation for the full number of passengers. I do not mean for a moment by that to suggest that it is not necessary to have boats; that is not the point of my observation at all. What I do mean is that the first thing to look to is the provide as far as you possibly can, according to the scientific knowledge of the present day, the unsinkability of the vessel. And, my Lord, one has to bear in mind also in that connection that it is an extremely rare occurrence in the annals of the sea for a vessel to be struck as this one was in so many compartments. In the ordinary course of things, if you provide that your vessel was unsinkable, assuming she had two adjoining compartments holed, and particularly if she was so loaded that she would float with a third compartment also penetrated, that would be all that human ingenuity could devise for the purpose of protecting the ship. In this particular case, as I have already indicated and submitted to the Court, and do not want to repeat, the grave injuries that were inflicted were owing to the excessive speed at which this vessel was travelling when meeting the iceberg, the consequence of which was that she received so many wounds. The view taken with regard to this has been very consistent from the time the Bulkhead Committee - what has been called Sir

## **Page 936**

Edward Harland's Committee - was appointed in 1890, and reported, up to the present date; and it seems also to have been the view of the German authorities, because your Lordship will remember from the documents which I put before you that they have the same system in Germany, that provided a vessel is equipped with efficient watertight compartments, the demand that is made upon her for additional boat accommodation is

dispensed with to a certain extent. That is what they say - you need only provide half the full boat accommodation if you have efficient watertight compartments. What we do is very much the same thing, I am referring now to Rule 12, to which your Lordship has had a good deal of reference, in the Board of Trade Rules. It is on page 16 of the Rules of the Board of Trade. "When ships of any class are divided into efficient watertight compartments to the satisfaction of the Board of Trade, they shall only be required to carry additional boats, rafts, and buoyant apparatus one-half of the capacity required by these Rules, but the exemption shall not extend to lifejackets or similar approved articles of equal buoyancy suitable to be worn on the person."

I am only referring to that for this purpose. I only want to show that the policy has been the same in this country and in Germany to encourage efficient watertight compartments, and that those charged with the administration of these maritime matters in Germany as well as here have taken the view that, provided there is an efficient subdivision of proper watertight compartments, there is an exemption from the provision that the full number of additional craft of all kinds shall be carried.

*The Commissioner:* I do not see the reason.

*The Attorney-General:* One reason I should think would be that they want to encourage vessels to have efficient watertight compartments.

*The Commissioner:* It seems to me a most improper thing to bribe, as it were, the shipowner to build his vessel with the lives of the people who are on board.

*The Attorney-General:* That is not what they intend to do. Both in Germany and here, what they thought they were doing by it -

*The Commissioner:* As long as there is a reasonable possibility of the ship foundering why should there be less boat accommodation than the number of lives requires?

*The Attorney-General:* The view, no doubt, is, that if you have provided efficient watertight compartments, you have made a very good provision against the foundering of the vessel; and that they can keep the vessel afloat so much longer, and that if you have a certain number of boats you may be able then, with this number, to get assistance or to take your passengers off to another vessel or to the shore, as the case may be, inasmuch as you can keep your vessel afloat so much longer if you have watertight compartments.

*The Commissioner:* This Rule was made long before the days of Marconi apparatus.

*The Attorney-General:* Oh, yes, it was made about 10 years before they had that. I think the evidence is the first vessel was in 1900 in which they had wireless telegraphy. The Report of Sir Edward Harland's Committee was in 1890.

*The Commissioner:* Was it, or was it in 1894?

*The Attorney-General:* No, in 1894 there was another alteration.

*The Commissioner:* There was one alteration, from 9,000 to 10,000.

*The Attorney-General:* Yes; that is on a different matter. That is dealing with the scale of boats. But whatever the reason was, and I quite appreciate the criticism which may be directed in view of what we now know; it certainly would not entitle, and I would not suggest that it entitled, a shipowner to dispense with a sufficient number of boats. But the view taken, the policy pursued right through from 1894, not only here but abroad, was that if you had these watertight compartments you may dispense with some part of the additional boat accommodation.

*The Commissioner:* There has been very little.

*The Attorney-General:* Not much. I think we had the evidence. It is some 60 odd during the number of years, at most, three or four a year.

*The Commissioner:* Are you upon the question of the Board of Trade now with reference to the boat accommodation?

*The Attorney-General:* Yes, I shall have to deal with that now.

*The Commissioner:* Are you upon it now?

*The Attorney-General:* Yes, I indicated just now I am going to deal with the boat accommodation, and of course in considering it I have to consider the suggestion which was made and the criticism upon the conduct of the Board of Trade. I must consider that in dealing with the whole of this matter. It applies, and I think you must bear it in mind, both in dealing with the bulkheads and with the boats. What I wanted to say about the boats, before I get to what actually happened with the Board of Trade, is that one must bear in mind in this connection that so far as the records of loss of life at sea go there is no case on record where the boats provided have not been sufficient for the purposes of saving life. There is no case on record, according to the evidence - your Lordship will remember Captain Young was asked the question, and I think by your Lordship - in which it has been shown that life has been lost in consequence of an insufficiency of boats. You also have to bear in mind in this connection that for a great number of years the loss of life was very small compared to the number of passengers carried. The reason why I refer to that is, as your Lordship will appreciate, that the Committee that was sitting considering these matters and the Board of Trade afterwards, in dealing with the advice of the Committee, would have naturally to have regard to what had happened as guiding them as to what was likely to happen in the future.

Now, there are a number of criticisms which have been directed, and properly directed, I think, to the providing of increased boat accommodation. I do not profess to say, and I gather from what your Lordship said at an earlier stage, you did not intend to say what number of boats should be provided in a vessel of this character, but I think one is entitled to say this; that as the result of what has happened with regard to the "Titanic," it is clear there should be a larger number of boats provided. That is, I think, how it stands at present, that it is not sufficient merely to stipulate that there should be a boatage accommodation of 9,625 feet cubic capacity, as it was prior to this for vessels of 10,000 tons and upwards, but there ought to be increased accommodation; and when I say that, your Lordship will bear in mind that the matter has been enquired into quite recently by the Committee in 1911, and that they formulated their views as to a new scale with regard to boats.

Before I deal with the boats I want to clear out of the way, if I may, the question relating to bulkheads. I am bound to refer to it, because of course it forms an important element, or has been thought to form an important element, in considering how many boats should be provided for a vessel. But in this Enquiry, and in your Lordship's Report, as we know, we have not to deal with the requirements, we have not to consider whether or not the Bulkheads Committee which reported in 1890, or which was appointed in 1890, when sufficiently far; whether there should be a watertight deck, a matter which has formed the subject of considerable discussion; or whether you should have longitudinal divisions such as exist in the "Mauretania" and the "Lusitania." I think what one may say with

reference to it, and what one is justified in saying upon the evidence, is that the "Titanic," according to all the knowledge available at the time of her construction, was a well equipped vessel, and was efficiently provided with watertight compartments. Whether the system which they adopted was as good as or better than the system adopted in the "Mauretania" and "Lusitania" is no doubt a matter which will form the subject for

**Page 937**

investigation by the Committee which has been appointed to consider these matters. But there are obviously considerations which must apply, considerations of advantages and disadvantages of both systems. In fact, I am quite sure from what your Lordship has said, that you are not in a position to pronounce, and that you do not intend to pronounce, upon that question in this Enquiry. It is obviously as the result of the questions which have been put during the course of this investigation, a very difficult matter and one which will involve a great deal of expert knowledge and investigation. The only reason that I am referring to it at present is that I do not feel that it would be right to suggest, and I certainly do not suggest, that the "Titanic" when she left on this first voyage was not properly equipped or not properly constructed or not properly designed. The view which I present to your Lordship as the result of all the evidence is that she was according to all experience and knowledge as good a ship as had ever left port, and that every care had been taken to make her, as they thought, unsinkable. But as we know from the result of what happened, they turned out to be quite wrong.

*The Commissioner:* "Unsinkable" is a comparative term in that connection.

*The Attorney-General:* As your Lordship pleases. I was going to say "unsinkable" means having regard to what you would ordinarily expect to happen to a vessel. The term has undoubtedly been used with regard to vessels, and was used with regard to the "Titanic" and the "Olympic" because it was thought that a vessel which would float with two adjoining compartments flooded was an unsinkable vessel. I propose therefore to say nothing further with regard to bulkheads than that, merely having called attention to the design of this vessel, as I am bound to do, because of the questions which are before your Lordship.

A good deal of criticism was directed also at one time, with which I am not going to deal, as to the requirements of the Board of Trade, or some officials of the Board of Trade not having been complied with - I mean with reference to Table C. I think my friend, Mr. Laing, showed quite clearly from the correspondence that that was erroneous.

*The Commissioner:* I think the correspondence quite disposed of that.

*The Attorney-General:* Yes, my Lord; it has quite disposed of it, and I do not propose to say anything more about it. When one read the correspondence it disposed entirely of that question.

When we come to consider what boat accommodation should have been provided, there are a number of considerations which certainly have affected those who have advised the Board of Trade hitherto, apart from what has happened to the "Titanic." It was said and thought apparently that if you carried more boats on a vessel such as the "Titanic," or a large increase in the number of boats, you would make her too tender. It was thought that you would hamper her decks, and it would be difficult to use the boats. Another

consideration which was put, was that it would be difficult to launch them, that you would not be able to launch a large number of the boats if you had them on the deck. Then one must also bear in mind that it is an extremely rare occurrence that you would be able to launch all the boats on both sides of the vessel, as happened in this case. But, nevertheless, the view that I suggest to the Court as the result of all this evidence is, that more boats could be carried. What number I do not propose to say, because naturally that must depend upon many considerations. I think the best answer that can be given to the arguments that were urged about the tenderness of the vessel is that in fact a larger number of boats is carried on board of some of the larger German vessels.

I want now to direct your Lordship's attention to what has happened with regard to the Board of Trade.

*The Commissioner:* Have you another copy of the Memorandum?

*The Attorney-General:* Yes, my Lord.

*The Commissioner:* It contains a history of what the Board of Trade have done?

*The Attorney-General:* Yes, my Lord; your Lordship shall have it in a moment.

*The Commissioner:* You need not trouble; I have it now.

*The Attorney-General:* What appears first from this is that under the Statute of 1888, which I am only referring to for the purpose of history, so that one may appreciate what happened hereafter, a committee was to be appointed which was to advise the Board of Trade as to life-saving appliances. It is unnecessary to refer in detail to it because by the 17th Schedule of the Merchant Shipping Act, 1894, the constitution of the Committee which is to be formed, is provided. What really happened was that the Act of 1888 was repealed, and the Merchant Shipping Act of 1894 provided the constitution of the Committee which was to act. Then just before I get to the Statute of 1894, which for the moment I have only called your Lordship's attention to for the purpose of showing of whom the Committee was to consist, you will find that in 1890 the Committee which was advising the Board of Trade on life-saving appliances (that was the Committee which had been appointed under the Act of 1888) reported in favour of a scale extending to 9,000 tons and upwards. It stopped at that. Then if your Lordship will look at page 3 of the Memorandum you will see it summarises the history very well.

At the bottom of the page, the last three paragraphs it says: "It will be convenient to summarise the effect of these Rules of 1889, 1890 and 1894 on the minimum provision of boat accommodation required from large passenger steamers carrying emigrants. The life-saving appliances Rules, which came into operation on the 31st March, 1890, provided for ships up to a maximum tonnage of 9,000 tons and over. If efficiently divided into watertight compartments so that with two compartments flooded the vessel would not sink, ships of 9,000 tons and over were relieved from the provision of one-half of the additional boat accommodation required from ships not so divided. The total boat accommodation which they were required to provide was 14 boats under davits of 5,250 cubic feet and additional accommodation making in all a boat capacity of 7,875 cubic feet."

That of course is dealing, as your Lordship sees, with watertight compartments. Then "the total boat accommodation which vessels of 9,000 tons and upwards were to provide, if not efficiently divided into watertight compartments, was a total boat capacity of

10,500 cubic feet.”

That is the difference between having to carry a full additional number of boats and only half the additional number of boats.

I will go now to the Rules which came in in June, 1894, because I do not think it is important to trouble you with the slight alteration in November, 1890. In the Rules which came into effect on the 1st of June, 1894, the Table was extended to provide for vessels of 10,000 tons and upwards. Now, will your Lordship look at the Table which follows a little lower? You really get the whole effect in that Table and for the three material periods. I am only going to deal with the first and third because I do not think the one of November, 1890, is of any value. For vessels of 10,000 tons and upwards, under the Rules which came into operation in March, 1890, it was 10,500 cubic feet, if not divided into watertight compartments; if they were divided into watertight compartments it would be 7,875 cubic feet. In June, 1894, there is this alteration, that if they are not divided into watertight compartments, it is 9,625 cubic feet capacity which was to be provided, and if they were divided into watertight compartments, 7,562 cubic feet.

Now the importance in this case is that from June, 1894, until the present date, at any rate until the date of the “Titanic” disaster, that remained the scale in force. Of course, it is said that as ships increased in size so it ought to have become necessary to have more boat accommodation.

Now I want your Lordship just to consider in that connection what the position was when

### **Page 938**

the Rules were made which came into force in June, 1894. Apparently then there were already vessels in existence of just on 13,000 tons. The “Lucania” is given as an instance. And the view taken then was that the provision for 10,000 tons and upwards was sufficient, and nothing further was done. That continued for a very considerable time. These Rules were really re-enacted in 1902, and again the scale remained for 10,000 tons and upwards, and there is no further gradation. In 1909, 1910 and 1911 there were further alterations made in the Rules, but they did not effect this scale, I mean the Committee was sitting. There was specially, your Lordship may remember, a provision made with regard to motor lifeboats, but nothing was done which affected this scale until you get to the period of February, 1911. That, I think is the important period. In February, 1911, the question was undoubtedly raised, that it was desirable that there should be a further scale and better boat accommodation on the big vessels. Of course, meanwhile, there had been much larger vessels built.

Now, my Lord, just to get the dates correctly. On the 4th April, 1911, there was the reference to the Committee to deal with this matter. It is worth bearing in mind so as to follow what happened, that by the Merchant Shipping Act, 1906, the Merchant Shipping Advisory Committee was constituted under the Statute of 1906, and that since that, what has been done is that references in connection with life-saving appliances have been made to the Merchant Shipping Advisory Committee, which apparently appointed a subcommittee to deal with life-saving appliances. It is just necessary to bear in mind the

change which had been made from the earlier days when they had a special committee constituted under the Act for life-saving appliances.

On the 4th April, 1911, this reference was made, and your Lordship will remember what had happened before that, which I must state quite shortly; I will refer to the reports a little more in detail directly. By the 4th April there had been a considerable amount of discussion at the Board of Trade with reference to the number of boats to be provided. That led to some reports. Your Lordship will remember reports were asked for, and produced, and are contained in this bundle. There are the reports showing what each of the Surveyors who were asked to report thought was necessary, and the effect (I am only stating it for the moment quite broadly) was that they differed as to the number of boats that would be required and as to the carrying capacity, but they agreed that it would be necessary and desirable from their point of view to have a scale above the 10,000 tons and upwards; and that is the position. They thought there ought to be a scale above, but undoubtedly they differed very materially as to what the cubic capacity was that was to be provided for, as to the number of boats, and on various points.

Those reports were then sent in and the Board of Trade in consequence of that and seeing the difference of opinion there was between their advisers, referred it to the Committee by the letter of the 4th April, 1911. I will call your Lordship's attention a little more in detail to it in a minute; I just wanted to go through the dates so as to bring quite clearly before your Lordship how the matter stands.

That was reported upon on the 4th July, 1911, by the Committee, and the Committee did make a report which provided for an increased scale, but a scale very far short of sufficiency to provide for all the persons who were carried on a vessel like the "Titanic." Their report in substance came to this, that there should be a cubic capacity of boatage accommodation of 8,300 feet and that there should be a total exemption given from the necessity for providing additional craft if there was an efficient system of watertight bulkheads. This was the matter upon which your Lordship will remember Mr. Carlisle was examined, and explained what he meant by saying "it is quite true they provided for additional boat accommodation, but took it away again by the next paragraph." What he meant by that was that they provided the exemption.

Now, if your Lordship will look at the reference of the 4th of April before you get to the Committee stage, on page 22 of the report, your Lordship will see what they said to the Advisory Committee: "I am directed by the Board of Trade to enclose herewith, for the information of the Merchant Shipping Advisory Committee, a copy of a question asked in the House of Commons on the 15th of February and of the answer given by the President of the Board of Trade with reference to the Life-Saving Appliances Rules made under Section 427 of the Merchant Shipping Act, 1894. The Board are of opinion that the Table in the Appendix to the Rules should be extended upwards in the form indicated in the accompanying scale, so as to provide for vessels of tonnage up to 50,000 tons gross and upwards. It appears to the Board that the number of boats and the boat capacity need not necessarily increase in a regular proportion according to the increase in tonnage, and that due regard should be paid to what is reasonable and practicable in passenger steamers exceeding 10,000 tons. The attention of the Merchant Shipping Advisory Committee is invited to the Rule of the 19th April, 1910, as to the stowage of boats" - I do not think I need read that. Then "I am to state that the Board would be obliged if the Merchant

Shipping Advisory Committee would be so good as to suggest in what manner the scale (*see accompanying copy*) should be continued upwards, having due regard to the considerations indicated above. I am further to state that the Board would be glad to learn whether the Advisory Committee are of opinion that Rule 12 should or should not be revised so as to exempt altogether from the requirement of additional boats and/or rafts those vessels which are divided into efficient watertight compartments to the satisfaction of the Board of Trade. I am to add that in considering the questions dealt with in this letter, the constitution of the Merchant Shipping Advisory Committee should be identical with that of the Committee as recently constituted for the purpose of considering an amendment of the Life-saving Appliance Rules in connection with the Englehardt collapsible lifeboat.”

That led to the Report which I will call attention to at once at page 24.

*The Commissioner:* What is the date of this?

*The Attorney-General:* 4th of July, 1911.

*The Commissioner:* I do not see any date on it.

*The Attorney-General:* I do not see it, but I think I am right. *The*

*Commissioner:* I see the date is on the covering letter.

*The Attorney-General:* Yes, that is the 4th July. “In accordance with the decision of the Merchant Shipping Advisory Committee, at their meeting on Friday, the 28th April, we have given careful consideration to the letter of the 4th April from the Board of Trade, in which the Committee were asked to advise: (1) As to the manner in which the Table in the Appendix to the Life-Saving Appliances Rules should be extended so as to provide for vessels of tonnage up to 50,000 tons gross and upwards; and (2) as to whether Rule 12 should or should not be revised so as to exempt altogether from the requirement of additional boats and for rafts, those vessels which are divided into efficient watertight compartments to the satisfaction of the Board of Trade. In considering these questions, we have had specially in mind the fact that the number of passengers carried does not necessarily increase in proportion to the increase in the tonnage of the vessel. This is particularly true in the case of vessels exceeding 10,000 tons, a type of vessel which is practically only built to provide special accommodation for large numbers of first and second class passengers. Similarly there is no fixed relation between the tonnage of vessels and the deck space available for the carrying of lifeboats under davits. Increase in the length of a vessel is only one of the factors, and often not the most material factor contributing to the increase in its tonnage,

## **Page 939**

and it should also be remembered, in estimating the space available for the launching of lifeboats, that it is impossible to place davits forward of the bridge, and very undesirable to have them on the quarters of the vessel. We are strongly of opinion that every encouragement should be given to secure the provision of vessels which by their construction have been rendered as unsinkable as possible, and which are provided with efficient means for communicating with the shore or with other vessels in case of disaster. In view of these considerations we have agreed upon the following recommendations. (1) That it is questionable whether it is practicable to increase the

number of davits; (2) That any increase in the number of lifeboats to be carried can probably be best effected by providing for the launching of further boats from the existing davits; (3) That the table should be extended in the manner indicated below.” Then you will find for 45,000 tons and upwards, 16 boats minimum to be placed under davits; eight additional boats as a minimum to be readily available for attachment to davits, and the total minimum cubic contents of boats required by those two columns is 8,300 cubic feet.

*The Commissioner:* Accommodation for 830 people.

*The Attorney-General:* Yes. That was the view, one must bear in mind, of course, before such a disaster as the “Titanic” had happened that it was sufficient to provide accommodation for 830.

Then the Report proceeds: “It is further recommended that all passenger vessels of 10,000 tons gross tonnage and upwards should be required to be fitted with wireless telegraphy apparatus; (4) That the Rules should be amended so as to admit of decked lifeboats of an approved type being stowed on top of one another or under an open lifeboat, subject to suitable arrangements being made for launching promptly the boats so stowed; (5) That the additional boats and rafts required under the provisions of Division A, Class 1 (d) of the Life-Saving Appliances Rules shall be of at least such carrying capacity that they, and the boats required by columns 2 and 3 of the above Table, provide together three-fourths more than the minimum cubic contents required by column 4 of that Table; (6) That vessels divided into efficient watertight compartments to the satisfaction of the Board of Trade should (provided they are fitted with wireless telegraphy apparatus) be exempt from the requirements of additional boats and for rafts. The Committee suggest, in this connection, that the Board of Trade should review the requirements designed to attain the standard as to watertight compartments at present enforced by them under Rule 12, having regard to the developments of shipbuilding since the Report of the Committee on the spacing and construction of watertight bulkheads. We have also had before us the Board’s further letter of the 17th May, enquiring whether, in the opinion of the Advisory Committee, it would be advisable to prescribe a maximum depth for lifeboats as compared with their breadth, and if so, what that proportion should be. In connection with this letter, we have been supplied by the Board of Trade with Reports from their Principal Officers in Great Britain, giving the dimensions and cubic capacities of the various kinds of boats on five typical ships in each of eight ports. We recommend that the Board should be advised to alter the Life-Saving Appliances Rules so as to provide that, in future, the depth of lifeboats supplied to a British merchant vessel shall not exceed 44 percent of their breadth.”

Your Lordship sees the gentleman by whom this was signed. This was the Subcommittee appointed by the Merchant Shipping Advisory Committee created under the statute of the Merchant Shipping Act, 1906 - this was a Sub-committee for dealing with life-saving appliances. Without going through the names of which your Lordship has heard sufficiently for the moment, and some of them will be very well known to you, it is quite plain that this was as representative a committee as you could get. There were undoubtedly representatives of shipowners, of shipbuilders, and seamen, the Union of Seamen and Firemen, of Lloyd’s, and also of the Underwriters’ Association. So that one has got here really as good a committee as I think could have been selected for the

purpose of enquiring into what boat accommodation should be provided. But it cannot be said it is done in the interest of the shipowners - certainly not of the shipbuilders, but not of the shipowners - because you have got the seamen also represented and Lloyd's, who are vitally interested in a question of this character, and the Underwriters' Association. If your Lordship will look at page 21, you will see Sir Theodore Doxford was the representative of the Institution of Naval Architects. Your Lordship will see on page 21 who the gentlemen are who constituted the Committee. Mr. Carlisle, at the bottom of the page, was co-opted for the occasion as representing shipbuilders, and Mr. Royden as representing shipowners; he was the gentleman who represented the Cunard Company. Sir Theodore Doxford represented the Institution of Naval Architects, and the signatory, George N. Hampson, is Captain Hampson, of the Imperial Merchant Service Guild, representing the masters and officers, Mr. Rowe represented Lloyd's Register, Mr. Ogilvie represented the Institute of London Underwriters, Mr. Havelock Wilson represented the National Sailors' and Firemen's Union, and Mr. Spencer represented the Marine Engineers' Association, that is the engineer officers.

I think it must be apparent from that, that every interest that could really give any guidance upon it was represented. This report of the Sub-Committee was adopted by the Advisory Committee.

*The Commissioner:* When was it adopted by the Advisory Committee; was it adopted immediately afterwards?

*The Attorney-General:* It is in the very letter we were referring to of the 4th July, 1911, at the bottom of page 23, the one where your Lordship got the date from: "We have the honour to report that your letter of the 4th April, with reference to the minimum number of lifeboats to be carried on vessels of 10,000 tons gross tonnage and upwards, and your letter of 17th May on the subject of the depth of lifeboats, have been very carefully considered by the Merchant Shipping Advisory Committee, and that it was unanimously decided at a meeting held on the 29th ultimo to adopt the report of a Sub-Committee which was specially appointed to enquire into these questions. A copy of the report is accordingly forwarded herewith, and the Committee desire us to suggest for the consideration of the Board of Trade, that effect should be given to the recommendations contained in it."

*The Commissioner:* I see what happened. The Advisory Committee sent this copy of the Report of the Sub-Committee.

*The Attorney-General:* Yes, with a statement that they adopted it unanimously. *The Commissioner:* Adopted on the 29th June.

*The Attorney-General:* Yes. "A copy of the report is accordingly forwarded herewith and the Committee desire us to suggest, for the consideration of the Board of Trade, that effect should be given to the recommendations contained in it."

*The Commissioner:* We get then to the 4th July when the Advisory Committee forward to Sir Walter Howell this report of the Sub-Committee and stated that they approved of it.

*The Attorney-General:* Yes. Now one fact I think we must bear in mind in connection with the Committee that the division of opinion and the differences of opinion that had taken place between the various gentlemen, who had been asked to report in answer to a circular letter which was sent out by the Board of Trade, and of which you have the

details, was not stated to the Committee. There was a suggestion that it was, but it clearly was not.

*The Commissioner:* It was thought better not.

*The Attorney-General:* Yes. I submit that was the right course for them to take. The Advisory Committee were going to deal with this matter quite apart from any view which the Board of Trade officials might take, and of course the Board of Trade would then have to consider it after they

## **Page 940**

got the report of the Advisory Committee. Then after that came back, a series of experiments were made, the view taken about this matter by the Board of Trade being that before they could prescribe a scale which was to take effect, and which could take effect as regards all ships in this country, they had to make quite sure not only of the scale which they intended to recommend, but also issue at the same time such new Rules as they intended to make with regard to the construction of boats.

*The Commissioner:* Of boats?

*The Attorney-General:* Yes.

*The Commissioner:* You mean lifeboats?

*The Attorney-General:* Yes. That had formed the subject of a good deal of discussion, as your Lordship has seen from the report of the Committee. It formed the subject of much discussion, and also some experiments, and it was one of the matters which led up to the sending the question of boating accommodation to the Committee in April, 1911. It is one of the matters dealt with, and one of the matters reported upon.

Captain Young deals with this at page 643. Sir Walter Howell dealt with it, but I am not going to call your Lordship's attention to his evidence, because it really does not assist very much. So far as he was concerned, what he did was to state what was done by Captain Young, and what was done by the Board of Trade, but Captain Young himself has been called, and has told you what he was doing, and, therefore, it is best to go direct to his evidence.

At page 643, Question 23290, he goes into detail as to what was done. His explanation of what happened is worth referring to before we deal with the documents upon which his statement is based, so that your Lordship may see what his explanation is. At Question 23290, Mr. Scanlan says: "When did you come to this conclusion with reference to these big boats." That is, of course, dealing with increased accommodation. - (A.) "Some months back -"

*The Commissioner:* With reference to these big boats like the "Titanic" you mean?

*The Attorney-General:* Yes. When he mentions about big boats, my friend is speaking of big vessels like the "Titanic."

*The Commissioner:* I do not find here the expression "big boats" at all in the question which you are reading.

*The Attorney-General:* It is there, I think.

*The Commissioner:* "When did you come to this conclusion with reference to the boatage for the 'Titanic'? - (A.) I did not specially consider the 'Titanic' before the disaster."

*The Attorney-General:* Will your Lordship read your question which follows it?

*The Commissioner:* Yes, I beg your pardon.

*The Attorney-General:* "(*The Commissioner.*) You do not follow what Mr. Scanlan means. When did you come to this conclusion with reference to these big boats? - (A.) Some months back, my Lord; in fact, when the Report of the Advisory Committee was presented, and I went into the matter, I had this in my mind, but it was complicated by a matter which was of a very serious import, and upon that matter hangs the whole of the so-called delay, which has taken place between the 4th July and the 4th April." That is the 4th April, 1912. "The import of that was I had several matters to consider. In the course of my experience I had realised that the boats that were supplied to ships as lifeboats had been steadily deteriorating in form. I may say that is my opinion. And it appeared to me not only undesirable, but it would have been wrong, in my opinion, with those ideas, to advocate a very large extension of the boat scale; in other words, piling up a large number of boats on to a ship with the knowledge that I had in my mind at the time that those boats were not well adapted for that purpose. In other words, I was impressed with the view that in anything but the calmest weather those boats would not be able to carry in safety the number of people for which they measured; and, therefore, it was" - it is according to the report "unnecessary" but that is clearly wrong - and, therefore, it was necessary under those circumstances to associate with the Report of the Advisory Committee this question of the proper form of the ship's lifeboats. That is the object that I had in view. That is the sole cause of the delay which has been attributed to the Board of Trade in this matter."

Then your Lordship puts to him: "Do you wish us to understand that the boats of the 'Titanic' were not in a proper form? - (A.) I am not alluding to the 'Titanic,' my Lord; I am alluding to the general question of the boats. I believe, from what I have seen of the boats that have been turned out from the yard of Harland and Wolff, that those boats are of the proper form. They are of very good form. But there were many ships' boats turned out, and still are, of a form which is not the best form that can be used on board ships. I may as well say while I am on this subject that the Marine Department of the Board of Trade naturally would not take my assertion simply as an assertion, but they felt it was necessary that that assertion should be verified, and, therefore, they issued instructions for boats to be experimented with around the coast with a complement of persons for which the boats measured. I have no hesitation in saying that the results of those investigations and experiments have fully justified the action which I took on receipt of the Advisory Committee's Report."

May I pause there for a moment just to say what it is he is explaining there. His view, rightly or wrongly was this, that before they issued these Instructions or Rules for the boat scale, they ought to take care also to have quite clear in their minds what construction of boat it was that they were going to require or what special provisions they were going to make and the ratio of depth to breadth. That was the point he had in mind because his view was that in order to make up the cubic capacity to what was required the boats were made far deeper than they ought to be, with the consequence that they would

not be able to carry the number of persons for whom really boats of that cubic capacity were intended by the Board of Trade. That was his point. He took the view that in those circumstances what he had to do was to get quite clear what kind of boat they were going to prescribe, and what dimensions, so that they should not first of all issue regulations which would affect the mercantile marine as to the number of boats that were to be carried, and allow them to get boats of some particular construction and of dimensions then in force, when perhaps six or nine or twelve months later they might issue further regulations, saying that all boats must have a certain ration [ratio] of depth to breadth. That is what he has in mind. Whether it is right or wrong, of course, your Lordship will consider, but that is what he means by it, and he says he thought it was important that the Board of Trade in making the demands which it was going to make upon the mercantile marine, upon these passenger and emigrant vessels, should definitely determine for itself, not only the number of boats that were to be carried, but also the dimensions which they were going to require in respect of the boats to be supplied; so that one set of Rules could be provided dealing with the whole thing.

One has to bear in mind, I think, in this connection, I submit to your Lordship, that at this time, and up to this time, from the figures which you have already got, the loss of life on this track was excessively small. There is no record of any such disaster as this, I mean no record which necessitated a very large number of boats to start with, and again, a record of carrying boats on passenger and emigrant vessels, equipped as they were both with watertight compartments and with boats which had carried passengers in safety during the last 20 years. There was ever, as your Lordship will remember from the figures provided to your Lordship, a decreasing percentage of loss of life compared with the number of passengers carried during the whole of those 20 years. I called your Lordship's particular attention to it at the time I handed those figures in.

## **Page 941**

Now it is a little difficult - I am only making this observation in passing to your Lordship, I am sure your Lordship will bear it in mind when you come to consider what Captain Young meant, and whether he was right or wrong in the view he took - it is a little difficult now, after the event and after the loss of the "Titanic," to appreciate the position that he was taking at that time. Of course, when you have had a disaster such as this, I quite understand that it necessitates immediately that something should be done and done as speedily as possible; but you cannot in these matters make a Rule without taking into account all the various elements which naturally must affect the mercantile marine when you are going to make it.

I do not mean by that that you are to consider the cost, and say if it is too expensive, or because it involves an extra cost, therefore, the shipowner should not be called upon to do it when he is carrying passengers and emigrants, but what I mean is it is important that a public department should not harass a great industry like the shipping industry by first making one demand upon it and then making another which may mean that boats which they have provided in accordance with the Rules, we will say, in 1912, may be useless in consequence of a new Rule in 1913. That is evidently what Captain Young means by the explanation which he has given.

Then, my Lord, he goes on to tell you of the nature of the experiments and by whom they were made. They were made in the main in London and in Liverpool, and in Glasgow.

*The Commissioner:* Where is this?

*The Attorney-General:* Your Lordship will find that at Question 23295.

*The Commissioner:* Yes, I have it. They were, I suppose, experiments?

*The Attorney-General:* Yes, with boats. I will give your Lordship the dates first: February, 1911. There were some experiments then which led to the question formulated to the Committee in April, 1911. That of course is before the reference to the Committee. He says: "The London Principal Officer forwarded on April 19th" - I am reading about ten lines down in that question - "A report respecting defective boats on certain vessels after only a few months' use, and it was mentioned that there was a tendency to build boats with too great a depth in order to increase the cubic capacity. The Board thereupon wrote to the Advisory Committee on 17th May, asking whether it would be advisable to prescribe a maximum depth for boats, compared with their breadth, and if so, what that proportion should be.' I may state here this is the preliminary investigation which preceded the experiments which were inaugurated after my assertions." Then he goes on to deal with what happened on the 19th. "On the 19th May the Advisory Committee applied, semi-officially, for particulars. . . The Advisory Committee replied to the Board on the various matters under consideration on the 4th of July." - that is the Report of the Committee - "and as regards the proportions of ship's boats, recommended the alteration of the life-saving appliances Rules to provide that in future the depth of lifeboats should not exceed 44 percent of their breadth.' We had this the other day my Lord. 'This recommendation was submitted to the Principal Ship Surveyor on the 8th July.'"

Now your Lordship will see what we are dealing with in the Report. Up to now it has been the investigation before the Report. "The recommendation was submitted to the Principal Ship Surveyor on the 8th July, and on the 11th July he suggested that Principal Officers might test different types of boats with a full complement of persons and report the result of the tests with reference to height of gunwale, stability, and the use of the oars.' This second series of experiments was in consequence of the assertions which I have referred to. 'This suggestion was approved on the 15th July, requesting that practical tests should be made by officers at London, Liverpool and Glasgow on the 21st July, suggesting that practical tests should be made with a view to determining - (a) a standard type of boat, (b) a maximum depth, (c) a maximum proportion of depth to breadth, and that full details should be given, with drawings of the best and worst forms tested, and notes on the height of gunwales, use of the oars, and the question of stability. The first report was received from the London Principal Officers on August 25th, and related to two boats that had been tested." I will not trouble your Lordship with reading the result of the test. He gives the particulars in detail: (a) That is London, then (b), about 15 lines down: "A further Report from the London Principal Officer was received on September 19th and gave results of tests as follows." Those were tests which were made by Captain Clarke at Southampton. Various examinations of boats which he had made and which had continued apparently up to September 15th; and again on September 16th Mr. Penney of London made a suggestion that the divisor should be 12 instead of 10 or 8. That exhausts London. The last of the Reports is September 16th.

So that what we have got is that after the report of the Advisory Committee of the 4th July, which, at any rate, made some recommendations with reference to the questions submitted to them about the construction of the boats, and the dimensions of the boats that were hereafter to be used, according to Board of Trade requirements, the London Principal Surveyor made his experiments by September 15th. From Glasgow, on November 3rd, the report was received. It is at the bottom of page 644. "On November 3rd the Glasgow Principal Officer forwarded reports of tests, as follows." He gives a series of reports which had been made in October and the beginning of November, and then in the right-hand column, about five lines down, there is the report from the Liverpool Principal Officer, dated 11th November; it was stated to have been delayed owing to the recent labour troubles. "The Principal Officer forwarded details by Mr. Jenkins, the Senior Ship Surveyor, of eight tests that he had made." Then he goes into the particulars of those tests. Then, if your Lordship will look eight lines further down. "A further report was received from the Liverpool Principal Officer, dated November 15th, with remarks by two nautical Surveyors, Messrs. Rice and Jenkins. They recommended a minimum depth of 3 feet 4 inches, or breadth by 4, and a breadth of 3.5. This was a mere matter of discussion, which we went into, and did not quite agree with." Then he goes on: "A summary of all these reports was drawn up and completed on January 4th, 1912, and the Principal Ship Surveyor was asked for his observations on the whole question."

Now may I pause there for a minute and see where we are at this date. From that time, that is from July, 1911, until this period of January 4th, 1912, the experiments had been made of which the last report comes in on November 15th, 1911. They are all considered, and the summary of them is drawn up and then presented to the Principal Ship Surveyor, who is asked for his observations upon it. "The Principal Ship Surveyor was away ill at this time, and the matter was taken up by Mr. Daniel, an officer in his department acting as his deputy, who reviewed the reports of the Surveyors and their suggestions. He replied on the 27th January."

Then there is the substance of his report, "the question of the form of boat is important. Boats are generally built 'to the eye,' with simply a midship mould. It has been found that boats of the same dimensions differ considerably in actual carrying capacity. Mr. Daniel, therefore, suggested the following method: A boat should not be regarded as capable of accommodating the number of persons for which it measures according to the Rules unless it has half an inch of sheer per foot of length, and unless the half-girth of midships is at least 90 percent of the sum of the depth and half-breadth." I need not trouble your Lordship with the details of these dimensions which they were considering there, "a draft amendment of the General Rules on these lines was prepared on 1st February" - that is the draft amendment of the Rules which were to carry out the report of the

## **Page 942**

Committee which had been made in July, 1911 "and it was decided to submit the matter again to the Advisory Committee. Memoranda on other subjects were at the same time being prepared, and eventually the whole of the subjects that had been under consideration were, on the decision of Sir Walter Howell (4th April) embodied in one letter, which was addressed to the Committee on 16th April." Now, my Lord, the effect

of that is to show that the reason of the delay in a Rule being formulated is that they were waiting, first of all, for experiments to be made which had been delayed, certainly partly, in Liverpool, for the reason given there, owing to labour trouble, and then eventually all these matters had to be considered by the Principal Ship Surveyor, and the draft Rules are formulated on 1st February, 1912.

*The Commissioner:* There is this memorandum at page 28.

*The Attorney-General:* Yes, that is right, my Lord. Those are the draft Rules.

*The Commissioner:* Then, on the 4th April, what happened?

*The Attorney-General:* On the 4th April, after consideration of the various matters pointed out to Captain Young, the order is given that the letter shall be written, and, of course, it is an unfortunate thing that that letter was not written immediately, but your Lordship has had all the evidence before you about that, and it is not open to any doubt, that the order was given on the 4th April, although, in fact, the letter was not sent out until the 16th.

*The Commissioner:* I am quite satisfied with the explanation given about it.

*The Attorney-General:* Yes, it is quite clear. Your Lordship saw the original documents which were produced, and, fortunately, one is able to remove any misapprehension with regard to that, because quite naturally it might have been thought that that was only sent out in consequence of what had happened. The Easter holiday had intervened, and apparently the letter was not sent immediately.

Now, my Lord, that brought us to the 16th April, when the letter was sent, to which attention has been called, and which undoubtedly is an important letter.

*The Commissioner:* Yes, but you have now got to a date after the "Titanic" disaster. *The Attorney-General:* Yes.

*The Commissioner:* Has anything been done up to now?

*The Attorney-General:* No. It is quite right to say nothing has been done; I mean no Rule has been made at present.

*The Commissioner:* Are you going to wait for the Report of the other Committee? *The Attorney-General:* I am going to tell your Lordship what happened with regard to it.

The vessels first of all have agreed and the passenger-carrying vessels of 15,000 tons and upwards have agreed now, as was stated by the President and also was stated in evidence here, to place a sufficient number of boats on board to carry the number of passengers on the vessel. That is the position. Your Lordship heard what happened with regard to the "Olympic." I do not know whether your Lordship saw it when you were there, but we did certainly and a great number of boats were on the deck, principally Berthon boats that had been provided in order to meet what was the very natural anxiety of the public at the time, after the "Titanic" disaster.

*The Commissioner:* What I asked was this. Are you going to wait for the Report of the other Committee?

*The Attorney-General:* That must depend, my Lord. Of course, the Board of Trade has not known up to now whether your Lordship is going to report or not upon it. I mean to say whether, as a result of this Report they may be going to alter the Rules. I do not know, and it is not for me to say, but I should very much doubt whether those Rules would be sufficient now.

*The Commissioner:* Have you read them?

*The Attorney-General:* Yes, I have.

*The Commissioner:* I have not. I know nothing about them.

*The Attorney-General:* I have read them, and I have read the scale.

*The Commissioner:* I do not know what it is that you expect me to report which would affect this question. What is it that you expect me to do that will affect this question of the Rules?

*The Attorney-General:* Of course, your Lordship may come to the conclusion that you will not say anything about the number of boats that ought to be carried, but I rather gathered from what your Lordship said at an early stage that you did not intend to say what number of boats should be carried, but nevertheless your Lordship may come to the conclusion that a greater number of boats should be carried, not only than were in fact carried, but that it was suggested should be carried in the recommendations of the Committee, and your Lordship sees from any point of view the result of all this evidence must throw a considerable amount of light upon it.

*The Commissioner:* People outside say the Board of Trade are always waiting for somebody else to do something for them.

*The Attorney-General:* Of course, the Board of Trade may make a Rule at once. It ought not to make a Rule at once, but then the difficulty of it is, I should have thought, that in a panic it ought not to do it.

*The Commissioner:* Clearly not.

*The Attorney-General:* And it ought not to make a Rule which is going to affect the whole of the shipping trade without the fullest consideration; and further, it ought not to make a Rule of this character without taking the advice of experts, and therefore it must refer it to a Committee. I mean it ought not to depend upon its own officials, and at least Parliament did not think so, because that is why it appointed the Committee, but whether Parliament is right or not I am not going to say.

*The Commissioner:* You must act at the end of it, of course.

*The Attorney-General:* You must act, certainly.

*The Commissioner:* You must act at some time.

*The Attorney-General:* Certainly; but you must get advice before you act; and as in this particular case, as your Lordship will remember, what happened was that Rules were formulated, and of course if it had not been for the disaster which has taken place, the Rules, no doubt, would have been in force.

*The Commissioner:* They first of all formulated Rules between 1894 and 1911. First of all in 1911 they came to the conclusion that some change in their old Rules was desirable.

*The Attorney-General:* Yes.

*The Commissioner:* Then they communicated with four of their best men, and those four gentlemen in course of time bring forward new Rules, different of course, but they all agree in one matter, that an increase in the number of boats is desirable, and after those Reports are made, without sending those Reports to the Advisory Committee, they write to the Advisory Committee, and the Advisory Committee having considered the matter, refer it to a sub-committee. That sub-committee then considers the question that is referred to them and reports to the Advisory Committee, and that Report is sent on to the Board of Trade, and then the Board of Trade tell them that they cannot act, we must have

a number of experiments, and then there are a number of experiments; then after the experiments are made, after a considerable interval, comes a letter. But it seems to me very strange that nothing was done in the interval, and nothing has been done even yet.

*The Attorney-General:* Yes; but your Lordship will remember that the Committee only makes recommendations with regard to depth and breadth. They do not formulate Rules.

*The Commissioner:* No, not at all. It is no part of their duty to do so.

*The Attorney-General:* But then the Board of Trade formulates the Rules which provide in detail for the dimensions of the boats which are to be constructed. Those are the draft Rules which are at pages 28 and 29, and which go into detail,

## Page 943

and which, of course, can only be done by the Board of Trade, and as they thought ought only to be done by them after they had had experiments made by their Principal Officers in Liverpool, Glasgow and London. When they got those reports then, did they formulate the Rules? Then having got those Rules, they tell the Committee what they are going to do.

*The Commissioner:* How do you explain the delay between 1890 and 1911?

*The Attorney-General:* 1894 your Lordship means.

*The Commissioner:* Yes, 1894 and 1911. During the whole of that time apparently ships were increasing in size; they were carrying more and more people?

*The Attorney-General:* Yes; but the view taken always was that the number of boats was sufficient as in the first instance, when the Rule was first formulated.

*The Commissioner:* But the question is, was that a reasonable view to take. It evidently was not the right view; and the shipowners themselves recognised that it was not the right view, because they themselves increased them far beyond the statutory requirements.

*The Attorney-General:* I quite agree; but it was the view taken as the result of the Committee which sat in those days.

*The Commissioner:* Which days?

*The Attorney-General:* 1890 and 1894, my Lord.

*The Commissioner:* Yes, but then things change.

*The Attorney-General:* Yes, that is quite right, my Lord; but at the same time, since 1894, when the Rules were formulated for 10,000 tons and upwards, you have got vessels much above that tonnage.

*The Commissioner:* The biggest boat in those days, if I recollect rightly, did not exceed 13,000 tons.

*The Attorney-General:* Not quite 13,000. The "Lucania" was one. And then the provision was made, of course, that anything over and above 10,000 tons would have to carry this particular number of boats, and there it was left, and nothing further was done. The view seems to have been that as we were proceeding, and vessels were being constructed which were better equipped as regards watertight compartments, the larger vessels that were being constructed had the best provision for watertight compartments, and that, therefore, they were as unsinkable as it was possible to make vessels according to the view that was held up to that time, and it appears that with the larger vessels carrying

passengers and emigrants, it was thought that the vessels were practically unsinkable. That is the reason, as far as I am able to make out.

*The Commissioner:* The reason for the long delay between 1894 and 1911 is stated in the evidence of Sir Alfred Chalmers at page 630. Mr. Aspinall was examining the witness and it begins thus: "I considered the matter very closely from time to time. I first of all considered the record of the trade - that is to say, the record of the casualties - and to see what immunity from loss there was. I found it was the safest mode of travel in the world, and I thought it was neither right nor the duty of a State department to impose regulations upon that mode of travel as long as the record was a clean one." I do not read the whole of it, but it goes on much further; however, that reason was as forcible at any time before the disaster to the "Titanic" as during those years that he is talking about. I do not see why, unless the "Titanic" disaster had happened they should have altered the watertight compartments according to that view. But there is this to be said, Mr. Attorney - I do not know whether you will agree with me - that if they had made Rules, the Rules would not in all probability have provided for a larger number of boats than there were in fact carried on the "Titanic." That is so, is it not? *The Attorney-General:* Oh, yes.

*The Commissioner:* So that it may be said that the absence of the Rules in no way aggravated the calamity that happened. At the same time the delay that took place does require some explanation. Perhaps it is in that evidence of Sir Alfred Chalmers. It strikes the imagination at once! Rules made in 1894, laying down how many boats should be carried by ships up to 10,000 tons and upwards; nothing done until the "Titanic" disaster, and nothing done even now.

*The Attorney-General:* Well, I do not think there is any complaint to be made about what has happened since April.

*The Commissioner:* Sir Alfred Chalmers was rather emphatic about it.

*The Attorney-General:* I know. He took a very strong view.

*The Commissioner:* He did, and Captain Young said he did not agree.

*The Attorney-General:* Quite, and that was the position. Sir Alfred Chalmers was of opinion that it was unnecessary, and he adhered to that view when he was in the Box; and at any rate that was the opinion that he had formed.

*The Commissioner:* It is not perhaps quite fair to ask you the question, and, therefore, I cannot expect you to answer it, but do you think that there was no delay?

*The Attorney-General:* Delay there certainly was.

*The Commissioner:* Unnecessary delay.

*The Attorney-General:* During what period my Lord? If you are asking during the period from 1894 to 1911, the only answer I think one can make - you may accept it or not, you may think that it was wrong on somebody's part or not, I do not know, - but the answer is made, and the view that was taken about it was that it was not necessary to provide for it. That was the reason apparently why they had not provided for it right away through.

*The Commissioner:* If it was not necessary then why is it considered necessary now?

*The Attorney-General:* There is a little more light thrown upon it now. It never was thought that you would have to take off the whole of your passengers by your boats and of course it is very easy to make reflections upon what the Board of Trade was doing with regard to this, but the same view was taken abroad.

*The Commissioner:* What occurred to me was that the Board of Trade may be said to have been much too cautious. To be very cautious is a very good thing, but you can be too cautious.

*The Attorney-General:* Yes, but what I was remarking upon was that even in Germany, with regard to which your Lordship, of course, asked questions as to what they had done, and where they did have a scale over and above the scale that we have here, still their scale did not provide for everybody who was to be carried on board the vessel.

*The Commissioner:* I quite understand that.

*The Attorney-General:* Of course, I agree. I pointed out in the course of the case that it was a bigger scale, undoubtedly, than the one that would be required here.

*The Commissioner:* Now you cannot finish today?

*The Attorney-General:* I am afraid not, my Lord.

*The Commissioner:* Obviously, you cannot. When shall we see you again?

*The Attorney-General:* On Wednesday morning, my Lord.

*The Commissioner:* Very well. And you will promise, if I do not interrupt you, to finish on Wednesday?

*The Attorney-General:* I do not like to make a promise with that condition, my Lord, because, if I may say so, I welcome interruptions of all kinds, but I will promise to finish, notwithstanding your Lordship's interruptions, if I may put it in that way.

*(Adjourned to Wednesday next at 10.30 o'clock.)*

WRECK COMMISSIONER'S COURT,  
SCOTTISH HALL,

BUCKINGHAM GATE,  
*Wednesday, 3rd July, 1912.*

## PROCEEDINGS

THE RIGHT HON. LORD MERSEY,  
*Wreck Commissioner of the United Kingdom,*

WITH

REAR ADMIRAL THE HON. S. A. GOUGH-CALTHORPE, C.V.O., R.N.,  
CAPTAIN A. W. CLARKE,  
COMMANDER F. C. A. LYON, R.N.R.,  
PROFESSOR J. H. BILES, LL.D., D.Sc., MR.  
E. C. CHASTON, R.N.R.  
*Acting as Assessors.*

ON A FORMAL INVESTIGATION

ORDERED BY THE BOARD OF TRADE INTO THE

# LOSS OF THE S. S. "TITANIC."

## THIRTY-SIXTH DAY.

THE RIGHT HON. SIR RUFUS ISAACS, K.C., M.P. (Attorney-General), SIR JOHN SIMON, K.C., M.P. (Solicitor-General), MR. BUTLER ASPINALL, K.C., MR. S.A.T. ROWLATT and MR. RAYMOND ASQUITH (instructed by Sir R. Ellis Cunliffe, Solicitor to the Board of Trade) appeared as Counsel on behalf of the Board of Trade.

THE RIGHT HON. SIR ROBERT FINLAY, K.C., M.P., MR. F. LAING, K.C., MR. MAURICE HILL, K.C., and MR. NORMAN RAEBURN (instructed by Messrs. Hill, Dickinson and Co.) appeared as Counsel on behalf of the White Star Line.

MR. THOMAS SCANLAN, M.P. (instructed by Mr. Smith, Solicitor), appeared as Counsel on behalf of the National Sailors' and Firemen's Union of Great Britain and Ireland, and of the personal representatives of several deceased members of the crew and of survivors who were members of the Union. (Admitted on application.)

MR. BOTTERELL (instructed by Messrs. Botterell and Roche) appeared on behalf of the Chamber of Shipping of the United Kingdom. (Admitted on application.)

MR. THOMAS LEWIS appeared on behalf of the British Seafarers' Union. (Admitted on application.)

MR. L. S. HOLMES (of Messrs. Miller, Taylor and Holmes of Liverpool) appeared on behalf of the Imperial Merchant Service Guild. (Admitted on application.)

MR. COTTER appeared on behalf of the National Union of Stewards. (Admitted on application.)

MR. HAMAR GREENWOOD, M.P. (instructed by Messrs. Pritchard and Sons), watched proceedings on behalf of the Allan Line Steamship Company; and (instructed by Messrs. William A. Crump and Son) also on behalf of the Canadian Pacific Railway Company.

MR. ROCHE (instructed by Messrs. Charles G. Bradshaw and Waterson) appeared on behalf of the Marine Engineers' Association. (Admitted on application.)

MR. A. CLEMENT EDWARDS, M.P. (instructed by Messrs. Helder Roberts and Co.), appeared as Counsel on behalf of the Dock, Wharf, Riverside and General Workers' Union of Great Britain and Ireland. (Admitted on application.)

MR. W. D. HARBINSON (instructed by Mr. Farrell) appeared on behalf of the third class passengers. (Admitted on application.)

MR. C. ROBERTSON DUNLOP watched the proceedings on behalf of the owners and officers of the s.s. "Californian" (Leyland Line). (Admitted on application.)

Mr. H. E. DUKE, K.C., M.P., and MR. VAUGHAN WILLIAMS (instructed by Messrs. A. F. and R. W. Tweedie) appeared as Counsel on behalf of Sir Cosmo and Lady Duff Gordon. (Admitted on application.)

MR. F. LAING, K.C., and MR. ALFRED BUCKNILL appeared on behalf of Messrs. Harland and Wolff. (Admitted on application.)

### Page 946

*The Attorney-General:* My Lord, when we adjourned on Monday I was dealing with the steps which have been taken by the Board of Trade, and more particularly with the question which your Lordship put to me about what had been done by the Board of Trade. In this Enquiry no evidence has been given, certainly not in detail, of what had happened since the 15th April, when the news came. I think I ought to tell your Lordship, particularly as we are very anxious that you should understand this, that the only reason why no Rules have been published, at least laid before the House of Commons, is that in consequence of the disaster and this Enquiry it was thought that this was a matter which they ought not to publish Rules upon until they had your Lordship's report, not only out of respect to the Court but also in the desire that any Rules that they might make should

embody any recommendations which have been made by this Court, and that they should put any suggestions which they could adopt into the Rules. It was thought right, and I do venture respectfully to submit that that was the proper view for the Board of Trade to have taken, that they should take no steps until after the Report had been made. But in order to secure the safety of the public as far as possible, what was done was, the owners of the various lines were seen or communicated with, and as a result the owners of all passenger vessels of over 1,500 tons, not 15,000 tons, as unfortunately appears in the Shorthand Note twice - I make that correction because it is very necessary - but all over 1,500 tons, have agreed at an early date, in fact, almost immediately after the disaster happened, to put boats on their vessels sufficient to accommodate all those on board. I refer to that for this reason; it indicates to you that the Board of Trade did secure the best boat accommodation immediately the disaster happened. Whether ships will in future have to provide accommodation for all those they carry is a question which is still, I think, open to some discussion, and upon which I do not venture to say anything, except that we shall follow out any recommendation that comes either from your Lordship or from the Committee which is dealing with the question of life-saving appliances. That is how the matter stands. I was anxious your Lordship should understand it exactly, so that it might not be thought that the Board of Trade had done nothing since the 15th April, whatever may be said in criticism of them before.

I ought perhaps, also to tell your Lordship that an International Conference is proposed to deal with life-saving appliances at sea, including, of course, boat accommodation. So that we may get some Regulations which will apply to vessels of all countries. As your Lordship will appreciate, it is of the utmost importance, particularly where there is competition; and keen competition, that there shall be an agreement between the countries if possible.

*The Commissioner:* It is of the utmost importance that there should be an agreement between the different countries.

*The Attorney-General:* Yes, and that is what the Board of Trade is now striving to obtain.

I have been carefully through all the evidence, including the evidence that has been given in answer to a number of suggestions which were made during the course of the Enquiry, and of which I make no complaint - on the contrary, I am very glad that we had the opportunity of meeting any such suggestions - suggestions that were made that the Board of Trade had in some way failed to take proper precautions either with regard to bulkheads or the loadline point, which your Lordship will remember, and with regard to some other matters with which they are charged. What I want to say with regard to it is this. I am not going to deal with them in detail, because I think it must be apparent - I am sure it is to your Lordship - that, as the result of all the investigation, no such charge can be made and no such charge is made, as I understand it, against the Board of Trade in respect of any of those matters. What has been said and what has been argued before you is that they ought to have taken precautions to provide a larger boat accommodation before this disaster happened; and that is the point, of course, to which I directed my observations last Monday. The only reason why I am making these remarks is that I do not want to take up your time unnecessarily in going through evidence dealing with various suggestions made throughout the case, and which have really eventually come to

nothing. Unless there is something in your Lordship's mind that you would like me to deal with, I do not propose to deal with them.

*The Commissioner:* I had better tell you my view at present about this matter.

*The Attorney-General:* If you please.

*The Commissioner:* I do not mean to bind my self, but I mention it in the presence of the gentlemen who appear, as it were, against the Board of Trade.

*The Attorney-General:* Yes.

*The Commissioner:* My own view, at present, is that the only complaint against the Board of Trade which has any substance is the complaint about the delay in altering the Rules of 1894 with reference to boats. I have not realised that there is any other complaint that the evidence really supports.

*The Attorney-General:* If I may respectfully say so, that is the view I have formed after reading the evidence and taking into account the suggestions that have been made. I would just like to make some observations in answer to the complaint that has been made, or to the criticism that has been directed, to the Board of Trade, for not having increased the scale; that is to say, for not having made a scale with a higher gradation for vessels of over 10,000 tons, which is the substance of the complaint, as your Lordship says. I dealt with that to some extent last Monday, but I would draw your attention to this. The Board of Trade from 1894 onwards during the years which elapsed, the 20 years up to 1911, had, so far as practical experience was able to guide them, no reason to doubt that the precautions that they were providing - *The Commissioner:* That who were providing?

*The Attorney-General:* The precautions that the Board of Trade were providing under their Regulations, and that the scale which was in force under their Regulations were sufficient, because your Lordship will have appreciated this - take, for example, the last ten years from 1902 to 1911 - that during those ten years there had been over 6,000,000 passengers carried, and a large number of them, of course, carried in larger vessels than had existed at any rate before 1904. 1903-4 marks the stage at which vessels of much larger tonnage were constructed.

*The Commissioner:* When you say carried, are you confining your observations to the Atlantic trade?

*The Attorney-General:* Yes.

*The Commissioner:* I thought so, because there must have been an enormous number, a much larger number, carried over the surface of the globe.

*The Attorney-General:* Yes.

*The Commissioner:* To which these Rules apply.

*The Attorney-General:* I quite appreciate that.

*The Commissioner:* These Rules are not confined to the Atlantic?

*The Attorney-General:* No, but we have only the figures of the North Atlantic. The only figures we have are for the voyages on this route; that is why I am referring to them. They are very, very significant I submit. During those 10 years, of the 6,000,000 passengers carried, more than half of them (we do not exactly know the number or the proportion) were carried in vessels which belonged to the United Kingdom.

*The Commissioner:* What do you mean by that?

*The Attorney-General:* All the vessels that were carrying the passengers, of course, were not British vessels; the 6,000,000 includes all the passengers carried to and fro. Your Lordship asked the question as to whether it was possible to separate the number of passengers into those carried in British vessels and those carried in other vessels,

**Page 947**

but the figures are not available for doing that, and we have not been able to get them, and the result is we have to take it in this way, that over 6,000,000 passengers were carried during those ten years, that is the last ten years, and that more than half of them, and considerably more than half, were carried in British vessels. We do know the number of lives lost in British vessels, and that is nine during those ten years. That is the point I wanted to bring to your Lordship's attention.

That really means this, whether they were right or wrong in the view that they took, that it was much more important that they should have a construction of vessels - I think I am entitled to say the vessels themselves forming lifeboats - that it was much more important that they should have vessels constructed with efficient watertight compartments (although I agree they have no power to enforce it; I am going to call attention to that in a moment) than that they should have a larger provision of boats. Again, the view which they took, whether right or wrong - certainly the view that Sir Alfred Chalmers took, who was at the head for so many years - was that it was not possible to have a larger number of boats without interfering with the vessel, without hampering her decks, and without, at any rate, providing boats which he thought it would be very difficult to launch. Whether he was right or wrong in that, certainly the result is this, that very few lives were lost, and the importance of it is, that fewer lives were lost during that ten years than in the preceding ten years. In the preceding ten years, your Lordship will remember, the figures that were given corresponding to the figures that I gave just now, were three and a half millions, and during those ten years the total number of passengers lost was 73.

*The Commissioner:* Those figures are all set out in Sir Robert Finlay's speech. *The Attorney-General:* Yes, they are taken from the evidence.

*The Commissioner:* He used them for the purpose of showing how negatively good the system of steaming ahead without taking into account the possibility of there being ice on the track had been.

*The Attorney-General:* And there is, of course, this observation to be made with regard to both arguments, with regard to the purpose for which he used them, and the purpose for which I am using them, that these arguments stand very well until you get a disaster of this character. Then, no doubt, you have got totally different considerations to apply, and the only use I am intending to make of it is not to say it is unnecessary to provide for their boat accommodation in the future, but I am putting it before you for your Lordship's consideration, as, at least, evidence which justified the Board of Trade, if it had been right in its opinion upon the material which it hitherto had had, in coming to the conclusion that further boat accommodation was not necessary in vessels of 10,000 tons. That is all I want to say about it.

*The Commissioner:* I think you are also entitled to say this, that they knew that, Rules or no Rules, these big liners were provided with boats far in excess of the requirements of their own Rules.

*The Attorney-General:* Yes. Wherever you are dealing with these big liners undoubtedly they did, as is shown from the Tables and considerably in excess. Undoubtedly these vessels did, trading as they were, and carrying as did the "Olympic," for example, a boat accommodation, which, I think I am right in saying was equivalent to 53 percent of the number of persons carried on the ship. She carried boat accommodation for 1,178 persons, and according to the Board of Trade Regulations she would have had to carry accommodation for 962, or 9,625 cubic feet, as against 11,325 cubic feet which she did carry.

There is this observation to be made, which I am sure is present to your Lordship's mind, that in fact the accommodation for 1,178 persons on this particular voyage in this disaster was not even used; I mean to say the full capacity of it, although available, was not used by those on board the "Titanic." All that you have is that 711 persons were saved out of the total number that could have been saved, according to the capacity of the boats and assuming that the last collapsible was launched, namely, 1,178.

I only use that for the purpose of showing this, that even with the comparatively large boat accommodation that there was of 53 percent of the persons carried, nothing like that number of persons were in fact saved; and that even if you had had a larger accommodation it is very doubtful (I do not want to put it too high) whether you would have saved any more persons. I mean by that, that according to the evidence which has been given in this case, it is said that you could not get women and children to step into the boats, a large number of women and children were still on the ship and were not saved. And supposing you had had double the number of boats, it is very doubtful whether you would have had any more persons saved. Again, I am not using that for the purpose of saying that you should not have boats in the future. I am only using it in order to see what the result would have been if more boats had been provided on the "Titanic," that is all, as applied to this particular disaster, and not as intending in any way to relieve shipowners from having to provide more boats in future.

Those are reflections which, I think, one is bound to make, because naturally if you have in mind that more boats might have been provided, either by the Board of Trade Regulations, or by the shipowners themselves, in view of suggestions that were made to them, one must see, as far as one can, what the effect would have been if they had been provided. I know the evidence is so present to your Lordship's mind upon this that I am not going to dwell in detail upon it.

One has further to bear in mind this, that on this particular occasion the weather was extraordinarily favourable for the launching of boats; you might never get such an occasion again. If an accident happens, and if there is a collision, it is almost more than one could possibly expect that you would have an absolutely calm sea such as you had on this night; no wind, and even no swell, and that you could lower boats from the height of the davits of 65 feet above the water level. You do require a vessel to be very steady, and you require very good weather to be able to do that.

*The Commissioner:* I thought the boat deck was about 90 feet above the water. *The Attorney-General:* 95 feet from the keel, but 65 feet from the waterline. I think I am right in that.

*The Commissioner:* There is one matter that is quite beside the point, but I want to mention it now because my attention has been drawn to it, and you have just stated a point which makes it applicable at this time. You were talking about the women and children. I do not know whether, in providing lifebelts, any lifebelts are made specially for children, because I am told that the lifebelts which are made for adults are not really available for children. I only mention it; but if it is so, I think the attention of shipowners ought to be directed to it, so that it will be necessary that they should have some lifebelts on board which could be used by small children.

*The Attorney-General:* Yes, my Lord.

*The Commissioner:* I only mention it.

*The Attorney-General:* Again, I think one must remember the very considerable difficulty that there would be in a vessel in lowering boats from both sides. Certainly in a heavy sea you could only lower boats on one side, as we know; it would be useless to attempt to lower them on the weather side; you could not do that, you could only lower them on the lee-side. So that if you had the full boat accommodation, still the great probability is in the event of your requiring them you could only use the one side. *The Commissioner:* And I suppose if the ship has a list.

## **Page 948**

*The Attorney-General:* Yes, I was going to say in a list, again, you can only lower on the one side.

Then there is the further difficulty which has been much discussed in this case, of finding a place for them. It is not for me to express an opinion on that; it is a matter for your Lordship as to whether there was more room on the "Titanic," more space available for boats. All I will venture to say with regard to it is, that certainly, according to the evidence, it does seem that more boats could have been placed on the deck. I do not profess to be an expert upon it.

*The Commissioner:* More boats could have been placed there - there is no doubt about that - because they have placed them since on the "Olympic."

*The Attorney-General:* Yes, but, as I saw them placed - I do not know whether the same idea occurred to you when you saw them - they would have a very great difficulty in using all those boats on that deck if the occasion arose.

*The Commissioner:* And it may be the further provision of boats would be quite useless - very likely it would be - but I am sure of this, that at present you will not get the public to travel upon a boat that has not got what the public thinks is a sufficient supply of lifeboats.

*The Attorney-General:* No, and certainly, I think the result of the evidence which has been given in this case so far as I am able to form an opinion upon it - I put it forward with diffidence, having regard to the presence of those who are much more able to speak upon this matter with authority than I - is that it does seem that more boats could with safety have been carried, and placed under davits on the vessel.

*The Commissioner:* I have had sent to me an advertisement of a line of steamers which contains one line: "Lifeboats carried sufficient for all passengers and crew." *The Attorney-General:* No doubt, for a time those advertisements may have some effect. As we know, eventually the public forgets all about them, and we get back to the old state of things, so that some Regulations have to be made.

There are, no doubt, many considerations of that character which must naturally affect the minds of those who have to determine whether or not there should be boat accommodation for all. I propose to leave that part of the subject now; I have dealt with it so far as it is material to this Enquiry, and it is useless, as it seems to me, to examine all the suggestions that have been made, and the objections to them, again.

*The Commissioner:* Fishing boats, I suppose, carry boats, but do they carry lifeboats?

*The Attorney-General:* Not lifeboats, but boats, I think.

*The Commissioner:* Not lifeboats?

*The Attorney-General:* No; boats. It is very difficult to say that boats should be carried for all persons on board, for instance, on excursion steamers. There are all those matters to be considered. Your Lordship will remember in the provisions as to boats there are a series of classes of vessels dealt with which gives you a very good idea of the difficulties that there necessarily must be in prescribing what is to happen with regard to all vessels. You first of all have got steamships carrying emigrant passengers. They come under the provisions of the Merchant Shipping Act so far as they go. In that connection you have also got the foreign-going steamships which have passenger certificates under the Act, which do not carry emigrants. That is a second class. Then you have steamships which have passenger certificates carrying passengers anywhere within the home trade limits, as defined, as your Lordship will remember, under the Merchant Shipping Act, between places in the United Kingdom and ports in Europe, between the River Elbe and Brest. Then you have foreign-going steamers which are not certified to carry passengers. Those are easily dealt with because they have ample accommodation there and your Lordship will remember so easy is it that in some of these vessels you have got the accommodation provided on each side sufficient to carry the whole of the passengers on board the vessel, which are the crew. But you can only do that, of course, when you are dealing with a foreign-going vessel which is not carrying passengers at all.

*The Commissioner:* I have forgotten what I have been told about Channel steamers going to Calais and Boulogne. Do they carry lifeboats sufficient to carry all the people?

*The Attorney-General:* No, they certainly do not. That is what I was thinking of at the moment.

*The Commissioner:* I came across at the end of March, I think it was; we were packed like pigs almost, I am sure there were not sufficient lifeboats then.

*The Attorney-General:* No.

*The Commissioner:* But I did not trouble my head about it.

*The Attorney-General:* I will not trouble you to go through it, but merely give an indication of the kind of provisions that would have to be made, necessarily for the different classes of vessels. In this case, and applying the test to this disaster; what happened on the "Titanic," the fact must always remain in the end that there was the strongest disinclination on the part of the majority of persons on board the "Titanic" to leave that great big ship for the very small boat into which they were asked to enter.

Whether it is reasonable or not it is useless to enquire. It seems natural, and it is what happened in this case, and in all probability it is what would happen if, Heaven forbid, such a disaster happened again; people would be disinclined to leave the big vessel for the small boat in the water on a dark night.

The only further observation I want to make about it is that naturally, when you get to this stage of knowledge, when we know all that has happened, and more particularly when we know of the disaster which took place on this 15th of April, with the great loss of life that there was there, it sets the Board of Trade, like every other person, examining into the conditions with regard to vessels going to sea. And quite rightly. It showed what may happen, notwithstanding all the precautions you might take, notwithstanding that your vessel might be constructed according to the best knowledge and experience, and by one of the best builders in the world, and notwithstanding that no expense was spared. The vessel was built; as your Lordship will remember, at cost price, plus a commission; and so far as I followed the evidence there was no attempt on the part of the owners to save money, certainly no attempt by them to save money in the building of the ship which would involve in the slightest degree any omission to make a vessel either sufficiently strong, or to equip her properly for carrying passengers. And one understands why, apart from any other reason; in the competition that there is between these great liners, a vessel must be equipped according to the best results of modern science, and really taking advantage of everything that knowledge can give us at the present day, otherwise she cannot compete with the other liners. That is, no doubt, in one sense a great safety and security.

What does strike one in this matter, and what I am suggesting for your Lordship's consideration, if you think it right to put it forward as a recommendation, or as a subject which is well worthy of consideration, is that the Board of Trade might have greater powers with regard to inspection of bulkheads and requirements as to the watertight compartments and spacing and construction, and so forth. One thing is apparent from the investigation which we have made that they have practically no control. It is quite true that they have some with reference to the loadline. Your Lordship will remember what that is. It is comparatively slight, it seems to me. Although it is quite true that shipowners as a Rule, agree to conform to requirements that may be made, the Board of Trade has little power to interfere.

*Mr. Laing:* It can refuse a passenger certificate.

## **Page 949**

*The Attorney-General:* What it has to do is to consider whether or not in the one case the vessel is satisfactory, that is to say, whether she is constructed satisfactorily, and they may take it into account, no doubt, the construction and division of watertight compartments. But what I mean is that it is quite possible, as it occurs to me, that greater powers might be given by Act of Parliament - they would have to be given by Act of Parliament - to the Board of Trade if, as a result of the Enquiry which is now about to take place, and which is taking place by the Committee which has been appointed since this disaster, the definite recommendations are made as to what is the best means, what is the safest means to be adopted for effective provision of watertight compartments; it

occurs to me that they might have some power of enforcing them. But that depends very much upon the result of the Committee's report. All I am suggesting is that it is well worth considering - I should have to leave it there - I suggest it is well worthy of consideration whether they should not have greater powers in that respect. Suppose, for example, you got as the result of Enquiry and investigation a definite decision that a watertight deck at a certain level from the bottom would be of the greatest value; suppose you had such a finding from the Bulkheads Committee, that no doubt ought to be carried out and would have to be carried out by Act of Parliament. There would be no power as the law stands at present - that is certainly my view of the Board of Trade - to insist on that. Supposing the vessel is properly equipped as a passenger vessel I do not see that the Board of Trade would have the power to say, under the law as it stands at present, "This is the best means of construction that can be adopted; to have a watertight deck of this character, and you have not got it and, therefore, we will not give you a certificate." *The Commissioner*: Knowledge is always increasing, and if you had statutory provisions of that kind it appears to me they might require alteration every twelve months, or every six months. For my own part I do not like statutory provisions hampering trade at all, and I should very much like to know whether in Germany, for instance, there are laws which compel ships to be constructed in this way, or in that way, or whether it is left to the discretion of qualified people who examine the ship. *The Attorney-General*: Yes, I agree. That is one of the matters which no doubt would have to be considered by the Committee before it comes to a conclusion, what the course is that is adopted there and what actually are the requirements. I have two letters which we have received since the evidence was closed from the German companies which, if your Lordship thought right, could be put upon the Note; I have not troubled you with them because in view of what your Lordship's decision has been upon this question of bulkheads, it seemed unnecessary to go into detail with regard to what they do in Germany, how their vessels of the particular lines there are constructed. What I do propose to do with them is that those letters should be handed to the Committee which is going to enquire into this matter.

*The Commissioner*: That is the best thing to do. I do not want the Note encumbered with them.

*The Attorney-General*: No, my Lord; that is what I thought. But it is important that those who will have to deal with this should have it before them, and as we have acquired the information during the course of this investigation, I propose to have those letters sent to that Committee to consider. What I meant was not that you should have stereotyped in an Act of Parliament - a particular form of construction. I agree, if I may say so, that that would be most undesirable, because as you say, knowledge progresses week by week. I did not mean that at all. What I did mean was that it may be necessary that some further powers should be given as to requirements of the Board of Trade with reference to bulkheads and watertight compartments. I need not go into that, because the time has not come for dealing with that. It must depend upon the Report of the Committee. I think the opinion which was formed by the Board of Trade after the receipt of this Committee's report of July, 1911, and after the investigations and the experiments which had been made for the purpose of enabling them to frame the draft Rules, is dealt with in the letter of the 16th April, the letter which was ordered on the 4th April, which sets out exactly

what the Board of Trade's opinion was before the "Titanic" disaster. One may summarise it in this way, I think, that they had come to the conclusion that it was necessary to have a revision of the Tables, and they transmitted a copy of the memorandum and tables which they were proposing to adopt to the Committee, for the Committee's approval before they were published, and before they were laid on the table. That was the position.

*The Commissioner:* Was the Board of Trade put in motion by anything that took place in the House of Commons; I mean, put in motion in reference to the matters they dealt with in 1911?

*The Attorney-General:* Yes, certainly, a question was asked in February, 1911.

*The Commissioner:* It seems to me I have seen it somewhere.

*The Attorney-General:* It is quite right.

*The Commissioner:* In February, 1911, some question was asked in the House of Commons.

*The Attorney-General:* Yes.

*The Commissioner:* And, as the result of that question the four gentlemen were asked to report.

*The Attorney-General:* Yes. If you look at page 18 of the Memorandum you will see the circular which was issued which resulted in the report of the four officials. *The*

*Commissioner:* Apparently the Board of Trade did not move of its own initiative. *The*

*Attorney-General:* I do not think that is quite right. So far as I follow it, they had had the matter under consideration and were considering it at the time this question was put.

What they say in this note of the 18th February, 1911, is this: "The Board have under consideration the question of amending the present requirements of the Statutory Rules." There was a question put in February, 1911, but there had been a question put in November, 1910, and that explains, no doubt, why it was they had had it under consideration before this Memorandum is sent out, of the 18th February.

*The Commissioner:* Is the question of November, 1910, mentioned in the Memorandum that you handed up to me?

*The Attorney-General:* I think not; no, it is not. The reference to the question is at page 5, and that only deals with the question of February, 1911. I will just read what was said there and then I will tell you what happened in November, 1910. On page 5 of the Memorandum it says: "In February, 1911, a question was asked in the House of Commons as to the desirability of revising the Regulations governing the number of lifeboats in passenger vessels, having regard to the increased tonnage of modern ships. The President of the Board of Trade replied that the question of the revision of the Rules was engaging the serious attention of the Board, and that he had decided to refer the matter to the Merchant Shipping Advisory Committee for consideration and advice."

*The Commissioner:* Who was the President of the Board of Trade that time? *The*

*Attorney-General:* Mr. Buxton was the President in February, 1911. I can supply your Lordship with the questions and answers if you would like them.

*The Commissioner:* I do not want them. You were going to tell me now about November, 1910.

*The Attorney-General:* Yes. In November, 1910, the question was put by the same member.

*The Commissioner:* Who was he?

*The Attorney-General:* Mr. Bottomley, asking whether the President's attention had been called to the fact that the "Olympic" was provided with 14 lifeboats only, being less than a quarter of the

**Page 950**

number furnished by most other vessels of similar tonnage. That is what he says in the question.

*The Commissioner:* What is the answer?

*The Attorney-General:* The answer is - this may be the Under-Secretary: "I understand that the 'Olympic' will be provided with 14 lifeboats and two ordinary boats, of an aggregate capacity of 9,752 cubic feet, which is in excess of the requirements of the Statutory Rules."

*The Commissioner:* Is this Mr. Buxton?

*The Attorney-General:* No, Mr. Tennant, the Parliamentary Secretary of the Board of Trade; he answered for the Board of Trade. "I have no information as to any vessel carrying four times this number of boats. The 'Lusitania' and the 'Mauretania' each carry 16 boats." And then the other question, if your Lordship would like the one in February, 1911, which followed upon it. It is this: "To ask the President whether he will state the date of last Regulations made by the Board of Trade in reference to the number of lifeboats necessary to be attached to passenger vessels, and whether, having regard to the increased tonnage of modern ships he will consider the desirableness of revising the Regulations." Mr. Buxton answered: "Those Regulations were last revised in 1894. The question of their further revision is engaging the serious attention of the Board of Trade, and I have decided to refer the matter to the Merchant Shipping Advisory Committee for consideration and advice." That is how the matter stood.

Then came the circular of the 18th February, 1911, which, as I said, is at page 18 of the Memorandum, and that led to the four reports of which your Lordship no doubt has sufficient particulars. Substantially, what that came to was this; the view of the Board of Trade, and certainly of Sir Alfred Chalmers, up to that time, had been that it was not necessary. Sir Alfred Chalmers, who was the head of the Marine Department, had certainly taken that view very strongly.

*The Commissioner:* And does still.

*The Attorney-General:* And does still. Then, in November, 1910 undoubtedly attention was directed to it - the matter was then considered - and by February, 1911, the attention of the various gentlemen at the Board of Trade, the four gentlemen whose names have been mentioned whose reports you have, was directed to this, and they were asked to report, and the effect of their reports was to show that they thought (it is clear that all four thought) that some further boat accommodation should be required on these large vessels. They varied undoubtedly as to the extent.

*The Commissioner:* But if the suggestion of the man whose demands had been greatest had been listened to there would not, as I understand, have been boat accommodation on the "Titanic" as large as, in fact, was provided. Is that so? *The Attorney-General:* No, I do not think that is right.

*The Commissioner:* I thought that was so.

*The Attorney-General:* No.

*The Commissioner:* Now will you tell me.

*The Attorney-General:* I will tell you exactly how it stands. I think it would be right to say that there would not have been sufficient boats for the number of persons on board the vessel.

*The Commissioner:* That is quite certain; but I want you to tell me this if you can. I think it was the man in Glasgow, was it not, who made the largest.

*The Attorney-General:* Mr. Harris - well, Mr. Archer -

*The Commissioner:* Yes, I am told Mr. Archer, the Principal Surveyor.

*The Attorney-General:* Yes, I think Mr. Archer puts forward the largest.

*The Commissioner:* Very well. What did Mr. Archer suggest for a ship of 45,000 tons, because it was all arranged according to tonnage, was it not?

*The Attorney-General:* Yes, your Lordship will find his scale at page 18. The effect of it for 45,000 to 50,000 tons is that there should be a minimum number of 24 boats to be placed under davits, with a cubic capacity of 14,250 feet, and with additional boats of 24,937 cubic feet.

*The Commissioner:* How much does that make altogether?

*The Attorney-General:* If you take the divisor at 10, as I think we have done throughout, that would give sufficient for all, because there were 2,201 on board the vessel. That is the exception that I should have made to what I said.

*The Commissioner:* What I had in my mind was this, I think, that it does not make provision for all who might by law be carried.

*The Attorney-General:* No, it does not. By law the number was 3,547.

*The Commissioner:* And what was the boat accommodation recommended?

*The Attorney-General:* The highest was 24,937 cubic feet. It would be 2,493, taking the divisor of 10.

*The Commissioner:* Yes, that is 2,493. Supposing the boat carried a full complement of passengers and crew she would be short of lifeboat accommodation to the extent of more than 1,000?

*The Attorney-General:* Yes; but I think also one must take into account what the other recommendations were. Mr. Archer went furthest.

*Mr. Laing:* Archer was going to dispense with the additional boats.

*The Commissioner:* Does he go further in the direction of watertight bulkheads, or something of that kind.

*The Attorney-General:* He is in favour of the exemption of the necessity for additional boats.

*The Commissioner:* Rule 12 do you mean?

*The Attorney-General:* Yes, but it goes further. It is on page 17 of the Memorandum: "If, however, the vessel be divided into efficient watertight compartments to the Board's satisfaction"-

*The Commissioner:* That is Rule 12.

*The Attorney-General:* Yes - "the total boat equipment would be (say) 36 boats of 21,313 cubic feet. I would suggest, however, that an alteration could usefully be made in

No. 12 of the Rules in the direction of making a larger concession in the case of vessels which are efficiently subdivided. Owing, no doubt, to the very small reduction of lifesaving appliances at present sanctioned by this Rule, none of the large vessels recently constructed have complied with the recommendations of the Bulkhead Committee.” *The Commissioner*: That comes to this, does it not, that he thinks you ought to cause shipowners to improve the watertight attributes of the vessel by bribing them with a promise that if they do, they need not provide so many lifeboats.

*The Attorney-General*: That seems to have been the view right away from 1891. May I finish what Mr. Archer says because it is important, having regard to the Table to which I called attention, he says; “It is suggested that in the case of vessels divided into efficient watertight compartments in accordance with the Committee’s recommendations, the additional boats or life-rafts required by Division A. Class 1 (d), might be dispensed with altogether, provided the boat scale is maintained at about the values shown by the diagram. This would imply, in a vessel of 50,000 tons” - and therefore that is what we must take as what he would have required - “13 lifeboats, 7,750 cubic feet, 775 persons; 11 C. and 2 D. boats, 7,750 cubic feet, 968 persons; making a total of 15,500 cubic feet and 1,743 persons.” He takes a different divisor there; no doubt he has got different boats. The substance of that is, and I think that is as far as we can take Mr. Archer’s recommendation as applying to a vessel of the character of the “Titanic,” that she should have had altogether 24 boats, that is 13 lifeboats and 11 other C. and D. boats with an accommodation for 1,743 persons. I am taking his smaller divisor for that - cubic capacity, 15,500; persons to be accommodated; 1,743.

*The Commissioner*: That would be very much less than the number she might carry.

*The Attorney-General*: Oh, yes, very much less.

*The Commissioner*: Of course one sees the logic of it. If you can get a boat so built that she

## **Page 951**

cannot sink then you do not want any lifeboats at all.

*The Attorney-General*: No.

*The Commissioner*: But until you get that one can always conceive that there may be an occasion when lifeboats for all the people on board are required.

*The Attorney-General*: Yes. Might I add something to what your Lordship said, which is no doubt present to your Lordship’s mind? Although you may not have boat accommodation for all the persons on board, if you have an efficient watertight provision on your vessel you can keep the vessel afloat much longer, even though you cannot save her altogether, and with wireless telegraphy which will put you into communication both with the shore and with other vessels, no doubt it was thought that with a sufficient number of boats to take the passengers off to the other vessels or to the shore and to come back again in case of need, they had done all that was necessary.

*The Commissioner*: That may be very reasonable.

*The Attorney-General*: That seems to have been the view.

*The Commissioner:* But at the same time there is no provision there for that possible, though very improbable, calamity, when no assistance comes to the ship.

*The Attorney-General:* Quite. Of course, dealing with these large vessels they must be in communication with a number of other vessels, because of the track along which they travel, which is after all just like a main road on land, and indeed when they get within a certain distance along the road they are in communication with the land as we know. They were in communication with Cape Race. That is considered more especially in the recommendation of the Committee in July, 1911, because in the recommendation which they made, they took into account the enormous development that there had been in modern science by the application of wireless telegraphy.

*The Commissioner:* Do you suppose, Mr. Attorney, if the "Titanic" had been provided with lifeboat accommodation for all the people on board that any more people would have been saved?

*The Attorney-General:* Well, my Lord, the result of the evidence, to my mind, is contrary to that. I was indicating it a little earlier.

*The Commissioner:* It is pointed out to me quite properly that the wireless installations are only really of service in a trade like the trade of the Atlantic, where there are many steamers within range, and the recommendations will probably apply to vessels all over the globe.

*The Attorney-General:* Yes; but it is quite right to say that they would only apply to vessels on that track? I agree what is meant is that no doubt it would be of much greater value - wireless telegraphy would be of much greater value in a track like that than it would be elsewhere.

*The Commissioner:* Take the voyage from the Cape of Good Hope, for instance, to Australia; a wireless installation would probably not be of great value there because the ships would be too far away to be of any use. *The Attorney-General:* Of course it all depends.

*The Commissioner:* The ships that you summoned to your aid would be too far away to be of use.

*The Attorney-General:* That is no doubt always a factor to be taken into account. It is of the greatest value, of course, where you have vessels navigating along the same track to and fro, as you have here. It is of some value - I should have thought it must be of some value - to any vessel whatever the track it is following but not of such value. *The*

*Commissioner:* There is always hope that the message will reach some vessel which is within reasonable reach.

*The Attorney-General:* Or it may be even within reasonable reach of shore. *The*

*Commissioner:* Or reasonable reach of shore. It would not bring it within reasonable reach of shore, I suppose, from the Cape of Good Hope to Australia. If she had only been a few hours from the Cape of course it would.

*The Attorney-General:* As your Lordship says quite rightly that is one voyage, but you may take a number of others. In that particular one, of course, they would be a long way from land for a very long period.

Now, my Lord, if I may go back for a moment just before I say another word about what the Advisory Committee reported, the other gentlemen who reported on this matter gave lower figures.

*The Commissioner:* Yes, but I would rather take the higher figure.

*The Attorney-General:* Very well, the others are before you; we will leave it at that.

*The Commissioner:* Yes.

*The Attorney-General:* Then I will not bother about the other three, but I do think we must deal with the Advisory Committee's figures, because there you had the result, at any rate, of a very expert Committee. We have gone into it, and it is sufficient to give the figure. 8,300 cubic feet capacity would be the extent of the requirements for vessels of 45,000 tons and upwards according to that Committee's Report of July, 1911. All I wanted to say was that was the view of that Committee in July, 1911, an Advisory Committee constituted, as this Committee was, of representatives of all those who really had the means of bringing expert knowledge to bear upon the subject, and all of the different interests, also, in the shipping world. The result nevertheless, was that in July, 1911, the full extent of the boat accommodation required by that Committee in a vessel which was fitted with efficient watertight compartments was 8,300 cubic feet. So that in July, 1911, according to that Committee's requirement, the boat accommodation for the "Titanic" would have been less than under the Regulations which had hitherto existed. I will tell your Lordship why I say that.

*The Commissioner:* That is not quite accurate.

*The Attorney-General:* I will tell you why I say it. 8,300 feet compares with 5,500 feet in the Table of 1894.

*The Commissioner:* Well?

*The Attorney-General:* But under the Regulations for 1894 they would have had to find three-fourths additional unless they complied with Rule 12, which brought it up to the 9,625 feet. Under this scale, which was recommended by this Committee, if you had efficient watertight compartments it was not a question of being relieved of a portion only of the additional boat accommodation required, but you were to be relieved of it altogether. Under the old Rule you were only relieved of one-half of the additional boat accommodation; under this Report you were to be relieved of it all. So that under this Committee's Report, assuming that the "Titanic" was fitted with efficient watertight compartments, which I should have thought no one would doubt, having regard to the knowledge at that time, then all that she would have required to find would have been 8,300 cubic feet - boat accommodation for 8,300 feet, which would have given 830 persons.

*The Commissioner:* What I must have had in mind in what I said just now was that, under the Regulations of the Sub-Committee, which were adopted by the Advisory Committee, if the "Titanic" had been provided with lifeboat accommodation according to their recommendations, she would not have had as much lifeboat accommodation as she in fact had.

*The Attorney-General:* That is so.

*The Commissioner:* That is true, is it not?

*The Attorney-General:* That is true. That is upon the assumption which I made as I stated just now for this purpose, that she was fitted with efficient watertight compartments and applied for the exemption.

*The Commissioner:* Now, what is the definition of "efficient watertight compartments"? Is there any?

*The Attorney-General:* No, there is not.

**Page 952**

*The Commissioner:* It is left entirely to the Surveyor.

*The Attorney-General:* There is not a definition, and that is just what I meant by the observation I made just with reference to watertight compartments. That is left undoubtedly, at present absolutely, to the Surveyor. I said, and I think I am justified in saying, that having regard to the state of knowledge at that time no Surveyor would have said, the Board of Trade Surveyor or otherwise, that the watertight compartments of the "Titanic" were not an efficient provision.

*The Commissioner:* Then can you tell me why the White Star Line, the Oceanic Steam Navigation Company, did not apply under Rule 12?

*The Attorney-General:* Oh yes, for the simple reason that they meant to carry more boats than were required by the Board of Trade Rules, as, in fact, they did. They carried 11,325 cubic feet capacity as against 9,625, the maximum which could be required under the Board of Trade regulation. I have no doubt that what affected them was that it was desirable in order to attract persons to travel by their lines that they should carry more boats. I should imagine that that was the reason. Their's was a commercial enterprise, and they thought it was desirable to carry more, but when you have that Committee's Report before you, the latest document giving the latest results, the consequence would have been, as your Lordship said, that if that Report had been accepted in its entirety there would have been only accommodation for 830 persons.

*The Commissioner:* I suppose it is impossible to make a ship unsinkable, and, at the same time, for it to be of mercantile value.

*The Attorney-General:* I should certainly assume it, otherwise I am quite sure it would have been done.

*The Commissioner:* It would have been done.

*The Attorney-General:* Yes, because, if anybody could say now he could make an unsinkable ship nobody would want to travel in any other. But just see the difficulty of it.

*The Commissioner:* You could conceive of its being rivetted so that no water could possibly get into it, and when put into the sea and it will not sink, but it is not very much use as a cargo carrying ship.

*The Attorney-General:* And less as a passenger carrying ship.

*The Commissioner:* Well, I should think so.

*The Attorney-General:* You may say a vessel should have a double bottom Well, she has, up to a point. You may say, "Well, she shall have a double skin right through, an inner and an outer skin."

*The Commissioner:* It is even if she has a double bottom, I suppose?

*The Attorney-General:* Yes, but what is equally important is, that she may be penetrated above the double bottom.

*The Commissioner:* I suppose some people would say the double bottom ought to be carried up?

*The Attorney-General:* That is what I meant by saying an inner and an outer skin.

*The Commissioner:* A double bottom and a double top?

*The Attorney-General:* Yes, If this vessel had been holed in the double bottom, a totally different state of things would have happened. There you have every provision made for safety; but when she is holed above, once the side is penetrated and the water is pouring in, of course, you have only your watertight compartments to depend upon. And if she is holed in a sufficient number of compartments, as she was in this particular case, then it is impossible to keep your vessel afloat. I mean, that is the position. I suppose the true answer would be that a naval architect would have told you - again I speak with all diffidence - that you have done everything that could be desired if you have provided a vessel which will float with two adjoining compartments flooded and still have a freeboard from 2 1/2 to 3 feet - the top of her bulkhead still 2 1/2 to 3 feet above the waterline, with two adjoining compartments flooded. It is difficult, indeed, to say the extent to which modern science can go; taking two compartments, one fore and one aft, that is not sufficient, but if you have two compartments in a vessel which would stand penetration and flooding, I think it would be said that you have done everything that could be desired. But this vessel went further in her construction, because she was designed and constructed to float with two adjoining compartments flooded, and not only that, but, as your Lordship remembers, in this particular case, loaded as she was on this occasion she would have even floated with three adjoining compartments flooded. That was the view of Mr. Wilding, shown by him by the plans which he put in. But what, of course, nobody ever contemplated - that is the real explanation of the difficulty that happened here - no one ever contemplated that you would have that kind of disaster which could penetrate a vessel in five compartments, and assuming that she was holed in No 4, even six.

*The Commissioner:* In five or six?

*The Attorney-General:* Yes, I say six assuming she was penetrated in No. 4. I was leaving it out because, as I have said, I do not think the evidence quite establishes it, and therefore I do not want to put it too high. But assuming you have the vessel grievously wounded as this one was, penetrated through five compartments, then, of course, the difficulties are immensely multiplied, and I do not suppose anybody ever contemplated that would happen; and it never could have happened if it had not been for the fact that this vessel was going at 22 knots, which is such an important factor in it, and that she came across this submerged part of a berg which seems to have somehow had a number of projections which caused this damage. *Mr. Laing:* It was six or seven compartments.

*The Attorney-General:* I know, if you take Nos. 1, 2 and 3 holds; but you cannot call them compartments quite. If you take it as it is in the forepeak and in the 1st, 2nd and 3rd holds and also in No. 6, which is the foremost boiler section, and No. 5 boiler section, there is no doubt of the holing. If you treat those as separate compartments, it would make six, without taking into account No. 4. With No. 4 it would make seven. But your Lordship knows how that stands. The importance of it in my mind, according to the submission I am making to you, is that this particular damage that was done to this vessel, as we know it, was of a kind which nobody had ever contemplated as possible. That, I submit, is the true explanation.

*The Commissioner:* Can you tell me this; has an unsinkable ship ever been constructed?

*The Attorney-General:* Not that we know. I do not know of any. These vessels which

have been referred to, and vessels of that kind, like the “Mauretania” and “Lusitania,” were thought to be unsinkable in a comparative sense. You cannot put it any higher than that. It does not mean that it was impossible to sink them. What it did mean was that so far as one knew they never would be sunk because they were so constructed that they would float under conditions which it was thought comprised every possible danger that might happen to them. That, I think, was the view held right up to the disaster to the “Titanic.”

*The Commissioner:* There are a great many gentlemen who imagine that they can construct ships which would be unsinkable, and I have received endless notices of valuable patents for that purpose.

*The Attorney-General:* I know. One gentleman is very anxious that I should interest myself in a scheme under some patent of his which would save every person within five minutes of a disaster happening of whatever form or kind, and he is quite ready to expound it.

*The Commissioner:* And give him a fortune?

*The Attorney-General:* Oh, yes, my Lord, which he is anxious to share with me, provided that I supply the capital.

Now, my Lord, I think that exhausts what I want to say to your Lordship about the boat accommodation and the criticism that has been

## **Page 953**

directed to that. All I am anxious is that your Lordship should have present to your Lordship’s mind, as you have, all the considerations which may be urged *pro* and *con* when dealing with the criticisms and comments which have been made in reference to the Board of Trade.

Now I propose to deal with the last question, and that is, as to the “Californian.” I want to preface any observations I am going to make -

*The Commissioner:* You must tell me what my position is with regard to the “Californian.”

*The Attorney-General:* Yes, my Lord. First of all the view which I take of it is that so far from being desirous of bringing home to the Captain of the “Californian,” or to any of the officers of the “Californian,” that they saw distress signals and that they took no step after they had seen them, I am most anxious, and have been throughout, to find some possible excuse, for the inaction on the part of the “Californian.” It is not a case of desiring to bring home to them that they did not do their duty; our anxiety and your Lordship’s anxiety would be, if possible, to find some reason to explain the failure by them to take any steps when they had seen distress signals. I can only say that to me it is a matter of extreme regret that I have come to the conclusion that the submission I must make to you, is that there is no excuse. Whether I am right or wrong in that is, of course, for your Lordship’s consideration.

Now the position of matters in this Enquiry is this. Attention was called at an early stage of the Enquiry to the fact that the “Californian” had seen the distress signals and had taken no steps in consequence, and further the allegation was undoubtedly made that the

ship that she saw was the "Titanic." Upon that my friend, Mr. Dunlop, appeared when Captain Lord of the "Californian" was called. One must bear in mind also that this was not a new suggestion; that it was made first in America; and that it was enquired into in America. I am not, of course, going to refer to the details of what took place there. The only reason I am calling attention to it is that they knew perfectly well what the complaint was with regard to the "Californian." And no doubt that is the reason why my friend was instructed to appear, and did appear, as he stated at first, both for the owners and the Master of the vessel. I pointed out at once that in the view which I took of this matter the owners were not affected at all. No one suggested that the owners were responsible for this. This was a matter which affected the Master and, it might be, the officers of the vessel. I notice it is on page 156 that Mr. Dunlop first appeared in the matter, when he asked for leave to appear, when he said he was appearing for the owners. He said: "Will your Lordship allow me to appear on behalf of the Leyland Line - the owners, Master and officers from the 'Californian,' who are to be examined today?" That was my friend's application before they were examined. So that he knew quite well what the point was of calling them. Then I stated what the questions were that would be discussed. Then later on your Lordship says to Mr. Dunlop: "In the meantime, what you can do is to watch, and, if you find any attack is made upon your clients, then you can ask me to allow them to go into the box," I said, "It cannot affect the owners, I think; it may affect the Master if the story were true." Your Lordship will remember the position we were in at that moment. All that we knew about it was that the donkeyman Gill had made a statement on affidavit, and that that had been reported in the public press, and that the Master of the vessel had been examined in America, of which we also had some report in the newspapers. But that is how it stood. Whether the story was true or not we did not know. Then I said: "It cannot affect the owners, I think; it may affect the Master if the story were true." Then your Lordship says: "I understand this gentleman was applying on behalf of the owners and the Master," and my friend, Mr. Dunlop, says: "Yes." Then I say: "I do not see how it can affect the owners." There the matter rested. Then Captain Lord is examined and my friend Mr. Dunlop examined him, and some question was raised about it at page 170 only because I pointed out that he was leading Captain Lord. I thought, and I am going to say when I examine his evidence, that he was an unsatisfactory witness, and Mr. Dunlop was putting leading questions to him on the most vital points in the case. If you look at the top of page 170, I say: "I quite understand that he is here for the protection of the Master, and I am raising no objection to that, but in all the circumstances I think it would be better to let him tell a little of the story." That was the discussion. Then your Lordship says you did not think any harm had been done at that time, and later on your Lordship pointed out at Question 7834: "You are falling into the error that the Attorney-General warned you not to fall into. You are putting the words into the man's mouth. You might as well hand your proof to him and tell him to read it out." That makes it quite plain that my friend appeared, and appeared from the first moment, for the Master.

May I just call your Lordship's attention to the Rules. My submission with regard to it is that by appearing he becomes a party. I am not asking your Lordship in any way to deal with this matter, except to state the conclusion of fact to which you arrive.

*The Commissioner:* Have I any jurisdiction to do more?

*The Attorney-General:* I think not. If your Lordship will remember, you put this question to me at an early stage of the “Californian” Enquiry, and the view I took then was the view I take now, and that I submit to you that all we are asking your Lordship to deal with is the conflict of fact that arises upon the evidence, and nothing more. I am dealing only with the evidence of the “Californian” for this purpose. There is a conflict between the various witnesses called from the “Californian.” The facts alleged on the one hand are these, that the “Californian” saw distress signals. As to that there is no conflict. To be quite accurate with regard to it I think one might say that the Captain does not admit that they were distress signals, but he admits that they might have been. That is the exact position. I will show that by reference to one question. Further, that those distress signals came from a vessel in the direction in which the “Titanic” was. That there is no dispute about. The further point is that, having seen the distress signals, the “Californian” took no steps, except to attempt to do Morse signaling with a light. I think that is the position. The comment I make upon it is that for the Master of a British vessel to see distress signals, whether they came from a passenger steamer or not, and whether from a passenger steamer of the size of the “Titanic” or not, is a very serious matter, and because it is a serious matter we have enquired into it very carefully during the course of this investigation; but, having regard to the Enquiry, I think all that your Lordship is asked to do, certainly all that I am asking you to do, is to give the view of the facts which you have formed after hearing all the evidence. I mean by that that suppose your Lordship came to the conclusion that we were right in saying that she did see distress signals and that they were the signals of a passenger steamer of the “Titanic,” and took no steps, that is a finding of fact which I should ask your Lordship to give in the Report which you may make. I do not ask you to do anything more. In point of fact Captain Lord is not summoned before you to answer some attack upon his certificate. That is not the position of matters. What has happened here is that in the course of the Enquiry facts which are relevant to this Enquiry have been brought before your Lordship, that there is a conflict of evidence as to these facts, that on one view of the facts they have a bearing undoubtedly upon the conduct of one or more persons upon the “Californian,” but they also are relevant to the Enquiry, and if they are relevant to the Enquiry the fact that your Lordship may in arriving

## **Page 954**

at your conclusion find a state of things to have existed which reflects upon some person who is not actually on trial and cited to appear before you as on trial, is no reason, I submit, why your Lordship should not express your opinion on the facts.

*The Commissioner:* Finding the facts and expressing an opinion upon them are two different things.

*The Attorney-General:* I agree; that is why I said expressing your opinion upon the facts and ask you to say on the somewhat conflicting evidence which is the correct one. *The Commissioner:* Let me put it quite plainly: If Captain Lord saw these distress signals and neglected a reasonable opportunity, which he had of going to the relief of the vessel in distress, it may very well be that he is guilty of a misdemeanor. That is so, is it not?

*The Attorney-General:* Yes, under the Merchant Shipping Act, 1906.

*The Commissioner:* Am I to try that question.

*The Attorney-General:* Certainly not.

*The Commissioner:* I think not.

*The Attorney-General:* Certainly not, my Lord. I never asked and could not ask your Lordship to try that question, but, nevertheless, the facts, which you are asked to find, whether they reflect upon him or not, are material to the Enquiry.

*The Commissioner:* The facts I can find, but I do not want, unless I am obliged to do it, to find a man guilty of a crime.

*The Attorney-General:* No, my Lord.

*The Commissioner:* I do not think I have tried him for any such purpose.

*The Attorney-General:* I agree.

*The Commissioner:* And, moreover, as you know perfectly well, he might, if he had had any idea that he was going to be tried for a crime, have said when he was in the witness-box: "I refuse to answer these questions because they may incriminate me."

*The Attorney-General:* Yes.

*The Commissioner:* But he did not do that, you know.

*The Attorney-General:* Different considerations apply, I think, when you are determining whether a crime has been committed, and your Lordship would have to go into questions which certainly, it appears to me, it is unnecessary to find in this case, and which I am not asking you to find in order to determine whether a crime was committed. I will give an indication of what I mean. Supposing he came to a mistaken conclusion with regard to what he saw, clearly there is no crime. Supposing he was careless in coming to that conclusion, there is no crime; but, nevertheless, if you were sitting on another tribunal dealing with the matter from other points of view, you might say, "Well, he ought to have come to the conclusion that these were distress signals from a passenger steamer, and he ought to have gone to the rescue of that vessel." Suppose he, the Captain of the "Californian," thought that these rockets were distress signals, and that they came from a vessel in distress, apart altogether from whether she was a passenger steamer or not, then you have to consider whether he has any excuse for not going to the assistance of this vessel. Of course there are a number of considerations which you would have to take into account then: Whether he thought he could safely reach her; whether he thought he was running a risk; whether, owing to the fact that he was among ice, and, apparently, according to his evidence, for the first time, that may have formed some explanation of why he did not at once proceed to the assistance of this vessel. All those are questions which no doubt would be very relevant indeed when you are considering whether or a not a misdemeanor has been committed. I am not going to ask you to find that at all. What I am asking you to find is the fact that they did see on the "Californian" distress signals and that were distress signals from the "Titanic," and that the distance of the "Titanic" from the "Californian" was only a few miles. *The Commissioner:* How many?

*The Attorney-General:* I should put it at something like seven or eight. It is very difficult to say. I do not profess to be able to say with precision. *The*

*Commissioner:* That is a very difficult question on the evidence.

*The Attorney-General:* I agree it is very difficult to say. I think it was put by him in America and also here at 19 1/2 miles; and then by a later explanation he says he had to steam just on 30 miles to get there.

*The Commissioner:* Because he could not go the direct way.

*The Attorney-General:* Yes, that is as far as I ask the Court to go. It is as far as it is necessary to go for the questions I am putting to you. For one thing, I should be very sorry to do an injustice to Captain Lord, and I am very anxious that in any event nothing should be said as a conclusion by your Lordship which would suggest that he had committed a misdemeanor. Of course, as your Lordship says, no such question is put to you and no such question is made by me. But still we must get to some conclusion upon this state of the evidence.

*The Commissioner:* You formulated a question for me to answer?

*The Attorney-General:* Yes, purposely.

*The Commissioner:* And I must answer it somehow; at least, I think I must.

*The Attorney-General:* It is the question in Question 24: How it was that assistance did not reach the "Titanic" before the "Carpathia" arrived? The "Californian" is the vessel.

*The Commissioner:* It is the only vessel as is pointed out.

*The Attorney-General:* Yes, I framed the question purposely so as to get an answer upon this evidence.

*The Commissioner:* I think you have explained to me sufficiently how you think I ought to deal with this.

*The Attorney-General:* If your Lordship pleases.

*The Commissioner:* Unless you wish to say anything more; I am not stopping you on the evidence you know.

*The Attorney-General:* No. I am very anxious not to press it too far. At the same time I am very anxious that after the evidence we have had, such conclusions as are relevant to this Enquiry should be given by your Lordship when you have considered the evidence. Now, the evidence, which is voluminous, is undoubtedly to some extent very conflicting on some points. I am not sure that it is possible to reconcile some of these statements that are made, from whatever aspect you look at them. But upon the material points, I submit there is not any real difficulty. The material points are first of all whether the "Californian" saw distress signals. One answer of the Captain it seems to me quite disposes of that.

*The Commissioner:* Captain Lord?

*The Attorney-General:* Yes, my Lord.

*The Commissioner:* I do not know whether it will relieve you at all in the trouble you are taking, but I think we are all of opinion that the distress rockets that were seen from the "Californian" were the distress signals of the "Titanic."

*The Attorney-General:* That relieves me of a great deal of evidence, my Lord. That is the material fact of this case. Your Lordship will remember the evidence that was given by Gibson, the Apprentice, with reference to his going to the chart room and the Captain's explanation of that. My submission, in considering this evidence, is that one must come to the conclusion that Captain Lord's evidence, as given in this Court, was unsatisfactory upon this very vital point of what happened after he had once seen that there was a vessel

there. He was himself stopped in the ice because of the danger of proceeding, so that he had well present to his mind the possibility of another vessel being in jeopardy, in all likelihood, by proceeding through the ice; yet he not only goes to his chart room, but remains in the chart room after he has had notice that at least one distress signal had been sent up. His view about that at first - I doubt whether it is persisted in throughout his evidence or whether he intended to make an impression

## Page 955

that he persisted in it - was that he expected the boy to come down, because he had told Mr. Groves, who was the Third Officer, to send the boy down to him as soon as there was any change or as soon as there was anything to report. And the boy does come to the chart room. The Captain's explanation of it is rather difficult to get by piecing question and answer together because it travels over so much ground, but the explanation of it, giving it quite fairly to him, is that he remembered the door opening and the boy opening it. He said, "What is that?" and the boy closed the door and went away without saying anything further. That was his explanation of it. On the other hand, the boy's statement is very definite and very specific as to what had happened. But, my Lord, before the boy goes to the chart room, according to the evidence at a quarter-past one (but I shall submit it must have been somewhere about a quarter to one) notice is given to him by the officer on deck, through a speaking tube which existed, into the chart room that a white rocket had been seen. That is Question 6790, page 158. This is the Captain's admission. 6790 is the crucial question upon this point, but he is asked just a little before that, at Question 6785, "Did you speak to him through the speaking tube? - (A.) At 20 minutes to one." Your Lordship will remember he had said he remained on deck till a quarter-past 12, when he went into the chart room. Question 6786 is, "Did he say whether she had changed her position? - (A.) I asked him if the steamer was the same. He said it was the same; he had called her up once, but she would not reply to him." So that he is trying to get into communication with her and had failed. "(Q.) Then you went to lie down in the chart room? - (A.) Yes; I told him I was going to lie down in the chart room then. (Q.) A little later did he whistle down the tube and tell you she was altering her bearings? - (A.) A quarter-past one. (Q.) Did he say how she was altering her bearings? - (A.) Towards the S. W. (Q.) Did he tell you whether he had seen any signal? - (A.) He said he saw a white rocket. (Q.) From her? - (A.) From her." An attempt has been made - it is not really more - to explain that he did not understand what that white rocket meant, but my submission is that it completely breaks down. The suggestion at first was that it was a Company's signal. He admitted quite plainly that he knew it was not a Company's signal, or, at any rate, received no satisfactory explanation that it was a Company's signal. Will your Lordship look at page 161, Question 6898; "(A.) I heard of one rocket. I did not see it fired. (Q.) You heard of one? - (A.) Yes.(Q.) That was before you went to the chart room? - (A.) No, at a quarter-past one." Then, at Question 6902: "(Q.) Did you remain in the chart room when you were told that a vessel was firing a rocket? - (A.) I remained in the chart room when he told me this vessel had fired a rocket. (Q.) I do not understand you. You knew, of course, that there was danger in this field of ice to steamers? - (A.) To a steamer steaming, yes. (Q.) You knew there was danger? - (A.) Yes. (Q.) That is why

you stopped? - (A.) Yes. (Q.) And you knew also that it was desirable, at any rate, to communicate with the 'Titanic' to tell her that there was ice? - (A.) Yes. (Q.) You had done that? - (A.) I had done that. (Q.) And you knew that this vessel, whatever it was, that you saw, had stopped? - (A.) Had stopped, yes. (Q.) I do not understand - it may be my fault? - (A.) Shall I explain to you? (Q.) What did you think this vessel was firing rockets for? - (A.) I asked the Second Officer. I said, 'Is that a Company's signal?' and he said he did not know. (Q.) Then that did not satisfy you? - (A.) No, it did not. (Q.) I mean whatever it was it did not satisfy you that it was a Company's signal? - (A.) It did not, but I had no reason to think it was anything else." *The Commissioner:* That is a curious condition of mind.

*The Attorney-General:* Very. And if your Lordship looks at the question just opposite to that, after a series of questions we get eventually to Question 6943. "(Q.) Very well, that did not satisfy you? - (A.) It did not satisfy me. (Q.) Then if it was not that, it might have been a distress signal? - (A.) It might have been. (Q.) And you remained in the chart room? - (A.) I remained in the chart room."

Now, my Lord, that establishes quite clearly this, that he thought it might have been, and the moment a man thinks it might have been a distress signal and does not know what else it could be, I should have thought it really means that he knew - I will not say he was quite certain - but he knew at any rate this, that there was a serious possibility of some vessel being in urgent need of assistance close by. It is very difficult to understand. I find it very difficult to understand in reading through all this evidence why it was that in those circumstances he remained in the chart room and took no step. Your Lordship will see what he does. He says he remained there expecting Gibson, the Apprentice, to come down and report. I want to make this comment upon that evidence. It is very unfortunate, to say the least of it, that there is no entry made in the log of these distress signals. The shifting of time, according to the evidence that is given, has some bearing upon it. It is said, for example, in this case that this white rocket, the first distress signal, was not seen till a quarter-past one. It is very difficult to explain that, in view of the evidence of the "Titanic," which is that they were sending up these rockets from 12.45. I should have thought upon this evidence and upon the evidence which follows it, that the estimate of time must be quite wrong.

*The Commissioner:* There might be some difference in the clocks of the two vessels.

*The Attorney-General:* Yes, certainly, there might be.

*The Commissioner:* That might partly account for it.

*The Attorney-General:* Yes, it might; but having regard to the news they got in the early morning of the loss of the "Titanic," I cannot help thinking it is very striking that you find no entry of any sort or description of the distress signals which had undoubtedly been seen during that night, and to the number of eight. According to the Apprentice Gibson it is about 2 o'clock that he goes down into the chart room. That is the time which he gives. That is at Question 7277. The Master speaks of it, and says he came down at about 2 o'clock, and he gave that extraordinary account of what had happened. Your Lordship will remember the boy's account was a very different one. The boy's account was a very important one.

It is put, I think, at page 168 in further examination by me of the Captain, Question 7280: "Did not the boy deliver the message to you, and did not you enquire whether they were

all white rockets? - (A.) I do not know; I was asleep.” The first reference to the boy in that is at Question 7278: “(7281.) (Q.) I think this is a very important matter. - (A.) It is a very important matter. I recognise that. (Q.) It is much better to tell us what happened, Captain. - (A.) He came to the door, I understand. I have spoken to him very closely since. He said: I opened my eyes and said, ‘What is it?’ and he gave the message; and I said, ‘What time is it?’ and he told me; and then I think he said I asked him whether there were any colours in the light. (Q.) That is what the boy has said to you. You have questioned him a good many times since? - (A.) Yes, I have questioned him since. (Q.) Is he still an Apprentice on your ship? - (A.) He is. (*The Commissioner.*) Is he telling the truth? - (A.) Is the boy telling the truth? (Q.) Yes? - (A.) I do not know. I do not doubt it for a moment. (*The Attorney-General.*) Just think. You say you do not doubt it for a moment. Do you see what that means. That means that the boy did go to the chart room to you. He did tell you about the rockets from the ship, and you asked whether they were white rockets, and told him that he was to report if anything further occurred? - (A.) So he said. That is what he said. (Q.) Have you any reason to doubt that is true? - (A.) No; I was asleep.”

## Page 956

Then if you turn to what the boy says about this it is at page 173, Question 7552: “(Q.) What were the orders which the Second Officer gave you when she disappeared? - (A.) Call the Captain and tell him that that ship has disappeared in the South-West, that we are heading West-South-West and that she has fired altogether eight rockets. (Q.) Did you report that to the Captain? - (A.) Yes. (Q.) Where did you go to? - (A.) Into the chart room. (Q.) Was the chart room door shut? - (A.) Yes. (Q.) Did you open the door and go in? - (A.) Yes. (Q.) Did you find the Captain there? - (A.) Yes. (Q.) Did you speak to him? - (A.) Yes. (Q.) Did you give him the report you were ordered to give him? - (A.) Yes. (Q.) What did the Captain say? - (A.) He asked me were they all white. (Q.) The rockets? - (A.) Yes, were there any colours in the rockets at all? (Q.) What did you tell him? - (A.) I told him that they were all white. (Q.) Did he give any instructions? - (A.) No. (Q.) Did he say anything further? - (A.) He asked me the time. (Q.) What was the time? - (A.) Five minutes past two by the wheelhouse clock. (Q.) You told him that, did you? - (A.) Yes.” Then he said the Captain was awake, and then he explains that he had up to that time seen five more rockets. Having done that he goes back and reports to the officer. He says at Question 7572 that he had reported what he was told to do.

*The Commissioner:* I do not understand this boy’s evidence - that he saw three rockets at twenty minutes to four.

*The Attorney-General:* It may be one of two things. It might be that they were some of the signals which were sent up from the boats, but if they were rockets it may be they were the ‘Carpathia’s.”

*The Commissioner:* She sent up rockets?

*The Attorney-General:* Yes.

*The Commissioner:* That is quite possible.

*The Attorney-General:* Of course, he does not see those until about twenty to four.

*The Commissioner:* "I cannot say at twenty minutes to four, but it was about that time." However, you can pass it by; it does not affect my mind.

*The Attorney-General:* Again, it is a little difficult to tell what time exactly that boy saw those rockets. He saw some after the eight rockets which had been sent up by the "Titanic." The difficulty is to reconcile that evidence with the Captain's. *The*

*Commissioner:* I asked the boy, was the Captain awake, and he said, "Yes." *The Attorney-General:* Yes, certainly, your Lordship did.

*The Commissioner:* The Captain's excuse for not hearing or understanding what the boy said to him is that he was asleep.

*The Attorney-General:* Yes. Well, my Lord, I must say that with the greatest desire to accept that evidence, if possible, I find it impossible. He cannot have been asleep in view of what he was expecting. He had had the report; he was waiting to know whether they had managed to call up this vessel or not. He had had the report according to his own view half an hour before, that they had not yet managed to get into communication this vessel; they were trying to; and he says, "Let me know later." Then he is in his chart room waiting for this boy, the boy comes down and all this takes place; and it is very difficult to imagine that the Captain has forgotten all about this incident, or that it did not take place. I will not say more about it than that, but I do submit that the true view of the evidence is that what the boy Gibson is stating is correct; and if you take that view it means this -

*The Commissioner:* He struck me as a perfectly honest witness, and the Captain himself, when he is asked if he thinks the boy is speaking the truth, says he does.

*The Attorney-General:* Yes, and may I add one further factor for your Lordship's consideration. That boy when he was called was certainly very reluctant to say anything which he thought would tell against his Captain.

*The Commissioner:* Certainly.

*The Attorney-General:* I mean he was not anxious to make a case against him - quite the reverse, and I think the same observations would apply to Mr. Groves, the Third Officer, who also gives very pertinent evidence. But when you have got as far as that, I submit it is really as far as one need go in this case. The important fact is this, having regard to what your Lordship has said you are satisfied about; it means this, that that establishes that the signals were sent, that they were seen by the "Californian," that they came from the "Titanic," that the Captain knew that these signals had been sent up, and that the Captain remained in the chart room and did nothing. Those are the facts which are relevant for the purpose of this Enquiry. If he had taken another course, and if he had done what one would have expected him to do, he would have immediately steamed to the assistance of this vessel in distress. I do not profess to say - I doubt very much whether anyone can say - exactly the distance which the "Titanic" was from the "Californian" at the time of sending up the rockets. But according to the testimony (and this is not unimportant) of all those on the "Titanic" who saw the lights, the vessel they saw was, according to them, at a distance of something like five or six miles.

*The Commissioner:* Who were the witnesses on the "Titanic" who saw the Morse light?

*The Attorney-General:* My Lord, I think it is only Boxhall.

*The Commissioner:* At page 158, Question 6761, Captain Lord says this with reference to the green light that he saw and the distance. He is asked: "What distance do you think she was from you when you could see the lights? - (A.) About five miles."

*The Attorney-General:* That is about what is said by the "Titanic" witnesses.

*The Commissioner:* And that agrees with the "Titanic" witnesses.

*The Attorney-General:* Yes. There are a number of witnesses who speak to that light on the "Titanic." I agree that there is some discrepancy between the witnesses as to exactly how the light bore with regard to them. There are two factors to bear in mind in that connection which, I think, are essential to bear in mind, in order to understand the evidence. The one is that the "Californian" was swinging during the whole of this time. It explains what otherwise might be inexplicable - that is, why at first the green light is seen and then subsequently the red light. It explains it, I was going to say, for this reason -

*The Commissioner:* Seen by the "Californian"?

*The Attorney-General:* Yes. The "Californian" first of all sees the green light, the "Californian" is then heading about E. N. E.; it is after she stopped. The "Titanic" is proceeding to the Westward, and at this time the "Titanic" would expose her green light to a vessel which is heading E. N. E. The "Titanic" would be exposing a green light quite clearly.

*The Commissioner:* At what time?

*The Attorney-General:* I am speaking of the time now when the light was first seen.

*The Commissioner:* When was that?

*The Attorney-General:* The "Californian" stops at 10.20 and she shows the light. The Captain sees the light before he goes below into the chart room. It is between 11 and 11.30, he puts it. He says 11, and then in another question he says, it might have been a little later. But, in any event he sees the vessel coming towards him, and, heading as he was, the "Titanic" would be approaching him in the course she was taking, and heading, as he was in the "Californian," he would see her starboard

## **Page 957**

light. That is what he does see. He said at the question before that, which your Lordship referred to just now; where he said she was then about five miles off. "I saw it some time between 11 and half-past; I do not know exactly. (Q.) What distance do you think she was from you when you could see the lights? - (A.) About five miles. (Q.) As much as that? - (A.) About that, I should think."

Then after that the "Titanic," when she comes into collision with the iceberg, also swings. The evidence about that is the evidence of Rowe, at page 419, Question 17658. He gives the same evidence. First of all he saw a light four or five miles off, and then he asked, at Question 17667, "When you saw this light did you notice whether the head of the 'Titanic' was altering either to port or to starboard? - (A.) Yes. (Q.) You did notice? - (A.) Yes. (Q.) Was your vessel's head swinging at the time you saw this light of this other vessel? - (A.) I put it down that her stern was swinging. (Q.) Which way was her stern swinging? - (A.) Practically dead South I believe then. (Q.) Do you mean her head was facing South? - (A.) No, her head was facing North. She was coming round to

starboard. (Q.) The stern was swung to the South? - (A.) Yes. (Q.) And at that time you saw this white light? - (A.) Yes. (Q.) How was it bearing from you? - (A.) When I first saw it it was half a point on the port bow, and roughly about two points when I left the bridge.”

*The Commissioner:* What Question is that?

*The Attorney-General:* That is 17667 to 17674. If your Lordship will look now at Gibson’s evidence at page 172 you will find the evidence of the “Californian” swinging, Question 7470. “Can you tell us whether your ship during that hour had been heading the same way, or whether she had shifted her position? - (A.) The ship was swinging round. (Q.) Your ship was? - (A.) Yes. (Q.) Of course, if your ship was swinging round, even though the other ship was stationary, after a bit her lights would bear differently from you? - (A.) Yes. (Q.) When you say it was 2 1/2 points upon the starboard beam, do you mean forward of the starboard beam? - (A.) Before the beam. (Q.) Five and a half from the bows? - (A.) Yes. (Q.) You say that the ‘Californian’. was swinging. Can you tell me, do you know, which way she was swinging? - (A.) She was swinging towards the nor’ard.” Then came the statement as to what he saw after that. If you look at page 186, Question 8150, you will find what Mr. Groves, the Third Officer, says about that. This is after he had seen the two masthead lights, your Lordship will recollect. “How were you heading? - (A.) At that time we would be heading N. E. when I saw that steamer first, but we were swinging all the time because when we stopped the order was given for the helm to be put hard a-port, and we were swinging, but very, very slowly.” He deals with this again at page 188. I will begin at Question 8239 so as to make it intelligible. “(Q.) It was after you had seen those white lights disappear that you had a conversation with him in which he said to you, ‘the only passenger steamer is the “Titanic”’? - (A.) That is so. (*Mr. Rowlatt.*) Did you have any further conversation with the Captain? - (A.) I did not. (Q.) Did he stay on the bridge or go down again? - (A.) I do not think he would have been up there for more than three minutes at the outside with me. (Q.) Then he went down again? - (A.) He did. (Q.) Did you stop on the bridge? - (A.) I stopped on the bridge. (Q.) Did you continue to observe the steamer? - (A.) After I had tried ineffectually to Morse her I did not pay any particular attention to her. (Q.) Did you not notice her, or did you notice her? - (A.) Oh! I noticed her, certainly. (Q.) Was she keeping her same position? - (A.) The same position, yes. We were swinging slowly to port, very slowly.” That is a mistake, as the Admiral points out. It is corrected later. “(Q.) Did you not take her bearing by the compass? - (A.) Not that steamer’s bearing, no. (Q.) She would appear to be coming round more towards your stern? - (A.) No, she would appear, as we were swinging, to be working towards our head. (Q.) I thought you were swinging to port? - (A.) No, we were swinging to starboard that is, to the right hand.” It is worth taking a note also of the evidence of Mr. Stone at page 182, Question 8061: “We were heading E. N. E., at the beginning of the watch, and slowly turned round to W. S. W. When I lost sight of this steamer we would be heading then about W. S. W., and she would be about two points on our port bow. I saw then her stern light, not her red light. She shut in her red light. (Q.) You must have seen her green light if it was showing, before she shut in her stern light? - (A.) If she shut in her red light. I did not say she shut in her stern light. She did not shut her stern light in at all the whole period.”

Now, the effect of that evidence is to show this, that both vessels were swinging, and the consequence is you get some explanation, if you take into account that they are swinging, and that this vessel, which was heading E. N. E., was swinging all the time, and that also the "Titanic's" stern was swinging to the South, as we have heard it, one gets some explanation of why it is that, first, you hear from the witnesses that they saw a green light and that subsequently they saw a port light. If I may illustrate that, suppose you have the "Californian's" head E. N. E., and you have the vessel going to the Westward, almost due W., I assume, of course, during that time the starboard light is exposed. First of all there would be the masthead lights seen of the vessel approaching the "Californian" being still, and then the green light of the "Titanic" would be seen. Then the "Titanic" comes to a stop, having approached a certain distance, and then she begins to swing to the Southward, and the consequence is she is in that position (*indicating*). The other vessel is swinging all the time. When she gets in that position the port light would be exposed, and that would explain why it is that you get first of all a green light seen, and then a red light, of the vessel according to the evidence which is given. The whole importance of it is, of course, not so very great as your Lordship must come to the conclusion, the same conclusion that one of the officers on board the vessel did, that the vessel which they saw that night and the vessel which had been sending out the distress signals was the "Titanic."

If one wanted any corroboration, but I do not dwell upon it inasmuch as your Lordship and those associated with you are satisfied about this, it would be found in Gibson's evidence when he talks about the blaze of light on the deck of the vessel. I should have thought the last thing you would see in the ordinary course of things on a cargo vessel would be a blaze of light on the deck, and that is a thing he talks of right through, a blaze of light right through. That is what you would expect to find on a passenger steamer, and no doubt what he did see. Once we have got as far as having established that these distress signals came from the "Titanic," that the Captain knew of them, and that he did not proceed either to the rescue of the vessel in distress or take what I should have thought was the step which was dictated at once when there was any doubt about it, that is, to call up the wireless operator and let him get into communication with the vessel, one gets really a state of things which is quite inexplicable.

*The Commissioner:* It is a most extraordinary thing that no attempt was made to communicate with the "Titanic."

*The Attorney-General:* Quite, the more extraordinary inasmuch as I have certainly understood as the Rule which everybody who goes to sea would never fail to observe, that if you see a vessel in distress you must do your utmost to get to it. I have always understood, certainly amongst sailors, not only in this country, but elsewhere, that that is a Rule of honour from which they do not depart, although they may commit other errors. In this particular case I am unable to find any possible explanation of what happened, except it may be that the Captain of the vessel was in ice for the first time, and would not take the risk of going to the rescue of another vessel

which might have got into trouble, as he thought, from proceeding through ice when he himself had stopped. But even that does not explain why they did not call up the wireless operator to ascertain what the condition of things was. We have heard no explanation of it. I think your Lordship is left absolutely in the dark with reference to it. One can only conjecture, and I do not know that it is perhaps quite safe to speculate upon the reasons that made Captain Lord neither come out of his chart room to see what was happening, nor to take any step to communicate with the vessel in distress, even such a very slight effort as to have the wireless operator called up.

So far as it throws any light upon this Enquiry I do submit that the answer is to be found in the evidence to which I have already called attention, and that really we get very little assistance by going further into it. That this vessel, the "Californian," could have got to the "Titanic" and might have got to the "Titanic" in time to save the passengers is, I am afraid, the irresistible conclusion from this evidence. If she was at this distance of 5 to 7 miles, and she could steam 11 knots an hour; she did steam 11 - she could, in fact, do as much as 13 - even allowing for her having to deviate so as to avoid the ice-field, there still would have been a very considerable opportunity for her to have got there in time, more especially, I think, if you take into account that there must have been some discrepancy between the clocks, or anyhow, the time as given of these events by the witnesses for the "Californian." We know, fortunately, in one way the times at which the various things happened on board the "Titanic" with some exactness, partly by reason of the wireless messages which enable us to tell accurately what was happening within a few moments right up to the time when the "Titanic" was no longer able to send wireless messages, and if you put those times together, and compare them with the times of the "Californian," it is quite plain that at a quarter to one they were sending up rockets, and it is equally plain that the "Californian" must have seen the first or among the first of the rockets that were sent up by the "Titanic"; and it, therefore, must place the time, if you are comparing it with the "Titanic" time, at a quarter to one or thereabouts, and not a quarter-past one.

In point of fact the "Titanic" did not go down for an hour and a half after that, and that gave an hour and a half for this vessel, which could steam as much as 13 knots, but was certainly able to steam 11 knots; and putting it even further than the five to seven miles, it still gave her ample time to get there. Of course, the Captain says he was 19 1/2 miles away. No human being would suggest that the "Californian" could have seen the sidelights of the "Titanic," either her red light or her green light at a distance of 19 1/2 miles. She must have been within an easy distance in order that her masthead lights and her sidelights were seen, as they were, by the "Californian."

And, my Lord, I would add to that that the "Californian" is shown to have been seen by the "Titanic"; that in any event the light that was seen so far as we know, according to all enquiries made and according to all the evidence put before you, was the light of the "Californian." I will not say that all the evidence points irresistibly to that, but I do say this, that if you compare the "Titanic" evidence with the "Californian" it is abundantly plain that the distance between them must have been comparatively small, that is to say certainly within five to seven miles, and could not have been 19 to 20 miles as the Captain of the "Californian" suggests.

Now I do not propose to go further into the evidence of the "Californian" unless your Lordship desires it, because it seems to me that when you have got those facts, really there is sufficient to establish quite clearly that these distress signals which were seen, were seen at a distance which would have enabled the "Californian" to get to the "Titanic." That is no doubt a material point, in view of the question which is put to your Lordship.

Now, my Lord, that I think concludes all that I desire to say to you upon the evidence in the case. The final conclusion to which I would call attention would be this, that this Court may recommend most useful precautions for saving life. The Board of Trade and Parliament may take the amplest care that proper precautions should be prescribed, and that there should be a sufficient protection given to those who are sailing on the seas against loss of life in the event of disaster. No human wisdom however great it may be, will, by means of regulations of this character or of Acts of Parliaments, be able to prevent, I will not say a recurrence of such a disaster as this, but the recurrence of disasters at sea. That is for the simple reason that everything depends, all the safety of the vessel depends, not upon the precautions that have been taken either by Government departments, or in consequence of any Act of Parliament, but upon the exercise of judgment and care by those who are responsible for the navigation. I can only say that as the result of this Enquiry it is to be hoped that no vessel will ever take such utterly unnecessary risks as I submit were taken on this voyage - that no vessel will ever again take such a risk as that, and that it will always be borne in mind by those who are responsible for the navigation that a little longer period passed by the passengers on board the vessel, and a few more hours taken in the passage from the United Kingdom to New York, or the return journey, are after all, and will after all, be very much better in the interests of everybody than to press along at a great rate of speed when there has been some indication of danger ahead. Nobody can say, I do not suppose any human being would be able to predict, that a vessel might meet an iceberg again in the same conditions as happened with the "Titanic"; but what one can predict is that there will come occasions upon which those responsible for the navigation will have to make up their minds whether it is not more prudent in the circumstances, to reduce speed and to go at a moderate speed, instead of pressing forward through the night in order to arrive at a particular time which they desire, and take, as I submit they were taking by this, an utterly unnecessary risk.

That is one lesson which, apart from every other lesson that may have been taught in this case, will, I hope, be borne upon those who are responsible for the navigation of our vessels. Your Lordship has had considerable experience in the Court over which you presided, more particularly in the Admiralty Division, of cases of collisions at sea. I would appeal to your Lordship's experience and the experience of those who are practiced in those Courts and those who also have experience in the navigation of vessels. Speaking generally the two causes of disaster to vessels are failure to keep a good lookout and proceeding at too great a rate of speed.

This disaster, as I submit, impresses upon all those who would have to consider these questions how important it is that in both these matters, both as regards look-out and as regards speed, the greatest care should be taken, when there is a definite indication, as

there was given according to the view I have submitted in this case, of a possible danger by meeting either icebergs or ice-fields.

It only remains for me to say to your Lordship, if I may respectfully say so, that the latitude which you have seen fit to allow during the course of this case, so that all questions might be asked which

**Page 959**

would be of the slightest use, has had this effect, that it has very much narrowed the range of controversy, when we get to the end of the Enquiry. The result of it has been that on many of the points it has been shown quite clearly there can be no dispute, and that there is nothing, therefore, into which your Lordship would have to enquire closely for the purpose of making your Report. The points at issue have been very much narrowed. The result of it has been that, in any event, everything has been put before this Court, and I hope that your Lordship will be satisfied of that, that all the evidence that can have been of use to you has been presented to you, and certainly, as far as the Board of Trade is concerned, that all the material which can be of any value has been put before you. With that, and thanking your Lordship, and thanking your Lordship in all earnestness and sincerity for the patience with which you have listened to this long Enquiry, I leave the matter to your Lordship for your Report.

*The Commissioner:* Very well. Thank you, Mr. Attorney. I will try to get this Report out in reasonable time.

*(Adjourned sine die.)*
